On the motion of a small rigid body in a viscous compressible fluid

Eduard Feireisl, Arnab Roy, and Arghir Zarnescu

ABSTRACT
We consider the motion of a small rigid object immersed in a viscous compressible fluid in the 3-dimensional Euclidean space. Assuming the object is a ball of a small radius \( \varepsilon \) we show that the behavior of the fluid is not influenced by the object in the asymptotic limit \( \varepsilon \to 0 \). The result holds for the isentropic pressure law \( p(\rho) = a\rho^\gamma \) for any \( \gamma > \frac{3}{2} \) under mild assumptions concerning the rigid body density. In particular, the latter may be bounded as soon as \( \gamma > 3 \). The proof uses a new method of construction of the test functions in the weak formulation of the problem, and, in particular, a new form of the so-called Bogovskii operator.

1. Introduction
Consider a rigid body immersed in a viscous fluid. Intuitively, the impact of a “small” body on the fluid motion should be negligible. A rigorous justification of this statement has been obtained in several recent studies on condition that the fluid is incompressible, see Lacave and Takahashi [1], Iftimie et al. [2], He and Iftimie [3,4], Dashti and Robinson [5], Chipot et al. [6], and Feireisl et al. [7]. The approach of [1] is based on the \( L^p - L^q \) estimates for the associated solution semigroup available in the 2D-setting, while He and Iftimie [3] used a specific construction of time dependent test functions vanishing on the moving body. In [5], a viscous fluid-rigid disk system has been studied where the disk is not rotating and they proved that the body does not influence the flow in the asymptotic limit. Lacave [8] studies the limit of a viscous fluid flow in the exterior of a thin obstacle shrinking to a curve. In [6], Chipot et al. considered two-dimensional “punctured periodic domain” with the periodic boundary conditions on the boundary of the domain and examine the behaviour of solutions as the radius of the obstacle goes to zero. In [9], the authors consider the motion of a rigid body inside a compressible fluid in planar domain and establish that the influence of the body on the fluid is negligible if the diameter of the body is small and the fluid is nearly incompressible (the low Mach number regime).

Recently, Bravin and Nečasová [10] combined the technique of [3] with the pressure estimates obtained via the new Bogovskii operator introduced in [11] and Lu and
Schwarzacher [12] to handle the 3D compressible case under certain technical restrictions imposed on the pressure–density equation of state, notably on the value of adiabatic exponent. The above-mentioned technique seems difficult to adapt to the planar (2D) motion of a compressible fluid and the results are not optimal even in the 3D-setting, where certain additional restrictions are needed on the value of the adiabatic exponent. Indeed, a single point in the $d$-dimensional space has a positive $W^{1,p}$ capacity as soon as $p > d$. Accordingly, the approximation technique developed in [3] requires the pressure to be uniformly $\frac{d}{d-1}$ integrable when the diameter of the body approaches zero. Unfortunately, the best known estimates for the standard example of the isentropic pressure $p(q) = aq^\gamma$ read

$$p(q) \in L^q, \text{ with } q = \frac{d + 2}{d} - \frac{1}{\gamma}$$

see Lions [13], meaning the value $q = 2$ for $d = 2$ is never achieved, while $q = \frac{3}{2}$ for $d = 3$ requires $\gamma \geq 6$.

To handle physically realistic adiabatic exponents, we propose a new approach based on the concept of weak solution introduced in [14]. We first observe that the test functions used for the approximate problem need not vanish on the moving body but only satisfy the rigid body motion constrain. Using this rather straightforward observation, we construct a new approximation operator based on the version of the Bogovskii operator on uniformly John domains due to Diening et al. [15]. The result seems optimal as we recover the desired convergence without any additional restrictions on the equation of state, notably on the adiabatic coefficient $\gamma > \frac{3}{2}$, $d = 3$ in agreement with the available existence theory.

The article is organized as follows. In Section 2, we formulate the problem, recall the concept of weak solution and state the main result of the article. The available uniform bounds are summarized in Section 3. Sections 4 and 5 are the heart of the paper. We construct a general restriction operator along with its vector valued version preserving the divergence of the extended function. The pressure estimates necessary to perform the asymptotic limit for “vanishing” body are derived in Section 6. Finally, the convergence proof is completed in Section 7.

