Abstract

The present investigation was conducted at LRC, ICAR-NDRI, Karnal to find out the effect of polyherbal mixture supplementation on colostrum production and SCC of the Sahiwal cows during the transition period. For that 32 multiparous Sahiwal cows were selected and divided into four groups. Eight cows in each group. Control (T₀) group of cows were offered the ration as per the standard feeding schedule (NRC, 2001). The treatments group (T₁, T₂ and T₃) cows were offered the same ration and with additionally in T₁ group 200 g poly-herbal (50 g each Shatavardi, Methi and Jeera; 25 g each Dalchini and Tulsi; added with 250 g jaggery) mixture was offered for 30 days before and 60 days after calving and in T₂ group 150 g poly-herbal (25 g each Ajwain, Fennel, Ginger, Black cardamom and Black seeds, 20 g Turmeric and 5 g Clove; boiled with 25 g Black salt and jaggery) mixture was offered from parturition to 7 days postpartum and in T₃ group the poly-herbal mixture combination was given as a treatment. The colostrum yield and SCC of Sahiwal cows were recorded on 1st, 3rd and 5th day after calving. The analysis of variance of data revealed that, the cows of T₁, T₂ and T₃ groups had significantly (P<0.05) higher colostrum yield on 5th day. The SCC of colostrum was lower (P<0.05) at 5th day in T₁ followed by T₂ and T₃ groups of Sahiwal cows. The combination of poly-herbal supplementation had better effect on the colostrum production and quality of the Sahiwal cows during the transition period.

Keywords: Transition period, poly herbal mixture, colostrum yield, Colostrum SCC, Sahiwal cow

Introduction

India is leading country in milk production worldwide. For this the National Dairy Plan-I (NDP-I) has been launched by the government of India (GOI) with the aim to double milk production in the country by 2020. In relation to the milk production growth rate, our demand (6-8%) for milk is also increasing continuously. Milk is an important component of diets for all humans especially for vegetarians, as it is high in essential amino acids that are most likely to be deficient in diets based on vegetable protein. At present the milk production is 176.3 million tonnes with 375 gm/d per capita availability of milk (dahd.nic.in, 2017-18) and contributing 4.11% to GDP. Our country owns 192.49 million of total cattle population that contributes 35.94% of the total livestock (2019 Livestock census). Due to inferior usage of breeds and lack of availability of balance feed to animals, we could not able to fulfill our country’s demand.

The population of Sahiwal cattle in the country is nearly 2.75 million (GoP, 2006) [8]. Because they are well known for disease resistance, heat tolerance and bred naturally (Leroy and Marchot, 1987) [14]. The demand of indigenous cow's milk increasing day by day due to the good quality protein. Milk from the Sahiwal breed (Bos indicus) is of A₂ variety, with the best Beta Casein protein and 22 soluble minerals. It is non-allergic, need not be skimmed, as the fat is digestible and stays good for seven hours. Indigenous cows are also called farmer’s friend (Chauhan, 2007) [4].

But our indigenous cattle faced discrimination due to their low milk productivity and short lactation period. This problem can be minimized by giving more attention during transition period.
Transition phase is most important, challenging and critical period in relation to the dairy cow’s health status during the lactation cycle, defined as the period between three weeks before to three weeks after parturition (Drackley, 1999) [17]. To ensure more net return and to minimize high expenditure on feed are the main challenges, for which many research strategies have been practiced such as introducing feed supplements and feed additives (Pervez, 1992) [13]. Supplementation of spices and herbs having oxidative potential (Hui, 1996) [11], antimicrobial activity (Dorman and Deans, 2000) [6], enhancing digestion by stimulating endogenous enzymes (Brugalli, 2003) [10]. Keeping in view the above-mentioned fact, an alternative approach toward potentiating the colostrum production performance of Sahiwal cow with the use of natural ingredients will not only solve these problems but also ensure general wellbeing of cows and consequently will help to increase the functional life of cow and her progeny performance.

Materials and Methods

The study was conducted at the Livestock Research Centre, National Dairy Research Institute (NDRI), Karnal, India which is located at 29° 42” 20 sec N and 76° 58” 52.5 sec E at an altitude of 834 feet above mean sea level. Minimum and maximum ambient temperature ranged from near freezing point in winter to 45 °C in summer with an annual rainfall of 700 mm. The experiment was conducted during February, 2017 to end of November, 2017 with daily minimum and maximum temperature averaging 5.6 °C and 40 °C, respectively. The sample analysis was done in Feed Processing and Quality Control Laboratory and Precision Instrument Laboratory of Dairy Cattle Nutrition Division, NDRI, Karnal.

