Acids, flavonoids, reducing sugars, tannins and many other active metabolites. 

**ABSTRACT**

*Lagerstroemia speciosa* (Family: Lythraceae) is native to Asia-tropical and subtropical regions. The phytochemical investigation of *Lagerstroemia speciosa* leaf and fruit revealed that it contained steroids, terpenoids, glycosides, phenolic compounds, α-amino acids, saponins, starch, alkaloids, carbohydrates, organic acids, flavonoids, reducing sugars, tannins and many other active metabolites. *Lagerstroemia speciosa* possessed many pharmacological effects included antimicrobial, antioxidant, antitumor, antidiabetic, hypolipidemic, anti-inflammatory, analgesic, gastro-intestinal, diuretic, thrombolytic, cardiovascular, central nervous, inhibition of TNFα production, xanthine oxidase inhibition, hepatoprotective and nephroprotective effects. The current review discussed the chemical constituents, pharmacological and therapeutic effects of *Lagerstroemia speciosa*.

**Keywords:** Constituents, Pharmacology, *Lagerstroemia speciosa*

**INTRODUCTION**

Plants are a valuable source of a wide range of secondary metabolites, which are used as pharmaceuticals, agrochemicals, flavours, fragrances, colours, biopesticides and food additives. Recent reviews revealed that the medicinal plants possessed antimicrobial [1-3], antiparasitic [1], central nervous [2-4], cardio-vascular [1-5], antioxidant [5], reproductive [1-5], gastro-intestinal [1-5], respiratory [2], antidiabetic [3], dermatological [5], antioxidant, anticancer, antidiabetic, hypolipidemic, anti-inflammatory, analgesic, gastrointestinal, diuretic, thrombolytic, cardiovascular, central nervous, inhibition of TNFα production, xanthine oxidase inhibition, hepatoprotective and nephroprotective effects. The current review will highlight the chemical constituents, pharmacological and therapeutic effects of *Lagerstroemia speciosa*.

**Plant profile**

**Synonyms**

Adameba glabra, Lagerstroemia augusta, Lagerstroemia flos-reginae, Lagerstroemia macrocarpa, Lagerstroemia major, Lagerstroemia murchausa, Lagerstroemia plicifolia, Lagerstroemia reginae, Munchausia speciosa [7].

**Taxonomic classification**

Kingdom: Plantae; Subkingdom: Viridiplantae; Infrakingdom: Streptophyta; Superdivision: Embryophyta; Division: Tracheophyta; Subdivision: Spermatophyta; Class: Magnolophida; Suborder: Rosanae Order: Myrtales Family: Lythraceae Genus: Lagerstroemia; Species: *Lagerstroemia speciosa* [8].

**Common names**

Arabic: Zahar khawa katheb, ward al-khawa, lilik hind, hemma hind, berangik; Sinhali: resed-flor-da-rainha, resed-gigante; Burmese: Gawking-uchyamang; Chinese: Bai ri hong; Da hua zi wei; English: Banaba, Pride of India, queen's crape-myrtle, queen of flowers; Hindi: Jarul, Arjuna, Bondaro, Chara, Ajhar, Varagogi, Motobhandaro; Indonesian: Bungur, Bungur tekuyung, Ketangi; Thai: Chuang kuu, Thaek dam; Inthanin nane [6, 9].

**Distribution**

It was native to Asia-tropical and subtropical regions: India, Sri Lanka, Cambodia, Myanmar, Thailand, Vietnam, Indonesia, Malaysia, Philippines, Bangladesh, Japan, and it was widely cultivated [9-11].

**Description**

*Lagerstroemia speciosa* is a medium-large-sized evergreen tree grows up to 25 m high. The leaves are opposite, l苍thy, oblong to ovate in shape, with short petiole, and measures 10-20 cm x 5-7.5 cm. The flowers are in large terminal panicle, regular in shape, varying from pink to purple in color, measure 5-0.7-5.5 cm wide. The calyx is in green ribbed tube with 6 lateral sepal lobes and 6 lilac purple petals with wavy margins up to 3.5 cm long, attached between the sepal by short claws. The stamens are numerous, with purple filaments and golden yellow anthers. The pistil is simple with 5 long style up to 5 cm long, dark pink stigma and a superior ovary. The fruit is a hard woody, subglobose, measures about 3.5 cm long. The seeds are winged [12, 13].

**Traditional uses**

The roots were used as an astringent, stimulant and febrifuge. It was also used for stomach problems. Two of the leaves was used in the treatment of diabetes mellitus and for weight loss. The leaves, flowers and barks were used as purgative. Leaf decoction or infusion was used for bladder and kidney inflammation, dysuria and other urinary dysfunctions, for cholesterol deduction, hypertension and diabetes. Poultice of the leaves was used as remedy for malaria, headache and cracked healing by application over the lesions. Decoction of the bark was used for gastrointestinal tract disturbance, stomachach, haematuria and depression. The seeds were used as a narcotic [9, 14-16].

**Parts used**

The roots, leaves and barks [9, 17].