### 2. Problem formulation, weak solutions, main results

The motion of a compressible viscous fluid in the barotropic regime is governed by the Navier–Stokes system

$$\partial_t \rho + \text{div}_x (\rho u) = 0, \quad (2.1)$$

$$\partial_t (\rho u) + \text{div}_x (\rho u \otimes u) + \nabla_x p = \text{div}_x S(\nabla_x u), \quad (2.2)$$

supplemented with

Newton’s rheological law

$$S(\nabla_x u) = \mu \left( \nabla_x u + \nabla_x' u - \frac{2}{d} \text{div}_x u \mathbb{I} \right) + \eta \text{div}_x u \mathbb{I}, \mu > 0, \eta \geq 0. \quad (2.3)$$

Here, $\rho$ is the mass density and $u$ is the fluid velocity.
For mostly technical reasons, we focus on the Cauchy problem for \( d = 3 \) and neglect the effect of external forces. Accordingly, the fluid occupies the whole physical space \( \mathbb{R}^3 \), where the density and the velocity satisfy the far-field conditions

\[
\mathbf{u} \to 0, \ \bar{\rho} \to 0 \text{ as } |x| \to \infty.
\]

(2.4)

In particular, we suppose the total mass of the fluid–body system is finite,

\[
\int_{\mathbb{R}^3} \bar{\rho}(t, \cdot) \, dx < \infty.
\]

More general far-field conditions

\[
\mathbf{u} \to 0, \ \bar{\rho} \to \bar{\rho}_{\infty} \text{ as } |x| \to \infty, \ \bar{\rho}_{\infty} \geq 0 - \text{ constant},
\]

can be handled in the similar fashion.

We suppose the rigid body is a ball of the radius \( \varepsilon \) occupying at a given time \( t \geq 0 \) the compact set

\[
B_{\varepsilon,t} = \left\{ x \in \mathbb{R}^3 \mid |x - \mathbf{h}_e(t)| \leq \varepsilon \right\}.
\]

We suppose that the mass density of the body \( \rho_{\varepsilon,B} > 0 \) is a positive constant and the motion of the body is determined by the rigid velocity field

\[
\mathbf{u}_{\varepsilon,B}(t,x) = Y_e(t) + Q_{\varepsilon,t}(t)(x - \mathbf{h}_e(t)), \quad \frac{d}{dt} \mathbf{h}_e(t) = Y_e(t).
\]

Accordingly, the fluid domain \( Q_f \) is defined as follows:

\[
Q_f = \left( (0, T) \times \mathbb{R}^3 \right) \setminus \left( (0, T) \times \cup_{t \in [0,T]} B_{\varepsilon,t} \right) \subset [0, T) \times \mathbb{R}^3.
\]

### 2.1. Weak solutions

Following [14] we introduce a concept of weak solution of the fluid–body interaction problem.

**Definition 2.1** (Weak solution).

We say that \((\rho_{\varepsilon}, \mathbf{u}_{\varepsilon})\) is weak solution of the fluid–body interaction problem with the initial state \( \rho_{\varepsilon,0}, \mathbf{u}_{\varepsilon,0} \) if the following holds:

- **Compatibility.** \( \rho_{\varepsilon} \in L^\infty(0,T; L^1 \cap L^r(\mathbb{R}^3)) \),
  \[
  \rho_{\varepsilon}(t,x) = \begin{cases} \rho_{\varepsilon,B} & \text{if } x \in B_{\varepsilon,t} \\ \geq 0 & \text{otherwise} \end{cases}
  \]
  \[
  \int_{\mathbb{R}^3} \rho_{\varepsilon}(t, \cdot) \, dx = \int_{\mathbb{R}^3} \rho_{\varepsilon,0} \, dx \text{ for any } t \in [0,T);
  \]
  \[
  \mathbf{u}_{\varepsilon} \in L^2(0,T; D^{1,2}(\mathbb{R}^3; \mathbb{R}^3)),
  \]

- **Energy estimate.**

- **Analysis of the interaction.**

- **Energy decay.**

- **Regularity.**

- **Existence.**

- **Uniqueness.**

- **Stationary solutions.**

- **Approximation.**

- **Numerical solution.**
\( \mathbf{u}_e(t, x) = \mathbf{u}_{e,B}(t, x) \) if \( x \in B_{e,t}; \)

