Abstract
Two new spider species of the genus *Chrysso* O. P.-Cambridge, 1882 are reported from Hainan Island, China, *Chrysso bifurca* sp. n. (male, female) and *C. bicuspidata* sp. n. (male, female). *C. bimaculata* Yoshida, 1998 is recorded from China for the first time.

Introduction

The genus *Chrysso* was erected by O. P.-Cambridge (1882). It was regarded as a junior synonymy of *Theridion* Walckenaer, 1805, and removed by Bryant (1940). Levi and Levi (1962) considered this genus as a senior synonym of *Arctachaea* Levi, 1957, *Argyroaster* Yaginuma, 1958 and *Meotipa* Simon, 1894, but Deeleman-Reinhold (2009) removed the genus *Meotipa* from the synonymy of *Chrysso*. Until now no large revision of this genus has been done. However, Agnarsson (2004) listed 10 autapomorphies of the *Chrysso* in his phylogeny, these characteristics are putative *Chrysso* synapomorphies.
Currently 62 *Chrysso* species are reported, mostly from America and Asia (Levi 1957; Levi and Levi 1962; Barrion and Litsinger 1995; Miller and Agnarsson 2005; Gonzaga et al. 2006; Yoshida 2009; Siliwal 2009; Platnick 2012), among them, 22 species are known from China. 94 species out of 24 genera are known from Hainan Island, China (Zhu 1998; Song et al. 1999; Yoshida et al. 2000; Tang et al. 2003; Song et al. 2006), including six *Chrysso* species: *C. cyclocera* Zhu, 1998, *C. trispinula* Zhu, 1998, *C. trimaculata* Zhu, Zhang & Xu, 1991, *C. scintillans* (Thorell, 1895), *C. pulcherrima* (Mello-Leitão, 1917) and *C. nigra* (O. P.-Cambridge, 1880).

During the examination of spider specimens collected from 2007 to 2009 in Hainan Island, China, two new species, *Chrysso bifurca* sp. n. and *C. bicuspidata* sp. n. were recognized and are described here. *C. bimaculata* Yoshida, 1998, known from Japan previously, is newly recorded from Hainan, China.

**Material and methods**

All specimens were kept in 75% ethanol and examined, drawn and measured under a Tech XTL-II stereomicroscope equipped with an Abbe drawing device. Carapace length was measured medially from the anterior margin to the rear margin of the carapace. Eye sizes were measured as the maximum diameter of the lens in dorsal or frontal view. MOA length was measured medially from the anterior margin to the rear margin of MOA. Leg measurements are given as: total length (femur, patella, tibia, metatarsus, tarsus). Epigynes were cleared in warm potassium hydroxide (KOH) and transferred to 75% ethanol for drawing. The labeling of the palpal sclerites is adopted following Agnarsson (2004). All measurements are in millimeters. All specimens studied are deposited in the Museum of Hebei University (MHBU), Baoding, China.
