Non-relativistic Schrödinger theory on q-deformed quantum spaces II
The free non-relativistic particle and its interactions

Abstract

This is the second part of a paper about a q-deformed analog of non-relativistic Schrödinger theory. It applies the general ideas of part I and tries to give a description of one-particle states on q-deformed quantum spaces like the braided line or the q-deformed Euclidean space in three dimensions. Hamiltonian operators for the free q-deformed particle in one as well as three dimensions are introduced. Plane waves as solutions to the corresponding Schrödinger equations are considered. Their completeness and orthonormality relations are written down. Expectation values of position and momentum observables are taken with respect to one-particle states and their time-dependence is discussed. A potential is added to the free-particle Hamiltonians and q-analogs of the Ehrenfest theorem are derived from the Heisenberg equations of motion. The conservation of probability is proved.

1 Introduction

There is a great hope in physics that lattice-like space-time structures can help to overcome the difficulties with infinities in quantum field theory [1,2]. Snyder’s concept of ‘quantized space-time’ was one of the first attempts to implement that idea [3,4]. Due to its attractiveness other researchers took up this idea over and over again [5–8]. A more recent but very promising approach to the problem of discretizing space-time arises from the theory of quantum groups and quantum spaces [9–34]. If quantum groups and quantum spaces indeed imply a more detailed description of space-time, they should lead to a mathematical theory being compatible with successful conceptions in physics [35–47].

In part I of this paper we started developing a non-relativistic Schrödinger theory on q-deformed quantum spaces as the braided line or the q-deformed Euclidean space in three dimensions. Such a program can help to get a better understanding of the implications of q-deformation in physics, since the treatment of more realistic space-time structures like the q-deformed Minkowski space [48–52] is very awkward (for other deformations of space-time see Refs. [53–59]).

From part I of this paper we know that the braided line as well as the q-deformed Euclidean space in three dimensions can be extended by a time coordinate. This way we obtain space-time structures in which time behaves like a commutative and continuous variable, while in space a lattice can be singled out. This situation is also reflected in the objects of q-analysis and
the time-evolution operators on these spaces. Especially, we saw that q-
analysis leads to discretized versions of classical partial derivatives, integrals,
and so on, whereas the time-evolution operators are of the same form as their
undeformed counterparts. This observation is in complete accordance with
the fact that time is completely decoupled from space. For this reason, the
Schrödinger equations and Heisenberg equations of motion on the quantum
spaces under consideration are of the same form as in the undeformed case.

In part II of our paper we continue the considerations about a non-
relativistic Schrödinger theory on q-deformed quantum spaces. We first ap-
ply the general formalism developed in part I in order to describe free non-
relativistic one-particle states. In Sec.2 we introduce free-particle Hamilton-
ians and show that q-analogs of plane waves provide a complete and
orthonormal set of solutions to the corresponding Schrödinger equations.
Then we calculate expectation values for position and momentum operators
taken with respect to free one-particle states and discuss their time depen-
dence. Section 3 is devoted to q-analogs of the theorem of Ehrenfest. In
Sec.4 we prove that in our formalism conservation of probability is satisfied.
We close our considerations by a conclusion in Sec.5. Finally, it should be
noted that we assume the reader to be familiar with the results and conven-
tions of part I. In this respect, we recommend to have a look at Sec.3.1 or
3.2 of part I.

2 Free particles on quantum spaces

In this section we would like to study free one-particle states within the
framework developed in part I of our paper. First of all, we have to find a
Hamiltonian suitable for describing a free particle on the q-deformed quan-
tum spaces under consideration, i.e. braided line and three-dimensional q-
deformed Euclidean space. After that we consider q-analogs of plane waves
and show that they give a complete and orthonormal set of solutions to
Schrödinger equations. Finally, we write down expressions for expectation
values of momentum and position observables taken with respect to one-
particle wave functions.

2.1 Free-particle Hamiltonians

Clearly, the free-particle Hamiltonian should be invariant under translations
and rotations. Thus, a possible choice is given by an element that spans the
one-dimensional eigenspace of the corresponding R-matrix:
(i) (braided line)

\[ H_0 \equiv P_1 P_1 (2m)^{-1}, \]  

(1)

(ii) (q-deformed Euclidean space in three dimensions)

\[ H_0 \equiv g^{AB} P_B P_A (2m)^{-1}, \]  

(2)

where \( g^{AB} \) denotes the quantum metric of the q-deformed three-dimensional Euclidean space. The constant \( m \) stands for a mass parameter. It is a central and real element of the momentum algebra. One should also notice that the momentum operators can be expressed by partial derivatives, as we have \( P_A = i \partial_A \). In this manner, \( H_0 \) becomes an Hermitian operator. (In textbooks on quantum mechanics one usually finds the convention \( P = i^{-1} \partial_A \), but such a choice would make our formalism more complicated. For this reason, some expressions in this paper contain an additional minus sign compared to the formulae the reader may be familiar with.)

As a consequence of their very definition the Hamiltonians in (1) and (2) behave like scalars. On these grounds, they commute with momentum operators, i.e.

\[ [H_0, P_A] = 0. \]  

(3)

Furthermore, we demand that \( H_0 \) inherits the braiding properties from \( \partial_0 \). Realizing that \( \partial_0 \) has trivial braiding this requirement implies for braided products between the mass parameter \( m \) and a function in position or momentum space that

(i) (braided line)

\[
\begin{align*}
    m \odot_L f(p_i) &= f(q^2 p_1, p_0) \otimes m, \\
    m \odot_L f(p_i) &= f(q^{-2} p_1, p_0) \otimes m, \\
    m \odot_{\bar{L}} f(x^i) &= f(q^{-2} x^1, x^0) \otimes m, \\
    m \odot_{L} f(x^i) &= f(q^2 x^1, x^0) \otimes m,
\end{align*}
\]

(4)

(ii) (q-deformed Euclidean space in three dimensions)

\[
\begin{align*}
    m \odot_L f(p_i) &= f(q^4 p_A, p_0) \otimes m, \\
    m \odot_L f(p_i) &= f(q^{-4} p_A, p_0) \otimes m, \\
    m \odot_{\bar{L}} f(x^i) &= f(q^{-4} x^A, x^0) \otimes m,
\end{align*}
\]

(6)
2 FREE PARTICLES ON QUANTUM SPACES

\[ m \odot_L f(x^i) = f(q^A x^A, x^0) \otimes m, \]  

(7)

where the symbols \( \odot, \gamma \in \{ L, \bar{L}, R, \bar{R} \} \), denote the braided products. These braided products represent realizations of braiding mappings [44]. One should also notice that we took the convention from part I that capital letters like \( A, B, \) etc. denote indices of space coordinates, i.e., for example, \( x^i = (x^A, x^0) = (x^A, t) \).

In part I we derived q-analogs of the Schrödinger equation. With the free-particle Hamiltonians they become

\[ i\partial_0^t \psi(x^A, t) = H_0 \psi(x^A, t), \]

\[ i\hat{\partial}_0^\bar{t} \phi(x^A, t) = H_0 \phi(x^A, t), \]

(8)

and

\[ \psi(x^A, t) \triangleq (i\hat{\partial}_0^\bar{t}) = \phi(x^A, t) \triangleq H_0, \]

\[ \phi(x^A, t) \triangleq (i\partial_0^t) = \phi(x^A, t) \triangleq H_0. \]

(9)

2.2 Plane waves

Its is now our aim to seek solutions to the equations in (8) and (9). To this end let us recall that q-exponentials on quantum spaces play the role of momentum eigenfunctions [42, 43, 47, 60, 61]. To be more specific, we have

\[ i\partial_i^\bar{x} \exp(x^i|x^{-1}p_i)_R = \exp(x^i|x^{-1}p_i)_R \otimes p_i, \]

\[ i\hat{\partial}_i^\bar{x} \exp(x^i|x^{-1}p_i)_R = \exp(x^i|x^{-1}p_i)_R \otimes p_i, \]

(10)

\[ \exp(i^{-1}p_i|x^k)_R \triangleq (i\partial^\bar{x}) = p_i \otimes \exp(i^{-1}p_i|x^k)_R, \]

\[ \exp(i^{-1}p_i|x^k)_R \triangleq (i\hat{\partial}^\bar{x}) = p_i \otimes \exp(i^{-1}p_i|x^k)_R. \]

(11)

With these equalities at hand one can prove that solutions to the Schrödinger equations on the braided line are given by the functions

\[ (u_{R,L})_{p,m}(x^i) \equiv \exp(x^i|i^{-1}p_j)_R \bar{L}, \]

\[ = \sum_{n_0,n_1=0}^{\infty} \frac{1}{n_0!(n_1)!} x^{n_0}(x^i)^{n_1} \otimes (i^{-1}p_1)^{2n_0+n_1}(2m)^{-n_0} \]
Now, we come to the solutions for the three-dimensional q-deformed Euclidean space. In this case, however, we have to work a little bit harder. Again, we substitute $p^2(2m)^{-1} = g^{AB}p_B \otimes p_A(2m)^{-1}$ for $p_0$, but now we have to apply star multiplication [39, 62–64]. In this manner, the unconjugate
solutions to the three-dimensional Schrödinger equations then become

\[
(u_{R,L})_{p,m}(x^i) \equiv \exp(x^i|^{i-1}p_j)_{R,L} \big|_{p_0 = (p_1)^2(2m)^{-1}} 
= \sum_{n=0}^{\infty} \sum_{k=0}^{n-1} \frac{(i-1)^{n_0}(-\lambda_+)^{n_0-k}q^{2k-2n_3(n_0-k)}}{n_0![[n_+]_q][[n_3]_q][[n_-]_q]} \binom{n_0}{k} q^k \\
\times (x^0)^{n_0} (x^+)^{n_+} (x^3)^{n_3} (x^-)^{n_-} \\
\otimes (i-1)^{p_+} n_+ + n_0 - k (1-1)^{p_3} n_3 + 2k (1-1)^{p_-} n_- + n_0 - k (2m)^{-n_0}, \tag{18}
\]

\[
(u_{\bar{R},\bar{L}})_{p,m}(x^i) \equiv \exp(x^i|^{i-1}p_j)_{\bar{R},\bar{L}} \big|_{p_0 = (p_1)^2(2m)^{-1}} 
= \sum_{n=0}^{\infty} \sum_{k=0}^{n-1} \frac{(i-1)^{n_0}(-\lambda_+)^{n_0-k}q^{2k-2n_3(n_0-k)}}{n_0![[n_+]_q][[n_3]_q][[n_-]_q]} \binom{n_0}{k} q^k \\
\times (x^0)^{n_0} (x^-)^{n_-} (x^3)^{n_3} (x^+)^{n_+} \\
\otimes (i-1)^{p_+} n_+ + n_0 - k (1-1)^{p_3} n_3 + 2k (1-1)^{p_-} n_- + n_0 - k (2m)^{-n_0}, \tag{19}
\]

and for the conjugate solutions we likewise find

\[
(\bar{u}_{R,L})_{p,m}(x^i) \equiv \exp(i-1\ p_j|x^i)_{R,L} \big|_{p_0 = (2m)^{-1}p_1^2} 
= \sum_{n=0}^{\infty} \sum_{k=0}^{n-1} \frac{(-i)^{n_0}(-\lambda_+)^{n_0-k}q^{2k-2n_3(n_0-k)}}{n_0![[n_+]_q][[n_3]_q][[n_-]_q]} \binom{n_0}{k} q^k \\
\times (2m)^{-n_0} (-i)^{-1} n_- + n_0 - k (-i)^{-1} p_3 n_3 + 2k (-i)^{-1} p_+ n_+ + n_0 - k \\
\otimes (x^0)^{n_0} (x^+)^{n_+} (x^3)^{n_3} (x^-)^{n_-}, \tag{20}
\]

\[
(\bar{u}_{\bar{R},\bar{L}})_{p,m}(x^i) \equiv \exp(i-1\ p_j|x^i)_{\bar{R},\bar{L}} \big|_{p_0 = (2m)^{-1}p_1^2} 
= \sum_{n=0}^{\infty} \sum_{k=0}^{n-1} \frac{(-i)^{n_0}(-\lambda_+)^{n_0-k}q^{2k-2n_3(n_0-k)}}{n_0![[n_+]_q][[n_3]_q][[n_-]_q]} \binom{n_0}{k} q^k \\
\times (2m)^{-n_0} (-i)^{p_+} n_+ + n_0 - k (-i)^{-1} p_3 n_3 + 2k (-i)^{-1} p_- n_- + n_0 - k \\
\otimes (x^0)^{n_0} (x^-)^{n_-} (x^3)^{n_3} (x^+)^{n_+}, \tag{21}
\]

where \( \lambda_+ = q + q^{-1} \). The \( q \)-binomial coefficients are defined by the formula [21]

\[
\binom{\alpha}{k}_q \equiv \frac{[[\alpha]]_q [i-1]^q \ldots [i-k-1]^q}{[[k]]_q^q}, \tag{22}
\]

with \( \alpha \in \mathbb{C}, k \in \mathbb{N} \).
We would like to say a few words about the ideas the derivation of the expressions in (18)-(21) is based on. We concentrate attention to the expression in (18), since the other formulae follow from similar reasonings.