- **Equation of continuity.** The integral identity
  \[
  \int_0^T \int_{\mathbb{R}^3} [\varrho_e \partial_t \varphi + \varrho_e \mathbf{u}_e \cdot \nabla_x \varphi] \, dx \, dt = - \int_{\mathbb{R}^3} \varrho_{e,0} \varphi(0, \cdot) \, dx
  \]
  holds for any \( \varphi \in C^1_c([0, T] \times \mathbb{R}^3). \) In addition, the renormalized equation
  \[
  \int_0^T \int_{\mathbb{R}^3} \left[ b(\varrho_e) \partial_t \varphi + b(\varrho_e) \mathbf{u}_e \cdot \nabla_x \varphi + (b(\varrho_e) - b'(\varrho_e)) \varrho_e \nabla_x \mathbf{u}_e \varphi \right] \, dx \, dt
  \]
  \[
  = - \int_{\mathbb{R}^3} b(\varrho_{e,0}) \varphi(0, \cdot) \, dx
  \]
  holds for any \( \varphi \in C^1_c([0, T] \times \mathbb{R}^3) \) and any \( b \in C^1[0, \infty), \) \( b' \in C_c[0, \infty). \)

- **Momentum equation.** The integral identity
  \[
  \int_0^T \int_{\mathbb{R}^3} \left[ \varrho_e \mathbf{u}_e \cdot \partial_t \varphi + \varrho_e \mathbf{u}_e \otimes \mathbf{u}_e : \nabla_x \varphi + p(\varrho_e) \nabla_x \varphi \right] \, dx \, dt
  \]
  \[
  = \int_0^T \int_{\mathbb{R}^3} \mathbf{S}(\nabla_x \mathbf{u}_e) : \nabla_x \varphi \, dx \, dt - \int_{\mathbb{R}^3} \varrho_{e,0} \cdot \varphi(0, \cdot) \, dx
  \]
  holds for any \( \varphi \in C^1_c([0, T] \times \mathbb{R}^3) \) such that
  \[
  \mathbb{D}_x \varphi(t, \cdot) \equiv \frac{1}{2} \left( \nabla_x \varphi + \nabla_x^t \varphi \right)(t, \cdot) = 0 \text{ on an open neighborhood of } B_{e,t}. \quad (2.8)
  \]

- **Energy inequality.**
  \[
  \int_{\mathbb{R}^3} \frac{1}{2} \varrho_e |\mathbf{u}_e|^2(\tau, \cdot) \, dx + \int_{\mathbb{R}^3 \setminus B_{e,\tau}} P(\varrho_e)(\tau, \cdot) \, dx + \int_{\mathbb{R}^3} \mathbf{S}(\nabla_x \mathbf{u}_e) : \nabla_x \mathbf{u}_e \, dx \, dt
  \]
  \[
  \leq \int_{\mathbb{R}^3} \frac{1}{2} \left| \varrho_{e,0} \right|^2 \, dx + \int_{\mathbb{R}^3 \setminus B_{e,0}} P(\varrho_{e,0}) \, dx
  \]
  for a.a. \( \tau \in (0, T), \)
  \[
  P'(\varrho) \varrho - P(\varrho) = p(\varrho) \text{ or equivalently } P(\varrho) = \varrho \int_1^\varrho \frac{p(\tau)}{\tau^2} \, d\tau.
  \]

**Remark 2.2.** The homogeneous Sobolev space \( D^{1,2}(\mathbb{R}^3) \) is defined as follows:
  \[
  D^{1,2}(\mathbb{R}^3) = \left\{ \mathbf{v} \in L^6(\mathbb{R}^3) \mid \nabla_x \mathbf{v} \in L^2(\mathbb{R}^3) \right\}.
  \]

The existence of global-in-time weak solutions under the hypothesis \( p \approx \varrho^\gamma, \) \( \gamma > \frac{3}{2} \) in a *bounded* domain \( \Omega \subset \mathbb{R}^3 \) was proved in [14, Theorem 4.1]. The extension to the present setting is straightforward. The form of the energy inequality (2.9) follows from [14, formula (2.6) and Lemma 3.2].
2.2. Main result

Let us denote
\[ q_{\varepsilon f}(t, \cdot) = q_{\varepsilon}(t, \cdot) \|_{R^3 \setminus B_r} \]
the fluid density. We are ready to state our main result.