**Physicochemical characteristics**

The physicochemical investigation of *Lagerstroemia speciosa* leaves showed the following values: loss on drying 82.14±0.9300,
moisture content 7.69±0.814%. total ash content 7.472±0.8077 and acid insoluble ash content 1.217±0.6232% of the dry weight. Ethanol-, dichloromethane- and water extractive values were 9.0280±2.2937, 2.9442 ±0.8827 and 13.1895 ±1.9934% of the dry weight, respectively [18]. The moisture content of fruit was 14.77%, and the total ash contents was 4.42% [19].

Chemical constituents

The preliminary phytochemical investigation of Lagerstroemia speciosa leaf and fruit showed that they contained steroids, terpenoids, glycosides, phenolic compounds, α-amino acids, saponins, starch, alkaloids, carbohydrates, organic acids, flavonoids, reducing sugars and tannins [19-19, 2-1.23].

The fat content for leaf and fruit was 3.36% and 0.26%. The fiber content was 15.76%, protein content was 11.24%, and carbohydrate content was 51.20% for Lagerstroemia speciosa leaf. The fiber, protein and carbohydrate contents for Lagerstroemia speciosa fruit were 35.39%, 2.88% and 42.28%, respectively. The relative abundance of minerals in Lagerstroemia speciosa leaf was 0.456% for Ca, 0.443% for K, 0.206% for S and 0.017% for Mn. The relative abundance of minerals in Lagerstroemia speciosa fruit was 0.384% for Ca, 8.217% for K, 5.521% for P, 2.477% for Fe, 0.15% for Zn, 0.49% 1.04% for Cu and 0.29% for Sr [19].

Heavy metals analysis of the Lagerstroemia speciosa leaf extracts showed that they contained mercury 0.63 ppm, arsenic 2.01 ppm, lead 1.16 ppm and cadmium 0.26 ppm, the levels of all the studied heavy metals were below the recommended concentrations [22]. β-Coumaric acid, kaempferol, quercetin, and isouqueritrin, were isolated from the roots. Six pentacyclic triterpene acids (oleanolic, arjunic acid, lupeol, lonic acid and 25-hydroxyuponic acid) were isolated from the leaves [24].

Significant variation in percentage distribution of coroic acid ranging from 0.005% to 0.888% dry weight were recorded in 12 natural populations across the Southern Western Ghats of India [25].

Many phenolics included ellagic acid, epicatechin gallate, quercetin, and phenolic glucosides [1-O-benzyl-6-O-E-caffeoyl-β-D-glucopyranoside] were isolated from the aerial parts of Lagerstroemia speciosa pyranoside [19].

Total phenol, total flavonoid and tannin contents determined in the leaves of Lagerstroemia speciosa were 159.93±0.73 μg/mg and 150 μg GAE in μg/mg respectively [26, 27].

Antimicrobial effects

Seed extracts were tested for antibacterial effect against different bacterial organisms. Some fractions of seed extracts of Lagerstroemia speciosa showed high antibacterial activity when tested against both Gram-positive and Gram-negative bacteria [42].

The methanolic extracts of Lagerstroemia speciosa leaves and barks were evaluated for their antimicrobial activity against 11 Gram-positive, Gram-negative bacteria and 3 fungi using disk diffusion technique. The average zone of inhibition exhibited by methanolic leaf and barks extracts (500 μg/disc) was 10-20 mm and 12-21 mm respectively [43]. The Lagerstroemia speciosa leaf extracts were investigated for antimicrobial and antifungal activities against potential clinical strains (Staphylococcus aureus, Escherichia coli, P. aeruginosa and Salmonella typhi) by well diffusion technique. The antibacterial property was also investigated against common food borne pathogens (Listeria monocytogenes, Bacillus subtilis) at varied concentration 250 to 1000 μg/ml. The antibiotic assay was carried out from 250 to 1000 μg/ml against P. aeruginosa by cover slip technique. Only minimum inhibition was seen in alcoholic extract for antibacterial activity, whereas all other extracts showed negligible activity. P. aeruginosa biofilm inhibited to 95.02% and 91.6±2% at higher concentration (1000 μg/ml) by methanolic and ethanolic extract respectively [44].

Total phenol, total flavonoid and tannin contents determined in the leaves of Lagerstroemia speciosa were 159.93±0.73 μg/mg in μg/mg and 80.32±0.19 μg/mg in μg/mg respectively [28].

31-Norlagerenol acetate, 24-methylene cycloartenol acetate, its 31-nor analog, largerenol acetate, tintinol infectious C and D, lut, et, me, phytol, sitosterol and sitosterol acetate were isolated from the leaves of Lagerstroemia speciosa [29].

Saponins, starch, alkaloids, carbohydrates, organic acids, flavonoids, reducing sugars and tannins are prevalent in Lagerstroemia speciosa. Many phenolics included ellagic acid, epicatechin gallate, quercetin, and flavonoids [1-O-benzyl-6-O-E-caffeoyl-β-D-glucopyranoside] were isolated from the aerial parts of Lagerstroemia speciosa pyranoside [19].