First of all we make ansatz

\[ p^2 \otimes \ldots \otimes p^2 = \sum_{k=0}^{n} (C_q)_k^n (p_-)^{n-k} (p_3)^{2k} (p_+)^{n-k}. \]  

(23)

Exploiting the commutation relations of three-dimensional q-deformed Euclidean space [52] we find that the coefficients \((C_q)_k^n\) are subject to the recursion relation

\[ (C_q)_k^n = q^{4k}(-\lambda_+)(C_q)_k^{n-1} + q^{-2}(C_q)_k^{n-1}. \]  

(24)

As one can prove by inserting, the above recursion relation has the solution

\[ (C_q)_k^n = q^{-2k}(-\lambda_+)^{n-k} \left[ \frac{n}{k} \right]_{q^4}. \]  

(25)

From what we have done so far we get

\[ p^2 \otimes \ldots \otimes p^2 \otimes (p_-)^{n-k} (p_3)^{2k} (p_+)^{n-k} = \]

\[ = (p_-)^{n-k} \otimes p^2 \otimes \ldots \otimes p^2 \otimes (p_3)^{2k} (p_+)^{n-k}. \]

\[ = \sum_{k=0}^{n_0} (C_q)_k^n (p_-)^{n+k} (p_3)^{2k} (p_+)^{n+k} = \]

\[ = \sum_{k=0}^{n_0} q^{-2k}(C_q)_k^n (p_-)^{n+k} (p_3)^{2k} (p_+)^{n+k}. \]  

(26)

The point now is that the function \((u_{R,L})_{p,m}(x^i)\) arises from the q-exponential \(\exp(x^j i^{-1} p_j)\) by applying the substitution

\[ (p^0)^{n_0}(p_-)^{n-k}(p_3)^{2k}(p_+)^{n-k} \rightarrow \frac{p^2 \otimes \ldots \otimes p^2}{2m} \otimes (p_-)^{n-k}(p_3)^{2k}(p_+)^{n+k}. \]  

(27)

These arguments finally lead us to the last expression in (18).
Sometimes it is convenient to write the functions in (18)-(21) in a way that makes their dependence from time more explicit. In this manner we have

\[
(u_{R,L})_{p,m}(x^i) = \exp(x^i|^{-1}p_j)_{R,L}\vert_{x^0=0} \overset{p}{\otimes} \exp(-itp^2(2m)^{-1})_{R,L},
\]

\[
(u_{R,L})_{p,m}(x^i) = \exp(x^i|^{-1}p_j)_{R,L}\vert_{x^0=0} \overset{p}{\otimes} \exp(-itp^2(2m)^{-1})_{R,L},
\]

(28)

\[
(\bar{u}_{R,L})_{p,m}(x^i) = \exp(i(2m)^{-1}p^2t)_{R,L} \otimes (\exp(i^{-1}p_j|x^i)_{R,L})\vert_{x^0=0},
\]

\[
(\bar{u}_{R,L})_{p,m}(x^i) = \exp(i(2m)^{-1}p^2t)_{R,L} \otimes (\exp(i^{-1}p_j|x^i)_{R,L})\vert_{x^0=0},
\]

(29)

where the time-dependent phase factors take the form

(i) (braided line)

\[
\exp(-itp^2(2m)^{-1})_{R,L} = \exp(-itp^2(2m)^{-1})_{R,L}
= \sum_{n=0}^{\infty} \frac{1}{n!} (-itp_1)^n (2m)^{-n},
\]

(30)

\[
\exp(i(2m)^{-1}p^2t)_{R,L} = \exp(i(2m)^{-1}p^2t)_{R,L}
= \sum_{n=0}^{\infty} \frac{1}{n!} (2m)^{-n} (ip_1t)^n,
\]

(31)

(ii) (q-deformed Euclidean space in three dimensions)

\[
\exp(-itp^2(2m)^{-1})_{R,L} = \sum_{n=0}^{\infty} \frac{(-it)^n}{n!} \sum_{k=0}^{n} q^{-2k}(-\lambda_+)^{n-k} \left[ \frac{n}{k} \right] q^4 \times (p_-)^{-k}(p_3)^{2k}(p_+)^{n-k}(2m)^{-n},
\]

(32)

\[
\exp(-itp^2(2m)^{-1})_{R,L} = \sum_{n=0}^{\infty} \frac{(-it)^n}{n!} \sum_{k=0}^{n} q^{2k}(-\lambda_+)^{n-k} \left[ \frac{n}{k} \right] q^{-4} \times (p_+)^{-k}(p_3)^{2k}(p_-)^{n-k}(2m)^{-n},
\]

(33)

\[
\exp(i(2m)^{-1}p^2t)_{R,L} = \sum_{n=0}^{\infty} \frac{(it)^n}{n!} \sum_{k=0}^{n} q^{-2k}(-\lambda_+)^{n-k} \left[ \frac{n}{k} \right] q^4 \times (2m)^{-n}(p_-)^{-k}(p_3)^{2k}(p_+)^{n-k},
\]

(34)
\[ \exp(\im i(2m)^{-1} p^2 t)_{R,L} = \sum_{n=0}^{\infty} \frac{(i)^n}{n!} \sum_{k=0}^{n} q^{2k}(-\lambda_+)^{n-k} \left[ \frac{n}{k} \right] q^{-4} \times (2m)^{-n}(p_+)^{n-k}(p_3)^{2k}(p_-)^{n-k}. \] (35)

In the case of the braided line the star product in the relations of (28) and (29) is given by the commutative product. For later purpose we would like to mention that the conjugate solutions \((\tilde{u}_{R,L})_{p,m}\) and \((\tilde{u}_{R,L})_{p,m}\) describe particles traversing backwards in time, as can be seen from the equations in (28) and (29).

To sum up, we found q-analogs of the stationary solutions to the Schrödinger equation of a free non-relativistic particle. In analogy to the undeformed case they are eigenfunctions of energy and momentum, since we have

\[
\begin{align*}
P_A \triangleright (u_{R,L})_{p,m}(x^i) &= \im \partial_A \triangleright (u_{R,L})_{p,m}(x^i) = (u_{R,L})_{p,m}(x^i) \circ P_A, \\
H_0 \triangleright (u_{R,L})_{p,m}(x^i) &= (2m)^{-1} P^2 \triangleright (u_{R,L})_{p,m}(x^i) \\
&= (u_{R,L})_{p,m}(x^i) \circ p^2(2m)^{-1}, \tag{36}
\end{align*}
\]

\[
\begin{align*}
P_A \triangleright (u_{R,L})_{p,m}(x^i) &= \im \partial_A \triangleright (u_{R,L})_{p,m}(x^i) = (u_{R,L})_{p,m}(x^i) \circ P_A, \\
H_0 \triangleright (u_{R,L})_{p,m}(x^i) &= (2m)^{-1} P^2 \triangleright (u_{R,L})_{p,m}(x^i) \\
&= (u_{R,L})_{p,m}(x^i) \circ p^2(2m)^{-1}, \tag{37}
\end{align*}
\]

and

\[
\begin{align*}
(u_{R,L})_{p,m}(x^i) \lhd P_A &= (u_{R,L})_{p,m}(x^i) \lhd \im \partial_A = P_A \circ (u_{R,L})_{p,m}(x^i), \\
(u_{R,L})_{p,m}(x^i) \lhd H_0 &= (u_{R,L})_{p,m}(x^i) \lhd P^2(2m)^{-1} \\
&= (2m)^{-1} P \circ (u_{R,L})_{p,m}(x^i), \tag{38}
\end{align*}
\]

\[
\begin{align*}
(u_{R,L})_{p,m}(x^i) \lhd P_A &= (u_{R,L})_{p,m}(x^i) \lhd \im \partial_A = P_A \circ (u_{R,L})_{p,m}(x^i), \\
(u_{R,L})_{p,m}(x^i) \lhd H_0 &= (u_{R,L})_{p,m}(x^i) \lhd P^2(2m)^{-1} \\
&= (2m)^{-1} P \circ (u_{R,L})_{p,m}(x^i). \tag{39}
\end{align*}
\]

These relations are in accordance with the observation that energy and momentum commute with each other [cf. Eq. (3)].

In part I of this paper we discussed how the time evolution operators look
like on the quantum spaces under consideration. For the sake of completeness it should be noted that our solutions can alternatively be obtained by applying these time evolution operators onto time-independent plane waves, i.e.

\[
(u_{R,L})_{p,m}(x^i) = \exp(-t \otimes iH_0) \overset{H_0|x}{\triangleright} (\exp(x^i|i^{-1}p_j)_{R,L}|x^0=0),
\]

\[
(u_{R,L})_{p,m}(x^i) = \exp(-t \otimes iH_0) \overset{H_0|x}{\triangleright} (\exp(x^i|i^{-1}p_j)_{R,L}|x^0=0),
\]

and

\[
(\bar{u}_{R,L})_{p,m}(x^i) = \exp(i^{-1}p_l|x^k)_{R,L}|x^0=0 \overset{\triangleright}{\triangleleft} \exp(iH_0 \otimes t),
\]

\[
(\bar{u}_{R,L})_{p,m}(x^i) = \exp(i^{-1}p_l|x^k)_{R,L}|x^0=0 \overset{\triangleright}{\triangleleft} \exp(iH_0 \otimes t).
\]

Before we proceed any further let us note that the functions \((u_{R,L})_{\ominus L,p,m}, (u_{R,L})_{\ominus L,p,m}, (\bar{u}_{R,L})_{\ominus R,p,m},\) and \((\bar{u}_{R,L})_{\ominus R,p,m}\) give further solutions to the free-particle Schrödinger equations. (Notice that the operations \(\ominus R\) and \(\ominus \bar{R}\) can be viewed as right versions of \(\ominus L\) and \(\ominus L\), respectively. We did not mention them explicitly in part I, since we can make the identifications \(f(\ominus_R x^i) = f(\ominus_L x^i), \ f(\ominus_R x^i) = f(\ominus_L x^i).\) Similar reasonings hold for the operations \(\ominus \gamma\) and \(\ominus \bar{\gamma}, \gamma \in \{L, \bar{L}, \bar{R}\}.)\) Applying the operations \(\ominus \gamma\) to the momentum part of the equations in (28) and (29) one readily checks that

\[
i\partial_0 \overset{t}{\triangleright} (u_{R,L})_{\ominus L,p,m}(x^i) = H_0 \overset{\triangleright}{\triangleleft} (u_{R,L})_{\ominus L,p,m}(x^i),
\]

\[
i\hat{\partial}_0 \overset{t}{\triangleright} (u_{R,L})_{\ominus L,p,m}(x^i) = H_0 \overset{\triangleright}{\triangleleft} (u_{R,L})_{\ominus L,p,m}(x^i),
\]

and

\[
(\bar{u}_{R,L})_{\ominus R,p,m}(x^i) \overset{t}{\triangleleft} (i\hat{\partial}_0) = (u_{R,L})_{\ominus R,p,m}(x^i) \overset{\triangleright}{\triangleleft} H_0,
\]

\[
(\bar{u}_{R,L})_{\ominus R,p,m}(x^i) \overset{t}{\triangleleft} (i\hat{\partial}_0) = (u_{R,L})_{\ominus R,p,m}(x^i) \overset{\triangleright}{\triangleleft} H_0.
\]

Again, the unconjugate solutions in (42) move forward in time, while the conjugate ones in (43) move oppositely. For a better understanding of the new solutions the reader should be aware of the relations

\[
(u_{R,L})_{\ominus L,p,m}(x^i) = (u_{R,L})_{p,m}(\ominus_R x^A, t)
\]

\[
\neq (u_{R,L})_{p,m}(\ominus_R x^A, -t),
\]

and
\[ (u_{R,L})_{\otimes L,p,m} (x^i) = (u_{R,L})_{p,m} (\otimes_R x^A, t) \]
\[ \neq (u_{R,L})_{p,m} (\otimes_R x^A, -t), \] (45)

and

\[ (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i) = (\bar{u}_{R,L})_{p,m} (\bar{\otimes}_L x^A, t) \]
\[ \neq (\bar{u}_{R,L})_{p,m} (\bar{\otimes}_L x^A, -t), \] (46)

\[ (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i) = (\bar{u}_{R,L})_{p,m} (\bar{\otimes}_L x^A, t) \]
\[ \neq (\bar{u}_{R,L})_{p,m} (\bar{\otimes}_L x^A, -t). \] (47)

From now on we call this second set of solutions to the Schrödinger equations inverse momentum eigenfunctions. In what follows they will play an important role, so we would like to discuss their properties further. First of all, they are again eigenfunctions of energy. Concretely, we have

\[ H_0^\bar{x} (u_{R,L})_{\otimes L,p,m} (x^i) = (2m)^{-1} P^2 \bar{x} (u_{R,L})_{\otimes L,p,m} (x^i) \]
\[ = q^\zeta (u_{R,L})_{\otimes L,p,m} (x^i) \otimes p^2 (2m)^{-1}, \] (48)

\[ H_0^\bar{x} (u_{R,L})_{\otimes L,p,m} (x^i) = (2m)^{-1} P^2 \bar{x} (u_{R,L})_{\otimes L,p,m} (x^i) \]
\[ = q^{-\zeta} (u_{R,L})_{\otimes L,p,m} (x^i) \otimes p^2 (2m)^{-1}, \] (49)

and

\[ (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i) \bar{\otimes} H_0 = (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i) \bar{\otimes} (2m)^{-1} P^2 \]
\[ = q^\zeta (2m)^{-1} P^2 \bar{\otimes} (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i), \] (50)

\[ (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i) \bar{\otimes} H_0 = (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i) \bar{\otimes} (2m)^{-1} P^2 \]
\[ = q^{-\zeta} (2m)^{-1} P^2 \bar{\otimes} (\bar{u}_{R,L})_{\bar{\otimes} R,p,m} (x^i), \] (51)

where

(i) (braided line) \( \zeta = -1, \)

(ii) (q-deformed Euclidean space in three dimensions) \( \zeta = 2. \)

Compared to the relations in (36)-(39) the eigenvalues of energy now contain additional factors. Their occurrence is a consequence of the fact that we apply the operations \( \otimes_\gamma, \gamma \in \{ L, \bar{L}, R, \bar{R} \} \) to momentum eigenfunctions.
The concrete form of the additional factors should become clear from the definition of the operations $\otimes_γ$ together with the relations (for notation and conventions see part I)

\[
\otimes_L p^2 = (W_R^{-1} \circ S_L)(p^2) = q^r p^2,
\]

\[
\otimes_R p^2 = (W_R^{-1} \circ S_L)(p^2) = q^{-r} p^2.
\]

(52)

For the same reasons the time-dependence of inverse momentum eigenfunctions now takes on the form

\[
(u_{R,L})_{\otimes_L p,m}(x^i) = (u_{R,L})_{\otimes_L p,m}(x^i)|_{x^α=0} \overset{p}{\oplus} \exp(-i q^r tp^2(2m)^{-1})_{R,L},
\]

(53)

\[
(u_{R,L})_{\otimes_L p,m}(x^i) = (u_{R,L})_{\otimes_L p,m}(x^i)|_{x^α=0} \overset{p}{\oplus} \exp(-i q^{-r} tp^2(2m)^{-1})_{R,L},
\]

(54)

On the other hand we still have the identities

\[
(u_{R,L})_{\otimes_L p,m}(x^i) = \exp(-t \otimes i H_0)_{|x}^H (u_{R,L})_{\otimes_L p,m}(x^i)|_{x^α=0},
\]

(55)

\[
(u_{R,L})_{\otimes_L p,m}(x^i) = \exp(-t \otimes i H_0)_{|x}^H (u_{R,L})_{\otimes_L p,m}(x^i)|_{x^α=0},
\]

and

\[
(u_{R,L})_{\otimes_R p,m}(x^i) = (u_{R,L})_{\otimes_R p,m}(x^i)|_{x^α=0} \overset{x}{\otimes} \exp(i H_0 \otimes t),
\]

(56)

since inverse momentum eigenfunctions fulfill the same Schrödinger equations as the momentum eigenfunctions in (12)-(13) and (18)-(19).