This study was conducted after getting approval from the Research Committee and Institutional Animal Ethics Committee of ICAR - National Dairy Research Institute, Karnal, Haryana, India, the experiment was approved by the Institutional Animal Ethical Committee National Dairy (IAEC) of Indian Council of Agricultural Research (ICAR) Research Institute (NDRI) constituted as per article 13 of the CPCSEA rules, laid down by the Govt. of India (Regd no-1705/GO/ai/13 CPCSEA) dated 3/7/2013 A the ethical guidelines were followed during the course of the experiment. The experiment was carried out to study the effect of polyherbal mixture in transition Sahiwal cows. Thirty-two pregnant dairy cows in second to fifth lactation with most probable production ability (MPPA) of around 2000-2500 L milk production were selected from the herd, maintained at Cattle Yard, NDRI, Karnal. The MPPA or Expected

\[
P_{\text{MPPA}} = \frac{nr}{1 + (n - 1)r}(P - A)
\]

Producing Ability (EPA) was computed on the basis of formula given by Lush (1945) as follows:

Where, A = Population mean  
N = Total number of animals  
R = Repeatability of lactation milk record  
P = Milk yield in previous lactation

Thirty-two (32) Sahiwal cows were randomly divided into four (4) groups based on their MPPA and lactation number. Their requirements were fulfilled by feeding concentrate mixture, green fodder (sorghum, maize, oats, sugar graze) and dry roughage (wheat straw) (NRC, 2001).

Individual herb was procured from local market after assessing their quality in consultation with ayurvedic practitioner and drug manufacturer. Each herb was pulverized separately. The Polyherbal mixture was prepared after mixing pulverized herbs in specific proportion.

| Group | Experimental Design |
|-------|---------------------|
| Control (T₀) | Basal diet without supplementation (ICAR Feeding standard) |
| T₁ | Basal diet with poly-herbal mixture (200 g) - Shatavari, Methi, Jeera (50 g each) + Dulchini and Tulsi (25 g each) + along with this mixture jaggery (250 g) were fed 30 days before and 60 days after parturition. |
| T₂ | Basal diet with poly-herbal (kadha) mixture (150 g)- Ajwain, Fennel, Ginger, Black cardamom and Nigella sativa (25 g each) + Turmeric (20 g) + Clove (5 g) + along with this polyherbal mixture Black salt (25 g) + Jaggery (250 g) were fed immediately after parturition for 7 days. |
| T₃ | Basal diet with combination of 200 g/d poly-herbal mixture (30 days before and 60 days after parturition) + 150 g/d Polyherbal (kadha) mixture (immediately after parturition for 7 days) polyherbal mixture. |

At the time of morning and evening milking on 1st, 3rd and 5th day, Colostrum yield was recorded by using electronic weighing balance. Colostrum somatic cells were estimated by Lacto Scan Automatic Analyser (New Dairy Engineering and trading Co. Pvt. Ltd., Bulgaria) according to the manufacturer’s protocol.

The data obtained in the present study were analysed by Two Way ANOVA (analysis of variance) and the significance of the difference between the mean values of various parameters was determined by Duncan Post-hoc test using SPSS (version 16.0) computer software.

Results and Discussion

Effect of poly-herbal mixture supplementation on colostrum yield (Kg/day) of Sahiwal cows

The mean ± SE values of colostrum yield (Kg/day) were ranged from 3.35 ± 0.37 to 5.07 ± 0.50 in control (T₀), 4.42 ± 0.51 to 6.35 ± 0.50 in T₁, 3.57 ± 0.51 to 5.92 ± 0.52 in T₂ and 4.92 ± 0.52 to 7.35 ± 0.47 in T₃ (Table 2). The overall mean ± SE values of colostrum yield (Kg/day) were 4.14 ± 0.31, 5.38 ± 0.33, 4.73 ± 0.35, and 6.02 ± 0.35 in T₀, T₁, T₂ and T₃ respectively. In the present study colostrum yield was differ significantly (P≤0.05) between the periods in T₀, T₁ and T₂, but it was highly significant (P≤0.01) for T₃. Colostrum yield was not differ significantly at 1st and 3rd day however at 5th day after calving it was higher (P≤0.05) in T₀ followed by T₁, T₂ and T₀ groups of Sahiwal cows. The overall mean values of colostrum yield were also higher (P≤0.05) in T₃ followed by T₁, T₂ and T₀.

The results indicated that supplementation of poly-herbal mixture significantly increased colostrum yield as compared to control group. In agreement with our study Kumar et al. (2014) [12], studied the effect of shatavari in KF cows and they were reported that, it increased (P≤0.01) colostrum yield in shatavari supplemented groups than the control. The present study revealed that, polyherbal mixture improve the productive performance, it might be due to less stress and high DMI of Sahiwal cows during the transition period. In present experiment increase in colostrum yield might be due
to the hormonal effect as Dadkhah and Yeganehzad (2011) also reported that supplementation of galactogogue herbal mixture in dairy cows had higher levels of hormone prolactin and insulin, which lead to increase milk production.

