Abstract
A new planthopper genus Parasogata gen. n. (Delphacidae: Delphacinae: Delphacini) was described and illustrated with two new species P. binaria sp. n. and P. furca sp. n. from south China. A key to species of the new genus is also given.

Keywords
Delphacid, distribution, Fulgoroidea, new taxa, planthopper

Introduction
The planthopper tribe Delphacini Leach, 1815 is the largest clade of Delphacidae, occurring in all ecoregions (excluding Antarctica) and including approximately 1652 species in 319 genera (Bourgoin 2018). In China, 259 species in 135 genera are known (Ding 2006; Dong and Qin 2012; Hou et al. 2013, 2014a, b; Qin 2005, 2006, 2007; Qin et al. 2006, 2008, 2009a, b, 2010, 2011, 2012, 2014; Ren et al. 2015).
Here, a new genus, *Parasogata* gen. n., with two new species, *P. binaria* sp. n. and
*P. furca* sp. n., are described and illustrated from China. The new genus is assigned to
the Delphacini because the spinal formula of the hind leg 5–7–4, tibial spur large, thin,
flattened and bearing a row of fine, black-tipped teeth on the posterior margin; genital
diaphragm developed, suspensorium present. The similarities and affinities of the new
genus with similar genera are compared and discussed. A key to the species of the new
genus is also provided.

Materials and methods

Terminology of morphological and measurements follow Yang and Yang (1986) and
the morphological terminology of female genitalia follows Bourgoin (1993). Measure-
ments of body length equal the distance between the apex of vertex and tip of tegmen.
All measurements are in millimeters (mm). Dry specimens were used for the descrip-
tion and illustration. Color pictures for adult habitus were obtained by KEYENCE
VHX-1000. External morphology was observed under a stereoscopic microscope Leica
Mz 12.5 and characters were measured with an ocular micrometer. The genital seg-
ments of the examined specimens were macerated in 10% KOH and drawn from
preparations in glycerin jelly using Olympus CX41 and Leica MZ 12.5 stereomicro-
scope. Illustrations were scanned with Canon CanoScan LiDE 200 and imported into
Adobe Photoshop 6.0 for labeling and plate composition.

The type specimens of the new species are deposited in the Institute of Entomol-
ogy, Guizhou University, Guiyang, Guizhou Province, China (GUGC).

Taxonomy

Genus *Parasogata* gen. n.
http://zoobank.org/C168D41B-DB7F-4841-BCCC-EF3299BD2EC6
Figs 9–60

Type species. *Parasogata binaria* sp. n.

Diagnosis. This genus is readily recognized by its large size and vertex, pronotum and
mesonotum bearing an uninterrupted white fascia. The genus is most similar to *Sogata*
Distant, 1906 but separately by the phallus being up-curved (down-curved in *Sogata*
(Ding 2006: figs 281–283)), with a row processes at subapically (without process in *Sogata*).

Description. General color of male yellowish white to brown (Figs 9–12, 35–38).
Vertex, pronotum and mesonotum with an uninterrupted white fascia (Figs 9, 35).
Vertex, frons, face, antennae yellowish brown to yellowish white (Figs 9–12, 35–38).
Pronotum and mesonotum yellowish white (Figs 13, 39). Forewings and hindwings
hyaline (Figs 9–12, 35–38). Legs yellowish white (Figs 10, 36). Abdomen yellow (Figs
10, 36). Head including eyes narrower than pronotum (Figs 13, 15, 39, 41). Vertex
subquadrate, anterior margin arched, lateral carinae with slightly concave, submedian carinae uniting at apex. Frons with single median carina, longer in middle line than wide at widest part, widest at apex (Figs 14, 16, 40, 42). Y-shaped carina feeble (Figs 13, 15, 39, 41). Antennae cylindrical, with basal segment shorter than second, reaching frontoclypeal suture (Figs 14, 16, 40, 42). Pronotum with lateral carinae almost attaining hind margin (Figs 13, 15, 39, 41). Posttibial spur with 29–32 distinct teeth along hind margin.

**Male genitalia.** Anal segment collar-shaped, lateroapical angles produced into processes (Figs 24–25, 50–51). Pygofer in profile wider ventrally than dorsally, laterodorsal angles not produced, in posterior view with opening wider than long, lateral margins well defined, lateral quadrate areas strongly sclerotized, medioventral process absent (Figs 21–23, 47–49). Diaphragm broad (Figs 23, 49). Aedeagus long, tubular, with a row processes at subapically, slightly upward apically (Figs 26, 52). Genital styles simple, widely divergent apically (Figs 27–28, 53–54). Suspensorium large (Figs 29, 55).

**Etymology.** This generic name “Parasogata” refers to its strong similarity to *Sogata*. The name is to be treated as feminine.

**Distribution.** China.

**Remarks.** The genus *Parasogata* gen. n. resembles *Sogata* Distant, 1906, *Neometopina* Yang, 1989, *Neunkanodes* Yang, 1989 and *Lisogata* Ding, 2006 in vertex, pronotum and mesonotum with an uninterrupted white fascia, frons with median carina single (Figs 1–8), but differs from these genera by anal segment with two pairs of processes, or with a pair of forked processes (without process in *Lisogata*); aedeagus not forked at half of apex (with forked at half of apex in *Neometopina* and *Neunkanodes*); aedeagus with processes and decurved dorsad apically (without process and decurved ventrad apically in *Sogata*) (Table 1).

