Abstract: The constrained dipeptide surrogates 5- and 7-hydroxy indolizidin-2-one N-(Boc)amino acids have been synthesized from L-serine as a chiral educt. A linear precursor Δ4-unsaturated (2S,8S)-2,8-bis[N-(Boc)amino]azelic acid was prepared in five steps from L-serine. Although epoxidation and dihydroxylation pathways gave mixtures of hydroxy indolizidin-2-one diastereomers, iodolactonization of the Δ4-azelate stereoselectively delivered a lactone iodide from which separable (5S)- and (7S)-hydroxy indolizidin-2-one N-(Boc)amino esters were synthesized by sequences featuring intramolecular iodide displacement and lactam formation. X-ray analysis of the (7S)-hydroxy indolizidin-2-one N-(Boc)amino ester indicated that the backbone dihedral angles embedded in the bicyclic ring system resembled those of the central residues of an ideal type II β-turn indicating the potential for peptide mimicry.

Keywords: indolizidin-2-one amino acids; peptide mimic; iodolactonization; lactam; heterocycle

1. Introduction

In peptide science, conformationally constrained dipeptides serve effectively as tools for structure–activity relationship studies to identify biologically active conformers [1–20]. Among approaches for creating constrained dipeptides that employ steric [2,3], stereo-electronic [4,5], and covalent constraints [1,5–21], the use of azabicyclo[X.Y.0]alkanone amino acids offers unique potential for locking the polyamide backbone into specific orientations that may mimic natural secondary structures such as β-turns. Among such bicyclic systems, the azabicyclo[4.3.0]alkanone amino acids, so-called indolizidine-2-one amino acid (Faa) analogs and their ring-substituted derivatives (e.g., 1–3, Figure 1), are among the most studied for utility in dissecting the backbone geometry and side chain alignment responsible for peptide activity towards the development of receptor ligands (e.g., 4) and enzyme inhibitors (e.g., 5–7) [9–21].

Several synthetic methods have been developed to introduce substituents at the 5- and 7-positions along the Faa ring system (Figure 1) [9–19]. For example, 5-hydroxy-5-phenyl Faa analogs were synthesized by diastereoselective photochemical cyclization of carbamate-protected β-benzyloalaninyl prolinites [15]. A 5-chloro methyl Faa derivative was synthesized by the treatment of phthalimido allylglycinyl 5-methoxyprolinate with TiCl₄ in 64% yield [14]. Furthermore, 5-hydroxymethyl, 5-azidomethyl, 5-formyl, 5-carboxyl, 5-benzyl, 7-hydroxyethyl, 7-hydroxypropyl, 7-azidopropyl and 7-benzyl, as well as 5,7-dibenzyl Faa derivatives were all synthesized diastereoselectively by routes featuring, respectively, intramolecular displacements and reductive aminations of 4-substituted 5-methanesulfonyl and 5-keto 2,8-diaminoazelates to form 5-substituted prolines, which reacted in lactam cyclization [10–12]. Furthermore, 5-iodo Faa diastereomers were respectively prepared by transannular iodolactamization of hexahydro-1H-azonines [15]. Iodide elimination afforded the corresponding Δ3-indolizidine-2-one, which was subsequently arylated at the 5-position by oxidative Heck chemistry [16]. In addition, 7-hydroxyethyl,
7-azidoethyl, 7-carboxymethyl, and 7-guanidinylethyl F\(^2\)aas have been synthesized from routes commencing with allylation of glutamic acid [17,22], and utilized in a program towards the development of \(\alpha_v\beta_3\) and \(\alpha_v\beta_5\) integrin receptor ligands [18].

**Figure 1.** Indolizidine-2-one amino acid (Boc-F\(^2\)aa-OH) isomers 1, 5- and 7-hydroxy F\(^2\)aas 2 and 3, methyl ester counterparts 8 and 9, and biologically active 5- and 7-substituted F\(^2\)aa NK-2 ligand 4 and thrombin inhibitors 5–7.

The Hanessian laboratory has played an instrumental role in demonstrating the value of 5- and 7-substituted F\(^2\)aa residues in the study of biologically active peptide receptors [19–21]. For example, 5-benzyloxy F\(^2\)aa 4 was designed by Hanessian and shown to be a weak but selective antagonist of the tachykinin NK-2 (neurokinin-2) receptor [19]. Furthermore, 3,5,7-trisubstituted F\(^2\)aas 5–7 were designed, synthesized, and shown to act as potent thrombin [Factor IIa] and Factor VIIa inhibitors exhibiting selectivity over plasmin and Factor Xla [20]. Substituted F\(^2\)aa peptides 4–7 were respectively synthesized from pyroglutamate by routes featuring the addition of 2-trimethylsilyloxy furan onto an iminium ion intermediate, followed by lactone to lactam ring expansion to obtain the corresponding 5-hydroxy 9-silyloxyethyl indolizidine-2-one [19–21]. Subsequent installation of the amine and alkyl substituents at the 3-position and hydroxymethyl group oxidation at the 9-position gave the 3-azido indolizidine-2-one 9-carboxylate counterparts, which were introduced into the peptide mimic structures [19–21]. Validating their utility for peptide-based medicinal chemistry, the herculean research of the Hanessian laboratory has illustrated the necessity for effective synthetic routes to access 5- and 7-substituted F\(^2\)aa residues.

Streamlined syntheses of 5- and 7-hydroxy indolizidine-2-one N-(Boc)amino acids 2 and 3 are now reported by methods employing L-serine as a chiral educt. Motivated by the research of the Jackson laboratory in which (25,85)-1,9-dibenzyl \(\Delta^4\)-2,8-bis[N-(Boc)amino]azelate was prepared by the copper-catalyzed \(S_N2'\) reaction of the zincate derived from \(N\)-(Boc)-\(\beta\)-iodo alanine benzyl ester onto (E)-1,3-dichloroprop-1-ene [23], a series of related \(\Delta^4\)-2,8-diaminoazelates were synthesized and studied in different olefin oxidation chemistries to prepare intermediates towards the hydroxy indolizidine-2-one structures. Among different oxidation approaches yielding access to 5-hydroxy and 7-hydroxy F\(^2\)aa derivatives, useful routes to (3S,5S,6S,9S)-2 and (3S,6S,7S,9S)-3 were conceived by way of diastereoselective iodolactonization chemistry inspired by the seminal research of the Bartlett laboratory [24].
2. Results and Discussion