The antibacterial effect of the flowers extracts of Lagerstroemia speciosa was studied against Gram positive bacteria (Bacillus cereus, Bacillus megaterium, Bacillus subtilis, Staphylococcus aureus, Micrococcus luteus), Gram negative bacteria (Escherichia coli, Pseudomonas aeruginosa, Salmonella paratyphi, Salmonella typhi, Shigella boydii, Shigella dysenteriae, Vibrio mimicus, Vibrio parahemolyticus) and Fungi (Saccharomyces cerevisiae, Aspergillus niger). Melanolic crude extract possessed antimicrobial effect against all the tested microorganisms. The largest zone of inhibition (19 mm) was observed for the carbon tetrachloride soluble fraction against Staphylococcus aureus [46].

The antibacterial effect of the methanolic extract of Lagerstroemia speciosa leaves was investigated against Escherichia coli, Salmonella typhimurium, Staphylococcus aureus and Pseudomonas aeruginosa. The extract possessed high antibacterial activity against Escherichia coli (15 mm). Staphylococcus aureus (10 mm). Pseudomonas aeruginosa (10 mm). but had no activity against Salmonella typhimurium [47].

Lagerstroemia speciosa bark extract was investigated for its antimicrobial effect by using the time-kill curves assay. The extract showed a concentration-dependent killing effect for both B. spizizenii ATCC 6663 and A. anitratus. The number of bacteria was significantly reduced when they were exposed to 2MIC level. B. spizizenii ATCC 6663 was more susceptible to the extract as compared to A. anitratus [48].

The various extracts of the fruits of Lagerstroemia speciosa (50, 100 and 150 μg/ml) were screened for antimicrobial activity by paper
The ability of Lagerstroemia speciosa fruit extracts to antagonize cell-to-cell communication, expression of virulence genes and factors, and biofilm formation was evaluated in Pseudomonas aeruginosa strain PA01. The results revealed that Lagerstroemia speciosa fruit extract caused down regulation of quorum sensing-related genes (las and rhl) and their respective signalling molecules. N-acetylcysteine lactones, without affecting the growth of P. aeruginosa PA01. Significant inhibition of virulence factors Las A protease, Las B elastase, and pyoverdin production, were also recorded. Application of extract to P. aeruginosa PA01 biofilms increased P. aeruginosa susceptibility to tobramycin [49].

Antiviral activity of quercetin 7-glucoside isolated from Lagerstroemia speciosa was investigated against human rhinovirus 2 (HRV2) using a cytopathic effect reduction method. Quercetin 7-glucoside showed strong anti-HRV2 activity by reducing the formation of cytopathic effect. Quercetin 7-glucoside also inhibited virus replication in the initial stage of virus infection by indirect interaction with virus particles [51].

The protetive effects of hot water extracts from Lagerstroemia speciosa leaves were studied in SIN-1-induced oxidative stress in HTT-T15 cells, the cellular levels of ROS, lipid peroxidation and endogenous antioxidant enzymes, including superoxide dismutase, catalase and glutathione peroxidase were investigated. Treatment decreased the intracellular levels of ROS and lipid peroxidation, and increased the activities of antioxidant enzymes. The extract possessed a cytotoxic effect against SIN-1-induced oxidative stress in HTT-T15 cells through the inhibition of lipid peroxidation, a decrease in ROS levels and an increase in antioxidant enzyme activity [57].

Lagerstroemia speciosa flower essential oils demonstrated the highest antioxidant activity (IC_{50} = 4.20 ± 0.14 μg/ml) by (DPPH) [46].

The cytotoxicity of the Lagerstroemia speciosa flower essential oils was studied using Dalton's Lymphoma Ascites cells (DLA) and Ehrlich Ascites Carcinoma cells (EAC). The essential oils of the fruits of Lagerstroemia speciosa possessed cytotoxicity with IC_{50} value of 1.701 μg/ml in brine shrimp toxicity assay [40].

Anticancer effects

The antiviral activity of corosolic acid isolated from Lagerstroemia speciosa on cell viability and apoptosis was investigated in HCT116 human colon cancer cells. Corosolic acid was dose-dependently inhibited the viability of HCT116 cells. The features of apoptosis, such as chromatin condensation, a sub-G1 peak and phosphatidylserine externalization were apparent following treatment with corosolic acid. The apoptotic cell death induced by corosolic acid was accompanied by the activation of caspase 8-9 and 3, which was completely abrogated by the pan-caspase inhibitor, z-VAD-FMK. In addition, corosolic acid upregulated the levels of pro-apoptotic proteins, such as Bax, Fas and Fasl and down-regulated the levels of anti-apoptotic proteins, such as Bcl-2 and surviving [58].

The chloroform-soluble fraction of Lagerstroemia speciosa extract possessed the greater antioxidant property than the aqueous extract of leaf and fruit samples, by measuring lipid peroxidation. The ethyl acetate and ethanol extracts possessed the greater antioxidant property than the methanol and water extracts [55].

The ability of Lagerstroemia speciosa 40% methanolic extract to mitigate oxidative stress was demonstrated by hydrogen peroxide (H_{2}O_{2}) induced oxidative stress in 3T3-L1 cells. The IC_{50} value of Lagerstroemia speciosa extract was 20.43 μg/ml and that of ascorbic acid and rutin as positive control was 49.64 μg/ml [28].

