**ABSTRACT**

Objectives: *Caralluma* belongs to the family Asclepiadaceae, native to the Indian sub-continent have different medicinal properties and used in folk medicine as remedies to treat wide variety of diseases and health conditions. Objective of present study was to isolate, analyze and identify the phytochemicals composition from steam of *Caralluma quadrangula*.

Methods: Extractions of the chemical components was carried out by different chromatographic techniques. The phytochemical characterizations were evaluated by nuclear magnetic resonance and mass spectrometry.

Results: The quantitative phytochemical analysis of this species exhibited the presence of three compounds, Glochidonol (5gm), Dihydroxy-14-pregn-5-en-20-one (9.8gm), Hydroxystigmast-5-en-7-one (7.8gm) and Stigmasterol (5.7 mg). Hydroxystigmast-5-en-7-one, report from *Caralluma quadrangula* stem as first time.

Conclusion: The present study is strengthen for the discovery three pure chemical compounds from *C. quadrangula*.

Keywords: *Caralluma quadrangula*, Glochidonol, 3,14-dihydroxy-14-pregn-5-en-20-one, 3-Hydroxystigmast-5-en-7-one, Stigmasterol.

**INTRODUCTION**

Thousands of years, medicinal plants have an important role during the world in treating and preventing a diversity of diseases. *Caralluma* is belongs to the family Asclepiadaceae, medically important genus widely studied for its stem and fruits. *Caralluma* classification widely studied for its stem and fruits. *Caralluma* genus is classified into 200 genera and 2500 species. *Caralluma* genus have about 200 species spread in Africa and Asia. The common of these species are native to the Indian sub-continent and Arabian peninsula. Most species of *Caralluma* are edible and form part of the traditional medicine system in the word. Usually used in folk medicine as remedies to treat wide variety of diseases and health conditions. Also used to treat liver diseases, diabetes and hypertension. The *Caralluma* flowers are useful superficially for wounds and cuts, while the juice of the stem is given to sick people to speed convalescence of burns, itchy skin and sunburns. In the Indian state Andhra Pradesh, *C. attenuata* (Wight) is eaten raw as an antidiabetic agent, while the juice of the plant along with black pepper is recommended in the treatment of migraine. The diverse applications of *Caralluma* plants in folk medicine have prompted the phytochemical and biological investigations of their constituents. The key phytochemical ingredients in *Caralluma* are pregnane glycosides, flavone glycosides, megastigmane glycosides, bitter principles, triterpenes and saponins.

**MATERIALS AND METHODS**

General experimental procedures:-

All active constituent were purified by following standard procedures and all chemicals used Analytical Reagent grade.

Plant material:-

![Figure 1: Glochidonol](Image)
Stems a of *Caralluma quadrangula* (Asclepiadaceae) from Sana’a were collected (2014). The plant identified by Dr. Hessen Ibrahim. Deposited the sample of plant in Herbarium, Department of Phytochemistry.

**Extraction and Isolation**: Shade dried stems were powdered. The powder was stored in air close container. The powder was weighed and extracted with soxhlet extractor by using solvents (Hexane, Chloroform, and ethanol). To concentrate the extracts and removal of solvent, rotary evaporate was used\(^{15,16}\). Then, purify the crude extracts. By using Fisher-John apparatus melting point was taken. The \(^1H\) NMR and \(^13\)C NMR spectra done by Bruker 100 MHz and 300 MHz, spectrometer, using an internal standard like TMS. Mass spectra were recorded by using ZAB-HS mass spectrometer.

**Test for alcohol**
Dissolved little amount of crude extract was in 0.5 ml of dioxane. The solution was added to 0.5 ml of ceric ammonium nitrate reagent. Then one ml of dioxane was added and stunned. Yellow to red color formation gives an alcoholic hydroxyl group\(^7\).

**Libermann-Burchard test**
Acetic anhydride drops were added to the extract and boiled. Concentrated sulphuric acid was added to the above cooled solution. Presence of sterols gives a brown ring at joint of two layers and green color in upper layer\(^7\).

**General extraction and isolation**
The air-dried powder (1100g) of stems of *Caralluma quadrangula* was Soxhlet with solvents (3X, 8 hours each) and evaporated the combined extracts to give a dark brown residue (6 g) each) and evaporated the combined extracts to give a dark brown residue (6 g) subjected the extract to silica gel flash column chromatography (FCC) with chloroform containing increasing percentages of ethanol as eluent. Fractions 1-5 were combined and purification by C.C. to yield JJ1 (5.0 mg) known as Glochidonol, (1), (hexane-EtOAc), JJ2 (9.8 mg) known as 3,14-dihydroxy-14-pregn-5-en-20-one (2), JJ3 (7.8 mg) known as 3-Hydroxystigmast-5-en-7-one (3) and JJ5 (5.7 mg) known as Stigmasterol (4). All the isolated compounds were recognized by relationship with spectroscopy data.