Initially, 5- and 7-hydroxy indolizidine-2-one N-(Boc)amino esters 8 and 9 were pursued by pathways featuring a ring opening of 4-oxiranyl-2,8-diaminoazelates. Oxiranes 12a-c were synthesized by epoxidation of α,β-unsaturated α,β-unsaturated alkenes by copper catalyzed S$_{N}$2’ additions of zinates derived from methyl β-iodo alaninates 12a-c protected with Boc [25], Cbz [26], and Fmoc groups (Scheme 1) [27]. Although the 15 Hz coupling constant suggested the formation of the E-trans olefins 11a and 11b, without the corresponding Z-cis isomer, NOESY experiments were performed to confirm the double-bond geometry. The E, E-geometry of olefins 11a and 11b was ascertained by NOESY experiments in which the long-range through-space transfer of magnetization was observed, respectively, between the vinyl C4 (5.38 and 5.35 ppm) and allylic C6 protons (2.09 and 2.07 ppm) and between the vinyl C5 (5.51 and 5.48 ppm) and allylic C3 protons (2.47 and 2.50 ppm) (Scheme 1). No nuclear Overhauser effect was observed between the two vinyl protons nor between the two sets of allylic protons.

![Scheme 1. Synthesis of protected epoxides 12.](image)

Previously, epoxidations of N-Boc and N-Cbz allyl- and homoallyl-glycine esters with m-chloroperbenzoic acid (m-CPBA) in dichloromethane had given 1:1 diastereomeric mixtures of the corresponding oxiranes, which were inseparable by chromatography [28–30]. The C3-protons of benzyl (2S,4R,5S,8S)-2-(Boc)amino-3-(2-oxiranyl)propionate was reported to exhibit a doubling of signals in the $^1$H NMR spectrum [28]. The appearance of multiple sets of signals for the two possible isomers was similarly observed in the spectra of inseparable epoxide diastereomers 12a-c and validated by COSY spectra of the Cbz and Fmoc analogs 12b and 12c in which through-bond couplings between two sets of C3-protons with two overlapping downfield α-(C2)-proton signals were observed. Oxiranes 12a-c were thus obtained as 1:1 diastereomeric mixtures, which were used in the subsequent chemistry.

Based on the successful synthesis of 6-hydroxymethyl Faa diastereomers in which 5-hydroxymethyl prolines were prepared from a related C2 symmetric oxirane using Lewis-acid activation with BF$_3$·Et$_2$O in DCM at −78 °C [31], similar conditions were employed for the intramolecular ring-opening of epoxide 12a (Scheme 2). Multiple isomers of the
material with a molecular ion corresponding to proline 13 and hydroxyproline 14 were obtained from oxirane 12a likely by endo and exo ring openings by the attack of the two different carbamate-protected nitrogen [28,32,33]. Considering that the isomeric mix could be due, in part, to carboxation intermediates formed under the Lewis acid conditions, a method to remove the Boc group without the ring opening of the epoxide was attempted featuring heating oxirane 12a in water at reflux [34]. Deprotection of the Boc group, intramolecular epoxide ring opening, and lactam formation all occurred upon treating 12a with boiling water. Amine protection with di-tet-butyl dicarbonate and triethyl amine in dichloromethane, however, afforded four isomers of 5- and 7-hydroxy I2aa esters 8 and 9, which were observed by LCMS in a 1:1:1:1 ratio. Employing Cbz-protected epoxide 12b, hydrogenolytic cleavage of the carbamate using hydrogen and palladium-on-carbon in ethanol commenced an epoxide ring opening and lactam formation sequence, which was followed by Boc protection as described above to afford four isomers of 8 and 9, which were observed in a 1:1:1:1 ratio by HPLC. The improvement in selectivity may be due to a favored exo-tet-like ring opening of the epoxide diastereomers by the free amine, which when generated at a lower temperature reacted to favor the proline instead of the hydroxyproline counterparts [32,33]. In spite the possibility of improved regioselectivity in the epoxidation of olefins 11.

![Scheme 2. Syntheses of 5- and 7-hydroxy Boc-I2aa-OMe 8 and 9 from epoxide 12.](image)

Prompted by earlier success using transannular iodolactamization to prepare azabicyclo[X.Y.0]alkan-2-one ring systems [15,35], and related iodoamination protocols for preparing iodomethyl pyrrolidines and piperidines [36-38], Δ4-diaminoazetelate 11a was subjected to iodine and NaHCO3 at −20 °C (Scheme 3). The ring opening of the iodonium intermediate by one of the two carbamate-protected nitrogen appeared to be a method for selectively obtaining proline 15 instead of the azetidine counterpart; however, a mixture of diastereomeric iodolactones 16 was also produced as a competing side product. Considering the lactone as a potential means for differentiating between the two carboxylates, dihydroxylation of Δ4-diaminoazetelate 11a was performed using osmium tetroxide and N-methyl morpholine N-oxide (NMO) in aqueous acetone to provide hydroxy lactone 17 as a mixture of diasteromers [39]. Mesylate 18 was obtained by methanesulfonylation of hydroxy lactone 17 using methanesulfonyl chloride and triethylamine in dichloromethane. Mesylate 18 was converted to hydroxy I2aa analogs 8 and 9 by a three-step sequence featuring proline formation after Boc group removal with HCl gas bubbles in dichloromethane, lactam cyclization upon treatment of the hydrochloride salt with triethylamine in methanol
at reflux, and amine protection with di-tert-butyl decarbonate in dichloromethane. The HPLC chromatogram of the products from this sequence exhibited four peaks with molecular ions corresponding to 5- and 7-hydroxy Boc-I\textsuperscript{2aa}-OMe isomers 8 and 9 (Scheme 3) in a 1:1:1:1 ratio.

![Scheme 3](image)

**Scheme 3.** Strategies featuring iodoamination and dihydroxylation of \( \Delta^4 \)-diaminoazelaic acid 11a.

Different mixtures of 5- and 7-hydroxy Boc-I\textsuperscript{2aa}-OMe diastereomers 8 and 9 likely arose from a combination of a lack of facial selectivity in the epoxidation and the dihydroxylation of olefin 11 and competing nucleophilic attack from both nitrogen of diamino azelaic epoxide 12 and methanesulfonate 18. The loss of stereochemical integrity may also arise from competing \( \text{SN}_1 \) processes due to the epoxide ring opening prior to pyrrolidine formation. Intrigued by the production of iodolactone 16 as a side product from the iodoamination strategy, an iodolactonization approach was considered because of the high facial selectivity achieved on simpler \( \gamma,\delta \)-unsaturated carboxylic acids [24,40,41].