The hot water extracts of Lagerstroemia speciosa leaves showed strong antioxidant activity in a linoleic acid oxidation system. The extract also possessed potent radical scavenging action on 1,1-diphenyl-2-pircrylhydrazyl (DPPH) radicals and superoxide radicals (O^{2-}) generated by a lypoxygenase (HPE)/xanthine oxidase system. In vitro lipid peroxidation of rat liver homogenate induced by tert-butyl hydroperoxide was also inhibited by the addition of the extract in a dose-dependent manner [56].

The ability of 38 μg/ml ellagic acid was 17%, whereas the continuous treatment with 50 μg/ml ellagic acid was 17%, whereas the continuous presence of ellagic acid during infection led to a significant increase in the inhibition (70%). Treatment with 50 μg/ml ellagic acid caused a considerable suppression of HRV-4 infection only when added just after the virus inoculation (0 h) (97% inhibition), but not before 1 h or after 1 h or later (<20% inhibition) [53].
The ethanol extract of the dried fruits of *Lagerstroemia speciosa* was investigated for cytotoxic activity. The extract produced a prominent cytotoxic activity against brine shrimp *Artemia salina* with (LC50 = 60 μg/ml and LC90).

The brine shrimp lethality test was carried out to determine the toxic level of the *Lagerstroemia speciosa* bank extract towards the eukaryotic cells. The extract was found to be nontoxic during the short term (acute) exposure but it was toxic during the prolonged time (chronic) exposure. The LC50 for the acute and chronic tests were 342.68 and 35.30 μg/ml, respectively [48].

The cytotoxic potential of the flowers of *Lagerstroemia speciosa* was examined by brine shrimp lethality bioassay. The most prominent cytotoxic potency was showed by hexane soluble fraction (LC50 = 2.00 ± 0.31 µg/ml) [46].

The methanolic extracts of *Lagerstroemia speciosa* leaves and barks were evaluated for their cytotoxic effect using brine shrimp lethality bioassay; LC50 value of methanolic leaves extract was (9.602/μg/ml), comparing with LC50 of vincristine sulphate as a positive control (6.25/μg/ml) [43].

**Antidiabetic, hypolipidemic and antiobesity effects**

The ellagitannin (lagerstroemin) was identified as an effective component of the *Lagerstroemia speciosa* extract responsible for antidiabetic activity. In a different approach, using 3T3-L1 adipocytes as a cell model and a glucose uptake assay as the functional screening method, water extract exhibited an insulin-like glucose transport inducing activity. With the coupling of HPLC fractionation and a glucose uptake assay, galloretannins were identified in the extract as components responsible for the activity. Penta-O-galloyl-glucopyranose (PGG) was identified as the most potent gallotannin. PGG possessed significantly higher glucose transport stimulatory activity than lagerstroemin. PGG also exhibited anti-adipogenic properties in addition to stimulating the glucose uptake in adipocytes [61].

The hypoglycemic effect of the flowers of *Lagerstroemia speciosa* extract was examined in mice. The extract (400 mg/kg dose) reduced blood sugar level by 56.12% after three hours of administration of glucose solution [46].

The antidiabetic activity of the leaves extract of *Lagerstroemia speciosa* (standardized to 1% corosolic acid (Glucosol)) was studied in a randomized clinical trial in Type II diabetics. Glucosol at daily doses of 32 and 48 mg for 2 weeks reduced a significant reduction in the blood glucose levels. Glucosol in a soft gel capsule formulation showed a 50% decrease in blood glucose levels compared to a 20% drop in hard gelatin capsule formulation (P<0.001), suggesting that the soft gel formulation has better bioavailability than a dry-powder formulation [62].

The antidiabetic effect of the aequous leaf extract of *Lagerstroemia speciosa* was studied in streptozotocin-induced diabetic mice. The extract was effectively decreased the blood glucose after 15th day. The extract also inhibited lipid peroxidation, and at a dose of 150 mg/kg bw, it reduced streptozotocin generated reactive intermediates and radical species helping to regulate normal levels of antioxidative markers like superoxide dismutase, catalase, glutathione-S-transferase and reduced glutathione. Aqueous leaf extract of *Lagerstroemia speciosa* (150 mg/kg bw) effectively decreased the blood glucose in streptozotocin-induced diabetic mice after 15th day of treatment. The leaf extract potentially inhibited lipid peroxidation and effectively interfered/nurtured reactive oxygen species such as superoxide, H2O2 and NO based free radicals [63].

The hypoglycemic effect of *Lagerstroemia speciosa* leaves extract (500, 1000 and 2000 mg/kg) was studied in normal and streptozotocin-induced diabetic rats. A significant (P<0.05) decrease in fasting blood glucose level was observed in diabetic rats received the extract at the doses of 1000 and 2000 mg/kg on the 8th and 12th days of administration compared to the control diabetic group. In an oral glucose tolerance test, none of the doses of the extract showed any effects on blood glucose level in either diabetic or normal rats [64].