2.3 Completeness and orthonormality

Now, we have everything together to show that in complete analogy to the undeformed case momentum eigenfunctions on q-deformed quantum spaces establish a complete and orthonormal set of solutions to the free-particle Schrödinger equations in (16)-(17). This observation is a direct consequence of the results in Refs. [65,66], where we already derived orthonormality and completeness relations for q-analogs of plane waves. Although these plane
waves did not satisfy any energy-momentum relation it is straightforward to adapt the ideas of Refs. [65, 66] to our solutions.

Before we explain how to achieve this, let us first write down the explicit form of the orthonormality and completeness relations, as they read for our q-deformed momentum eigenfunctions. If we change the normalization of q-deformed momentum eigenfunctions according to

\[
(u_{R,L})_{p,m}(x^i) = (\text{vol}_1)^{-1/2} \exp(x^i | i^{-1} p_j)_{R,L} |_{p_0 = p^2/(2m)^\text{p}},
\]

\[
(u_{R,L})_{p,m}(x^i) = (\text{vol}_2)^{-1/2} \exp(x^i | i^{-1} p_j)_{R,L} |_{p_0 = p^2/(2m)^\text{p}},
\]

\[
(\bar{u}_{R,L})_{p,m}(x^i) = (\text{vol}_1)^{-1/2} \exp(i^{-1} p_j | x^i)_{R,L} |_{p_0 = p^2/(2m)^\text{p}},
\]

\[
(\bar{u}_{R,L})_{p,m}(x^i) = (\text{vol}_2)^{-1/2} \exp(i^{-1} p_j | x^i)_{R,L} |_{p_0 = p^2/(2m)^\text{p}},
\]

where

\[
\text{vol}_1 \equiv \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} d_1^0 x \int_{-\infty}^{+\infty} d_1^0 p \exp(x^i | i^{-1} p_j)_{R,L} |_{x^0 = 0} = \int_{-\infty}^{+\infty} d_1^0 p \int_{-\infty}^{+\infty} d_1^0 x \exp(i^{-1} p_j | x^i)_{R,L} |_{x^0 = 0},
\]

\[
\text{vol}_2 \equiv \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} d_2^0 x \int_{-\infty}^{+\infty} d_2^0 p \exp(x^i | i^{-1} p_j)_{R,L} |_{x^0 = 0} = \int_{-\infty}^{+\infty} d_2^0 p \int_{-\infty}^{+\infty} d_2^0 x \exp(i^{-1} p_j | x^i)_{R,L} |_{x^0 = 0},
\]

the orthonormality relations become

\[
\langle \langle (\bar{u}_{R,L})_{p,m}(x^A, \pm t), (u_{R,L})_{p,m}(x^B, \mp q^{-\zeta} t) \rangle \rangle \rangle_{1,x} =
\]

\[
= \langle \langle (u_{R,L})_{p,m}(x^A, \pm t), (\bar{u}_{R,L})_{p,m}(x^B, \mp q^{-\zeta} t) \rangle \rangle_{1,x}
\]

\[
= \int_{-\infty}^{+\infty} d_1^0 x (\bar{u}_{R,L})_{p,m}(x^A, \pm t) \otimes_R (\bar{u}_{R,L})_{p,m}(x^B, \mp q^{-\zeta} t)
\]

\[
= (\text{vol}_1)^{-1} \delta_1^0 (p_C \otimes_R (\otimes_R \bar{P_D})),
\]

\[
\langle \langle (\bar{u}_{R,L})_{p,m}(x^A, \pm t), (u_{R,L})_{p,m}(x^B, \mp q^{\zeta} t) \rangle \rangle \rangle_{2,x} =
\]

\[
= \langle \langle (u_{R,L})_{p,m}(x^A, \pm t), (\bar{u}_{R,L})_{p,m}(x^B, \mp q^{\zeta} t) \rangle \rangle_{2,x}
\]
\[ \begin{align*}
&= \int_{-\infty}^{+\infty} d^n x \, (u_{R,L})_{p.m}(x^A, \pm t) \, \otimes \, _R (\bar{u}_{R,L})_{\otimes R} \, (\bar{m}(x^B, \mp q^t)) \\
&= (\text{vol}_2)^{-1} \delta_2^n (p_C \oplus_R (\otimes_R \bar{p}_D)),
\end{align*} \]

and
\[ \begin{align*}
\langle (u_{R,L})_{\otimes L, m}(x^A, \pm q^{-c}t), (\bar{u}_{R,L})_{p,m}(x^B, \mp t) \rangle_1 &= \\
&= \langle (\bar{u}_{R,L})_{\otimes R, m}(x^A, \pm q^{-c}t), (u_{R,L})_{p,m}(x^B, \mp t) \rangle_2 \\
&= \int_{-\infty}^{+\infty} d^n p \, (u_{R,L})_{\otimes L, m}(x^A, \pm q^{-c}t) \, \otimes_L (u_p)_{R,L}(x^B, \mp t) \\
&= (\text{vol}_1)^{-1} \delta_1^n (\otimes_L \bar{p}_C) \oplus_L p_D). \tag{63}
\end{align*} \]

\[ \begin{align*}
\langle (u_{R,L})_{\otimes L, m}(x^A, \pm q^{c}t), (\bar{u}_{R,L})_{p,m}(x^B, \mp t) \rangle_2 &= \\
&= \langle (\bar{u}_{R,L})_{\otimes R, m}(x^A, \pm q^{c}t), (u_{R,L})_{p,m}(x^B, \mp t) \rangle_1 \\
&= \int_{-\infty}^{+\infty} d^n p \, (u_{R,L})_{\otimes L, m}(x^A, \pm q^{c}t) \, \otimes_L (u_p)_{R,L}(x^B, \mp t) \\
&= (\text{vol}_2)^{-1} \delta_2^n (\otimes_L \bar{p}_C) \oplus_L p_D). \tag{64}
\end{align*} \]

Clearly, the third equality in each of the above equations gives the explicit form of the sesquilinear form on position space. The symbol on top of the braided product indicates the tensor factors being involved in the braiding. Expressions for calculating q-integrals over the whole space were given in part I of our paper [cf. Sec. 5 of part I]. Notice that the q-deformed delta functions are defined by [65,67]

\[ \begin{align*}
\delta_1^n (p_A) &= \int_{-\infty}^{+\infty} d^n x \, \exp(i^{-1} p_k |x^j|)_{R,L} \bigg|_{x^0 = 0}, \\
\delta_2^n (p_A) &= \int_{-\infty}^{+\infty} d^n x \, \exp(i^{-1} p_k |x^j|)_{R,L} \bigg|_{x^0 = 0}. \tag{65}
\end{align*} \]

We recommend Refs. [47,65,66] if the reader wants to have some more information about our formalism.

Now, we come to the completeness relations for momentum eigenfunctions of equal time. They take the form

\[ \begin{align*}
\langle (u_{R,L})_{p,m}(x^A, \pm t), (\bar{u}_{R,L})_{\otimes R, p,m}(y^B, \mp q^{-c}t) \rangle_{1,p} &= \\
&= \langle (\bar{u}_{R,L})_{p,m}(x^A, \pm t), (u_{R,L})_{\otimes L, p,m}(y^B, \mp q^{c}t) \rangle_{1,p}.
\end{align*} \]
the relations in (28), (29), (53), and (54). The last assertion can easily be checked by direct inspection of phase factors. Due to their algebraic properties these are valid for \( t \). We first recall that in Ref. [66] it was already shown that the above relations results from phase factors. To check completeness and orthonormality of momentum eigen functions we would like to illustrate these reasonings by the following calculation:

\[
\langle (\tilde{u}_{R,L})_{p,m}(y^B, \mp q^\xi t), (\tilde{u}_{R,L})_{p,m}(x^A, \mp t) \rangle_{2, p} =
\]

\[
= \langle (\tilde{u}_{R,L})_{p,m}(x^A, \pm t), (\tilde{u}_{R,L})_{p,m}(y^B, \mp q^\xi t) \rangle_{2, p}
\]

\[
= \int_{-\infty}^{+\infty} d\gamma_p (\tilde{u}_{R,L})_{p,m}(x^A, \pm t) \odot_R (\tilde{u}_{R,L})_{p,m}(y^B, \mp q^\xi t)
\]

\[
= (\text{vol}_1)^{-1} \delta_1^n (x^A \oplus_R (\ominus_R y^B)),
\]  

(66)

and

\[
\langle (\tilde{u}_{R,L})_{p,m}(y^B, \pm q^\xi t), (\tilde{u}_{R,L})_{p,m}(x^A, \mp t) \rangle_{2, p} =
\]

\[
= \langle (\tilde{u}_{R,L})_{p,m}(x^A, \pm t), (\tilde{u}_{R,L})_{p,m}(y^B, \pm q^\xi t) \rangle_{2, p}
\]

\[
= \int_{-\infty}^{+\infty} d\gamma_p (\tilde{u}_{R,L})_{p,m}(x^A, \mp t) \odot_R (\tilde{u}_{R,L})_{p,m}(y^B, \pm q^\xi t)
\]

\[
= (\text{vol}_2)^{-1} \delta_2^n (x^A \oplus_R (\ominus_R y^B)),
\]  

(67)

To check completeness and orthonormality of momentum eigen functions we first recall that in Ref. [66] it was already shown that the above relations are valid for \( t = 0 \). However, the time-dependence of momentum eigenfunctions results from phase factors. Due to their algebraic properties these phase factors can be brought together in such a way that they cancel each other out. The last assertion can easily be checked by direct inspection of the relations in [28], [29], [53], and [54].

We would like to illustrate these reasonings by the following calculation:
\[
\psi_{\phi_1}'_{m}(\mathbf{x}^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \int_{-\infty}^{+\infty} d_1^p (\exp(i(2m)\mathbf{p}^2 t)_{R,L} \mathbf{p}^{(\bar{u}_{R,L})_{\otimes}_{R} p,m}(y^B,0)) \\
\psi_{\phi_2}'_{m}(\mathbf{x}^i) = \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \int_{-\infty}^{+\infty} d_2^p (\exp(-i(2m)\mathbf{p}^2 t)_{R,L} \mathbf{p}^{(\bar{u}_{R,L})_{\otimes}_{L} p,m}(x^A,0)) \\
= \int_{-\infty}^{+\infty} d_1^p (\bar{u}_{R,L})_{\otimes}_{R} p,m(y^B,0) \\
\psi_{\phi_1}'_{m}(\mathbf{x}^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \langle \mathbf{c}_1'_{\kappa p}, (\bar{u}_{R,L})_{\otimes}_{R} p,m(x^i) \rangle_{1, p}, \\
(\phi_1)'_{m}(\mathbf{x}^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \langle \mathbf{c}_1'_{\kappa p}, (\bar{u}_{R,L})_{\otimes}_{R} p,m(x^i) \rangle_{1, p} \\
= \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \langle \mathbf{c}_2'_{\kappa^{-1} p}, (\bar{u}_{R,L})_{\otimes}_{L} p,m(x^i) \rangle_{2, p}, \\
(\phi_2)'_{m}(\mathbf{x}^i) = \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \langle \mathbf{c}_2'_{\kappa^{-1} p}, (\bar{u}_{R,L})_{\otimes}_{L} p,m(x^i) \rangle_{2, p}, \\
= \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \langle \mathbf{c}_2'_{\kappa^{-1} p}, (\bar{u}_{R,L})_{\otimes}_{L} p,m(x^i) \rangle_{2, p}, \\
\quad \text{for } m = 0, 1, \ldots, \text{vol}_1^{1/2}, \text{vol}_2^{1/2}.
\]

For the first step we make use of the relations in (29) and (54). Then we rearrange terms by taking into account that the time-dependent phase factors commute with all other factors. For the third step we have to realize that the two phase factors are inverse to each other. The last equality is the completeness relation for time-independent momentum eigenfunctions as it was derived in Ref. [65].

In classical quantum mechanics momentum eigenfunctions are not elements of a Hilbert space, since they are not square-integrable functions. Instead, elements of a Hilbert space are obtained by linear superposition of stationary momentum eigenfunctions. In other words, physical states are represented by so-called wave packets. From the results in Ref. [66] we can read off the explicit form of these wave packets. Again, we can directly apply these reasonings, so we get

\[
(\phi_1)'_{m}(\mathbf{x}^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \int_{-\infty}^{+\infty} d_1^p (\exp(i(2m)\mathbf{p}^2 t)_{R,L} \mathbf{p}^{(\bar{u}_{R,L})_{\otimes}_{L} p,m}(y^B,0)) \\
(\phi_2)'_{m}(\mathbf{x}^i) = \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \int_{-\infty}^{+\infty} d_2^p (\exp(-i(2m)\mathbf{p}^2 t)_{R,L} \mathbf{p}^{(\bar{u}_{R,L})_{\otimes}_{L} p,m}(x^A,0)) \\
= \int_{-\infty}^{+\infty} d_1^p (\bar{u}_{R,L})_{\otimes}_{R} p,m(y^B,0) \\
\psi_{\phi_1}'_{m}(\mathbf{x}^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \langle \mathbf{c}_1'_{\kappa p}, (\bar{u}_{R,L})_{\otimes}_{R} p,m(x^i) \rangle_{1, p}, \\
(\phi_1)'_{m}(\mathbf{x}^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \langle \mathbf{c}_1'_{\kappa p}, (\bar{u}_{R,L})_{\otimes}_{R} p,m(x^i) \rangle_{1, p}, \\
= \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \langle \mathbf{c}_2'_{\kappa^{-1} p}, (\bar{u}_{R,L})_{\otimes}_{L} p,m(x^i) \rangle_{2, p}, \\
(\phi_2)'_{m}(\mathbf{x}^i) = \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \langle \mathbf{c}_2'_{\kappa^{-1} p}, (\bar{u}_{R,L})_{\otimes}_{L} p,m(x^i) \rangle_{2, p}, \\
= \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \langle \mathbf{c}_2'_{\kappa^{-1} p}, (\bar{u}_{R,L})_{\otimes}_{L} p,m(x^i) \rangle_{2, p}, \\
\quad \text{for } m = 0, 1, \ldots, \text{vol}_1^{1/2}, \text{vol}_2^{1/2}.
\]
and

\begin{align*}
(\phi_1^*)_m(x^i) &= (\text{vol}_1)^{1/2} \int_{-\infty}^{+\infty} d_1^p p (u_{R,L})_{p,m}(x^i) \mathbin{\#} (c_1^*)_{\kappa^{-1}p} \\
&= (\text{vol}_1)^{1/2} \langle (\bar{u}_{R,L})_{p,m}(x^i), (c_1^*)_{\kappa^{-1}p}\rangle_{1,p}, \\
(\phi_2^*)'_m(x^i) &= (\text{vol}_2)^{1/2} \int_{-\infty}^{+\infty} d_2^p p (c_2^*)_{\kappa p} \mathbin{\#} (\bar{u}_{R,L})_{p,m}(x^i) \\
&= (\text{vol}_2)^{1/2} \langle (c_2^*)_{\kappa p}, (u_{R,L})_{p,m}(x^i)\rangle_{2,p},
\end{align*}

where the constant \( \kappa \) takes on as values

(i) (braided line) \( \kappa = q \),

(ii) (q-deformed Euclidean space in three dimensions) \( \kappa = q^6 \).

