Chemistry (General). All reagents were obtained commercially unless otherwise noted. Reactions were performed using glassware that was oven dried (120°C) unless otherwise stated. Air- and moisture-sensitive liquids and solutions were transferred via syringe or stainless-steel cannula. Organic solutions were concentrated under reduced pressure (∼5 Torr) by rotary evaporation. Solvents were purified by passage under 12 psi N₂ through activated alumina columns. Chromatography was performed using Fisher Chemical™ Silica Gel Sorbent (230-400 Mesh, Grade 60). Compounds purified by chromatography were typically applied to the adsorbent bed using the indicated solvent conditions with a minimum amount of added dichloromethane as needed for solubility. Thin layer chromatography (TLC) was performed on Merck silica gel 60 F254 plates (250 μm). Visualization of the developed chromatogram was accomplished by fluorescence quenching or by staining with butanolic ninhydrin, aqueous potassium permanganate, ethanolic vanillin, or aqueous ceric ammonium molybdate (CAM).

Nuclear magnetic resonance (NMR) spectra were acquired on either a Bruker 400 operating at 400 and 100 MHz or a Varian-600 operating at 600 and 150 MHz for ¹H and ¹³C, respectively, and are referenced internally according to residual solvent signals. Data for ¹H NMR are recorded as follows: chemical shift (δ, ppm), multiplicity (s, singlet; br s, broad singlet; d, doublet; t, triplet; q, quartet; quint, quintet; sext, sextet; m, multiplet), integration, and coupling constant (Hz). Data for ¹³C NMR are reported in terms of chemical shift (δ, ppm). Infrared spectra were recorded using a Thermo Scientific Nicolet iS10 spectrometer with Smart iTX Accessory (diamond ATR) and are reported in frequency of absorption. Low-resolution mass spectra were obtained using a Waters Acuity Arc LC-MS.

Chemistry (Synthetic Details). The specific procedures used to synthesize the compounds reported in this manuscript are detailed below along with characterization data. Spectral data (¹H and ¹³C NMR spectra) for each compound tested in biological assays is included at the end of the supporting information. All compounds tested in biological assays were confirmed to be of >95% purity based on UHPLC analysis (Waters ACQUITY Arc).

Procedure for Preparing 4a and 4b. To a solution of pyridine (10.0 g, 126.4 mmol, 1.0 equiv) and sodium borohydride (4.8 g, 126.4 mmol, 1.0 equiv) in MeOH (56 mL, 2.3 M) at -78°C was added benzylchloroformate (18.0 mL, 216.6 g, 126.4 mmol, 1.0 equiv) via slow dropwise addition. Gas evolution was observed. The mixture was stirred for 3h at -78°C, diluted with Et₂O (100 mL) and H₂O (50 mL), and warmed to room temperature. The aqueous layer was extracted with Et₂O (3 x 50 mL). The combined organic extracts were washed with brine (3 x 50 mL), dried over Na₂SO₄, and concentrated under reduced pressure to yield a clear oil. The product was passed through a short plug of silica gel using hexanes:EtOAc (95:5) as the eluent. The resulting filtrate was concentrated under reduced pressure. After purging with nitrogen, methyl vinyl ketone (10.5 mL, 126.4 mmol, 1.0 equiv) was added to the flask and the neat solution was heated to 80°C for 24 h. After cooling the mixture to room temperature, MeOH (250 mL) was added followed by 25% w/w aqueous NaOMe (2.4 mL, 8.9 mmol, 0.07 equiv). The resulting mixture was stirred for 15 min, quenched with H₂O (5 mL), then concentrated under reduced pressure. The residue was dissolved in DCM (250 mL) and then washed with H₂O (100 mL) followed by brine (50 mL). The organic layer was dried over Na₂SO₄ and concentrated under reduced pressure. The product was purified by chromatography on silica gel (3:1 hexanes:EtOAc) to give a clear oil containing a mixture of 4a and 4b (26.5 g, 73% over 3 steps, ∼1:1 exo:endo as a mixture of rotamers).

**General Procedure for Preparing Hydrazines.** Most hydrazines were commercially available, however the 4-iodo and 4-benzoylhydrazines were synthesized in house according to the following procedure. A 0.5 M solution of 4-substituted aniline (3.99 mmol, 1 equiv) in aqueous concentrated HCl was cooled to 0°C before the addition of 2.0 M aqueous NaNO\(_2\) (3.91 mmol, 0.98 equiv). The solution was stirred for 20 min at 0°C. Next, a solution of SnCl\(_2\)•2H\(_2\)O (10.4 mmol, 2.6 equiv) dissolved in concentrated aqueous HCl (2.4 mL) was added. The mixture was stirred for 2 h, warmed to room temperature, filtered, and rinsed with \( \text{H}_2\text{O} \) and \( \text{Et}_2\text{O} \). The solids were dried under reduced pressure and used immediately without further purification.

**Preparation of 5-Substituted Tryptophols.** All 5-substituted tryptophols were prepared from the corresponding 4-substituted hydrazines as outlined here.