The hypoglycemic effects of *Lagerstroemia speciosa* was studied in alloxan-induced diabetes in ICR strain of mice. Spray-dried *Lagerstroemia speciosa* powder (1000 mg/kg) or decoction (20 ml/kg) was administered to mice for 28 days. Spray-dried *Lagerstroemia speciosa* powder and decoction significantly reduced blood (P<0.01), urinary glucose (P<0.05) levels, and body weight (P<0.05) of diabetic mice from day 8 to 28 compared with the diabetic control. The food intake of diabetic mice was higher (P<0.05) compared with non-diabetic control and *Lagerstroemia speciosa*-treated diabetic mice from day 22 to 28. The fluid intake was lower (P<0.01) in non-diabetic mice and *Lagerstroemia speciosa*-treated diabetic mice from day 8 to 28 compared with the diabetic mice [65].

Diet containing 5% of the hot-water *Lagerstroemia speciosa* leaves, fed to hereditary diabetic mice (Type II) for 5 weeks, significantly decreased blood plasma glucose level and significantly lowered serum insulin, total cholesterol level, and the amount of urinary excreted glucose [66].

The potential antidiabetic activity of ethyl acetate extract of the leaves of *Lagerstroemia speciosa* was investigated by alpha-amylase and alpha-glucosidase inhibition assay. Six pentacyclic triterpenes (oleanolic acid, arjunolic acid, asiatic acid, madecassic acid, corosolic acid and 23-hydroxyasiasic acid) isolated from the leaves of *Lagerstroemia speciosa* exhibited no significant inhibitory activity against alpha-amylase and alpha-glucosidase inhibitory activities. Corosolic acid showed the highest activity against alpha-glucosidase (IC50 = 3.53 micromg/ml) [24]. The results of in vitro alpha-glucosidase inhibitory assay showed that the IC50 value of the 40% methanolic leaves extract of *Lagerstroemia speciosa* was 0.3 μg/ml [28].

Some ellagittannins isolated from the leaves of *Lagerstroemia speciosa* exhibited strong activities in both stimulating insulin-like glucose uptake and inhibiting adipocyte differentiation in 3T3-L1 cells. Meanwhile, ellagic acid derivatives showed an inhibitory effect on glucose transport assay [30].

Ellagittannins, lagerstroemin, fasin B and reginin A, isolated from the aequous acetone extract of the leaves of *Lagerstroemia speciosa* increased glucose uptake of rat adipocytes, and could be responsible for lowering of blood glucose level [67].

Corosolic acid, isolated from the methanol extract of *Lagerstroemia speciosa* possessed antidiabetic activity. However, different cell model led to the discovery of other compounds. The ellagitannin, lagerstroemin was identified as an effective component of *Lagerstroemia speciosa* extract responsible for antidiabetic activity [61]. A randomized, double-blind, placebo-controlled clinical trial was carried out in 24 patients with metabolic syndrome. 12 patients received *Lagerstroemia speciosa*, 500 mg twice daily for 28 days, and 12 patients received placebo with the same prescription and for the same period. Area under the curve of glucose and insulin, total insulin secretion (insulinogetic index), first-phase of insulin secretion (Stumvoll index) and insulin sensitivity (Matsuda index) were determined. *Lagerstroemia speciosa* has shown evidence of beneficial modification of the metabolic syndrome, insulin sensitivity and insulin secretion [68].

The neuroprotective effects of alcoholic extract of *Lagerstroemia speciosa* (50 and 500 mg/l) was investigated in painful diabetic neuropathy in streptozotocin-induced diabetic neuropathy in rats. Lipid peroxidation, reduced glutathione and nitric oxide content in sciatic nerve were evaluated. The extract significantly restored the reduced body weight and the elevated blood sugar level. The extract also showed dose dependent reduction in pain threshold tested by mechanical, cold and thermal hyperalgesia. The extract also showed antioxidant effects [69].

Low doses of *Lagerstroemia speciosa* extracts inhibited the interactions between nuclear factors and target DNA elements mimicking sequences recognized by the nuclear factor kappaB (NF-kappaB). Aqueous extracts of the leaves of *Lagerstroemia speciosa* completely blocked the activation of NF-kappaB by tumour necrosis factor alpha (TNF-α) and lipopolysaccharide (LPS) [70].
factor (TNF) in rat cardiomyocyte H9c2 cells in a dose and time-dependent manner. Diabetes leads to cardiomyocyte hypertrophy in association with an upregulation of various factors and activation of nuclear factor (NF)-κB and activating protein-1. These effects possessed by the extract explained its inhibitory effect on diabetes-induced cardiomyocyte hypertrophy [70, 71].

The aqueous and alcoholic extracts of the Lagerstroemia speciosa possessed α-glucosidase inhibitory effects. The order of α-glucosidase inhibitory effect was: aqueous extract (fruit) (IC50 = 3.3 μg/ml)-ethanol extract (fruit) (IC50 = 4.3 μg/ml)-ethanol extract (leaf) (IC50 = 12.2 μg/ml)-aqueous extract (leaf) (IC50 = 18.3 μg/ml) [19].