Applying the substitutions

\[ L \leftrightarrow \bar{L}, \quad R \leftrightarrow \bar{R}, \quad \kappa \leftrightarrow \kappa^{-1}, \quad 1 \text{ (as label)} \leftrightarrow 2 \text{ (as label)}, \]

(75)

to the formulae in (71)-(74) yields further expressions for wave packets. The existence of such crossing-symmetries is a typical feature of q-deformation (see for example Ref. [47]).

The wave-packets in (71)-(74) give solutions to the free-particle Schrödinger equations in (8) and (9). Using the equations in (16) and (17) one readily checks that

\begin{align*}
i\partial_0 \overset{t}{\triangleright} (\phi_1^*)_m(x^i) &= H_0 \overset{\bar{x}}{\triangleleft} (\phi_1^*)_m(x^i), \\
i\partial_0 \overset{t}{\triangleright} (\phi_1^*)_m(x^i) &= H_0 \overset{x}{\triangleleft} (\phi_1^*)_m(x^i), \\
i\hat{\partial}_0 \overset{t}{\triangleleft} (\phi_2^*)_m(x^i) &= H_0 \overset{\bar{x}}{\triangleright} (\phi_2^*)_m(x^i), \\
i\hat{\partial}_0 \overset{t}{\triangleleft} (\phi_2^*)_m(x^i) &= H_0 \overset{x}{\triangleright} (\phi_2^*)_m(x^i),
\end{align*}

(76)

and

\begin{align*}
(\phi_2)_m(x^i) \overset{t}{\triangleleft} (i\hat{\partial}_0) &= (\phi_2)_m(x^i) \overset{\bar{x}}{\triangleleft} H_0, \\
(\phi_2^*)_m(x^i) \overset{t}{\triangleleft} (i\hat{\partial}_0) &= (\phi_2^*)_m(x^i) \overset{\bar{x}}{\triangleleft} H_0, \\
(\phi_1)_m(x^i) \overset{t}{\triangleright} (i\partial_0) &= (\phi_1)_m(x^i) \overset{x}{\triangleright} H_0,
\end{align*}

(78)
\[
(\phi_1^*)'_m(x^i) \overset{t}{\triangleleft} (i\partial_0) = (\phi_1^*)'_m(x^i) \overset{x}{\triangleleft} H_0. \tag{79}
\]

At this place it should be mentioned that \((\phi_i)'_m\) and \((\phi^*_i)'_m\) traverse forward in time, while \((\phi_i)_m\) and \((\phi^*_i)_m\) move oppositely with time. Concretely, the time evolution of these wave packets is determined by

\[
(\phi_1)'_m(x^i) = \exp(-t \otimes iH_0) \overset{H_0|x}{\triangleright} (\phi_1)'_m(x^A, t = 0),
\]
\[
(\phi^*_1)_m(x^i) = \exp(-t \otimes iH_0) \overset{H_0|x}{\triangleright} (\phi^*_1)_m(x^A, t = 0), \tag{80}
\]
\[
(\phi_2)'_m(x^i) = \exp(-t \otimes iH_0) \overset{H_0|x}{\triangleright} (\phi_2)'_m(x^A, t = 0),
\]
\[
(\phi^*_2)_m(x^i) = \exp(-t \otimes iH_0) \overset{H_0|x}{\triangleright} (\phi^*_2)_m(x^A, t = 0), \tag{81}
\]

and

\[
(\phi_2)_m(x^i) = (\phi_2)_m(x^A, t = 0) \overset{x}{\triangleright} H_0 \overset{x}{\triangleleft} \exp(iH_0 \otimes t),
\]
\[
(\phi^*_2)'_m(x^i) = (\phi^*_2)'_m(x^A, t = 0) \overset{x}{\triangleright} H_0 \overset{x}{\triangleleft} \exp(iH_0 \otimes t), \tag{82}
\]
\[
(\phi_1)_m(x^i) = (\phi_1)_m(x^A, t = 0) \overset{x}{\triangleright} H_0 \overset{x}{\triangleleft} \exp(iH_0 \otimes t),
\]
\[
(\phi^*_1)'_m(x^i) = (\phi^*_1)'_m(x^A, t = 0) \overset{x}{\triangleright} H_0 \overset{x}{\triangleleft} \exp(iH_0 \otimes t). \tag{83}
\]

A short glance at the expansions in \((71)-(74)\) shows us that they are written in terms of time-dependent momentum eigenfunctions. In the Schrödinger picture, however, operators are assumed to be independent from time and the same should hold for their eigenfunctions. Thus, to give the expansion coefficients a physical meaning it is convenient to reformulate the expansions in \((71)-(74)\) in terms of time-independent momentum states. In doing so, we find

\[
(\phi_1)'_m(x^i) = \frac{\kappa^n}{(\text{vol}_1)^{1/2}} \int_{-\infty}^{+\infty} d^np(c_1)_{\kappa p}(\kappa^{-2}t) \otimes_R (u_{R,L})_{\otimes_{L,p,m}} (x^A, t = 0)
\]
\[
= \frac{\kappa^n}{(\text{vol}_1)^{-1/2}} \langle (c_1)_{\kappa p}(\kappa^{-2}t), (u_{R,L})_{\otimes_{L,p,m}} (x^A, t = 0) \rangle'_{1,p}, \tag{84}
\]
\[
(\phi_2)_m(x^i) = \frac{\kappa^{-n}}{(\text{vol}_2)^{1/2}} \int_{-\infty}^{+\infty} d^np(u_{R,L}) \otimes_{L,p,m} (x^A, t = 0) \overset{x}{\triangleleft} L (c_2)_{\kappa^{-1}p}(\kappa^2t)
\]
\[
= \frac{\kappa^{-n}}{(\text{vol}_2)^{-1/2}} \langle (u_{R,L})_{\otimes_{L,p,m}} (x^A, t = 0), (c_2)_{\kappa^{-1}p}(\kappa^2t) \rangle_{2,p}. \tag{85}
\]
and

\[(\phi_1^*)_m(x^i) = (\text{vol}1)^{1/2} \int_{-\infty}^{+\infty} d^d p (u_{R,L})_{p,m}(x^A, t = 0) \odot (c_1^*)_p \kappa^{-1} (\kappa^2 t)\]

\[= (\text{vol}1)^{1/2} \langle (\bar{u}_{R,L})_{p,m}(x^A, t = 0), (c_1^*)_p \kappa^{-1} (\kappa^2 t) \rangle_{1,p}, \quad (86)\]

\[(\phi_2^*)_m(x^i) = (\text{vol}2)^{1/2} \int_{-\infty}^{+\infty} d^d p (c_2^*)_p \kappa^{-2} (\kappa^{-2} t) \odot (\bar{u}_{R,L})_{p,m}(x^A, t = 0) \]

\[= (\text{vol}2)^{1/2} \langle (c_2^*)_p \kappa^{-2} (\kappa^{-2} t), (u_{R,L})_{p,m}(x^i, t = 0) \rangle_{2,p}, \quad (87)\]

where the time-dependent expansion coefficients are now given by

\[(c_1)^{(1)}(t) = (c_1^*)_p \odot \exp(-i\xi^2 p^2 (2m)^{-1})_{R,L},\]

\[(c_2)^{(1)}(t) = (c_2^*)_p \odot \exp(i(2m)^{-1} p^2 t)_{R,L}, \quad (88)\]

\[(c_2)_p(t) = \exp(iq^{-1} (2m)^{-1} p^2 t)_{R,L} \odot (c_2)_p,\]

\[(c_1^*)_p(t) = \exp(-itp^2 (2m)^{-1})_{R,L} \odot (c_1^*)_p. \quad (89)\]

Notice that the last equalities are a direct consequence of the identities in \[\begin{align*}
23 \quad \text{and} \quad 24, \text{if we take into account the trivial braiding of the time-dependent phase factors.}
\end{align*}\]

Eqs. \[\begin{align*}
34 - 37
\end{align*}\] are nothing other than Fourier expansions of the solutions to the free-particle Schrödinger equations in \[\begin{align*}
3 \quad \text{and} \quad 9. \text{In this respect, the coefficients} \ (c_1)_p(t), \ (c_1)^{(1)}_p(t), \ (c_2)_p(t), \ \text{and} \ (c_2)^{(1)}_p(t) \ \text{can be viewed as probability amplitudes for observing a particle of definite momentum at time} \ t \ \text{(see also the discussion in Ref. 66). The reasonings about inverse Fourier transformations in Ref. 65} \ \text{showed us how to calculate these probability amplitudes from the corresponding wave packets. In this manner, we have}
\end{align*}\]

\[(c_1)^{(1)}_p(t) = (\text{vol}1)^{1/2} \int_{-\infty}^{+\infty} d^d p (\phi_1)_m(x^i) \odot (u_{R,L})_{p,m}(x^A, t = 0) \]

\[= (\text{vol}1)^{1/2} \langle (\phi_1)_m(x^i), (\bar{u}_{R,L})_{p,m}(x^A, t = 0) \rangle_{1,x}, \quad (90)\]

\[(c_2)_p(t) = (\text{vol}2)^{1/2} \int_{-\infty}^{+\infty} d^d p (\bar{u}_{R,L})_{p,m}(x^A, t = 0) \odot (\phi_2)_m(x^i) \]

\[= (\text{vol}2)^{1/2} \langle (u_{R,L})_{p,m}(x^A, t = 0), (\phi_2)_m(x^i) \rangle_{2,x}, \quad (91)\]
and

\[
(c_1^*)_p(t) = \frac{1}{(\text{vol}_1)^{1/2}} \int_{-\infty}^{+\infty} d^n x (u_{R,L} \otimes_{R,P,m}(x^A, t = 0))^p |_L (\phi_1^*)_m(x^i) \\
= \frac{1}{(\text{vol}_1)^{1/2}} \langle (\bar{u}_{R,L}) \otimes_{L,P,m}(x^A, t = 0), (\phi_1^*)_m(x^i) \rangle_{1,x}, \tag{92}
\]

\[
(c_2^*)_p(t) = \frac{1}{(\text{vol}_2)^{1/2}} \int_{-\infty}^{+\infty} d^n x (\phi_2^*)_m(x^i) \otimes_R (\bar{u}_{R,L}) \otimes_{L,P,m}(x^A, t = 0) \\
= \frac{1}{(\text{vol}_2)^{1/2}} \langle (\phi_2^*)_m(x^i), (u_{R,L}) \otimes_{R,P,m}(x^A, t = 0) \rangle_{2,x}. \tag{93}
\]

As already mentioned, the above formulae for computing the expansion coefficients refer to the Schrödinger picture. This can be seen from the observation that the momentum eigenfunctions are fixed in time. In the Heisenberg picture, however, observables together with their eigenfunctions vary with time. Fortunately, the transition to the Heisenberg picture can easily be achieved by exploiting the conjugation properties of time evolution operators.

We would like to illustrate this assertion by the following calculation:

\[
(c_1^*)_p(t) = (\text{vol}_1)^{-1/2} \langle (\bar{u}_{R,L}) \otimes_{L,P,m}(x^A, t = 0), (\phi_1^*)_m(x^i) \rangle_{1,x} \\
= (\text{vol}_1)^{-1/2} \langle (\bar{u}_{R,L}) \otimes_{L,P,m}(x^A, 0), \exp(-itH_0) |_{H_0}^{x} (\phi_1^*)_m(x^A, 0) \rangle_{1,x} \\
= (\text{vol}_1)^{-1/2} \langle \exp(itH_0) |_{H_0}^{x} (u_{R,L}) \otimes_{L,P,m}(x^A, 0), (\phi_1^*)_m(x^A, 0) \rangle_{1,x} \\
= (\text{vol}_1)^{-1/2} \langle (\bar{u}_{R,L}) \otimes_{L,P,m}(x^A, 0), \exp(iq^{-\zeta}tH_0), (\phi_1^*)_m(x^A, 0) \rangle_{1,x} \\
= (\text{vol}_1)^{-1/2} \langle (\bar{u}_{R,L}) \otimes_{L,P,m}(x^A, q^{-\zeta}t), (\phi_1^*)_m(x^A, 0) \rangle_{1,x}. \tag{94}
\]

The second equality in the above calculation holds due to the second relation in \([\text{90}]\). For the third equality we use fact that the adjoint of the time evolution operator is given by its Hermitian conjugate. Then we express the left action of the time evolution operator by a right one. The last equality can be recognized as the first identity in \([\text{41}]\). In very much the same way we get

\[
(c_2^*)_p(t) = (\text{vol}_2)^{-1/2} \langle (\phi_2^*)_m(x^A, 0), (u_{R,L}) \otimes_{R,P,m}(x^A, q^\zeta t) \rangle_{2,x}. \tag{95}
\]
and
\[
(c_1)_p(t) = (\text{vol}_1)^{1/2} \langle (\phi_1)_m(x^A,0), (\bar{u}_{R,L})_{p,m}(x^A, q^\xi t) \rangle_{1,x},
\]
\[
(c_2)_p(t) = (\text{vol}_2)^{1/2} \langle (u_{R,L})_{p,m}(x^A, q^{-\xi} t), (\phi_2)_m(x^A,0) \rangle_{2,x}.
\] (96)

From the considerations so far we can see that for one and the same wave function there exist different expansions in terms of momentum eigen-functions. This is a consequence of the fact that we can distinguish different \(q\)-geometries. Perhaps, the reader may have noticed that we often restrict attention to certain \(q\)-geometries, only. The reason for this lies in the fact that we can make transitions between the expressions corresponding to different geometries by means of the substitutions
\[
L \leftrightarrow \bar{L}, \quad R \leftrightarrow \bar{R}, \quad \kappa \leftrightarrow \kappa^{-1}, \quad q \leftrightarrow q^{-1},
1 \text{ (as label)} \leftrightarrow 2 \text{ (as label)}, \quad \partial \leftrightarrow \hat{\partial}, \quad \triangleright \leftrightarrow \hat{\triangleright}, \quad \triangleleft \leftrightarrow \hat{\triangleleft}.
\] (97)

Thus, it is sufficient to treat some \(q\)-geometries explicitly, since the expressions for the other ones are easily obtained via the substitutions in (97).

