Synthesis of novel 3-benzyl-2-phenyl-4(5H)-(substituted phenylhydrazino)-1, 3-oxazolidines and their antihyperglycemic activity

Abstract
A number of 3-benzyl-2-phenyl-4(5H)-(substituted phenylhydrazino)-1, 3-oxazolidines 6a-f derivatives were synthesized and their antihyperglycemic activity was evaluated by streptozotocin (STZ) and sucrose-loaded model. Many of oxazolidine derivatives as well as their corresponding substituted phenylhydrazine showed significant reduction in blood glucose level in STZ and sucrose-loaded rat models.

Key words: Antihyperglycemic activity, oxazolidine, substituted phenylhydrazine

INTRODUCTION

Diabetes mellitus is a main threat to human health in the 21st century.[1] The incidence of the disease currently is estimated to reach 300 million by the year 2025.[2] Oxazolidine is an important group of heterocyclic compounds that plays a vital role in many biological activities in the areas of medicine and molecules containing oxazolidine ring systems and exhibits many activities such as anti-TB activity,[3] antibacterial activity,[4] mono-amine oxidase inhibition,[5] and GP IIb/IIIa antagonism.[6] The information on oxadiazolidine as antihyperglycemic agents has been reported previously.[8] In view of the literature led to the conception that a novel series of 3-benzyl-2-phenyl-4(5H)-(substituted phenylhydrazino)-1, 3-oxazolidines 6a-f derivatives were synthesized and their chemical structure were confirmed by IR, 1H-NMR, mass spectral and elemental analyses. These compounds were screened for their antimicrobial activities.

MATERIALS AND METHODS

Materials
Synthetic starting material, reagents and solvents were of analytical reagent grade or of the highest quality that were commercially available and were purchased from Aldrich Chemical Co (Hyderabad, AndhraPradesh, India), Merck Chemical Co (Mumbai, Maharashtra, India) and Acros Organics (Mumbai, Maharashtra, India) and were dried when necessary.

The melting points were taken in open capillary tube and uncorrected. IR spectra were recorded with KBr pellets (ABB Bomem FT-IR spectrometer MB 104 ABB Limited, Bangaloru, India). Proton (1H) NMR spectra (Bruker 400 NMR spectrometer, Mumbai, India) were recorded with TMS as internal references. Mass spectral data were recorded with a quadrupole mass spectrometer (Shimadzu GC MS QP 5000, Chennai, India) and microanalyses were performed using a vario EL V300 elemental analyzer (Elemental Analysensysteme GmbH, Chennai, India). The purity of the compounds was checked by TLC on pre-coated SiO2 gel (HF254 200 mesh) aluminium plates (E. Merck) using ethyl acetate:benzene ratio of 1:3 and visualized in UV chamber. IR, 1H-NMR, mass spectral data and elemental analyses were consistent with the assigned structures.

General Procedures
The target novel oxazolidine derivatives were synthesized by previously reported method.[9,10] Accordingly, benzylamine 1 was treated with an equimolar amount of benzaldehyde 2 and an hydroxyacetic acid 3 in dry toluene under reflux 24-48 h to give 3-benzyl-2-phenyl-1,3-oxazolidine-4(5H)-one 4, further its treat with thionyl chloride and DMF to...
get chloro derivative 5. 3-benzyl-2-phenyl-4(5H)-chloro-1,3-oxazolidine and then coupled with substituted phenyl hydrazine, in dimethyl sulfoxide at temperature 100°C for 4-5 h and obtained 3-benzyl-2-phenyl-4(5H)-(substituted phenyl hydrazino)-1,3-oxazolidines 6a-f [Figure 1] were separated by filtration, vacuum dried and recrystallized from warm ethanol.

The in vivo antihyperglycemic activity of synthesized compounds was evaluated using male Sprague–Dawley rats in two different models.