After saponification of diester 11a with lithium hydroxide in aqueous dioxane, dicarboxylic acid 19 was treated with cesium carbonate and iodine in an ice-cold acetonitrile solution (Scheme 4). Analysis by LCMS demonstrated a major peak with a molecular ion corresponding to lactone 20. Subsequent treatment with iodomethane and potassium carbonate in DMF furnished the corresponding methyl ester tetrahydrofuran-2-one \( (1'R,5S)-16 \) after chromatography in 55% yield from diacid acid 19. Attempts to perform the iodolactonization without a base gave a product mostly from the loss of Boc protection. Employing the same three-step sequence described above to convert methane sulfonate 18 into esters 8 and 9, iodide \( (1'R,5S)-16 \) was transformed into separable 5- and 7-hydroxy Faa esters \((55,6S)-8 \) and \((65,7S)-9 \) in 42% and 34% overall yields, respectively. Subsequent saponification of esters \((55,6S)-8 \) and \((65,7S)-9 \) gave, respectively, the acids \((55,6S)-2 \) and \((65,7S)-3 \) in 64% and 78% yields.
Assignment of Regio-Chemistry and Stereochemistry of 5- and 7-Hydroxy I2aa Esters

The configuration of the ring fusion and hydroxyl group carbons of the 5- and 7-hydroxy I2aa esters 8 and 9, as well as the alcohol position on the ring system, were all assigned based on two-dimensional NMR spectroscopic experiments. The locations of the indolizidine-2-one ring protons were initially assigned by COSY experiments in which through-bond couplings were used to trace the sequence from the downfield shifted carbamate NH to the C9 hydrogen. Subsequently, heteronuclear single quantum coherence (HSQC) spectroscopy was used to correlate the protons linked to similar carbons. The β-protons on the same face as the C3 carbamate and C9 carboxylate appeared generally up-field of their α-counterparts due to anisotropic effects caused by the latter functional groups [42]. Finally, relative configurations were ascertained (Figure 2) based on NOESY experiments in which the observed through-space transfers of magnetization were used to correlate the stereochemical assignments.
The ring fusion protons (3.88 and 3.74 ppm) of 5- and 7-hydroxy Boc-I$_2$aa-OMe (5S,6S)-8 and (6S,7S)-9 were respectively assigned the S stereochemistry based on nuclear Overhauser effects (nOe) with the C4β and C8β protons (1.99 and 1.84 ppm) and with the C3 proton (4.13 ppm, Figure 2). No long-range through-space transfer of magnetization was observed for the protons on the alcohol-bearing carbons. In the case of (6S,7S)-9, the relative nOe between the C7 proton was stronger for the C8 proton (2.35 ppm) compared to that of the C8β proton (2.15 ppm). The stereochemical assignments for Boc-(7-OH)I$_2$aa-OMe (6S,7S)-9 were confirmed by X-ray analysis as discussed below.

The configurations of the hydroxyl group in Boc-(5-OH)I$_2$aa-OMe (5S,6S)-8 and the iodolactone of tetrahydrofuran-2-one (1'R,5S)-16 were based on the latter serving as a common intermediate for both the former and Boc-(7-OH)I$_2$aa-OMe (6S,7S)-9. The stereochemistry of the ring-fusion and alcohol carbons are respectively derived from the inversion on nitrogen attack of the iodide and retention on the lactone opening during synthesis of the bicycle. Although the order of attack of the iodine and carboxylate may proceed by a traditional iodonium intermediate (Scheme 4) [24], and by a more concerted nucleophile-assisted alkene activation mechanism [43], the stereochemical outcome of iodolactone (1'R,5S)-20 arises from the attack of iodine by the face of the olefin on the opposite side of the proximal carboxylate of Δ$^8$-azelate 19 (Scheme 4).

The relative configurational assignments for 7-hydroxy Boc-I$_2$aa-OMe (6S,7S)-9 were confirmed by X-ray analysis of crystals grown from a dichloromethane-in-hexanes mixture (Figure 3). Two conformers differing primarily by the carbamate orientation were present in the unit cell and connected by an intermolecular hydrogen bond from the 7-hydroxy group donor to the lactam carbonyl oxygen acceptor. Examination of the backbone dihedral angles embedded in the I$_2$aa ring system ($\psi^{i+1} - 172^\circ$ and $\phi^{i+2} - 78^\circ$; $\psi^{i+1} - 175^\circ$ and $\phi^{i+2} - 71^\circ$) of the conformers in the X-ray structure of the 7-hydroxy analog (6S,7S)-9 indicated a close relation to those of the central residues of an ideal type II' β-turn ($\psi^{i+1} - 120^\circ$ and $\phi^{i+2} - 80^\circ$) [44], and to that of the methyl ester of the parent I$_2$aa counterpart (6S)-21 ($\psi^{i+1} - 176^\circ$ and $\phi^{i+2} - 78^\circ$, Figure 4) [45]. Relative to the values in the crystal structure of Boc-I$_2$aa-OMe (6S)-21, the $\phi^{i+2}$ dihedral angle was apparently less influenced by the smaller 7β-hydroxy substituent than the 7α-hydroxymethyl substituent in Boc-(7-HOCH$_2$I)$_2$aa-OMe (22, $\psi^{i+1} - 175^\circ$ and $\phi^{i+2} - 68^\circ$) [11].
3. Materials and Methods

Anhydrous solvents (CH$_3$CN, DMF, (CH$_3$)$_2$CO, CH$_2$Cl$_2$, and CH$_3$OH) were obtained by passage through solvent filtration systems (GlassContour, Irvine, CA, USA). All reagents from commercial sources were used as received. Iodine was purchased from Aldrich (USA) and solvents were obtained from Fisher Chemical. The N-(Boc)-, (Cbz)-, and (Fmoc)-3-iodo-L-alanine methyl esters 10a–c were respectively prepared according to the literature methods reported in references [25–27]. Purification by silica gel chromatography was performed on 230–400 mesh silica gel; analytical thin-layer chromatography (TLC) was performed on silica gel 60 F254 (aluminum sheet) and visualized by UV absorbance or staining with KMnO$_4$. Melting points are reported in degree Celsius (°C), uncorrected and obtained using a Mel-Temp melting point apparatus equipped with a thermometer on the sample that was placed in a capillary tube. Spectroscopic $^1$H and $^{13}$C NMR experiments were recorded at room temperature (298 K) in CDCl$_3$ (7.26/77.16 ppm), DMSO-d$_6$ (2.5/39.56), and CD$_3$OD (3.31/49.0 ppm) on Bruker AV (500/125, and 700/175 MHz) instruments using an internal solvent as the reference. Spectra are presented in the Supplementary Materials. Chemical shifts are reported in parts per million (ppm), and coupling constant ($J$) values in Hertz (Hz). Abbreviations for peak multiplicities are s (singlet), d (doublet), t (triplet), q (quadruplet), q (quintuplet), m (multiplet), and br (broad). Certain $^{13}$C NMR chemical shift values were extracted from HSQC spectra. High-resolution mass spectrometry (HRMS) data were obtained on an LC-MSD instrument in electrospray ionization (ESI-TOF) mode by the Centre Régional de Spectrométrie de Masse de l’Université de Montréal. Either protonated molecular ions [M + H]$^+$ or sodium adducts [M + Na]$^+$ were used for empirical formula confirmation. Infrared spectra were recorded in the neat on a Perkin Elmer Spectrometer FT-IR instrument, and are reported in reciprocal centimeters (cm$^{-1}$). The X-ray structure was solved using a Bruker Venture Metaljet diffractometer by...
the Laboratoire de diffraction des rayons X de l’Université de Montréal. Specific rotations \([\alpha]_D\) were measured at 25 °C at the specified concentrations (c in g/100 mL) using a 0.5 dm cell on a PerkinElmer Polarimeter 589 instrument and expressed using the general formula \([\alpha]_D^{25} = (100 \times c)/\delta\).