The effects of extracts of Lagerstroemia speciosa on glucose transport and adipocyte differentiation were studied in 3T3-L1 cells using a radioactive assay, and the ability of extracts of Lagerstroemia speciosa to induce differentiation in preadipocytes was examined by Northern and Western blot analyses. The hot water Lagerstroemia speciosa extracts and the methanol extract stimulated glucose uptake in 3T3-L1 adipocytes with an independent response similar to those of insulin. There were no additive or synergistic effects between Lagerstroemia speciosa extracts and insulin on glucose uptake, and the glucose uptake activity of insulin was reduced by 18% after 30 min of incubation with 3T3-L1 adipocytes. Other studies showed that the ethanol extract did not induce adipocyte differentiation in the presence of 3-isobutyl-1-methylxanthine and dexamethasone. Lagerstroemia speciosa extracts inhibited the adipocyte differentiation induced by insulin plus 3-isobutyl-1-methylxanthine and dexamethasone of 3T3-L1 preadipocytes in a dose-dependent manner. In general, regarding the mechanisms of antidiabetic effects of Lagerstroemia speciosa, Florin stimulated insulin-like glucose uptake, increased glucose uptake of adipocytes, and lowered blood glucose level. Regnin increased glucose uptake of adipocytes and lowering blood glucose level. Many constituents such as lagerstroemin showed insulin-mimetic activities and stimulated insulin-like glucose uptake. Corosolic acid decreased blood sugar levels within 60 min in human subjects, and inhibited α-glucosidase activity. Many compounds such as 3-O-methylgallic acid, inhibited glucose transport. Lagerstroemia speciosa tea caused a 38% reduction of alpha-amylase activity. While, methanol and water extracts of Lagerstroemia speciosa reduced alpha-amylase and alpha-glucosidase activity. Both enzymes were involved in the carbohydrates digestion, their inhibition delayed carbohydrate absorption and decreased blood sugar. All these mechanisms could be participated in the action of Lagerstroemia speciosa in diabetes mellitus [24, 34-36, 72, 73].

The effects of corosolic acid (a pentacyclic triterpene) isolated from the leaves of the Lagerstroemia speciosa on dietary hypercholesterolemia and hepatic steatosis were assessed in KK-Ay mice, an animal model of type II diabetes. KK-Ay mice were divided into two kinds of high cholesterol diet with or without 0.023% corosolic acid for 10 w. Corosolic acid inhibited the mean blood cholesterol level by 32% (P<0.05) and the liver cholesterol content by 46% (P<0.05), 10 w after the start of dietary intake. Furthermore, corosolic acid inhibited the mean blood cholesterol level 4 h after the administration of a high-fat meal in an oral cholesterol-loading test, compared with that of control mice (P<0.05) [74].

The antibiosis effect of dietary Lagerstroemia speciosa leaves extract was studied in female mice with remarkable body weight gain. Mice were fed a control diet or test diet containing 5% of high-fat water leaves extract instead of cellulose for 12 wk. Neither group showed any changes in diet intake during the experimental period. Bodyweight gain and pancreatic adipose tissue weight were lowered significantly in Lagerstroemia speciosa diet group. Blood glucose levels were not suppressed in the Lagerstroemia speciosa diet group, but hemoglobin A1C was found to be suppressed at the end of the experiment. No effects on the serum lipids were observed, but the mice fed Lagerstroemia speciosa extract showed a significant decrease (65% of the control level) in total hepatic lipid contents [75].

A randomized, placebo-controlled, double-blind, parallel-group study conducted over 14 weeks (including a 2-week run-in phase) was designed to investigate the efficacy and safety of IQP-GC-101 (a standardized extracts of Garcinia cambogia, Camellia sinensis, unroasted Coffea arabica, and Lagerstroemia speciosa) in reducing body weight and body fat mass in overweight Caucasian adults. Subjects took three IQP-GC-101 or placebo tablets twice a day, 30 min before main meals. All subjects also adhered to a 500 kcal/day energy deficit diet with 30% of energy from fat for a 12-wk intervention. IQP-GC-101 resulted in a mean (±SD) weight loss of 2.2±2.37 kg compared with 0.5±2.34 kg for placebo (P=0.002). There was also significantly more reduction in body fat mass, waist circumference, and hip circumference in the IQP-GC 101 group. No serious adverse events were reported [76].

DLBS233, a combined bioactive fraction of Cinnamomum burmannii and Lagerstroemia speciosa, possessed beneficial effects on glucose and lipid metabolism through the upregulation of insulin-signal transduction. The clinical efficacy of DLBS233 was evaluated in type-2 diabetes mellitus subjects inadequately controlled by metformin and other oral anti-diabetic drugs. DLBS233 was given orally at the dose of 100 mg once daily for 12 w of therapy in addition to their baseline oral anti-diabetic medication. At 12 wk of treatment, the HbA1c level was reduced by 0.6±1.5% (P<0.001) from baseline (9.6±2.11%). While the 1h-postprandial glucose level was reduced by 1.45±3.89 mmol/l (P=0.021) from baseline (15.29±4.49 mmol/l). Insulin sensitivity, lipid profile and adiponectin level were improved to a considerable extent. DLBS233 did not adversely affect body weight, liver, and renal function. Most adverse events observed were mild and they all had been resolved by the end of the study [77].