2.4 Probability densities and expectation values

The existence of different \(q\)-geometries enables us to write down different versions of the normalization condition of wave functions. In Ref. [47] we discussed the normalization conditions for wave functions on position as well as momentum space. Adapting these ideas for our results gives
\[
1 = \langle \phi, \phi \rangle_{1,x} = \frac{1}{2} \langle (\phi_1)_m(-q^{-\xi} t), (\phi_1^*)_m(t) \rangle_{1,x}
+ \frac{1}{2} \langle (\phi_1^*)_m(t), (\phi_1)_m(-q^{-\xi} t) \rangle_{1,x}
= \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1)_p(-q^{-\xi} t) \otimes (c_1^\dagger)_{\kappa-1} p (\kappa^2 t) \right.
+ \left. (c_1^\dagger)_{\kappa-1} p (\kappa^2 t) \otimes (c_1)_p(-q^{-\xi} t) \right)
= \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1)_p \otimes (c_1^\dagger)_{\kappa-1} p + (c_1^\dagger)_{\kappa-1} p \otimes (c_1)_p \right),
\] (98)
\[
1 = \langle \phi, \phi \rangle_{2,x} = \frac{1}{2} \langle (\phi_2)_m(-q^\xi t), (\phi_2^*)_m(t) \rangle_{2,x}
+ \frac{1}{2} \langle (\phi_2^*)_m(t), (\phi_2)_m(-q^\xi t) \rangle_{2,x}
\]
\[= \int_{-\infty}^{+\infty} d_2 p\, \frac{1}{2} (\overline{(c_2)_p(-q^2t)} \odot (c_2^*)_{\kappa p}(\kappa^{-2}t) \]
\[+ \overline{(c_2^*)_{\kappa p}(\kappa^{-2}t)} \odot (c_2)_p(-q^2t)) \]
\[= \int_{-\infty}^{+\infty} d_2 p\, \frac{1}{2} (\overline{(c_2)_p} \odot (c_2^*)_{\kappa p} + \overline{(c_2^*)_{\kappa p}} \odot (c_2)_p), \quad (99) \]

and

\[1 = \langle \phi, \phi \rangle'_{1,x} = \frac{1}{2} \langle (\phi_1)'_{m}(q^{-\zeta}t), (\phi_1^*)'_{m}(-t) \rangle'_{1,x} \]
\[+ \frac{1}{2} \langle (\phi_1)'_{m}(-t), (\phi_1^*)'_{m}(q^{-\zeta}t) \rangle'_{1,x} \]
\[= \int_{-\infty}^{+\infty} d_1 p\, \frac{1}{2} ((c_1)'_{p}(q^{-\zeta}t) \odot (c_1^*)'_{-1-p}(-\kappa^{-2}t) \]
\[+ (c_1^*)'_{-1-p}(-\kappa^{-2}t) \odot (c_1)'_{p}(q^{-\zeta}t)) \]
\[= \int_{-\infty}^{+\infty} d_1 p\, \frac{1}{2} ((c_1)'_{p} \odot (c_1^*)'_{-1-p} + (c_1^*)'_{-1-p} \odot (c_1)'_{p}), \quad (100) \]

\[1 = \langle \phi, \phi \rangle'_{2,x} = \frac{1}{2} \langle (\phi_2)'_{m}(q^{\zeta}t), (\phi_2^*)'_{m}(-t) \rangle'_{2,x} \]
\[+ \frac{1}{2} \langle (\phi_2)'_{m}(-t), (\phi_2^*)'_{m}(q^{\zeta}t) \rangle'_{2,x} \]
\[= \int_{-\infty}^{+\infty} d_2 p\, \frac{1}{2} ((c_2)'_{p}(q^{\zeta}t) \odot (c_2^*)'_{\kappa p}(-\kappa^{-2}t) \]
\[+ (c_2^*)'_{\kappa p}(-\kappa^{-2}t) \odot (c_2)'_{p}(q^{\zeta}t)) \]
\[= \int_{-\infty}^{+\infty} d_2 p\, \frac{1}{2} ((c_2)'_{p} \odot (c_2^*)'_{\kappa p} + (c_2^*)'_{\kappa p} \odot (c_2)'_{p}). \quad (101) \]

Notice that the minus signs before the time variables are a consequence of the fact that the conjugate solutions to the free Schrödinger equations move backwards in time. The last equality in each of the above equations follows from the identities in (S9) and (S10). It tells us that the normalization of a free-particle wave function does not change in time. To get this result we have to choose the correct expansion for each argument of our sesquilinear forms. Furthermore, the time coordinate of one wave function as argument of a sesquilinear form has to be rescaled by a suitable factor.

Next, we come to the expectation values of momentum for a free particle.
Using the results of Ref. [47] once more, we get

\[ \langle \frac{1}{2}(P_A + \overline{P_A})\phi \rangle_{1,x} = \langle \phi, \frac{1}{2}(i\partial_A \hat{x} + \hat{x} \partial_A \phi) \rangle_{1,x} \]

\[ = \frac{1}{2} \langle (\phi_1)_m(-q^{-\zeta}t), i\partial_A \hat{x} (\phi_1^*)_m(t) \rangle_{1,x} \]

\[ + \frac{1}{2} \langle (\phi_1^*)_m(t), \overline{i\partial_A \hat{x}} (\phi_1)_m(-q^{-\zeta}t) \rangle_{1,x} \]

\[ = \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1)_p (-q^{-\zeta}t) \otimes P_A \otimes (c_1^*)_k p (\kappa^2 t) \right. \]

\[ + \left. (c_1^*)_k p (\kappa^2 t) \otimes P_A \otimes (c_1)_p (-q^{-\zeta}t) \right) \]

\[ = \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1)_p \otimes P_A \otimes (c_1^*)_k p \right. \]

\[ + \left. (c_1^*)_k p \otimes P_A \otimes (c_1)_p \right), \tag{102} \]

and

\[ \langle \frac{1}{2}(P_A + \overline{P_A})\phi \rangle'_{1,x} = \langle \frac{1}{2}(\phi \otimes (i\hat{\partial}_A) + \hat{x} \partial_A \phi), \phi \rangle'_{1,x} \]

\[ = \frac{1}{2} \langle (\phi_1')_m(q^{-\zeta}t) \otimes (i\hat{\partial}_A), (\phi_1')^*_m(-t) \rangle'_{1,x} \]

\[ + \frac{1}{2} \langle (\phi_1')^*_m(-t) \otimes i\hat{\partial}_A, (\phi_1')_m(q^{-\zeta}t) \rangle'_{1,x} \]

\[ = \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1')_p (q^{-\zeta}t) \otimes P_A \otimes (c_1')^*_k (-\kappa^2 t) \right. \]

\[ + \left. (c_1')^*_k (-\kappa^2 t) \otimes P_A \otimes (c_1')_p (q^{-\zeta}t) \right) \]

\[ = \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1')_p \otimes P_A \otimes (c_1')^*_k \right. \]

\[ + \left. (c_1')^*_k \otimes P_A \otimes (c_1')_p \right). \tag{103} \]

Furthermore, we have

\[ \langle \frac{1}{2}(P_A + \overline{P_A})\phi \rangle_{2,x} = \langle \phi, \frac{1}{2}(i\hat{\partial}_A \hat{x} + \hat{x} \partial_A \phi) \rangle_{2,x} \]

\[ = \frac{1}{2} \langle (\phi_2)_m(-q^\zeta t), i\hat{\partial}_A \hat{x} (\phi_2^*)_m(t) \rangle_{1,x} \]

\[ + \frac{1}{2} \langle (\phi_2^*)_m(t), i\hat{\partial}_A \hat{x} (\phi_2)_m(-q^\zeta t) \rangle_{1,x} \]
\[ \begin{align*}
\frac{1}{2} (P_A + \overline{P_A}) \phi \big|_{2,x} &= \frac{1}{2} \left( \phi \hat{\phi} (i\partial_A) + \phi \overline{\phi} \right) \big|_{2,x} \\
&= \frac{1}{2} \left( (\phi_1^*)_m(-q^{-\zeta}t) \hat{\phi} (i\partial_A) \right) \big|_{1,x} \\
&+ \frac{1}{2} \left( (\phi_1^*)_m(t) \overline{\phi} \right) \big|_{1,x} \\
&= \int_{-\infty}^{+\infty} d_1 \, p \, \frac{1}{2} \left( \left( (c_1)_p(-q^{-\zeta}t) \hat{\phi} (i\partial_A) \right) \big|_{1,x} \right. \\
&\quad \left. + \left( (c_1^*)_p(-q^{-\zeta}t) \overline{\phi} \right) \big|_{1,x} \right),
\end{align*} \]  

(105)

The last expression in each of the above formulae shows us that expectation values of momentum operators taken with respect to free-particle wave functions are independent from time. To obtain this result we made use of the fact that in (102)–(105) the time-dependent phase factors that are contained in the expansion coefficients [cf. the identities in (88) and (89)] commute with momentum variables and cancel each other out.

For the sake of completeness we wish to write down expectation values for position operators. We find

\[ \begin{align*}
\frac{1}{2} (X^A + \overline{X^A}) \phi \big|_{1,x} &= \langle \phi, \frac{1}{2} (x^A + \overline{x^A}) \phi \rangle \big|_{1,x} \\
&= \frac{1}{2} \left( (\phi)_m(-q^{-\zeta}t) x^A \hat{\phi} \right) \big|_{1,x} \\
&+ \frac{1}{2} \left( (\phi)_m(t) \overline{x^A} \overline{\phi} \right) \big|_{1,x} \\
&= \int_{-\infty}^{+\infty} d_1 \, p \, \frac{1}{2} \left( \left( (c_1)_p(-q^{-\zeta}t) \hat{\phi} \right) \big|_{1,x} \right. \\
&\quad \left. + \left( (c_1^*)_p(-q^{-\zeta}t) \overline{\phi} \right) \big|_{1,x} \right),
\end{align*} \]  

(106)

and

\[ \begin{align*}
\frac{1}{2} (X^A + \overline{X^A}) \phi \big|_{1,x}' &= \langle \phi \frac{1}{2} (x^A + \overline{x^A}), \phi \rangle' \big|_{1,x} \\
&= \frac{1}{2} \left( (\phi)_m(q^{-\zeta}t) \hat{\phi} \right) \big|_{1,x} \\
&+ \frac{1}{2} \left( (\phi)_m(-q^{-\zeta}t) \overline{\phi} \right) \big|_{1,x} \\
&= \int_{-\infty}^{+\infty} d_1 \, p \, \frac{1}{2} \left( \left( (c_1)_p(q^{-\zeta}t) \hat{\phi} \right) \big|_{1,x} \right. \\
&\quad \left. + \left( (c_1^*)_p(q^{-\zeta}t) \overline{\phi} \right) \big|_{1,x} \right).
\end{align*} \]
Likewise, we get
\[
\langle (c^*_1)^{\kappa-1}_p (-\kappa^2 t) \overset{p}{\triangleleft} i\hat{\partial}^A \rangle \overset{p}{\triangleleft} (c_1^*)_p (q^\xi t) \rangle'.
\] (107)

\[
\langle (X^A + \overline{X^A}) \phi \rangle'_{2,x} = \langle (\phi \overset{p}{\triangleleft} (X^A + \overline{X^A}) \overset{x}{\otimes} \phi) \rangle'_{2,x}
\]
\[
= \frac{1}{2} \langle (\phi_2)_m (-t) \otimes (\phi_2^*)_m (t) \rangle_{1,x}
\]
\[
+ \frac{1}{2} \langle (c_2^*)_{\kappa_p} (t) \overset{p}{\triangleleft} (i\hat{\partial}^A \overset{p}{\triangleleft} (c_2^*)_{\kappa_p} (-t)) \rangle.
\] (108)

\[
\langle (X^A + \overline{X^A}) \phi \rangle'_{2,x} = \langle (\phi \overset{p}{\otimes} (X^A + \overline{X^A}) \overset{x}{\otimes} \phi) \rangle'_{2,x}
\]
\[
= \frac{1}{2} \langle (\phi_2')_m (t) \overset{x}{\otimes} (\phi_2')^*_m (-t) \rangle'_{1,x}
\]
\[
+ \frac{1}{2} \langle (\phi_2^*)_m (-t) \overset{x}{\otimes} (\phi_2')^*_m (t) \rangle'_{1,x}
\]
\[
= \int_{-\infty}^{+\infty} d_2 p \frac{1}{2} \langle ((c_2')_p (t) \overset{p}{\otimes} (i\hat{\partial}^A \overset{p}{\otimes} (c_2')_{\kappa_p} (-t)) \rangle
\]
\[
+ \langle (c_2')_{\kappa_p} (-t) \overset{p}{\triangleleft} i\hat{\partial}^A \overset{p}{\triangleleft} (c_2')_{\kappa_p} (t) \rangle'.
\] (109)

The arguments that showed us time-independence of expectation values of momentum operators do not carry over to expectation values of position operators. This should be rather clear, since in general a free particle does not rest in space.