3.1. (3S,5S,6S,9S)-3-N-(Boc)amino-5-hydroxy-indolizin-2-one-9-carboxylic Acid [(3S,5S,6S,9S)-2]

A 0 °C solution of ester (3S,5S,6S,9S)-8 (15 mg, 0.046 mmol) in 1,4-dioxane (0.5 mL) was treated with a 1N solution of LiOH (1.9 mg, 0.046 mmol, 1 equiv.). The cooling bath was removed. The reaction mixture was warmed to room temperature with stirring overnight, at which time TLC indicated the consumption of the starting material. The volatiles were evaporated under reduced pressure. The residue was partitioned between H₂O (5 mL) and ethyl acetate (5 mL). The aqueous phase was acidified with 1 N HCl to pH 3 and extracted with ethyl acetate (3 × 10 mL). The organic extractions were combined, dried with Na₂SO₄, filtered, and concentrated under vacuum to afford (3S,5S,6S,9S)-2 (9 mg, 64%) as a white solid: mp 105–106 °C; \([\alpha]_D^{25} –19.13\) (c 0.32, CHCl₃); ¹H NMR (500 MHz, CDCl₃): δ 5.39 (s, br, 1H), 4.71 (s, 1H), 4.39 (s, br, 1H), 4.29–4.28 (m, 1H), 3.84–3.80 (m, 1H), 2.6–2.52 (m, 1H), 2.39–2.33 (m, 2H), 2.26–2.20 (m, 1H), 2.05–2.02 (m, 1H), 1.67–1.63 (m, 1H), 1.47 (s, 9H); ¹³C{¹H} NMR (125 MHz, CDCl₃) δ 172.0, 167.3, 147.3, 80.5, 64.0, 60.0, 35.2, 32.0, 30.0, 28.3, 26.1, 23.0; FT-IR (neat) \(\nu_{max}\) 3328, 2919, 1702, 1521, 1449, 1362, 1208, 1166, 1050, 1031 cm⁻¹; HRMS (ESI-TOF) \(m/z [M + Na]^+\) calcd for C₁₄H₂₂N₂O₆Na 337.1370, found 337.1374.

3.2. (3S,6S,7S,9S)-3-N-(Boc)amino-7-hydroxy-indolizin-2-one-9-carboxylic Acid [(3S,6S,7S,9S)-3]

A 0 °C solution of ester (3S,6S,7S,9S)-9 (150 mg, 0.46 mmol) in 1,4-dioxane (5 mL) was treated with a 1N solution of LiOH (19.2 mg, 0.46 mmol, 1 equiv.). The cooling bath was removed. The reaction mixture was warmed to room temperature with stirring for 3 h, at which time TLC indicated the consumption of the starting material. The volatiles were evaporated under reduced pressure. The residue was partitioned between H₂O (10 mL) and ethyl acetate (5 mL). The aqueous phase was acidified with 1 N HCl to pH 3 and extracted with ethyl acetate (3 × 10 mL). The organic extractions were combined, dried with Na₂SO₄, filtered, and concentrated under vacuum to afford (3S,6S,7S,9S)-3 (112 mg, 78%) as a white solid: mp 105–106 °C; \([\alpha]_D^{25} –19.13\) (c 0.23, CHCl₃); ¹H NMR (500 MHz, CD₂OD): δ 4.460–4.43 (dd, \(J = 9.3, 4.3\) Hz, 1H), 4.26–4.24 (m, 1H), 4.22–4.17 (m, 1H), 3.76–3.72 (m, 1H), 2.47–2.41 (m, 1H), 2.15–2.07 (m, 2H), 1.87–1.82 (m, 2H), 1.48 (s, 9H); ¹³C{¹H} NMR (125 MHz, CD₂OD) δ 174.0, 170.0, 156.6, 79.1, 71.2, 62.3, 57.2, 50.0, 37.0, 27.3, 27.0, 19.0; FT-IR (neat) \(\nu_{max}\) 3325, 2922, 1697, 1523, 1451, 1365, 1211, 1162, 1055, 1032 cm⁻¹; HRMS (ESI-TOF) \(m/z [M + Na]^+\) calcd for C₁₄H₂₅N₂O₆Na 337.1370, found 337.1374.
3.3. Methyl (3S,5S,6S,9S)-3-N-(Boc)amino)-5-hydroxy-indolizin-2-one-9-carboxylate and (3S,6S,7S,9S)-3-N-(Boc)amino)-7-hydroxy-indolizin-2-one-9-carboxylate [(3S,5S,6S,9S)-8 and (3S,6S,7S,9S)-9]

A solution of (1'R,5S)-1'-iodo-tetrahydrofuran-2-one (1'R,5S)-16 (1.0 g, 1.8 mmol) in dichloromethane (20 mL) was treated with HCl gas bubbles for 2-3 h, when TLC indicated complete consumption of the starting carbamate and LCMS analysis indicated a new peak RT = 0.7 min (C18 column, 10:90 CH3CN:H2O) with a molecular ion [M + H]+ m/z 357. The reaction mixture was evaporated to a residue, which was dissolved in MeOH (5 mL), treated with triethylamine (545 mg, 5.4 mmol, 3 equiv.), and heated at reflux using an oil bath overnight, when LCMS indicated a new peak RT = 0.68 min (eluent C18 column, 10:90 CH3CN:H2O) with the molecular ion [M + H]+ m/z. The volatiles were evaporated under reduced pressure. The residue was dissolved in dichloromethane (10 mL), treated with (Boc)2O (0.14 g, 0.63 mmol, 1.2 equiv.), and stirred for 3 h, when TLC indicated two new spots and LCMS indicated a new peak RT = 5.0 min (C18 column, 10:90 CH3CN:H2O). The volatiles were removed under reduced pressure. The residue was purified by flash column chromatography using 60–80% EtOAc in hexanes as eluent.