**Theorem 2.3** (Convergence).

*Let the pressure \( p \) be given by the isentropic equation of state
\[ p(q) = a q^{\gamma}, \quad a > 0, \quad \gamma > \frac{3}{2}. \]

Let the density of the rigid body \( q_{e, B} \) be a positive constant satisfying
\[ q_{e, B} \geq q > 0, \quad e^{-\beta} \lesssim q_{e, B} \lesssim e^{-\beta} \text{ as } \varepsilon \to 0 \]
for some \( 2 \left( \frac{3 - \gamma}{\gamma} \right) < \beta \leq \bar{\beta} < 2. \) (2.10)

Finally, suppose that the initial data and energy satisfy
\[ q_{e,0} > 0, \quad q_{e,0} \to q_0 \text{ weakly in } L^1(R^3), \quad q_{e,0} \to q_0 \text{ weakly in } L^1(R^3; R^3), \]
\[ \int_{R^3} \frac{1}{2} \left| q_{e,0} \right|^2 \, dx + \int_{R^3} P(q_{e,0}) \, dx \to \int_{R^3} \frac{1}{2} \left| q_0 \right|^2 \, dx + \int_{R^3} P(q_0) \, dx \]
(2.11)
as \( \varepsilon \to 0. \)

Then there is a subsequence (not relabelled) such that
\[ q_{\varepsilon f} \to q \text{ in } C_{\text{weak}}([0, T]; L^1(R^3)) \text{ and in } L^1_{\text{loc}}([0, T] \times R^3), \]
\[ u_e \to u \text{ weakly in } L^2(0, T; D^{1,2}(R^3; R^3)), \]
where \((q, u)\) is a weak solution to the Navier–Stokes system (2.1)–(2.4) with the initial data \( q_0, \ q_0. \)

**Remark 2.4.** Note that we may consider \( \bar{\beta} = \bar{\beta} = 0 \) in hypothesis (2.10) as soon as \( \gamma > 3. \)

**Remark 2.5.** Here and hereafter, the symbol \( a \sim b \) means there is a positive constant \( C \) such that \( a \leq C b. \)

The rest of the paper is devoted to the proof of Theorem 2.3. The leading idea is to use the test functions \( \varphi \) in the momentum equation (2.7) that are constant (spatially homogeneous) on a neighborhood of the rigid body, in particular they satisfy (2.8).

More specifically, the momentum balance yields that integral identity
\[ \int_0^T \int_{R^3} \left[ q_{e} u_e \cdot \partial_t \varphi + q_{e} u_e \otimes u_e : \nabla_x \varphi + p(q_{e}) \text{div}_x \varphi \right] \, dx \, dt \]
\[ = \int_0^T \int_{R^3} \mathcal{S}(\nabla_x u_e) : \nabla_x \varphi \, dx \, dt - \int_{R^3} q_{e,0} \cdot \varphi(0, \cdot) \, dx \]
holds for any \( \varphi \in C^1_c([0, T] \times R^3; R^3) \) such that
\[ \varphi(t,x) = \int_{B_{e,t}} \varphi(t,\cdot) \, dx \equiv \frac{1}{|B_{e,t}|} \int_{B_{e,t}} \varphi(t,\cdot) \, dx \text{ for any } x \text{ in an open neighborhood of } B_{e,t}. \]  

(2.13)

Using a simple density argument, it is easy to check that validity of (2.12) can be extended to a larger class of test functions, namely \( \varphi \in W^{1,\infty}_c([0,T) \times R^3; R^3) \),

\[ \varphi(t,x) = \int_{B_{e,t}} \varphi(t,\cdot) \, dx \equiv \frac{1}{|B_{e,t}|} \int_{B_{e,t}} \varphi(t,\cdot) \, dx \text{ for any } x \in B_{e,t}. \]  

(2.14)

3. Uniform bounds, weak convergence

3.1. Uniform bounds

We start with uniform bounds that follow immediately from hypothesis (2.11) and the energy inequality (2.9), namely

\[ \text{ess sup}_{t \in (0,T)} \| \varphi_{\text{ef}f} \|_{L^1(T;L^\infty(R^3))} \lesssim 1, \]  

(3.1)

\[ \text{ess sup}_{t \in (0,T)} \| \varphi_{\text{ef}} \|_{L^1(T;L^2(R^3))} \lesssim 1, \]  

(3.2)

\[ \text{ess sup}_{t \in (0,T)} \| \varphi_{\text{ef},f} \|_{L^1(T;L^{3/2}(R^3 \times R^3))} \lesssim 1 \]  