Once again, let us have a short look at the normalization conditions and expectation values as they read for wave functions on momentum space [cf. Eqs. (103)-(106)]. From these expressions it should become obvious that the probability densities for meeting a free particle at time \( t \) in an eigenstate of the momentum operator are given by
\[
\rho_1 (p_A, t) = \frac{1}{2} \langle (c_1^*)_p (-q^\xi t) \overset{p}{\triangleleft} (c_1^*)_p (-\kappa^2 t) \rangle
\]
\[
+ \langle (c_1^*)_p (-\kappa^2 t) \overset{p}{\triangleleft} (c_1^*)_p (-q^\xi t) \rangle,
\] (110)

\[
\rho_2 (p_A, t) = \frac{1}{2} \langle (c_2^*)_p (-q^\xi t) \overset{p}{\triangleleft} (c_2^*)_{\kappa p} (\kappa^2 t) \rangle
\]
\[
+ \langle (c_2^*)_{\kappa p} (\kappa^2 t) \overset{p}{\triangleleft} (c_2^*)_p (-q^\xi t) \rangle.
\]
\[ + (c_2^*)_{\kappa p}(\kappa^{-2} t) \otimes (c_2)_p(-q^\zeta t) \], \quad (111) \]

or
\[ (\rho_1)_\phi(p_A, t) = \frac{1}{2} \left[ ((c_1)_p(q^{-\zeta} t) \otimes (c_1^*')_{\kappa^{-1} p}(\kappa^{-2} t) \right. \]
\[ + (c_1^*)_{\kappa^{-1} p}(\kappa^{-2} t) \otimes (c_1')_p(q^{\zeta} t) \], \quad (112) \]
\[ (\rho_2)_\phi(p_A, t) = \frac{1}{2} \left[ ((c_2)_p(q^{\zeta} t) \otimes (c_2^*')_{\kappa p}(\kappa^{-2} t) \right. \]
\[ + (c_2^*)_{\kappa p}(\kappa^{-2} t) \otimes (c_2')_p(q^{\zeta} t) \]. \quad (113) \]

Of course, for a free particle there is no variation in the probability densities with time, thus the time variable as argument can be dropped in the above expressions.

Let us return to the expectation values of momentum operators. Their independence from time tells us that momentum of a free particle is a constant of motion. This becomes also evident from the Heisenberg equations of motion, as they were introduced in part I:
\[
\frac{d(P_A)_H}{dt} = i[H_0, (P_A)_H] = iP^2(2m)^{-1} (P_A)_H - (P_A)_H iP^2(2m)^{-1} = 0, \\
\frac{d(P_A)'_H}{dt} = i[(P_A)'_H, H_0] = (P_A)_H i(2m)^{-1} P^2 - i(2m)^{-1} P^2 (P_A)_H = 0, 
\]
(114)

where
\[
(P_A)_H = \exp(itH_0) P_A \exp(-itH_0) = P_A, \\
(P_A)'_H = \exp(-itH_0) P_A \exp(itH_0) = P_A. 
\]
(115)

Notice that the commutators in (114) vanish due to the property of \( H_0 \) to be central in the algebra of momentum space.

It is rather instructive to write down expectation values of momentum and position operators in the Heisenberg picture. To this end let us first demonstrate how to obtain expectation values in the Heisenberg picture. In complete analogy to the undeformed case we start from an expectation value in the Schrödinger picture and rewrite it in a way that wave functions
become independent from time:

\[
\langle \frac{1}{2} (P_A + \overline{P_A}) \phi \rangle_{1,x} = \\
= \frac{1}{2} \langle (\phi_1)_m (x^B, -q^{-\zeta} t), P_A \overline{\phi} (\phi^*_1)_m (x^C, t) \rangle_{1,x} \\
+ \frac{1}{2} \langle (\phi^*_1)_m (x^B, t), \overline{P_A} \overline{\phi} (\phi^*_1)_m (x^C, q^{-\zeta} t) \rangle_{1,x} \\
= \frac{1}{2} \langle (\phi_1)_m (x^B, 0) \overline{\phi}, \exp(-i q^{-\zeta} t H_0), P_A \overline{\phi} (\phi^*_1)_m (x^C, 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (P_A \exp(-itH_0)) \overline{\phi} (\phi^*_1)_m (x^B, 0), (\phi_1)_m (x^C, 0) \overline{\phi}, \exp(-i q^{-\zeta} t H_0) \rangle_{1,x} \\
= \frac{1}{2} \langle \exp(-itH_0) \overline{\phi} (\phi_1)_m (x^B, 0), (P_A \exp(-itH_0)) \overline{\phi} (\phi^*_1)_m (x^C, 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (P_A \exp(-itH_0)) \overline{\phi} (\phi^*_1)_m (x^B, 0), \exp(-itH_0) \overline{\phi} (\phi_1)_m (x^C, 0) \rangle_{1,x} \\
= \frac{1}{2} \langle (\phi_1)_m (x^B, 0), \exp(itH_0) P_A \exp(-itH_0) \overline{\phi} (\phi^*_1)_m (x^C, 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (\exp(itH_0) P_A \exp(-itH_0)) \overline{\phi} (\phi^*_1)_m (x^B, 0), (\phi_1)_m (x^C, 0) \rangle_{1,x} \\
= \frac{1}{2} \langle (\phi_1)_m (x^B, 0), (P_A)_{H} \overline{\phi} (\phi^*_1)_m (x^C, 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (P_A)_{H} \overline{\phi} (\phi^*_1)_m (x^B, 0), (\phi_1)_m (x^C, 0) \rangle_{1,x} \\
= \frac{1}{2} \langle (\phi_1)_m (x^B, 0), (P_A)_{H} \overline{\phi} (\phi^*_1)_m (x^C, 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (\phi^*_1)_m (x^B, 0), (P_A)_{H} \overline{\phi} (\phi_1)_m (x^C, 0) \rangle_{1,x}. \quad (116)
\]

The first equality is the defining expression for the expectation value of a momentum operator in the Schrödinger picture. Then we introduce the time-evolution operators by making use of the relations in (80) and (83). For the sake of convenience we rewrite the expression in a way that all time evolution operators act from the left. Next, we use the fact that the adjoints of the time-evolution operators are given by their Hermitian conjugates. Finally, we are in a position to identify the definitions of momentum operators in the Heisenberg picture.

Continuing these reasonings we find that in the Heisenberg picture expectation values of momentum operators taken with respect to free-particle
wave functions are of the form

\[
\langle \frac{1}{2} (P_A + \overline{P_A}) \phi \rangle_{1,x} = \\
= \frac{1}{2} \langle (\phi_1)_m(t = 0), (P_A)_H \overset{\bar{\times}}{\otimes} (\phi_1^*)_m(t = 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (\phi_1^*)_m(t = 0), \overline{(P_A)_H} \overset{\bar{\times}}{\otimes} (\phi_1)_m(t = 0) \rangle_{1,x} \\
= \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1)_p \overset{p}{\otimes} p_A \overset{p}{\otimes} (c_1^*)_\kappa^{-1}p \\
\quad + \overline{(c_1^*_\kappa^{-1}p \overset{p}{\otimes} \overline{P_A} \overset{p}{\otimes} (c_1)_p) \right),
\tag{117}
\]

and

\[
\langle \frac{1}{2} (P_A + \overline{P_A}) \phi \rangle'_{1,x} = \\
= \frac{1}{2} \langle (\phi_1')_m(t = 0) \overset{\bar{\times}}{\otimes} (P_A)_H \overset{\bar{\times}}{\otimes} (\phi_1')_m(t = 0) \rangle'_{1,x} \\
+ \frac{1}{2} \langle (\phi_1')_m(t = 0) \overset{\bar{\times}}{\otimes} \overline{(P_A)_H} \overset{\bar{\times}}{\otimes} (\phi_1')_m(t = 0) \rangle'_{1,x} \\
= \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1')_p \overset{p}{\otimes} p_A \overset{p}{\otimes} (c_1^*)_\kappa^{-1}p \\
\quad + \overline{(c_1^*_\kappa^{-1}p \overset{p}{\otimes} \overline{P_A} \overset{p}{\otimes} (c_1)_p) \right). \tag{118}
\]

Clearly, we can proceed in the same way for expectation values of position operators. In the Heisenberg picture they read as

\[
\langle \frac{1}{2} (X_A + \overline{X_A}) \phi \rangle_{1,x} = \\
= \frac{1}{2} \langle (\phi_1)_m(t = 0), (X_A)_H \overset{\bar{\times}}{\otimes} (\phi_1^*)_m(t = 0) \rangle_{1,x} \\
+ \frac{1}{2} \langle (\phi_1^*)_m(t = 0), \overline{(X_A)_H} \overset{\bar{\times}}{\otimes} (\phi_1)_m(t = 0) \rangle_{1,x} \\
= \int_{-\infty}^{+\infty} d_1 p \frac{1}{2} \left( (c_1)_p \overset{p}{\otimes} ((X_A)_H \overset{p}{\otimes} (c_1^*)_\kappa^{-1}p) \\
\quad + \overline{(c_1^*_\kappa^{-1}p \overset{p}{\otimes} \overline{X_A} \overset{p}{\otimes} (c_1)_p) \right), \tag{119}
\]

and

\[
\langle \frac{1}{2} (X^A + \overline{X^A}) \phi \rangle'_{1,x} = 
\]
= \frac{1}{2} \langle (\phi_1)'_m(t = 0) \otimes (X^A)'_{H}, (\phi^*_1)'_m(t = 0) \rangle'_{1, x}
+ \frac{1}{2} \langle (\phi^*_1)'_m(t = 0) \otimes (X^A)'_{H}, (\phi_1)'_m(t = 0) \rangle'_{1, x}
= \int_{-\infty}^{+\infty} d\tilde{p} \frac{1}{2} \left\langle \left( (c_1)'_p \tilde{A}(X^A)'_{H} \right) \otimes (c^*_1)'_{-\tilde{p}} \right.
+ \left. \left( (c^*_1)'_{-\tilde{p}} \tilde{A}(X^A)'_{H} \right) \otimes (c_1)'_p \right\rangle', \quad (120)

where

\begin{align*}
(X_A)_H &= \exp(i\hbar_0) X_A \exp(-i\hbar_0), \\
(X_A)'_H &= \exp(-i\hbar_0) X_A \exp(i\hbar_0). \quad (121)
\end{align*}

The expressions for the other geometries follow from the above formulae through the substitutions in (97).

We saw that expectation values of momentum operators are independent from time, if they are taken with respect to free-particle wave functions. On the contrary, expectation values of position operators should vary with time. Again, this observation is in agreement with the Heisenberg equations of motion for position operators,

\begin{align*}
\frac{d(X^A)_H}{dt} &= i[H_0, (X^A)_H] = i\hbar_0(X^A)_H - i(X^A)_H H_0 \\
&= -(2m)^{-1} P^2 \partial_p^A + \partial_p^A (2m)^{-1} P^2 \\
&= -(\partial_p^A)_{(2)} ((2m)^{-1} P^2 \partial_p^A)_{(1)} + \partial_p^A (2m)^{-1} P^2 \\
&= -\partial_p^A (2m)^{-1} P^2 - (2m)^{-1} P^2 \partial_p^A + \partial_p^A (2m)^{-1} P^2 \\
&= -(2m)^{-1} P^2 \partial_p^A, \quad (122)
\end{align*}

and

\begin{align*}
\frac{d(X^A)'_H}{dt} &= i[(X^A)'_H, H_0] = i(X^A)'_H H_0 - iH_0 (X^A)'_H \\
&= -\partial_p^A P^2 (2m)^{-1} + P^2 (2m)^{-1} \partial_p^A \\
&= -((\partial_p^A)_{(1)} \triangleright P^2 (2m)^{-1}) (\partial_p^A)_{(2)} + P^2 (2m)^{-1} \partial_p^A \\
&= -\partial_p^A \triangleright P^2 (2m)^{-1} - P^2 (2m)^{-1} \partial_p^A + P^2 (2m)^{-1} \partial_p^A \\
&= -\partial_p^A \triangleright P^2 (2m)^{-1}. \quad (123)
\end{align*}

For the fourth equality of both calculations we use the Leibniz rules.
of partial derivatives on momentum space. Since they are determined by the coproduct of partial derivatives, we write the Leibniz rules by using the Sweedler notation for the coproduct. The fifth equality then is a consequence of the trivial braiding of $H_0$.

To adjust the results in (122) and (123) to the quantum spaces under consideration we need to know that

(i) (braided line)

\[
\partial^1 \overset{\mathcal{P}}{\triangleright} p^2(2m)^{-1} = [2]_q P^1(2m)^{-1},
\]
\[
\hat{\partial}^1 \overset{\mathcal{P}}{\triangleright} p^2(2m)^{-1} = [2]_{q^{-1}} P^1(2m)^{-1},
\]
(124)

\[
(2m)^{-1} P^2 \overset{\mathcal{P}}{\triangleright} \partial^1 = -[2]_{q^{-1}}(2m)^{-1} P^1,
\]
\[
(2m)^{-1} P^2 \overset{\mathcal{P}}{\triangleright} \hat{\partial}^1 = -[2]_q(2m)^{-1} P^1,
\]
(125)

(ii) (q-deformed Euclidean space in three dimensions)

\[
\partial^A \overset{\mathcal{P}}{\triangleright} P^2(2m)^{-1} = [2]_{q^{-2}} P^A(2m)^{-1},
\]
\[
\hat{\partial}^A \overset{\mathcal{P}}{\triangleright} P^2(2m)^{-1} = [2]_{q^2} P^A(2m)^{-1},
\]
(126)

\[
(2m)^{-1} P^2 \overset{\mathcal{P}}{\triangleright} \partial^A = -[2]_{q^2}(2m)^{-1} P^A,
\]
\[
(2m)^{-1} P^2 \overset{\mathcal{P}}{\triangleright} \hat{\partial}^A = -[2]_{q^{-2}}(2m)^{-1} P^A.
\]
(127)

These relations can directly be derived from the Leibniz rules for partial derivatives on braided line and q-deformed three-dimensional Euclidean space (see part I of the paper). Notice that in the case of the braided line the contravariant derivatives are identical with the covariant ones, while for the q-deformed Euclidean space we have $\partial^A = g^{AB} \partial_B$.

Last but not least, we would like to mention that expressions with apostrophe and those without apostrophe can be transformed into each other via conjugation if we demand that

\[
(c_i)_{p}' = (c_i)_p, \quad (c_i^\ast)_{p} = (c_i^\ast)'_p.
\]
(128)

These identifications, in turn, imply that

\[
(c_i)_p(t) = (c_i)_p(t), \quad (c_i^\ast)_{p}(t) = (c_i^\ast)'_p(t).
\]
(129)
Comparing the different expressions for probability densities and expectation values [cf. Eqs. (98)-(109)] should then tell us that

\[
\langle \frac{1}{2} (P_A + P_A) \rangle_{i,x} (t) = \langle \frac{1}{2} (P_A + P_A) \rangle_{i,x}^\prime (-t),
\]

\[
\langle \frac{1}{2} (X_A + X_A) \rangle_{i,x} (t) = \langle \frac{1}{2} (X_A + X_A) \rangle_{i,x}^\prime (-t).
\]

Finally, for the different expansions in terms of plane waves one can check the identities

\[
(\phi_i)_m (x^A, t) = (\phi_i)_m^\prime (x^A, t), \quad \langle \phi_i^\ast \rangle_m (x^A, t) = \langle \phi_i^\ast \rangle_m^\prime (x^A, t).
\]

If the reader is not familiar with conjugation properties of the objects of q-analysis we recommend to consult Ref. [47].