The first to elute was Boc-(7-HO)I2aa-OMe (3S,6S,7S,9S)-9 (200 mg, 34%) as a white solid: mp 138–140 °C; Rf = 0.47, (100% EtOAc twice eluted, visualized with KMN2O4); [α]D25 = 28.2 (c 0.85, CHCl3); 1H NMR (500 MHz, CDCl3) δ 5.64 (s, br, NH), 4.46–4.44 (dd, J = 10 Hz, 1H), 4.14–4.12 (m, 1H), 3.84 (s, 3H), 3.76–3.71 (m, 1H), 3.61–3.58 (d, J = 15 Hz, OH), 2.4–2.33 (m, 2H), 2.29–2.22 (m, 1H), 2.15–2.12 (dt, J = 14.5, 0.9 Hz, 1H), 2.0–1.93 (m, 1H), 1.77–1.69 (m, 1H), 1.47 (s, 9H); 13C{1H} NMR (125 MHz, CDCl3) δ 175.5, 170.1, 156.0, 80.0, 73.0, 61.5, 57.1, 53.2, 51.0, 36.3, 28.3, 27.1, 19.2; FT-IR (neat) νmax 3357, 2979, 1693, 1636, 1518, 1437, 1392, 1249, 1165, 1099, 1063, 1005 cm−1 HRMS (ESI-TOF) m/z [M + Na]+ calcd for C15H24N2O6Na 351.1526 found 351.1522.

Next to elute was Boc-(5-HO)I2aa-OMe (3S,6S,7S,9S)-8 (250 mg, 42%) as a white solid: mp 75–77 °C; Rf = 0.3 (100% EtOAc, twice eluted, visualized with KMN2O4); [α]D25 = –12.6 (c 0.75, CHCl3). 1H NMR (500 MHz, CDCl3) δ 5.25 (s, br, NH), 4.50–4.44 (m, 2H), 4.27 (s, 1H), 3.89–3.86 (m, 1H), 3.77 (s, 3H), 2.74–2.68 (m, 1H), 2.44–2.40 (m, 1H), 2.11–2.04 (m, 2H), 2.00–1.97 (m, 1H), 1.95–1.92 (m, 1H), 1.88–1.83 (m, 1H), 1.45 (s, 9H); 13C{1H} NMR (125 MHz, CDCl3) δ 173.0, 168.0, 156.2, 80.0, 64.0, 63.3, 58.2, 52.3, 47.4, 36.0, 28.3, 28.0, 27.0; FT-IR (neat) νmax 3360, 2983, 1702, 1633, 1518, 1438, 1395, 1250, 1162, 1102, 1002 cm−1; HRMS (ESI-TOF) m/z [M + Na]+ calcd for C15H24N2O6Na 351.1526 found 351.1522.
3.4. Dimethyl (2S,4E,8S)-Δ4-2,8-(di-N-(Boc)amino)azole (11a)

In a 250-mL round bottom flask, fitted with a three-way stopcock, CuBr•DMS (1.22 g, 0.006 mol, 0.13 equiv.) was weighed, dried gently with a heat gun under vacuum until the powder changed color from white to light green, placed under argon, treated with dry DMF (30 mL), followed by (E)-1,3-dichloroprop-1-ene (2.5 g, 0.023 mol, 0.5 equiv.). In a Schlenk tube, zinc (8.9 g, 0.14 mol, 3 equiv.) and iodine (0.35 g, 0.0014 mol, 0.03 equiv.) were mixed under an argon atmosphere, and thrice heated under vacuum with a heat gun for 10 min and cooled under a flush of argon. A solution of N-(Boc)-3-iodo-L-alanine methyl ester 10a (15 g, 0.046 mol) in dry DMF (30 mL) was added to the Schlenk tube and stirred for 1 h, when TLC analysis confirmed the consumption of the iodide (Rf = 0.7, 30% EtOAc in hexanes) and formation of the organozinc reagent (Rf = 0.2, 30% EtOAc in hexanes). Stirring was stopped, the excess zinc powder was allowed to settle, and the supernatant was transferred dropwise via a syringe with care to minimize the transfer of zinc into the flask containing the copper catalyst. After stirring at rt overnight, TLC indicated a new spot (Rf = 0.48, 40% EtOAc in hexanes) and the reaction mixture was diluted with ethyl acetate (150 mL), stirred for 15 min, and filtered through a silica gel pad. The filtrate was treated with water (100 mL), transferred into a separatory funnel, and diluted with ethyl acetate (150 mL). The organic phase was washed successively with 1 M Na2S2O3 (2 × 100 mL), water (4 × 100 mL), and brine (2 × 100 mL), dried over Na2SO4, filtered, and evaporated. The volatiles were removed under reduced pressure to afford a residue that was purified by chromatography using 25–30% EtOAc in hexanes as the eluent. Evaporation of the collected fractions gave azelate 11a (11.4 g, 56%) as a colorless liquid: Rf = 0.48 (2.3 EtOAc/Hexanes, visualized with KMnO4); [α]D25 +25.2 (c 1.04, CHCl3); 1H NMR (500 MHz, CDCl3) δ 5.54–5.48 (dt, J = 15, 5 Hz, 1H), 5.39–5.34 (dt, J = 15, 5 Hz, 1H), 5.25–5.24 (d, J = 5.0 Hz, 1H), 5.03–5.01 (d, J = 10 Hz, 1H), 4.40–4.37 (m, 1H), 4.34–4.30 (m, 1H), 3.76 (s, 3H), 3.75 (s, 3H), 2.52–2.43 (m, 2H), 2.12–2.07 (m, 2H), 1.90–1.84 (m, 2H), 1.71–1.67 (m, 1H), 1.47 (s, 9H), 1.46 (s, 9H); 13C{1H} (125 MHz, CDCl3) δ 173.3, 173.0, 155.3, 155.2, 133.1, 125.5, 79.95, 79.84, 53.2, 53.0, 52.3, 52.2, 35.6, 32.4, 28.4, 28.3, 23.2; FT-IR (neat) νmax 3332, 2953, 1699, 1521, 1437, 1341, 1207, 1050 cm−1; HRMS (ESI-TOF) m/z [M + Na]+ calcd for C27H33N2O8Na 513.2231, found 513.2234.