(3.3)

\[ \| \mathcal{D}_x u_e \|_{L^2(0,T;L^2(R^3 \times R^3))} \lesssim 1. \]  

(3.4)

In particular, boundedness of the kinetic energy together with hypothesis (2.10) yield the following estimate on the velocity of the rigid body:

\[ Q_{e,B} c^3 |Y_e(t)|^2 \lesssim 1 \quad \Rightarrow \quad |Y_e(t)| \lesssim c^{\frac{3}{2}} (t^{-3}), \quad Y_e = \frac{d}{dt} h_e(t), \quad t \in (0,T). \]  

(3.5)

Finally, we deduce (3.4)

\[ \| u_e \|_{L^2(0,T;D^{1,2}(R^3;R^3))} \lesssim 1 \quad \Rightarrow \quad \| u_e \|_{L^2(0,T;D^{1,2}(R^3;R^3))} \lesssim 1. \]  

(3.6)

3.2. Convergence in continuity equation

In view of the uniform bounds obtained in the preceding section, we deduce the existence of suitable subsequences satisfying

\[ Q_{\text{ef}} \to q \text{ in } C_{\text{weak}}(0,T;L^1(R^3)), \]

\[ u_e \to u \text{ weakly in } L^2(0,T;D^{1,2}(R^3;R^3)), \]  

(3.7)

\[ Q_{\text{ef}} u_e \to q u \text{ weakly} - \text{*(*) in } L^\infty(0,T;L^{2\infty}(R^3;R^3)). \]
where we have used the fact that \((q_{\text{eff}}, u_e)\) satisfy the equation of continuity (2.5), cf. [14, Lemma 3.2]. Now, it is easy to perform the limit in the equation of continuity (2.5) to conclude

\[
\int_0^T \int_{\mathbb{R}^3} \left[ \rho \partial_t \varphi + \rho u \cdot \nabla_x \varphi \right] \, dx \, dt = -\int_{\mathbb{R}^3} \rho_0 \varphi(0, \cdot) \, dx \tag{3.8}
\]

for any \(\varphi \in C^1_{\text{c}}([0, T) \times \mathbb{R}^3)\).

Next, by virtue of hypothesis (2.10),

\[
\rho_e = q_{\text{eff}} + q_{e, B} \mathbb{1}_{B_e}, \quad \text{where } q_{e, B} \mathbb{1}_{B_e} \to 0 \text{ in } L^\infty(0, T; L^\Gamma(\mathbb{R}^3)) \text{ for some } \Gamma > \frac{3}{2}. \tag{3.9}
\]

In particular, the Young measure generated by \((q_{\text{eff}})_{e > 0}\) coincides with that one generated by \((q_e)_{e > 0}\). In particular, we may let \(e \to 0\) in the renormalized equation of continuity (2.6) obtaining

\[
\int_0^T \int_{\mathbb{R}^3} \left[ \overline{b}(\overline{q}) \partial_t \varphi + \overline{b}(\overline{q}) u \cdot \nabla_x \varphi + (b(\rho) - b'(\rho) \overline{q}) \text{div}_x u \varphi \right] \, dx \, dt = -\int_{\mathbb{R}^3} b(\rho_0) \varphi(0, \cdot) \, dx \tag{3.10}
\]

for any \(\varphi \in C^1_{\text{c}}([0, T) \times \mathbb{R}^3)\) and any \(b \in C^1[0, \infty), b' \in C_{\text{c}}[0, \infty)\). Here and hereafter, the symbol \(\overline{b}(\overline{q})\) denotes the weak limit of the compositions \((b(q_e))_{e > 0}\) or, equivalently, \((b(q_{\text{eff}}))_{e > 0}\).