In other studies, after 12 w, DLBS233 improved insulin resistance better than placebo as reflected by a reduced homeostatic model assessed insulin resistance (HOMA-IR) (-27.04%±29.41% vs -49.0%±24.127%, P=0.013). The improvement of first- and second-phase insulin secretion was consistently greater in DLBS233 group than placebo group (44.7±19.46 vs 7±1.7±15.79, P=0.022, and 45.6±24.87.5±6 vs 26.49±4.77, P=0.035, respectively). Furthermore, DLBS233 also significantly improved omeprazole disposition index than placebo. No serious hypoglycemia, edema, or cardiovascular-related adverse events were found in either groups [78].

Anti-inflammatory and analgesic effects

The anti-inflammatory activity of Lagerstroemia speciosa leaves ethyl acetate and ethanol extracts was examined using the carrageen-induced acute inflammation and chronic formalin-induced paw edema model. The ethyl acetate extract reduced the paw edema significantly in a dose-dependent manner. The aqueous extract possessed both central and peripheral effects, this was confirmed by its effect on both phases of formalin-induced pain. The crude plant extract significantly increased the reaction time of hot plate and immersion tests. It decreased the writhings of acetic acid-induced abdominal contractions and lickings of formalin-induced pain. The results also showed that the aqueous ethanolic extract possessed both central and peripheral effects, this was confirmed by its effect on both phases of formalin-induced pain. The extract also significantly decreased the rat paw edema volume at 200 mg/kg and above [79].

The analgesic potential of the flowers extracts of Lagerstroemia speciosa was assayed in mice. 16.68% inhibition of writhing was recorded for 400 mg/kg bw of the extract of Lagerstroemia speciosa. In central analgesic activity assay by tail-flick method, 48.24% elongation of the reaction time was observed after 30 min of administration of 400 mg/kg bw of the methanol extract of the flowers of Lagerstroemia speciosa [46].

The antineoplastic activity of chloroform extract of barks of Lagerstroemia speciosa was evaluated using acetic acid-induced gastric pain model in mice. The chloroform extract of bark of
Lagerstroemia speciosa exhibited significant inhibition of writhing (50.7%) at the highest dose tested (500 mg/kg bw). At the lower dose of 250 mg bark extract/kg bw, there was a decrease in the number of writhings compared to controls, but the decrease was not significant [80].

The methanolic crude extract of Lagerstroemia speciosa roots was investigated for analgesic activities using acetic acid-induced writhing inhibition method in mice. The methanolic crude extract at the dose of 200 and 400 mg/kg bw, produced 35.38% and 53.85% (p<0.001) inhibition of the writhing, respectively compared to standard diclofenac sodium (70.77% inhibition) [21].

The methanolic crude extract of Lagerstroemia speciosa also produced significant (p<0.001) writhing inhibition in acetic acid-induced writhing in mice at the oral dose of 250 and 500 mg/kg of bw, which was comparable to the standard drug diclofenac sodium at the dose of 25 mg/kg of bw [60].

Central nervous effects

The anticonvulsant activity of bark extracts of Lagerstroemia speciosa was studied in isoxazolid and pilocarpine-induced convulsions models. By both models, 400 mg/kg of extract showed significant anticonvulsant activity by delaying the onset of convulsions [20].

In phenobarbitone-induced sleeping time test, Lagerstroemia speciosa flower extract delayed the onset of sleep (30.22 min and 38.61 min at 200 and 400 mg/kg bw, respectively). The extract was also found to shorten the total sleeping time (99.45 min and 107.6 min at 200 and 400 mg/kg bw, respectively) [46].

Gastrointestinal effects

The bark extracts of Lagerstroemia speciosa at 200 and 400 mg/kg possessed anti-gastrointestinal motility activity in mice [20]. The methanolic crude extract of Lagerstroemia speciosa roots was investigated for anti diarrheal activities in an experimental animal model. The methanolic crude extract possessed anti diarrheal activity and inhibited the mean number of defecation by 32.75% (p<0.01) and 51.72% (p<0.001) at the dose of 200 and 400 mg/kg bw, respectively [21].

The ethanol extract of the dried fruits of Lagerstroemia speciosa also showed antidiarrheal activity on castor oil-induced diarrhoea in mice. It increased mean latent period and decreased the frequency of defecation significantly (P<0.001, P<0.01) at the oral dose of 500 mg/kg bw comparable to the standard drug loperamide at the dose of 50 mg/kg of bw [60].

The protective effect of an ethanolic extract of Lagerstroemia speciosa leaves (100 and 200 mg/kg bw orally for 7d) was evaluated against dextran sulfate sodium-induced colitis in C57BL/6 mice. Both the doses of extract significantly prevented dextran sulfate sodium-induced inflammatory and ulcerative damages of the colon, reduced lipid peroxidation and also restored the levels of innate antioxidants in the colon tissue [81].