**Glochidonol (1)**: White powder (4.9 mg), mp 226-230 \(^\circ\)C. \(^1H\) NMR (CDCl3, 300 MHz): \(\delta\) 4.71, 4.60 (2H, s, H-29a, b), 3.26 (1H, dd, J= 4.76, 11.00 Hz), 0.61, 0.63, 0.81, 0.92, 0.93, 1.01, 1.10 (each 3H, s, Mex7). \(^13\)C NMR (CDCl3, 100 MHz):\(\delta\) 214.68 (C-3), 149.08 (C-20), 105.46 (C-29), 80.09 (C-1), 55.51 (C-5), 50.62 (C-9), 48.54 (C-18), 48.10 (C-19), 43.12 (C-17), 43.02 (C-14), 41.08 (C-8), 40.24 (C-22), 39.10 (C-13), 38.29 (C-4), 37.30 (C-10), 35.85 (C-16), 34.53 (C-7), 30.01 (C-21), 28.25 (C-23), 27.63 (C-15), 27.54 (C-12), 25.27 (C-2), 21.06 (C-11), 19.52 (C-30), 18.48 (C-6), 18.21 (C-28), 16.26 (C-25), 16.20 (C-26), 15.61 (C-24), 14.66 (C-27).

EIMS m/z (rel. int.): 428 [M]+ (100), 410 (19), 395 (31), 287 (17), 247 (09), 192 (31). \(^1H\)-NMR (300 MHz, CDCl3): \(\delta\) 0.66 (3H, s, H-18), 1.15 (3H, s, H-19), 3.68 (1H, m, H-3a), 5.67 (1H, d, J = 1.8 Hz, H-6). \(^13\)C-NMR (150 MHz, CDCl3): \(\delta\) 36.27 (C-1), 31.15 (C-2), 70.51 (C-3), 41.77 (C-4), 166.12 (C-5), 124.20 (C-6), 202.83 (C-7), 45.55 (C-8), 49.92 (C-9), 38.32 (C-10), 21.21 (C-11), 38.82 (C-12), 43.08 (C-13), 49.93 (C-14), 26.54 (C-15), 28.11 (C-16), 54.48 (C-17), 11.94 (C- 18), 17.30 (C-19), 36.07 (C- 20), 18.91 (C-21), 33.93 (C-22), 26.34 (C-23), 45.87 (C-24), 29.68 (C-25), 18.75 (C-26), 19.78 (C-27), 23.02 (C-28), 11.93 (C-29).

**Figure 5**: 3\(\beta\)-Hydroxystigmast-5-en-7-one
RESULTS AND DISCUSSION

Compound 1: White powder, ¹H NMR scale showed seven tertiary methyl groups and one secondary hydroxyl group. Olefinic protons appeared at δ 4.71 and 4.60. ¹³C NMR of the Glochidonol showed hydroxyl group C-1 appeared at δ 80.09, 30 signals for the terpenoid of lupine skeleton which have seven methyl groups. The carbon double bonded of alkenic carbons appeared at δ 149.08 and 105.46.

Compound 2: Was white needle-like crystals, MP 200-201°C, molecular formula C₂₈H₄₂O m/z 412 M⁺. ¹H-NMR for three methyl singlet's at δ 1.05, 1.07 and 1.31. H-3 proton appeared as a multiple at δ 3.53 and singlet at δ 4.12. Also have olefinic protons at δ 5.17. The ¹³C NMR showed alkenes carbons appeared at δ 143.06 and 121.86 and have twenty one carbon signal with three methylenes, nine methylenes, five methins and five quaternary carbons. Carbon bond to hydroxyl group is C-3 and C-14 that appeared at δ75.2 and 78.3.

Compound 3: Were colorless granules, MS data of the compound gives m/z 428. ¹H NMR spectrum showed tow methyl groups appeared at δ 0.66 and 1.15. The H-3 proton appeared at δ 3.68 as multiplet and showed olefinic protons at δ 5.67. ¹³C NMR showed twenty one carbon signal with three methylenes, ten methylenes, nine methins and four quaternary carbons. Double bond carbons appeared at δ 166.12 and 124.20.

Compound 4: ¹H NMR data showed c proton of sterol part at δ 3.51 as multiple. Signals at δ 5.34, 5.10 and 4.97 correspond to two and one ethylene protons correspondingly present on C22, C23 and C6. Also have Peaks at δ 1.09 are corresponding to methyl groups (Me-18, Me-19, Me-21) and 0.85 are consequent to methyl groups (Me-26, Me-27 and Me-29). ¹³C NMR spectrum have six methyl, nine
methylene, eleven methine and three quaternary carbons. Double bond Signals appeared at δ 140.81 and 121.82. Proton additional of β-hydroxyl group to C3 showed a peak at δ 71.81.

CONCLUSION
The isolation and identification Glochidonol, 3,14-dihydroxy-14-pregn-5-en-20-one, 3-Hydroxystigmast-5-en-7-one and Stigmasterol from the stems of Caralluma quadrangula. The isolation, purification and analysis carried out by means of various physical (solvent extraction, column chromatography, radial chromatography, preparative TLC and melting points) and spectral techniques.

AUTHOR’S CONTRIBUTION
The manuscript was carried out, written, and approved in collaboration with all authors.