**Table 2: Colostrum yield (Kg/day) of Sahiwal cows**

| Days | Colostrum yield (Kg/d) |
|------|------------------------|
|      | T0 | T1 | T2 | T3 |
| 1    | 3.35 ± 0.37 | 4.42 ± 0.51 | 3.57± 0.51 | 4.92± 0.52 |
| 3    | 4.00 ± 0.58 | 5.35 ± 0.54 | 4.71±0.51  | 5.78± 0.51 |
| 5    | 5.07±0.50 | 6.35±0.50  | 5.92±0.52  | 7.35±0.57 |
| Overall mean | 4.14±0.31 | 5.38±0.33 | 4.73±0.35 | 6.02±0.35 |

Values with different superscripts abcd and wxyz differ significantly in a column (period wise) and in a row (group wise). Data represented as mean ± SE (*P<0.01, P<0.05)

**Effect of poly-herbal mixture supplementation on colostrum somatic cell count (x 10^3/ml) of Sahiwal cows**

The overall mean ± SE values of colostrum SCC were ranged from 2.39 ± 0.36 to 1.85 ± 0.14 in control (T0), 2.03 ± 0.35 to 1.69 ± 0.16 in T1, 2.43 ± 0.29 to 2.29 ± 0.18 in T2 and 2.21 ± 0.30 to 1.61 ± 0.17 in T3 (Table 3). The overall mean ± SE values of colostrum SCC were 2.10 ± 0.14, 1.85 ± 0.14, 2.29 ± 0.18 and 1.86 ± 0.15 in T0, T1, T2 and T3 respectively. The values of colostrum SCC were not differing significantly between the periods. Colostrum SCC was not differ significantly at 1st and 3rd day but at 5th day after calving it was lower (P<0.05) in T1 followed by T1, T2 and T0 groups of Sahiwal cows. The overall mean values of colostrum SCC were also lower (P<0.05) in T3 followed by T1, T2 and T0.

**Table 3: Colostrum somatic cell count (x 10^3/ml) of Sahiwal cows**

| Days | Colostrum somatic cell count (x 10^3/ml) |
|------|----------------------------------------|
|      | T0 | T1 | T2 | T3 |
| 1    | 2.39 ± 0.36 | 2.03 ± 0.35 | 2.43 ± 0.29 | 2.21 ± 0.30 |
| 3    | 2.06 ± 0.14 | 1.82 ± 0.23 | 2.14 ± 0.14 | 1.75 ± 0.26 |
| 5    | 1.85±0.14 | 1.69±0.16  | 2.29±0.18  | 1.61±0.17  |
| Overall mean | 2.10±0.14 | 1.85±0.14 | 2.29±0.12 | 1.86±0.15 |

Values with different superscripts abcd and wxyz differ significantly in a column (period wise) and in a row (group wise). Data represented as mean ± SE (*P<0.01, P<0.05)

SCC increases of greater than 200,000 cells/ml have been observed in cow milk as a result of bacterial infection and it affect quality and quantity of milk (Bramley, 1992; Harmon, 1994). Colostrum SCC was within the range in all supplemented animals except control group of Sahiwal cows. Similarly, Kumari, (2015) reported that, SCC was lower (P<0.05) in the polyherbal supplemented groups of Karan Fries cows than the control. The results of the present study were also in agreement with the Hashemzadeh-Cigari et al. (2014) who reported that the supplementation of phytobiotics-rich herbal mixture seems to be an effective strategy to enhance production performance and lower SCC, particularly in cows having high SCC levels in the milk. In relation the present study Sharma et al., 2014 reported that polyherbal supplementation at the rate of 200–250 mg/kg body weight reduced peri-parturient stress and improved immunity and udder health.

**Conclusions**

Poly-herbal supplementation containing the combination of 200 g polyherbal mixture –Shatavari, Methi and Jeera (50 g each) + Dalchini and Tulsi (25 g each) along with this mixture jaggery (250 g) were fed 30 days before and 60 days after parturition and 150 g polyherbal (kadha) mixture - Ajwain, Fennel, Ginger, Black cardamom and Nigella sativa (25 g each) + Turmeric (20 g) + Clove (5 g) + along with this polyherbal mixture Black salt (25 g) + Jaggery (250 g) were fed immediately after parturition for 7 days reduced peri-parturient stress improved colostrum production and udder health of Sahiwal cows.