**Streptozotocin model**
A solution of streptozotocin (STZ) (60 mg/kg) in 100 mM citrate buffer, pH 4.5 was prepared and calculated amount of the fresh solution was dosed to overnight fasted rats (60 mg/kg) intraperitoneally. The blood sugar level was measured after 48 h by glucometer. Animals showing 200-400 mg/dL were selected for antidiabetic screening. The diabetic animals were divided into groups of six animals each. Rats of experimental group were administered a suspension of the desired test sample (prepared in 1% gum acacia) orally (100 mg/kg body weight). Controlled group animals were also fed with 1% gum acacia. The blood glucose levels were measured at 1-, 2-, 3-, 4-, 5-, 6-, 7- and 24-h intervals. The % fall in blood glucose from 1 to 24 h by test sample was calculated according to the area under curve (AUC) method. The average fall in AUC in experimental group compared to control group provided % antihyperglycemic activity.

**Sucrose-loaded (SLM) model**
Overnight-fasted male Sprague-Dawley rats were used for sucrose-loaded experiment. Blood was collected initially and there after test compounds were given to the test group consisting of five rats by oral gavage at a dose of 100 mg/kg body weight. After half an hour post-test treatment, a sucrose load of 10 gm/kg body weight was given to each rat. Blood was collected at 30, 60, 90 and 120 min post-sucrose load. The % fall in blood glucose level was calculated according to the AUC method.

RESULTS AND DISCUSSION

Chemistry

The synthesized series of heterocycles, 6a-f by the reaction of 5 with appropriate substituted phenyl hydrazine in the presence of anhydrous sodium acetate and glacial acetic acid as presented in Scheme. The IR, $^1$H-NMR, mass spectroscopy and elemental analysis for the new compound 5. The proton magnetic resonance spectra of oxazolidine and their corresponding derivatives have been recorded in CDCl$_3$. The recorded IR spectrum of representative compounds 6a-f showed missing of chloro group bands. This clearly envisages that oxazolidinone. The title compounds 6a-f stretching and bending NH bands appear at 3300-3400 cm$^{-1}$ and 1300-1350 cm$^{-1}$, respectively. The recorded IR spectrum of representative compounds 6a-f showed missing of chloro group bands. This clearly envisages that oxazolidinone.

3-benzyl-2-phenyl-4(5H)-4'chlorophenyl hydrazino-1,3-oxazolidine (6b)

Pale Yellow Solid; Yield: 78%; Rf value:0.41; mp. 175-177°C, IR: 3029 (Ar-CH), 829 (C-Cl), 1484 (C=C), 1316 (N-H bending), 3391 (N-H stretching) cm$^{-1}$; $^1$H-NMR (CDCl$_3$); δ 6.87-7.42 (m, 14H, Ar-H), 5.22 (s, 2H, -CH), 7.51 (s, 2H, N-H), 3.49-3.57 (m, 4H, 2 × CH$_2$); EI-MS (m/z, %); [M+2] 381; (Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; 451.23). Anal. Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; C, 62.27; H, 5.23; N, 9.90; Found: C, 62.11; H, 5.22; N, 9.74.

3-benzyl-2-phenyl-4(5H)-4'fluorophenyl hydrazino-1,3-oxazolidine (6c)

Pale Yellow Solid; Yield: 78%; Rf value:0.41; mp. 175-177°C, IR: 3029 (Ar-CH), 829 (C-Cl), 1484 (C=C), 1316 (N-H bending), 3391 (N-H stretching) cm$^{-1}$; $^1$H-NMR (CDCl$_3$); δ 6.87-7.42 (m, 14H, Ar-H), 5.22 (s, 2H, -CH), 7.51 (s, 2H, N-H), 3.49-3.57 (m, 4H, 2 × CH$_2$); EI-MS (m/z, %); [M+2] 381; (Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; 451.23). Anal. Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; C, 62.27; H, 5.23; N, 9.90; Found: C, 62.11; H, 5.22; N, 9.74.