3.5. Dimethyl (2S,4E,8S)-Δ4-2,8-(di-N-(Cbz)amino)azole (11b)

Diamino azelate 11b with Cbz protection was synthesized according to the protocol described for the synthesis of Boc counterpart 11a using N-(Cbz)-3-iodo-L-alanine methyl ester 10b (8.0 g, 0.02 mmol) and isolated as a colorless liquid (3.5 g, 63%): Rf = 0.30 (2.3 E.A/Hexanes, visualized by UV); [α]D25 +15.9 (c 1.09, CHCl3); 1H NMR (500 MHz, CD3OD): δ 7.40–7.31 (m, 10H), 5.57–5.55 (d, J = 10 Hz, 1H), 5.52–5.45 (dt, J = 15, 5 Hz, 1H), 5.38–5.33 (dt, J = 15, 5 Hz, 1H), 5.29–5.27 (d, J = 10 Hz, 1H), 5.16–5.11 (m, 4H), 4.48–4.44 (m, 1H), 4.42–4.37 (m, 1H), 3.76 (s, 3H), 3.75 (s, 3H), 2.58–2.46 (m, 2H), 2.13–2.01 (m, 2H), 1.94–1.82 (m, 2H), 1.74–1.67 (m, 1H); 13C{1H} NMR (125 MHz, CDCl3) δ 172.2, 156.0, 136.2, 132.3, 128.57, 128.54, 128.52, 128.46, 128.25, 128.22, 128.16, 128.13, 125.32, 67.1, 67.0, 54.0, 53.0, 52.4, 52.3, 35.4, 32.4, 32.2, 28.2; FT-IR (neat) νmax 3332, 2953, 1699, 1521, 1437, 1341, 1207, 1050 cm−1; HRMS (ESI-TOF) m/z [M + H]+ calcd for C27H33N2O8 513.2231, found 513.2234.
3.6. Dimethyl (2S,4RS,5RS,8S)-2,8-di-N-(Boc)amino-4-oxiranyl-azelate (12a)

A solution of Δ^4-di-N-(Boc)aminoazelate 11a (2.0 g, 4.5 mmol) in dichloromethane (DCM, 30 mL) was cooled to 0 °C and treated with m-chloroperoxybenzoic acid (2.0 g, 9.0 mmol, 2.0 equiv.). The ice bath was removed. The suspension was warmed to room temperature with stirring overnight, when TLC showed the complete consumption of olefin 11a (R_f = 0.48, 40% EtOAc in hexanes) and a new polar spot for epoxide 12a (R_f = 0.2, 40% EtOAc in hexanes). The reaction mixture was diluted with DCM (30 mL), transferred to a separatory funnel, and washed sequentially with 1N NaOH (2 × 20 mL), water (20 mL), and brine (20 mL), dried over Na₂SO₄, filtered, and concentrated under vacuum to a residue that was purified by flash column chromatography using 20% EtOAc in hexanes as the eluent. Evaporation of the collected fractions afforded epoxide 20a (1.75 g, 84%) as a colorless oil: R_f = 0.2 (2:3 EtOAc/hexanes, visualized with KMnO₄); [α]D²⁵ +2.5 (c 0.81, CHCl₃); ¹H NMR (500 MHz, CDCl₃): δ 4.32–4.26 (m, 1H), 4.18–4.13 (m, 1H), 3.75 (s, 3H), 3.74 (s, 3H), 2.87–2.75 (m, 2H), 1.97–1.90 (m, 2H), 1.80–1.72 (m, 1H), 1.64–1.59 (m, 1H), 1.47 (s, 2OH); ¹³C{¹H} NMR (125 MHz, CDCl₃) δ 172.5, 172.1, 156.0, 136.2, 128.6, 128.3, 128.2, 128.1, 67.1, 57.5, 55.3, 53.5, 53.1, 51.4, 51.3, 34.0, 27.3; FT-IR (neat) ν_max 3326, 2955, 1699, 1523, 1437, 1210, 1045, 912 cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]+ calcd for C₂₁H₃₆N₂O₉Na 483.2313, found 483.2321.

![Diagram of 12a](image)

3.7. Dimethyl (2S,4RS,5RS,8S)-2,8-di-N-(Cbz)amino-4-oxiranyl-azelate (12b)

Epoxide 12b with Cbz protection was synthesized using the protocol described for the preparation of Boc counterpart 12a using dimethyl Δ^4-di-(Cbz)amino azelate 11b (3.2 g, 6.2 mmol) and isolated as a colorless liquid (2.5g, 76%): R_f = 0.21 (2:3 EtOAc/hexanes, visualized by UV); [α]D²⁵ +7.95 (c 0.88, CHCl₃); ¹H NMR (500 MHz, CDCl₃): δ 7.40–7.33 (m, 10H), 5.68–5.62 (d, J = 10Hz, 1H), 5.44–5.32 (d, J = 5Hz, 1H), 5.16–5.11 (m, 4H), 4.58–4.11 (m, 1H), 4.45–4.39 (s, 1H), 3.79–3.76 (s, 6H), 2.81–2.70 (m, 2H), 2.25–2.07 (m, 1H), 2.04–1.92 (m, 2H), 1.83–1.75 (m, 1H), 1.71–1.65 (m, 1H), 1.54–1.44 (m, 1H); ¹³C{¹H} NMR (125 MHz, CDCl₃) δ 172.5, 172.1, 156.0, 136.2, 128.6, 128.3, 128.2, 67.1, 57.5, 55.3, 53.1, 53.2, 53.0, 52.65, 52.57, 52.51, 52.2, 35.0, 30.0, 29.0, 28.0, 27.5; FT-IR (neat) ν_max 3332, 2953, 1700, 1521, 1437, 1344, 1208, 1049 cm⁻¹; HRMS (ESI-TOF) m/z [M + H]+ calcd for C₂₇H₃₅N₂O₉ 529.2180, found 529.2190.

