ABSTRACT

Background: Skin diseases among the pediatric age group people are more common and it contributes to significant burden to health sectors. Also, the pattern of skin diseases changes consistently with reference to place and time. Hence the present study was conducted to assess the pattern of skin diseases in pediatric age group patients attending a tertiary care hospital.

Methods: The cross-sectional study was conducted by the department of Dermatology, Venereology and Leprosy at Sri Muthukumaran Medical College Hospital and Research Institute, among the pediatric age group patients attending the outpatient department, during the month of October to December 2019. A total of 412 pediatric age group patients with skin disorder were included in the study. The study was conducted using a proforma with the clinical history and diagnosis of the participants. Data was entered in Microsoft excel and data analysis was done using SPSS version 17.

Results: The common skin disorders reported in this study includes infections (34.7%) followed by dermatitis (32.3%), infestations (11.4%), miliaria (8.3%), popular urticaria (7.5%) and urticaria (6.1%). Among the infections fungal, bacterial and viral pathogens contributes to 16.3%, 10.9% and 7.5% of cases, respectively. Also 11.2% of cases were found to be infested with scabies (9.2%) and pediculosis (2.2%).

Conclusions: Skin disorders in the pediatric age group are common and showing increasing trend. Hence health education of the parents and the school children about good nutrition, hygiene practices, and proper hydration of skin can be promoting in order to reduce the burden of skin disorders.

Keywords: Skin disorders, Pediatric age group, Infections, Dermatitis

INTRODUCTION

Dermato-epidemiology refers to study of the epidemiology of dermatological disorders.\(^1\) Distribution of skin diseases differs from country to country and even city to city. Some factors like genetic, environment, race, occupation, nutrition and habits can influence the pattern of skin diseases.\(^2\)-\(^4\)

Skin or dermatological disorders are more common and it is the fourth non-fatal health burden, globally.\(^5\) It constitutes two percentages of total outpatient department (OPD) consultations worldwide.\(^6\)

Various studies conducted in developing countries have concluded that skin diseases are very common among children and adolescents, infections and infestations being high on the list.\(^7\) India being the second most populous country in the world with about 35% of its population in the pediatric age group (<14 years of age).\(^8\)

Skin diseases in the pediatric age group can be transitory, chronic or recurrent. Primary or secondary
dermatological complaints constitute about 30% of all outpatient visit to a children clinic and dermatological outpatient department visits.9,11

The most important factors accounting for distribution of skin diseases in the developing country like India includes malnutrition socioeconomic status, poor standards of hygiene and overcrowding.7

The knowledge about the prevailing morbidity pattern of skin diseases among pediatric population is more important in order to take essential steps in reducing them and also health educational programs and precautionary measures like personal hygiene, proper nutrition can be planned which in turn improve the health status of pediatric population. Present study was conducted to assess the pattern of skin diseases in pediatric age group patients attending a tertiary care hospital.

**Objectives**

To assess the prevailing pattern of skin disorders among the pediatric age group patients attending outpatient department of dermatology in a tertiary care center.

**METHODS**

The cross-sectional study was conducted by the department of Dermatology, Venereology and Leprosy at Sri Muthukumaran Medical College Hospital and Research Institute, among the pediatric age group patients attending the outpatient department, during the month of October to December 2019. Based on the literature, considering the prevalence of common skin disorder among the pediatric age group as 41% with confidence of 95% and absolute precision of 5%, the sample size was calculated as 372.12 Also 10% non-response rate was added to the calculated sample size and thus a total of 412 pediatric age group patients with skin disorder were included in the study. All children between 0-12 years of age who were attending the outpatient department of dermatology, Venereology and Leprosy were included in the study. Participants who were immunocompromised were excluded from the study.

The individual participant’s parents were explained about the study and they were also assured that, their identity and their child identity would be kept strictly confidential and they have the option to refuse participation in the study. Written informed consent was obtained from the study participant’s parents prior to the interview.

Every effort was made, to be sure that all information collected from the participants, remain confidential. The study was conducted using a proforma with the clinical history and diagnosis of the participants. Data was entered in microsoft excel and data analysis was done using statistical package for social sciences (SPSS) version 17.