Diuretic activity:

The ethyl acetate, ethanol, methanol and water extracts (250 mg/kg bw, orally) of Lagerstroemia speciosa were evaluated for diuretic activity in rats. The aqueous extracts showed better diuretic effect compared with other extracts. Na+, K+ and Cl excretion and Na+/K+ ratio was higher in aqueous extract, followed by ethanol, ethyl acetate and methanol extracts [22].

Thrombolytic activity

The thrombolytic activity of Lagerstroemia speciosa leaf methanol extract was studied in 10 apparently healthy subjects (both male and female). Fraction of methanolic extract of the leaf of Lagerstroemia speciosa exhibited significant percentage of clot lysis of 25.4% compared to positive control streptokinase of (31.06%), while the negative control saline water showed 3.81% clot lysis [82].

The thrombolytic potential of the flowers of Lagerstroemia speciosa extracts was assessed using streptokinase as standard. the carbon tetrachloride soluble fraction induced clot lysis (64.80±0.27%) and prevented heat-induced hemolysis (41.90±0.10%) to the maximum extent [46].

Cardiovascular effects

The cardioprotective effect of Lagerstroemia speciosa leaves extract (containing 1% corosolic acid) was evaluated in isoproterenol-induced myocardial injury in mice. Extract pretreatment augmented myocardial antioxidant status and attenuated myocardial oxidative stress. Myocardial apoptosis, as well as MMPs activities, was significantly prevented by the extract pretreatment in isoproterenol-induced myocardial injury in mice. Furthermore, extract pretreatment enhanced the nuclear protein expression of Nrf2 [85].

Inhibited the TNFα production

The inhibitory effect of a plant extracts on AGE-stimulated TNFα production of CML-stimulated cultured macrophages was investigated. Pretreatment with extracts of Lagerstroemia speciosa, water chestnut, Chinese blackberry, persimmon leaf, kuma bamboo and their mixture inhibited the TNFα production by 14.6%–22.7%. Cell viability was not affected by the pre-treatment with these extracts [84].

Beneficial effect in skin aging

Oxidative stress and the enhanced activation of proteolytic enzymes were part of the mechanisms of skin aging. Inhibition of these mechanisms were a promising approach to prevent skin aging. The ethanolic flowers extract of Lagerstroemia speciosa was evaluated for its inhibitory effects against hyaluronidase, elastase and tyrosinase. Furthermore, the extract was investigated for its protective effects on hydrogen peroxide-induced oxidative stress in human keratinocytes. The results revealed that the antioxidant activities of the flowers extract of Lagerstroemia speciosa were equal to that of ascorbic acid. It also inhibited hyaluronidase, elastase and tyrosinase activity. In addition, the flower extract showed remarkable inhibitory potential against hyaluronidase, which was higher than that of the standard oleic acid. It also inhibited hydrogen peroxide-induced cell death in human keratinocytes [26].

Xanthine oxidase inhibition

The xanthine oxidase inhibition of the aqueous extracts of the leaves of Lagerstroemia speciosa was studied using a bioassy-guided fractionation technique. Two active compounds were isolated from the aqueous extracts of the Lagerstroemia speciosa leaves (valomic acid diacetate and alagic acid). The xanthine oxidase inhibitory effect of valomic acid diacetate was stronger than that of alagomolin [85].

Hepatoprotective effects

The hepatoprotective activity of poorly soluble hydroxy-and polyhydroxy-organic phytochemicals rich Lagerstroemia speciosa leaves extract was studied against carbon tetrachloride induced liver toxicity in rats. Oral administration of the extract (60 mg/kg) provided significant protection in marker enzymes, AST (P<0.001), ALT (P<0.001), ALP (P<0.001) and total bilirubin (P<0.001) comparable to that of silymarin. The extract also significantly increased GSH, SOD and CAT contents (P<0.001) [86].

Nephroprotective effects

The ethyl acetate extract of leaves of Lagerstroemia speciosa was studied for nephroprotective activity in cisplatin-induced acute renal injury in Balb/C mice. The ethyl acetate extract at dose levels of 50 and 250 mg/kg showed a dose-dependent reduction in cisplatin-induced elevation in urea and creatinine concentrations. It also prevented the cisplatin-induced decline of the renal antioxidant enzymes superoxide dismutase, catalase, glutathione peroxidase, and reduced glutathione [87].

Ginseng and Lagerstroemia speciosa leaf extracts, individually or in combination at a dose of 150 mg/kg bw/day for 15 d exhibited protective effects on fluoride intoxicated STL induced nephrotoxicity in mice [88].
Side effects and safety

The crude ethanol extract is non-toxic in rats, it was well tolerated at a concentration of 500, 1000, 2000, and 3000 mg/kg. No biochemical and histological changes were recorded [90]. In acute toxicity study, no mortality or toxic reaction was recorded in rats after administration of the ethanol crude extract of Lagerstroemia speciosa roots [200, 400, 800, 1600 and 3200 mg/kg orally] [21].

There were no side effects in human, with the using of the recommended doses (5-48 mg/day). However, higher doses associated with lowered blood glucose levels, headache, dizziness, and fatigue [90].