![Diagram of 12b](image)

3.8. Dimethyl (2S,4RS,5RS,8S)-2,8-di-N-(Fmoc)amino-4-oxiranyl-azelate (12c)

Dimethyl (2S,4E,8S)-Δ⁴-2,8-(di-N-(Fmoc)amino)azelate (11c) was synthesized using the protocol described for the synthesis of Δ^4-di-(Boc)amino azelate 11a from N-(Fmoc)-3-iodo-L-alanine methyl ester (10c, 1.5 g, 0.0022 mol) and isolated as a colorless liquid (0.7 g, 63%): R_f = 0.21 (4:6 ethyl acetate/hexanes, visualized by UV). Epoxidation was performed as described for Boc counterpart 11a using dimethyl (2S,4E,8S)-Δ⁴-2,8-(di-N-(Fmoc)amino)azelate (11c, 600 mg, 0.87 mmol), which gave a colorless solid (500 mg, 82%); mp 89–92 °C; R_f = 0.30 (4:6 EtOAc/hexanes, visualized by UV); [α]D²⁵ +5.5 (c 0.51, CHCl₃); ¹H NMR (500 MHz, CDCl₃): δ 7.79–7.77 (d, J = 10 Hz, 4H), 7.63–7.57 (m, 4H), 7.43–7.40 (m, 4H), 7.34–7.31 (m, 4H), 7.14–7.07 (dd, J = 10, 5 Hz, 1H), 5.48–5.34 (dd, J = 12, 10 Hz, 1H), 4.60–4.51 (m, 2H), 4.46–4.40 (m, 4H), 4.26–4.22 (m, 2H), 3.81 (s, 3H), 3.78 (s, 3H), 2.85–2.73 (m, 2H), 2.16–1.74 (m, 6H); ¹³C{¹H} NMR (125 MHz, CDCl₃) δ 172.6, 172.1, 156.0, 143.8,
143.7, 141.3, 130.0, 128.0, 127.1, 125.1, 120.0, 67.2, 67.1, 67.0, 57.4, 55.3, 55.1, 53.2, 52.7, 52.6, 52.5, 47.1, 35.0, 30.0, 28.97, 28.9, 27.6, 27.5; FT-IR (neat) \( \nu_{\text{max}} \) 3290, 2952, 1690, 1531, 1448, 1260, 1215, 1085, 1045 cm\(^{-1}\); HRMS (ESI-TOF) \( m/z \) [M + H]\(^+\) calcd for \( \text{C}_{41}\text{H}_{41}\text{N}_{5}\text{O}_{8} \) 705.2806, found 705.2819.

3.9. (2. \( S,4E,8S \)-\( \Delta^4 \)-2,8-(di-\( N \)-(Boc)amino)azelide) (19)

A 0 °C solution of dimethyl (2\( S,4E,8S \)-\( \Delta^4 \)-2,8-(di-\( N \)-(Boc)amino)azelide (11a, 500 mg, 1.12 mmol) in 1,4-dioxane (5 mL) was treated with a 1N solution of LiOH (94.4 mg, 2.25 mmol, 2 equiv.). The cooling bath was removed. The reaction mixture was warmed to room temperature with stirring for 3 h, at which time TLC indicated the consumption of the starting material. The volatiles were evaporated under reduced pressure. The residue was partitioned between \( \text{H}_2\text{O} \) (10 mL) and \( \text{EtOAc} \) (5 mL). The aqueous phase was acidified with 1 N HCl to pH 3 and extracted with ethyl acetate (3 × 10 mL). The organic extracts were combined, dried with \( \text{Na}_2\text{SO}_4 \), filtered, and concentrated under vacuum to afford diacid 19 (430 mg, 92%) as a white solid: mp 71–73 °C; [\( \alpha \)]\(^{25}_D\) +39.0 (c 0.82, \( \text{CHCl}_3 \)); \(^1\)H NMR (500 MHz, \( \text{DMSO-d}_6 \)) \( \delta \) 12.42 (s, 2H), 7.08–7.07 (d, \( J = 5.0 \) Hz, 1H), 6.97–6.96 (d, \( J = 5 \) Hz, 1H), 5.50–5.44 (m, 1H), 5.40–5.35 (m, 1H), 3.90–3.84 (m, 2H), 2.37–2.32 (m, 1H), 2.29–2.23 (m, 1H), 1.78–1.73 (m, 1H), 1.48 (s, 9H), 1.47 (s, 9H); \(^{13}\)C\(^{1}\)H NMR (125 MHz, \( \text{CDCl}_3 \)) \( \delta \) 175.0, 174.0, 156.03, 155.88, 132.2, 127.0, 78.47, 78.41, 60.2, 54.1, 53.3, 34.5, 31.1, 28.68, 28.66; FT-IR (neat) \( \nu_{\text{max}} \) 3697, 2980, 1694, 1507, 1393, 1367, 1245, 1157, 1053, 1033, 1018 cm\(^{-1}\); HRMS (ESI-TOF) \( m/z \) [M + Na]\(^+\) calcd for \( \text{C}_{19}\text{H}_{32}\text{N}_{2}\text{O}_{8}\text{Na} \) 439.2050, found 439.2070.

3.10. (1'\( R \),5\( S \))-3-\( N \)-(Boc)amino-5-[1'-iodo-4'-\( N \)-(Boc)amino-4'-methoxycarbonylbutyl]-tetrahydrofuran-2-one [(1'\( R \),5\( S \))-16]