**RESULTS**

In this study majority of the study participants (30.1%) were in the age group of 7-9 years followed by 27.4%, 22.1% and 20.4% of participants in the age groups of 3-6 years, less than 3 years and 10-12 years, respectively. The mean age of the study participants was found to be 7.21±4.53 years. This study showed male predominance with 58.5% and 41.5% of male and female participants, respectively (Table 1).

**Table 1: Proportion of participants in different age group and gender.**

| Variables     | Frequency | Percentage |
|---------------|-----------|------------|
| Age group (in years) |           |            |
| <3            | 91        | 22.1       |
| 3-6           | 113       | 27.4       |
| 7-9           | 124       | 30.1       |
| 10-12         | 84        | 20.4       |
| Gender        |           |            |
| Male          | 241       | 58.5       |
| Female        | 171       | 41.5       |

In the present study, the common skin disorders reported includes infections (34.7%) followed by dermatitis (32.3%), infestations (11.4%), miliaria (8.3%) and urticaria (6.1%). Among the skin disorders, infective disorders contribute to major proportion (34.7%). Among the infections fungal, bacterial and viral pathogens contributes to 16.3%, 10.9% and 7.5% of cases, respectively. Also 11.2% of cases were found to be infested with scabies (9.2%) and pediculosis (2.2%) (Table 2).

**Table 2: Proportion of cases with infections and infestations.**

| Variable      | Frequency | Percentage |
|---------------|-----------|------------|
| Infections    | 143       | 34.7       |
| Bacterial     | 45        | 10.9       |
| Viral         | 31        | 7.5        |
| Fungal        | 67        | 16.3       |
| Infestations  | 47        | 11.4       |
| Scabies       | 38        | 9.2        |
| Pediculosis   | 9         | 2.2        |

In this study, 32.3% of cases were found to have dermatitis with seborheic dermatitis being the most common (11.7%). Other dermatitis includes atopic dermatitis (6.3%), pityriasis alba (5.8%), eczema (4.4%), contact dermatitis (3.4%) and diaper dermatitis (0.7%). Urticaria was reported among 6.1% of cases with 5.1% and 1.0% cases of acute urticaria and chronic urticaria, respectively (Table 3).

In this study, miliaria and popular urticaria were reported among 8.3% and 7.5% of cases, respectively. Other
disorders like acne, vitiligo, autoimmune disorder, keloid, hair disorders were reported among 1.5%, 1.2%, 1.7%, 0.7% and 1.2% of cases, respectively (Table 4).

Table 3: Proportion of cases with dermatitis and urticaria.

| Variable              | Frequency | Percentage |
|-----------------------|-----------|------------|
| Dermatitis            | 133       | 32.3       |
| Atopic dermatitis     | 26        | 6.3        |
| Seborrhoeic dermatitis| 48        | 11.7       |
| Pityriasis alba       | 24        | 5.8        |
| Diaper dermatitis     | 3         | 0.7        |
| Contact dermatitis    | 14        | 3.4        |
| Eczema                | 18        | 4.4        |
| Urticaria             | 25        | 6.1        |
| Acute                 | 21        | 5.1        |
| Chronic               | 4         | 1.0        |

Table 4: Proportion of cases with uncommon skin disorders.

| Other skin disorders  | Frequency | Percentage |
|-----------------------|-----------|------------|
| Papular urticaria     | 31        | 7.5        |
| Acne                  | 6         | 1.5        |
| Vitiligo              | 5         | 1.2        |
| Autoimmune            | 7         | 1.7        |
| Keloid                | 3         | 0.7        |
| Miliaria              | 34        | 8.3        |
| Hair disorders        | 5         | 1.2        |
| Miscellaneous         | 12        | 2.9        |

DISCUSSION

In the present study, among the skin disorders, infective disorders contribute to major proportion (34.7%). Among the infections fungal, bacterial and viral pathogens contributes to 16.3%, 10.9% and 7.5% of cases, respectively. Also 11.2% of cases were found to be infested with scabies (9.2%) and pediculosis (2.2%).