Procedure for Preparing 9a, 9b, 10a, and 10b. First, the hydroxyl groups of the tryptophols shown above were converted to the iodides. To accomplish this transformation, a solution of iodine (251 mg, 0.99 mmol, 1.4 equiv) and triphenyl phosphate (260 mg, 0.99 mmol, 1.4 equiv) in DCM (2.75 mL, 0.25 M) was cooled to 0°C. Next, a tryptophol (0.71 mmol, 1.0 equiv) was added dropwise. The solution was stirred until starting material had been consumed as determined by TLC (~5 h). The reaction mixture was concentrated under reduced pressure to afford the alkyl iodide, which was used immediately without further purification.

In a separate flask, a mixture of 6a or 6b (271 mg, 1.0 mmol, 1.0 equiv) and 10% Pd/C (85 mg, 0.08 mmol, 0.08 equiv) was stirred in MeOH (5 mL, 0.2 M) under an atmosphere of N$_2$. The flask was then purged with H$_2$ gas and stirred vigorously under an atmosphere of H$_2$ until the starting material had been consumed as determined by TLC (~3 h). The mixture was filtered over a pad of Celite, which was washed with 50 mL of MeOH containing 1% aqueous NH$_4$OH. The filtrate was then dried over Na$_2$SO$_4$ and concentrated under reduced pressure to yield a clear oil. The oil was immediately dissolved in DMF (2.5 mL, 0.4 M) and added to a flask containing the unpurified alkyl iodide (271 mg, 1.0 mmol, 1.0 equiv, generated as described above) and
solid NaHCO₃ (168 mg, 2 mmol, 2 equiv.). The mixture was heated at 80°C for 20h before being cooled to room temperature and diluted with 1M aqueous Na₂CO₃ (15 mL) and EtOAc (15 mL). The aqueous layer was extracted with EtOAc (3 x 10 mL). The combined organic extracts were washed with H₂O (10 mL), 5% aqueous LiCl (10 mL), and brine (10 mL) before being dried over Na₂SO₄ and concentrated under reduced pressure. Procedure for Preparing 11a and 11b. First, the 5-benzylxy-isoquinuclidine was synthesized as described above. Next, this starting material (100 mg, 0.26 mmol, 1.0 equiv) was dissolved MeOH (1.3 mL, 0.2 M) containing 10% Pd/C (22 mg, 0.02 mmol, 0.08 equiv) under a N2 atmosphere. The flask was then purged with H2 gas and stirred vigorously under an atmosphere of H2 until the starting material had been consumed as determined by TLC (~24 h). The mixture was filtered over a pad of Celite, which was washed with 50 mL of MeOH containing 1% aqueous NH4OH. The filtrate was then dried over Na2SO4 and concentrated under reduced pressure to yield a brown oil. The product was purified by chromatography on silica gel (30:1 DCM:MeOH with 1% NH4OH).

Procedure for the Large-Scale Preparation of 18 • fumarate. To an ice-cold solution of aqueous 6 M HCl (30 mL) was added 3-methoxyaniline (4.4 ml, 40.0 mmol, 1.0 equiv) dropwise. Next, NaNO$_2$ (3.040 g, 44.0 mmol, 1.1 equiv) was dissolved in H$_2$O (30 mL) and added to the solution slowly. After stirring at 0 ºC for 15 minutes, SnCl$_2$ (22.8 g, 120.0 mmol, 3.0 equiv) dissolved in concentrated aqueous HCl (30 mL) was added to
the solution dropwise. After stirring at 0 °C for 2.5 h, the reaction mixture was filtered, washed with hexanes, and dried under reduced pressure to yield 3-methoxyphenylhydrazine hydrochloride as a light yellow solid (5.4 g, 78%) that was used without further purification.

To a solution of 3-methoxyphenylhydrazine hydrochloride (4.802 g, 27.6 mmol, 3.0 equiv) in 0.15 M EtOH (60 mL) was added 1-methylazepan-4-one hydrochloride (1.5 g, 9.2 mmol, 1.0 equiv) followed by concentrated aqueous HCl (3.1 mL, 36.8 mmol, 4.0 equiv). The mixture was refluxed for 12 h and then concentrated under reduced pressure. The oily residue was dissolved in DCM (~50 mL) and basified with 1M aqueous NaOH (~50 mL). The aqueous layer was extracted with DCM (3 x 30 mL). The combined organic extracts were dried over Na$_2$SO$_4$ and concentrated under reduced pressure to yield a mixture of the 6- and 4-substituted indoles. Addition of EtOAc to the unpurified product mixture resulted in precipitation of the 6-substituted isomer, which was isolated via filtration. The mother liquor was concentrated, and this procedure was repeated six times until a total of 1.028 g of tabernanthalog free base (49%) was collected.

Next, fumaric acid (408 mg, 3.5 mmol, 0.8 equiv) was added to a sealed tube containing acetone (20 mL). The solution was carefully heated until all of the fumaric acid dissolved. After cooling the solution to room temperature, a solution of 18 free base (1.028 mg, 4.4 mmol, 1.0 equiv) in acetone (5 mL) was added dropwise, and the mixture was cooled in the freezer overnight. The solid was filtered, washed with acetone, and dried under reduced pressure to yield 18 • fumarate as the 1:1 salt (1.055 g, 69%).