A 0 °C mixture of carboxylic acid (1'\( R \),5\( S \))-20 (2.1 g, 3.87 mmol) and \( \text{K}_2\text{CO}_3 \) (800 mg, 5.8 mmol, 1.5 equiv.) in \( \text{DMF} \) (20 mL) was treated with methyl iodide (820 mg, 5.8 mmol, 1.5 equiv.) in \( \text{DMF} \) (20 mL). The cooling bath was removed. After stirring for 2–3 h, the room temperature mixture exhibited a nonpolar spot (2:3 \( \text{EtOAc} \)/\( \text{hexanes} \)) by TLC and indicated a new peak at \( \Delta = 2.02 \) mm (2.1 g, 3.87 mmol) and \( \text{K}_2\text{CO}_3 \) (800 mg, 5.8 mmol, 1.5 equiv.). The ice bath was removed. After stirring for 2–3 h, the room temperature mixture exhibited a nonpolar spot (2:3 \( \text{EtOAc} \)/\( \text{hexanes} \)) by TLC and indicated a new peak (11a, 500 mg, 1.12 mmol) in 1,4-dioxane (5 mL) was treated with a 1N solution of LiOH (94.4 mg, 2.25 mmol, 2 equiv.). The cooling bath was removed. The reaction mixture was warmed to room temperature with stirring for 3 h, at which time TLC indicated the consumption of the starting material. The volatiles were evaporated under reduced pressure. The residue was partitioned between \( \text{H}_2\text{O} \) (10 mL) and \( \text{EtOAc} \) (5 mL). The ethyl acetate layer was washed with water (4 × 10 mL). The organic extractions were combined, dried with \( \text{Na}_2\text{SO}_4 \), filtered, and concentrated under vacuum to afford diacid 19 (430 mg, 92%) as a white solid: mp 71–73 °C; [\( \alpha \)]\(^{25}_D\) +39.0 (c 0.82, \( \text{CHCl}_3 \)); \(^1\)H NMR (500 MHz, \( \text{DMSO-d}_6 \)) \( \delta \) 12.42 (s, 2H), 7.08–7.07 (d, \( J = 5.0 \) Hz, 1H), 6.97–6.96 (d, \( J = 5 \) Hz, 1H), 5.50–5.44 (m, 1H), 5.40–5.35 (m, 1H), 3.90–3.84 (m, 2H), 2.37–2.32 (m, 1H), 2.29–2.23 (m, 1H), 1.71–1.50 (m, 4H), 1.39 (s, 9H), 1.38 (s, 9H); \(^{13}\)C\(^{1}\)H NMR (125 MHz, \( \text{DMSO-d}_6 \)) \( \delta \) 175.0, 174.0, 156.03, 155.88, 132.2, 127.0, 78.47, 78.41, 60.2, 54.1, 53.3, 34.5, 31.1, 28.68, 28.66; FT-IR (neat) \( \nu_{\text{max}} \) 3697, 2980, 1694, 1507, 1393, 1367, 1245, 1157, 1053, 1033, 1018 cm\(^{-1}\); HRMS (ESI-TOF) \( m/z \) [M + Na]\(^+\) calcd for \( \text{C}_{19}\text{H}_{32}\text{N}_{2}\text{O}_{8}\text{Na} \) 439.2050, found 439.2070.
3.11. \((1'R,5S)-3-N-(Boc)amino-5-[1'I-iodo-4'-N-(Boc)amino-4'-hydroxycarbonylbutyl]-tetrahydrofuran-2-one \((1'R,5S)-20\)

A solution of diacid \(19\) (1.6 g, 3.8 mmol) in acetonitrile (20 mL) was treated with \(\text{Cs}_2\text{CO}_3\) (3.7 g, 11.5 mmol, 3 equiv.), stirred for 15 min, cooled to 0 °C with an ice bath, and treated with iodine (2.93 g, 11.5 mmol, 3 equiv.). The ice bath was removed. After stirring for 3–4 h, the reaction mixture had warmed to room temperature and was observed by LCMS to contain a new peak at RT = 8.1 min (C18 column, 10:90 CH₃CN:H₂O) with a molecular ion \([M + Na]^+\) \(m/z\) 565. The reaction mixture was filtered through a pad of Celite™ and the filter cake was washed with acetonitrile (3 × 30 mL). The filtrate and washings were combined and evaporated under reduced pressure. The residue was partitioned between H₂O (50 mL) and EtOAc (25 mL). The aqueous phase was acidified with 1 N HCl to pH 3 and extracted with ethyl acetate (3 × 50 mL). The organic extractions were combined, dried with \(\text{Na}_2\text{SO}_4\), filtered, and concentrated under vacuum to afford tetrahydrofuran-2-one (19) (2.1 g) as a pale-yellow solid, which was used without further purification.

4. Conclusions

The copper catalyzed \(\text{SN}_2'\) addition of zincate derived from methyl \(\beta\)-iodo alaninate onto (E)-1,3-dichloroprop-1-ene has given useful entry into a set of protected \(\Delta^1\)-2,8-diaminoazelaic diacid \(19\) (1.6 g, 3.8 mmol) in acetonitrile (20 mL) was treated with \(\text{Cs}_2\text{CO}_3\) (3.7 g, 11.5 mmol, 3 equiv.), stirred for 15 min, cooled to 0 °C with an ice bath, and treated with iodine (2.93 g, 11.5 mmol, 3 equiv.). The ice bath was removed. After stirring for 3–4 h, the reaction mixture had warmed to room temperature and was observed by LCMS to contain a new peak at RT = 8.1 min (C18 column, 10:90 CH₃CN:H₂O) with a molecular ion \([M + Na]^+\) \(m/z\) 565. The reaction mixture was filtered through a pad of Celite™ and the filter cake was washed with acetonitrile (3 × 30 mL). The filtrate and washings were combined and evaporated under reduced pressure. The residue was partitioned between H₂O (50 mL) and EtOAc (25 mL). The aqueous phase was acidified with 1 N HCl to pH 3 and extracted with ethyl acetate (3 × 50 mL). The organic extractions were combined, dried with \(\text{Na}_2\text{SO}_4\), filtered, and concentrated under vacuum to afford tetrahydrofuran-2-one (19) (2.1 g) as a pale-yellow solid, which was used without further purification.

7-hydroxy indolizidine-2-one framework replicated that of the parent I$^2$aa ester (6S)-21 and mimicked the dihedral angles of the central dipeptide in a type II′ β-turn. The utility of 5- and 7-hydroxy indolizidin-2-one amino acids (35,5S,6S,9S)-2 and (3S,6S,7S,9S)-3 is currently being investigated inside biologically relevant peptides and will be reported in due time.

**Supplementary Materials:** The following supporting information can be downloaded, characterization data including $^1$H and $^{13}$C NMR spectra and X-ray coordinates.

**Author Contributions:** Conceptualization, methodology, validation, formal analysis, investigation, resources, writing—original draft preparation, writing—review and editing, all R.M. and W.D.L.; supervision, project administration, funding acquisition, all W.D.L. All authors have read and agreed to the published version of the manuscript.

**Funding:** The Natural Sciences and Engineering Research Council of Canada (NSERC) for Discovery Research Project (No. 04079), the Canadian Institutes of Health Research (CIHR), and the NSERC-CIHR for the Collaborative Health Research Project “Treatment of Preterm Birth with ProstaglandinF2alpha Receptor Modulators” No. 337381.

**Data Availability Statement:** CCDC 2125339 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge via [www.ccdc.cam.ac.uk/data_request/cif](http://www.ccdc.cam.ac.uk/data_request/cif) (accessed on 20 December 2021), or by emailing data_request@ccdc.cam.ac.uk (accessed on 20 December 2021), or by contacting The Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB2 1EZ, UK; fax: +44-1223-336033.

**Acknowledgments:** We acknowledge the assistance of members of the Université de Montréal facilities: A. Fürtös, K. Gilbert, M.-C. Tang, and L. Mahrouche (mass spectrometry), C. Malveau, P. Aguiar (NMR spectroscopy), and T. Maris, D. Chartrand (X-ray).

**Conflicts of Interest:** The authors declare no conflict of interest.

**Sample Availability:** Samples of the compounds are not available from the authors.