3-benzyl-2-phenyl-4(5H)-4'methoxyphenyl hydrazino-1,3-oxazolidine (6d)

Pale Solid; Yield: 71%; Rf value:0.37; mp. 193-195°C, IR: 3012 (Ar-CH), 1559 (C=C), 1316 (N-H bending), 3326 (N-H stretching) cm$^{-1}$; $^1$H-NMR (CDCl$_3$); δ 6.83-7.47 (m, 14H, Ar-H), 5.25 (s, 2H, -CH), 7.53 (s, 2H, N-H), 3.42-3.52 (m, 4H, 2 × CH$_2$); EI-MS (m/z, %); [M+2] 381; (Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; 451.23). Anal. Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; C, 62.27; H, 5.23; N, 9.90; Found: C, 62.11; H, 5.22; N, 9.74.

3-benzyl-2-phenyl-4(5H)-4'acetamidophenyl hydrazino-1,3-oxazolidine (6e)

Pale Solid; Yield: 71%; Rf value:0.32; mp. 181-183°C, IR: 3012 (Ar-CH), 1559 (C=C), 1316 (N-H bending), 3326 (N-H stretching) cm$^{-1}$; $^1$H-NMR (CDCl$_3$); δ 6.83-7.47 (m, 14H, Ar-H), 5.27 (s, 2H, -CH), 7.53 (s, 2H, N-H), 3.16 (s, 3H, -OCH$_3$) 3.36-4.85 (m, 4H, 2 × CH$_2$); EI-MS (m/z, %); [M+2] 381; (Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; 451.23). Anal. Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; C, 62.27; H, 5.23; N, 9.90; Found: C, 62.11; H, 5.22; N, 9.74.

3-benzyl-2-phenyl-4(5H)-4'chlorophenyl hydrazino-1,3-oxazolidine (6f)

Pale Yellow Solid; Yield: 71%; Rf value:0.41; mp. 175-177°C, IR: 3029 (Ar-CH), 829 (C-Cl), 1484 (C=C), 1316 (N-H bending), 3391 (N-H stretching) cm$^{-1}$; $^1$H-NMR (CDCl$_3$); δ 6.87-7.42 (m, 14H, Ar-H), 5.22 (s, 2H, -CH), 7.53 (s, 2H, N-H), 3.42-3.52 (m, 4H, 2 × CH$_2$); EI-MS (m/z, %); [M+2] 381; (Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; 451.23). Anal. Calcd for C$_{29}$H$_{27}$BrN$_3$O$_4$; C, 62.27; H, 5.23; N, 9.90; Found: C, 62.11; H, 5.22; N, 9.74.
Table 1: *In vivo* antihyperglycemic activity of various 3-benzyl-2-phenyl-4(5H)-(substituted phenylhydrazino)-1, 3-oxazolidines 6a-f derivatives in streptozotocin (STZ) and sucrose-loaded (SLM) rat models

| Compounds       | % Blood sugar lowering activity (100 mg/kg) | STZ model | SLM model |
|-----------------|-------------------------------------------|-----------|-----------|

| Glybenclamide   |                                           | 29.0      | 33.7      |

Antihyperglycemic activity

Among the six screened compounds only 6e, 6a, 6b exhibit antihyperglycemic activity in STZ model and SLM model. Compound 6c displayed 27.3% blood glucose lowering activity at 100 mg/kg dose in SLM model and 6d showed 13.4% blood glucose lowering activity at 100 mg/kg dose in STZ model. In these compounds, 3-benzyl-2-phenyl-4(5H)-4'acetamidophenyl hydrazino-1, 3-oxazolidine 6e reduced blood glucose level to 54 and 71% in STZ and SLM models, respectively. It is evident from Table 1 that, the presence of benzyloxy (6f) caused a complete loss of antihyperglycemic activity. A closer inspection of data from this table indicates that compounds acetamido, bromo and chloro phenylhydrazino substitution of oxazolidine having excellent antihyperglycemic activity compared with standard. The transformation order of screened compounds is 6e>6a>6b>6c>6d>6f. Metformin and glybenclamide were used as standard antidiabetic drug in both the models.