In this study, 32.3% of cases were found to have dermatitis with seborrhoeic dermatitis being the most common (11.7%). Other dermatitis includes atopic dermatitis (6.3%), pityriasis alba (5.8%), eczema (4.4%), contact dermatitis (3.4%) and diaper dermatitis (0.7%). Urticaria was reported among 6.1% of cases with 5.1% and 1.0% cases of acute urticaria and chronic urticaria, respectively.

In this study, Miliaria was reported among 8.3% of cases. Other disorders like acne, vitiligo, autoimmune disorder, keloid, hair disorders were reported among 1.5%, 1.2%, 1.7%, 0.7% and 1.2% of cases, respectively.

Dogra et al reported that in their study the most common skin conditions was infections (11.4%) followed by pityriasis alba (8.4%), dermatitis/nonspecific eczemas (5.2%), infestations (5.0%), disorders of pigmentation (2.6%), keratinization disorders (mostly keratosis pilaris) (1.3%) and nevi/hamartomas (1.1%).

In their study they reported that the point prevalence of eczemas/dermatitis was 6.5%. This finding was comparatively much lower than the findings of the present study and the studies conducted in the Western countries which reported prevalence between 11-22%. 

Ghosh et al conducted a study among 500 children (<12 years) attending dermatology OPD were recruited to study the pattern of common dermatoses. In their study, pyoderma was the most common skin disease (35.6%), followed by scabies (22.4%), eczema (17.6%), molluscum contagiosum (4.6%), papular urticaria (4.0%), vitiligo (3.4%), miliaria (2.8%) and nevi (1.6%).

An epidemiologic study from Garhwal et al, conducted in the hilly area of Uttar Pradesh in children showed that pediculosis capitis (22.6%) was the most common dermatosis, followed by pyoderma (15.4%), pityriasis alba (10.4%) and eczema (8.1%). 

Nutritional deficiency dermatoses (17.5%) were also common in this region (common manifestations included sparse hair (6.2%) and pigmented skin (7%)).

A study from south India by Karthikeyan et al among the children of less than 14 years of age reported that infections and infestations (54.5%) were the most common pediatric dermatoses.

Bisht et al reported that infections and infestations were commonest disorders contributing to 36.46% of all cases. Major infections/ infestations were viral (9.76%) followed by scabies (9.29%), fungal (9.01%) and bacterial (8.46%). 

Other important groups of dermatological disorders were dermatitis in 29.63% cases out of which seborrhoeic dermatitis (10.12%), atopic dermatitis (5.96%), pityriasis alba (5.96%), non-specific eczema (3.46%) and contact dermatitis (2.77%). Other skin diseases included papular urticaria/insect bite allergy (8.46%), naevi/developmental lesions (4.02%), pigmented lesions (3.32%), sweat gland disorders (2.08%) and miscellaneous group (6.38%) respectively.

Balai et al reported that infection and infestation were the most common finding in their study (40.6%) followed by eczematous (34.8%) and hypersensitivity (10.2%). They reported that among the infection and infestation, bacterial infection (13.7%) was the most common entity followed by scabies (10.4%), fungal (6.5%), and viral infection (3.4%).

In the present study, 4.4% of cases had eczema. Eczemas, including atopic dermatitis, have a higher prevalence in developed countries, being influenced by socioeconomic and environmental factors such as excessive hygiene, carpets, and central heating.
CONCLUSION

Skin disorders in the pediatric age group are common and showing increasing trend compared to the previous studies. Hence there is a need for diagnostic and therapeutic training for dermatologists, general practitioners and pediatricians in this group of disorders. Also, health education of the parents and the school children about good nutrition, hygiene practices, and proper hydration of skin can be promoting in order to reduce the burden of skin disorders.

ACKNOWLEDGEMENTS

I would like to thank all, who has guided me by extending their knowledge and experience right from the inception to the completion of the work. Also, I would like to acknowledge the medical superintendent and all the staffs, for their support during the study period. Last but not least I am thankful to my study participants, the staffs, for their support during the study period.