3 Theorem of Ehrenfest

In the last section we found solutions to q-deformed analogs of the free-particle Schrödinger equation. In what follows we would like to deal with situations where the movement of a particle is influenced by the presence of a rather weak potential, as it is the case in the theory of scattering.

Before we start developing a q-deformed version of propagator theory in part III of the paper we would like to consider some more general aspects of a system described by the Hamiltonian

\[
H = H_0 + V(x^A).
\]

We demand that the potential \( V(x^A) \) is central in the algebra of coordinate space and shows trivial braiding. These requirements ensure that \( H \) obeys the same algebraic properties as time derivatives. Furthermore, we should have

\[
\overline{V(x^A)} = V(x^A) \Rightarrow \overline{H} = H.
\]

We wish to give examples for potentials with these features:

(i) (braided line)

\[
V(x^1) = -a|x^1|^{-b},
\]
(ii) (q-deformed Euclidean space in three dimensions)

\[ V(x^A) = -ar^{-b}, \]  

(135)

where \( r \) denotes the radius of q-deformed Euclidean space in three dimensions. The constants \( a \) and \( b \) have to be subject to

(i) (braided line)

\[
\begin{align*}
    a \odot_L f(p_i) &= f(q^{-b}p_1, p_0) \otimes a, \\
    a \odot_L f(p_i) &= f(q^b p_1, p_0) \otimes a,
\end{align*}
\]

(136)

\[
\begin{align*}
    a \odot_L f(x^i) &= f(q^b x^1, x^0) \otimes a, \\
    a \odot_L f(x^i) &= f(q^{-b} x^1, x^0) \otimes a,
\end{align*}
\]

(137)

(ii) (q-deformed Euclidean space in three dimensions)

\[
\begin{align*}
    a \odot_L f(p_i) &= f(q^{-2b}p_A, p_0) \otimes a, \\
    a \odot_L f(p_i) &= f(q^{2b} p_A, p_0) \otimes a,
\end{align*}
\]

(138)

\[
\begin{align*}
    a \odot_L f(x^i) &= f(q^{2b} x^A, x^0) \otimes a, \\
    a \odot_L f(x^i) &= f(q^{-2b} x^A, x^0) \otimes a,
\end{align*}
\]

(139)

These relations guarantee for the trivial braiding of the potentials in (134) and (135). Additionally, we assume the element \( a \) to be real and central in the algebra of position space.

To get a better understanding how the potential \( V(x^A) \) influences the movement of a particle it is helpful to concentrate attention on the Heisenberg equations for momentum operators, i.e.

\[
\frac{d(P_A)_H}{dt} = i[H, (P_A)_H] = i[H_0, (P_A)_H] + i[V(x^B), (P_A)_H]
\]

\[
= iV(x^B)i(\partial_A)_x - i(\partial_A)_x iV(x^A)
\]

\[
= -V(x^B)(\partial_A)_x + (\{([\partial_A]_x(1) \triangleright V(x^B))[([\partial_A]_x)_2)
\]

\[
= -V(x^B)(\partial_A)_x + (\partial_A)_x \triangleright V(x^B) + V(x^B)(\partial_A)_x
\]

\[
= (\partial_A)_x \triangleright V(x^B),
\]

(140)

\[
\frac{d(P_A)'_H}{dt} = i[(P_A)'_H, H] = i[(P_A)'_H, H_0] + i[(P_A)'_H, V(x^B)]
\]
\begin{align*}
&= i(\partial_A)_x i V(x^B) - i V(x^B) i(\partial_A)_x \\
&= -(\partial_A)_x V(x^B) + [i(\partial_A)_x, (2) (V(x^B) \triangleleft [i(\partial_A)_x])] \\
&= -(\partial_A)_x V(x^B) + (\partial_A)_x V(x^B) + V(x^B) \triangleleft (\partial_A)_x \\
&= V(x^B) \triangleleft (\partial_A)_x. \quad (141)
\end{align*}

For the third step of the above calculations we insert the operator expressions for momentum in the Heisenberg picture. Notice that the commutators with $H_0$ vanish due to the identities in (114). For the next step we apply the Leibniz rules for partial derivatives. Finally, we make use of the trivial braiding of $V(x^A)$. This way, we arrive at q-analogs of operator equations that correspond to the second law of Newtonian mechanics.

Next, we come to the Heisenberg equations for position operators. They take the form

$$\frac{d(X^A)_H}{dt} = i[H, (X^A)_H] = i[H_0, (X^A)_H] + i[V(x^B), (X^A)_H]$$

$$= \partial^A_p \triangleright P^2(2m)^{-1}, \quad (142)$$

$$\frac{d(X^A)'_H}{dt} = i[(X^A)'_H, H] = i[(X^A)'_H, H_0] + i[(X^A)'_H, V(x^B)]$$

$$= (2m)^{-1} P^2 \triangleleft \partial^A_p. \quad (143)$$

For these calculations we applied the results in (122) and (123) from the proceeding section together with the property of the potential $V(x^A)$ to be central in the algebra of position space. Notice that the above operator equations correspond to the definition of momentum in classical mechanics.

Nothing prevents us from combining the Heisenberg equations for momentum operators with those for position operators. In doing so, we can obtain

(i) (braided line)

$$\begin{align*}
(\hat{\partial}_0)^2 & \triangleright (X^1)_H = \hat{\partial}_0 \triangleleft \left( (P^2)_H (2m)^{-1} \triangleleft \hat{\partial}_0 \right) \\
&= -[\left[ 2 \right]_q (i \hat{\partial}_1) \triangleright V(x^B) (2m)^{-1}, \\
(\hat{\partial}_0)^2 & \triangleright (X^1)_H = \hat{\partial}_0 \triangleleft \left( (2m)^{-1} (P^2)_H \triangleleft \hat{\partial}_0 \right) \\
&= -[\left[ 2 \right]_q^{-1} (i \hat{\partial}_1) \triangleright V(x^B) (2m)^{-1}, \quad (144) \\
(X^1)'_H & \triangleleft (\hat{\partial}_0)^2 = - (\hat{\partial}_1 \triangleright (P^2)'_H (2m)^{-1}) \triangleleft \hat{\partial}_0
\end{align*}$$
\[ (X^1)'_H \overset{\hat{t}}{\triangleleft} (\partial_0)^2 = -(\partial_1 \overset{\hat{t}}{\triangleright} (P^2)'_H (2m)^{-1} \overset{\hat{t}}{\triangleright} \partial_0 \overset{\hat{t}}{\triangleleft} (i \hat{\partial}_1) = [2]_q^{-1} (2m)^{-1} V(x^B) \overset{\hat{x}}{\triangleleft} (i \hat{\partial}_1), \] 

(145)

(ii) (q-deformed Euclidean space in three dimensions)

\[ (\hat{\partial}_0)^2 \overset{\hat{t}}{\triangleright} (X^A)_H = \partial_0 \overset{\hat{t}}{\triangleright} ((P^2)_H (2m)^{-1} \overset{\hat{t}}{\triangleright} \partial^A) = -[2]_q^{-1} (i \hat{\partial}^A) \overset{\hat{x}}{\triangleright} V(x^B)(2m)^{-1}, \]

(146)

\[ (X^A)'_H \overset{\hat{t}}{\triangleleft} (\hat{\partial}_0)^2 = -(\hat{\partial}^A \overset{\hat{t}}{\triangleright} (P^2)'_H (2m)^{-1} \overset{\hat{t}}{\triangleright} \hat{\partial}_0 \overset{\hat{t}}{\triangleleft} (i \hat{\partial}^A), \]

(147)

We first apply the results of (142) and (143). Then we plug in the expressions listed in (124)-(127). This way, we arrive at formulae that can be rewritten by making use of the Heisenberg equations in (140) and (141).

Let us note that the above equations do not give the only possibility to combine the Heisenberg equations of motions, but for us it seems to be the most natural one. The reader should not be confused about the different time derivatives. If we write \(d/dt\) we mean the usual time derivative from classical physics, which can be used to represent the partial derivatives \(\partial_0\) by

\[ \partial_0 \overset{t}{\triangleright} f(x^i) = \hat{\partial}_0 \overset{\hat{t}}{\triangleright} f(x^i) = df(x^i)/dt, \]

\[ f(x^i) \overset{\hat{t}}{\triangleleft} \partial_0 = f(x^i) \overset{\hat{t}}{\triangleright} \hat{\partial}_0 = -df(x^i)/dt. \] (148)

To get q-analogs of the celebrated Ehrenfest theorem it remains to take expectation values of the operator equations in (144)-(147). In this manner, we get

\[ (\partial_0)^2 \overset{\hat{t}}{\triangleright} \langle (\psi_1)_m(x^B, 0), (X^A)_H \overset{\hat{x}}{\triangleright} (\psi_1^*)_m(x^C, 0) \rangle_{1,x} = \]
and the expectation values in (149)-(152) are taken to be subject to

\[ \langle \psi_1 \rangle_m(x^B, 0), ((i\partial^A) \triangleright V(x^D)) \triangleright (\psi_1^*)^T_m(x^C, 0) \rangle \]

(\hat{\partial}_0)^2 \triangleright \langle (\psi_1^*)^T_m(x^B, 0), (X^A)_H \triangleright (\psi_1)_m(x^C, 0) \rangle \]

\[ = -\frac{[2]}{2m} \langle (\psi_1^*)^T_m(x^B, 0), ((i\partial^A) \triangleright V(x^D)) \triangleright (\psi_1)_m(x^C, 0) \rangle \]

\[ = -\frac{[2]}{2m} \langle (\psi_1^*)^T_m(x^B, 0), ((i\partial^A) \triangleright V(x^D)) \triangleright (\psi_1)_m(x^C, 0) \rangle \]

and

\[ \langle (\psi_1^*)^T_m(x^B, 0) \triangleright (X^A)_H, (\psi_1^*)^T_m(x^C, 0) \rangle \]

\[ = \frac{[2]}{2m} \langle (\psi_1^*)^T_m(x^B, 0) \triangleright (V(x^D) \triangleright (i\partial^A)), (\psi_1^*)^T_m(x^C, 0) \rangle \]

\[ = \frac{[2]}{2m} \langle (\psi_1^*)^T_m(x^B, 0) \triangleright (V(x^D) \triangleright (i\partial^A)), (\psi_1^*)^T_m(x^C, 0) \rangle \]

Similar relations hold for the other geometries. As usual, they can be obtained from the above formulae by applying the substitutions in (97). Thus, the details of their derivation are left to the reader.

Finally, it should be mentioned that the wave functions in respect to which the expectation values in (149)-(152) are taken have to be subject to

\[ i\partial_0 \triangleleft (\psi_1^*)^T_m(x^i) = H^T \triangleleft (\psi_1^*)^T_m(x^i), \]

\[ i\partial_0 \triangleleft (\psi_1^*)^T_m(x^i) = H^T \triangleleft (\psi_1^*)^T_m(x^i), \]

\[ i\partial_0 \triangleleft (\psi_2^*)^T_m(x^i) = H'' \triangleleft (\psi_2^*)^T_m(x^i), \]

\[ i\partial_0 \triangleleft (\psi_2^*)^T_m(x^i) = H'' \triangleleft (\psi_2^*)^T_m(x^i), \]

and

\[ (\psi_1)_m(x^i) \triangleleft (i\partial_0) = (\psi_1)_m(x^i) \triangleleft H', \]

\[ (\psi_1)_m(x^i) \triangleleft (i\partial_0) = (\psi_1)_m(x^i) \triangleleft H', \]

\[ (\psi_2)_m(x^i) \triangleleft (i\partial_0) = (\psi_2)_m(x^i) \triangleleft H'', \]

\[ (\psi_2)_m(x^i) \triangleleft (i\partial_0) = (\psi_2)_m(x^i) \triangleleft H'', \]
where

\[ H' = q^{-\zeta} H_0 + V(x^A), \quad H'' = q^{\zeta} H_0 + V(x^A). \]  

(157)

4 Conservation of probability

From classical quantum theory we know that the Schrödinger equation implies a continuity equation for the probability flux. If we assume that the wave function behaves like a scalar and has trivial braiding we are able to derive q-analogs of this continuity equation.