**Table 1.** Differences among *Parasogata* and similar genera.

|                        | *Parasogata* gen. n. | *Neometopina* | *Sogata* | *Neunkanodes* | *Lisogata* |

**Type material.** Holotype: ♀, CHINA, Yunnan: Daweishan National Natural Reserve (22°81'N, 103°79'E), 18 Aug. 2017, Y.-J. Sui. Paratypes: 1♂1♀, same data as holotype; 1♂2♀, same data as holotype except, 22 Aug. 2017, Q. Luo; 6♂5♀, same data as holotype except, 19 Aug. 2017, N. Gong.

**Measurements.** Body length (from apex of vertex to apex of forewing): male 5.10–5.20 mm (n = 9); female 5.90–6.00 mm (n = 8); forewing length: male 4.30–4.42 mm (n = 9); female 5.10–5.12 mm (n = 8).

**Diagnosis.** Big-sized species with general color yellowish white to yellowish brown, anal segment with two pairs of spinose processes; aedeagus with ten processes subapically and with irregular teeth on ventral side of apex, constriction and bluntly rounded at apex (Fig. 26).

**Description.** Coloration. General color yellowish white to yellowish brown. Head yellowish brown (Figs 13–16). Vertex yellowish white, except along lateral margin dark brown (Figs 13–16). Frons black, except median carinae yellowish white and lateral margins yellowish brown (Fig. 14). Clypeus and genae yellowish brown (Fig. 14). Rostrum yellowish brown, with apex brown. Eyes generally yellow to brown (Figs. 9–16), ocelli dark brown (Figs 10, 12, 14, 16). Antennae yellow (Figs 13–16). Pronotum and mesonotum yellowish brown, except media carinae yellowish white (Figs 13, 15). Forewings with veins dark brown (Figs 9–12). Hindwings pale white, with veins brown. Legs yellowish white to pale yellow, tibiae pale yellow basally, tarsomeres yellowish white (Figs 10, 12). Abdomen brown, except lateral margins yellow (Figs 9–12).

**Structure.** Head including eyes narrower than pronotum, ratio 0.77:1 (Figs 13, 15). Vertex with anterior margin arched, lateral carinae slightly concave, submedian carinae uniting at apex, longer than wide at base, ratio 1.28:1, narrower at apex than at base, ratio 0.64:1 (Figs 13, 17). Frons longer in middle line than wide at widest part, ratio 2.28:1 (Figs 14, 18), lateral carinae nearly straight (Figs 14, 18). Postclypeus wider at base than frons at apex, slightly longer than wide at base (Figs 14, 18). An-
Parasogata binaria sp. n. 9, 10 Male habitus (dorsal and lateral views) 11, 12 Female habitus (dorsal and lateral views) 13 Male head and thorax, dorsal view 14 Male front 15 Female head and thorax, dorsal view 16 Female front. Scale bar: 0.5 mm.

tennae cylindrical, basal segment longer than wide, ratio 1.55:1, shorter than second, ratio 0.42:1 (Figs 14, 18). Pronotum shorter than vertex, ratio 0.75:1 (Figs 13, 17). Mesonotum longer than pronotum and vertex combined, ratio 1.25:1 (Figs 13, 17). Posttibial spur with approximately 30–32 distinct teeth along hind margin. Forewings longer than widest part, ratio 3.48:1, widest at apical 1/4 (Figs 10, 12, 19).

**Male genitalia.** Anal segment with two pairs of spinose processes, upper pair smaller (Figs 24–25). Pygofer quadrate in posterior view (Figs 21–23). Diaphragm broad, transparent (Fig. 23). Aedeagus with ten processes subapically and with irregularity teeth at ventral of apex, constriction and blunt rounded at apex (Fig. 26). Genital styles with inner margin arched and outer margin concave in caudal view, distinctly constricted at apex (Figs 27–28). Suspensorium large and arrow-shaped (Fig. 29).

**Female genitalia.** Gonocoxa VIII at base of inner margin arched (Fig. 31). Gonapophyses VIII with apex sharp, with ventral margin membranous at half of apex, dorsal

aspect with several small teeth apically (Fig. 32). Gonapophyses IX long, sclerotized, curved basally, narrowing towards apex, with approximately 17 teeth, abruptly reduced and indistinct at apex (Fig. 33). Gonoplascs twisted, long and stripe-shaped (Fig. 34).

**Report hosts.** None.

**Distribution.** China (Yunnan).

**Etymology.** The specific epithet is from the Latin word *binaria* (bipartite), referring to the anal segment with two pairs of processes.
Figures 30–34. *Parasogata binaria* sp. n., female 30 Abdomen, ventral view 31 Gonocoxa VIII 32 Gonapophysis VIII 33 Gonapophysis IX 34 Gonoplac. Scale bars: 0.5 mm (30); 0.2 mm (31–34).

**Remarks.** The species is similar to *Sogata dohertyi* (Distent, 1906), but can be distinguished by anal segment with processes cross (not cross in *Sogata dohertyi*), aedeagus with a row processes (without process in *Sogata dohertyi*).