Towards this end we start from the probability densities \((i = 1, 2)\)

\[
\begin{align*}
(\rho_i)_m(x^A, t) &= \overline{\psi_i^*}_m(x^A, -t) \otimes \psi_i)_m(x^A, t), \\
(\rho_i^*)_m(x^A, t) &= (\overline{\psi_i^*})_m(x^A, -t) \otimes (\psi_i)_m(x^A, t), \\
(\rho_i)'_m(x^A, t) &= \overline{\psi_i^*}'_m(x^A, t) \otimes (\psi_i')_m(x^A, t), \\
(\rho_i^*)'_m(x^A, t) &= (\overline{\psi_i^*})'_m(x^A, t) \otimes (\psi_i')_m(x^A, t).
\end{align*}
\]

(158)

(159)

To ensure that all wave functions in these expressions describe the same physical state we require for them to give solutions to the Schrödinger equations in \((153)-(156)\) in the sense that it holds

\[
\begin{align*}
(\psi_1)'_m(x^A, t) &= \exp(-t \otimes iH') \overset{H'}{\triangleright} \psi_m(x^A, t = 0), \\
(\psi_1^*)_m(x^A, t) &= \exp(-t \otimes iH) \overset{H}{\triangleright} \psi_m(x^A, t = 0), \\
(\psi_2)'_m(x^A, t) &= \exp(-t \otimes iH'') \overset{H''}{\triangleright} \psi_m(x^A, t = 0), \\
(\psi_2^*)_m(x^A, t) &= \exp(-t \otimes iH) \overset{H}{\triangleright} \psi_m(x^A, t = 0),
\end{align*}
\]

(160)

(161)

and

\[
\begin{align*}
(\psi_2)_m(x^A, t) &= \psi_m(x^A, t = 0) \overset{x|H''}{\triangleleft} \exp(iH'' \otimes t), \\
(\psi_2^*)_m(x^A, t) &= \psi_m(x^A, t = 0) \overset{x|H}{\triangleleft} \exp(iH \otimes t), \\
(\psi_1)_m(x^A, t) &= \psi_m(x^A, t = 0) \overset{x|H'}{\triangleleft} \exp(iH' \otimes t), \\
(\psi_1^*)_m(x^A, t) &= \psi_m(x^A, t = 0) \overset{x|H}{\triangleleft} \exp(iH \otimes t).
\end{align*}
\]

(162)

(163)
4 CONSERVATION OF PROBABILITY

As next step we consider the time derivatives of the probability densities. In doing so, we get, for example,

\[ \partial_0 \mathcal{I}(\rho^*_1)_{m}(t) = \partial_0 \mathcal{I}(\overline{(\psi_1)_m}(-t) \mathcal{\otimes} (\psi^*_1)_m(t)) \]

\[ = (\partial_0 \mathcal{I}(\psi_1)_m(-t) \mathcal{\otimes} (\psi^*_1)_m(t)) + (\psi_1)_m(-t) \mathcal{\otimes} (\partial_0 \mathcal{I}(\psi^*_1)_m(t)) \]

\[ = i^{-1}(-H' - (\psi_1)_m(t) \mathcal{\otimes} (\psi^*_1)_m(t)) + i^{-1}(\psi_1)_m(-t) \mathcal{\otimes} (H \mathcal{\otimes} (\psi^*_1)_m(t)) \]

\[ = -i^{-1}(q^{-\xi}(2m)^{-1}P^2 \mathcal{\otimes} (\psi_1)_m(-t) \mathcal{\otimes} (\psi^*_1)_m(t)) \]

\[ + i^{-1}(\psi_1)_m(-t) \mathcal{\otimes} ((2m)^{-1}P^2 \mathcal{\otimes} (\psi^*_1)_m(t)). \]  

(164)

The first equality is the definition of the probability density and the second equality is nothing other than the Leibniz rule of the time derivative. In the third step we try to apply the Schrödinger equations in \[(153)-(156).\]

To achieve this we need the Schrödinger equation for the conjugate wave function \((\psi_1)_m(x^A, -t).\) It follows from the considerations

\[ (\psi_1)_m(x^i) \mathcal{\mathcal{\otimes}} (i \partial_0) = (\psi_1)_m(x^i) \mathcal{\otimes} H' \]

\[ \Rightarrow - (\psi_1)_m(x^i, -t) \mathcal{\otimes} (i \partial_0) = (\psi_1)_m(x^i, -t) \mathcal{\otimes} H' \]

\[ \Rightarrow - (\psi_1)_m(x^A, -t) \mathcal{\otimes} (i \partial_0) = (\psi_1)_m(x^A, -t) \mathcal{\otimes} H' \]

\[ \Rightarrow - (i \partial_0) \mathcal{\otimes} (\psi_1)_m(x^A, -t) = H' \mathcal{\otimes} (\psi_1)_m(x^A, -t), \]  

(165)

where we made use of reality of the Hamiltonian \(H',\) i.e.

\[ \mathcal{H} = q^{-\xi}P^2(2m)^{-1} + V(x^A) = q^{-\xi}P^2(2m)^{-1} + V(x^A) = H', \]  

(166)

and the conjugation properties of the time derivative. For the last step in \[(164)\] we insert the expressions for the Hamiltonians \(H\) and \(H'.\) Realizing that the potential \(V(x^A)\) and the wave function \((\psi_1)_m(x^A, -t)\) commute with each other (both behave like scalars) we find that the contributions from \(V(x^A)\) cancel out against each other.

To proceed any further we need the identities

\[ (q^{-\xi}(2m)^{-1}P^2 \mathcal{\otimes} (\psi_1)_m(-t)) \mathcal{\otimes} (\psi^*_1)_m(t) = \]

\[ = -((\psi_1)_m(-t) \mathcal{\otimes} \partial^A \partial_0) \mathcal{\otimes} (\psi^*_1)_m(t)(2m)^{-1} \]
\[ (\psi_1)_m(−t) \otimes ((\partial A)_{(1)} △ (\psi_1^*)_m(t)) \triangleleft (\partial A)_{(2)} (2m)^{-1} \]

and

\[ (\psi_1)_m(−t) \otimes ((2m)^{-1} P^2 △ (\psi_1^*)_m(t)) = \]

\[ = −((\psi_1)_m(−t) \otimes (\partial A△ (\psi_1^*)_m(t)) (2m)^{-1} \]

\[ = −(\partial A)_{(2)} △ \left( (\psi_1)_m(−t) △ (\partial A△ (\psi_1^*)_m(t)) \right)(2m)^{-1} \]

\[ = −(\partial A) △ \left( (\psi_1)_m(−t) △ (\partial A△ (\psi_1^*)_m(t)) \right)(2m)^{-1} \]

\[ − \partial A △ \left( (\psi_1)_m(−t) △ (\partial A△ (\psi_1^*)_m(t)) \right)(2m)^{-1}. \]

With the results of (167) and (168) the last expression in relation (164) becomes

\[ \partial_0 △ (\rho_1^*)_m(t) = i^{-1} \left( (\psi_1)_m(−t) △ (\partial A) △ (\psi_1^*)_m(t) \right) △ (\partial A)(2m)^{-1} \]

\[ − i^{-1} \partial A △ \left( (\psi_1)_m(−t) △ (\partial A△ (\psi_1^*)_m(t)) \right)(2m)^{-1}. \]

Let us shortly explain the line of reasonings leading to (167) and (168).

In both calculations we first express momentum operators by partial derivatives. In the calculation of (167) we switch from the left action of $H_0$ to its right action. In doing so, the factor $q^{-C}$ vanishes, while the wave functions remain unchanged, since they behave as scalars with trivial braiding. One should also notice that we are free to move the mass parameter $m$ to the far right. Then we apply Leibniz rules for partial derivatives. These Leibniz rules can be simplified further if we take into account once more that the wave functions transform as scalars.

Let us return to (169) and have a look on its right-hand side. It remains to bring the partial derivative in the first summand from the far left to the far right. This task can be achieved by means of the relation

\[ f △ (\partial A) = S_L^{-1}(\partial A) △ f. \]

Remember that $S_L$ denotes the inverse of an antipode. It belongs to one of the Hopf structures we could assign to the quantum spaces under consid-
4 CONSERVATION OF PROBABILITY

The expressions for the probability fluxes take the form

\[ \partial_0 \triangleright (\rho^*_1)_m(t) = i^{-1} q^{-\zeta} \partial^A \triangleright \left( \left( \psi_1 \right)_m(-t) \overset{x^t}{\otimes} \psi_1^* \right) (2m)^{-1} \]

\[ \partial_0 \triangleright (\rho^*_2)_m(t) = i^{-1} \partial^A \triangleright \left( \left( \psi_1 \right)_m(-t) \overset{x^t}{\otimes} \psi_1^* \right) (2m)^{-1}. \]

From the last result we are able to read off the continuity equation

\[ \partial_0 \triangleright (\rho^*_1)_m(x^B, t) + \partial^A \triangleright [(j^*_1)_m]_A(x^B, t) = 0, \]

with

\[ [(j^*_1)_m]_A(x^B, t) \equiv i q^{-\zeta} \left( \left( \psi_1 \right)_m(x^B, -t) \overset{x^t}{\otimes} \psi_1^* \right) (2m)^{-1} \]

\[ \partial_0 \triangleright \left( \psi_1 \right)_m(x^B, -t) \overset{x^t}{\otimes} \psi_1^* \right) (2m)^{-1}. \]

Repeating the same steps as above for the other q-geometries we finally get the following collection of continuity equations:

\[ \partial_0 \triangleright (\rho^*_1)_m(x^B, t) + \partial^A \triangleright [(j^*_1)_m]_A(x^B, t) = 0, \]

\[ \hat{\partial}_0 \triangleright (\rho^*_2)_m(x^B, t) + \hat{\partial}^A \triangleright [(j^*_2)_m]_A(x^B, t) = 0, \]

\[ (\rho^*_1)_m(x^B, t) \hat{\partial}_0 + [(j^*_1)_m]_A(x^B, t) \hat{\partial} = 0, \]

\[ (\rho^*_2)_m(x^B, t) \hat{\partial}_0 + [(j^*_2)_m]_A(x^B, t) \hat{\partial} = 0, \]

and

\[ \partial_0 \triangleright (\rho^*_1)'_m(x^B, t) + \partial^A \triangleright [(j^*_1)'_m]_A(x^B, t) = 0, \]

\[ \hat{\partial}_0 \triangleright (\rho^*_2)'_m(x^B, t) + \hat{\partial}^A \triangleright [(j^*_2)'_m]_A(x^B, t) = 0, \]

\[ (\rho^*_1)'_m(x^B, t) \hat{\partial}_0 + [(j^*_1)'_m]_A(x^B, t) \hat{\partial} = 0, \]

\[ (\rho^*_2)'_m(x^B, t) \hat{\partial}_0 + [(j^*_2)'_m]_A(x^B, t) \hat{\partial} = 0. \]

The expressions for the probability fluxes take the form

\[ [(j^*_1)_m]_A(x^B, t) \equiv i q^{-\zeta} \left( \left( \psi_1 \right)_m(x^B, -t) \overset{x^t}{\otimes} \psi_1^* \right) (x^C, t) \]
4 CONSERVATION OF PROBABILITY

\[ -\frac{i}{2m} \left[ (\psi_1)_m(x^B, -t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_1)_m(x^C, t)) \right], \]

\[ ([j_2^*_m]_A(x^B, t) \equiv \frac{i q}{2m} \left[ (\psi_2)_m(x^B, -t) \overset{x}{\triangleleft} \partial_A \overset{x}{\triangleright} (\psi_2)_m(x^C, t) \right] \]

\[ -\frac{i}{2m} \left[ (\psi_2)_m(x^B, -t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_2)_m(x^C, t)) \right], \quad (178) \]

\[ ([j_1^*_m]_A(x^B, t) \equiv \frac{i^{-1} q}{2m} \left[ (\psi_1^*)_m(x^B, t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_1)_m(x^C, -t)) \right] \]

\[ -\frac{i^{-1} q}{2m} \left[ (\psi_1^*)_m(x^B, t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_1)_m(x^C, t)) \right], \quad (179) \]

and, likewise,

\[ ([j_2^*_m]_A(x^B, t) \equiv \frac{i^{-1} q}{2m} \left[ ((\psi_2^*)_m(x^B, -t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_2^*)_m(x^C, t)) \right] \]

\[ -\frac{i^{-1} q}{2m} \left[ (\psi_2^*)_m(x^B, -t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_2^*)_m(x^C, t)) \right], \quad (180) \]

\[ ([j_1^*_m]_A(x^B, t) \equiv \frac{i q}{2m} \left[ (\psi_1)_m(x^B, t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_1)_m(x^C, -t)) \right] \]

\[ -\frac{i}{2m} \left[ ((\psi_1)_m(x^B, t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_1)_m(x^C, t)) \right], \quad (179) \]

\[ ([j_2^*_m]_A(x^B, t) \equiv \frac{i q}{2m} \left[ (\psi_2)_m(x^B, t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_2)_m(x^C, -t)) \right] \]

\[ -\frac{i}{2m} \left[ ((\psi_2)_m(x^B, t) \overset{x, t}{\otimes} (\partial_A \overset{x}{\triangleright} (\psi_2)_m(x^C, t)) \right]. \quad (181) \]

Last but not least it should be noted that the different continuity equations transform into each other via the operation of conjugation. This can
be seen if one takes into account that we have
\[
(\rho_i)_m(x^A,t) = (\rho'_i)_m(x^A,t), \quad (\rho^*_i)_m(x^A,t) = (\rho'^*_i)_m(x^A,t),
\]
and
\[
[(j_i)_m]_A(x^B,t) = [(j'_i)_m]_A(x^B,t), \quad [(j^*_i)_m]_A(x^B,t) = [(j'^*_i)_m]_A(x^B,t).
\]
These relations are a direct consequence of the identifications
\[
(\psi_i)_m(x^A,t) = (\psi'_i)_m(x^A,t), \quad (\psi^*_i)_m(x^A,t) = (\psi'^*_i)_m(x^A,t),
\]
and the defining expressions for probability density [cf. relations in (158) and (159)] and probability flux [cf. relations in (178)-(181)].

5 Conclusion

Let us conclude our reasonings by some remarks. In part I of the paper we worked out a mathematical and physical framework, which in part II was applied to describe free-particles on q-deformed quantum spaces as the braided line and the q-deformed Euclidean space in three dimensions. We introduced q-analogs of the non-relativistic free-particle Hamiltonian and discussed solutions to the corresponding Schrödinger equations. We found that q-deformed exponentials can be viewed as eigenfunctions of momentum and energy. Furthermore, we saw that this set of functions is complete and orthonormal. Then we extended the free-particle Hamiltonian by a potential and showed that under certain assumptions we are able to formulate q-analogs of the Ehrenfest theorem. Finally, we could prove continuity equations for probability densities made up of wave functions with trivial braiding.

In this manner, our results seem to be in complete analogy to their undeformed counterparts, to which they tend when the deformation parameter $q$ goes to 1. However, there is one remarkable difference between a q-deformed theory and its undeformed limit, since in a q-deformed theory we have to distinguish different geometries. The reason for this lies in the fact that the braided tensor category in which the expressions of our theory live is not uniquely determined. This becomes more clear, if one realizes that each braided category is characterized by a so-called braiding $\Psi$. The inverse $\Psi^{-1}$ gives an equally good braiding, which leads to a second braided category being different from the first one. This observation is reflected in
the occurrence of two differential calculi, different types of q-exponentials, q-integrals and so on. In this manner each braided category implies its own q-geometry, so we could write down different q-analogs of well-known physical laws.

The point now is that we cannot restrict attention to one q-geometry, only, since they are linked via the operation of conjugation [34,68,69]. To be more precise, physical expressions have to be real, i.e. invariant under the operation of conjugation. But this can only be achieved if we combine expressions from different q-geometries. In the undeformed case, however, the two categories become identical, so there is no necessity to take account of different geometries.

Acknowledgements

First of all I am very grateful to Eberhard Zeidler for very interesting and useful discussions, special interest in my work and financial support. Furthermore, I would like to thank Alexander Schmidt for useful discussions and his steady support. Finally, I thank Dieter Lüst for kind hospitality.