Finally, by the same token: for \(\tau \in (0, T)\)

\[
\|q_{e, B} \mathbb{1}_{B_e} u_e(\tau, \cdot)\|_{\overline{L}^\infty(\tau ; \mathbb{R}^3)} \leq \|q_{e, B}\|_{\overline{L}^\infty(\mathbb{R}^3)} \|\nabla u_e(\tau, \cdot)\|_{\overline{L}^2(\mathbb{R}^3)} \to 0 \text{ uniformly for } \tau \in (0, T); \tag{3.11}
\]

whence

\[
q_{e, B} \mathbb{1}_{B_e} u_e(\tau, \cdot) \to 0 \text{ in } L^{\overline{L}^\infty(\mathbb{R}^3)} \text{ uniformly in } \tau \in (0, T). \tag{3.12}
\]

Combining (3.7), (3.9), (3.11), we may infer that

\[
q_e \to \varrho \text{ in } C_{\text{weak}}([0, T]; L^7(\mathbb{R}^3)) + L^\infty(0, T; L^\Gamma(\mathbb{R}^3)), \tag{3.13}
\]

\[
q_e u_e \to q u \text{ in } L^\infty(0, T; L^{\overline{L}^2(\mathbb{R}^3); \mathbb{R}^3}) - \text{weak} - (\ast) + L^\infty(0, T; L^{\overline{L}^\Gamma(\mathbb{R}^3); \mathbb{R}^3}). \tag{3.14}
\]

Moreover,

\[
\|\varrho_e\|_{L^\infty(0, T; L^1(\mathbb{R}^3))} \lesssim 1, \quad \|q_e u_e\|_{L^\infty(0, T; L^1(\mathbb{R}^3))} \lesssim 1. \tag{3.15}
\]

4. **Restriction operators**

In order to complete the proof of Theorem 2.3, we have to address the following issues:

- convergence of the convective term \(q_{\text{eff}} u_e \otimes u_e\) to its counterpart \(q u \otimes u\);
- uniform estimates and convergence of the pressure \(p(q_{\text{eff}})\);
- limit passage \(e \to 0\) in the momentum balance (2.7).
To this end, we need a suitable restriction operator to accommodate the test functions in the class (2.13). As the result is of independent interest, we consider a general $d$-dimensional space, $d \geq 2$.

### 4.1. Construction of restriction operator I

Consider a function

$$H \in C^\infty (\mathbb{R}), \ 0 \leq H(Z) \leq 1, \ H'(Z) = H'(1 - Z) \text{ for all } Z \in \mathbb{R},$$

$$H(Z) = 0 \text{ for } -\infty < Z \leq \frac{1}{4}, \ H(Z) = 1 \text{ for } \frac{3}{4} \leq Z < \infty. \quad (4.1)$$

For $\varphi \in L^1(\mathbb{R}^d)$ and $h \in \mathbb{R}^d$, we consider $E_\varepsilon(h)$,

$$E_\varepsilon(h)[\varphi](x) = \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \varphi \, dz \, H \left( 2 - \frac{|x - h|}{\varepsilon} \right) + \varphi(x) H \left( \frac{|x - h|}{\varepsilon} - 1 \right). \quad (4.2)$$

where $B_\varepsilon(h)$ denotes the ball centered at $h$ with the radius $\varepsilon > 0$.

The following properties are easy to check:

- The function $E_\varepsilon(h)$ is constant on a small neighborhood of the ball $B_\varepsilon(h)$. Specifically,

$$\frac{|x - h|}{\varepsilon} \leq 1 + \frac{1}{4} \Rightarrow \frac{|x - h|}{\varepsilon} - 1 \leq \frac{1}{4}, \ 2 - \frac{|x - h|}{\varepsilon} \geq \frac{3}{4} \quad (4.3)$$

$$\Rightarrow E_\varepsilon(h)[\varphi] = \int_{B_\varepsilon(h)} \varphi \, dx.$$

- Similarly,

$$\frac{|x - h|}{\varepsilon} \geq 1 + \frac{3}{4} \Rightarrow \frac{|x - h|}{\varepsilon} - 1 \geq \frac{3}{4}, \ 2 - \frac{|x - h|}{\varepsilon} \leq \frac{1}{4} \quad (4.4)$$

$$\Rightarrow E_\varepsilon(h)[\varphi] = \varphi,$$

meaning $E_\varepsilon(h)[\varphi]$ coincides with $\varphi$ on an open neighborhood of the set $\mathbb{R}^d \setminus B_{2\varepsilon}(h)$.

$$\text{supp}[E_\varepsilon(h)[\varphi]] \subset \mathcal{U}_{3\varepsilon}(\text{supp}[\varphi]) \quad (4.5)$$

Indeed, if

$$\text{dist} \left[ h; \text{supp}[\varphi] \right] \geq \varepsilon,$$

then

$$E_\varepsilon(h)[\varphi](x) = \varphi(x) H \left( \frac{|x - h|}{\varepsilon} - 1 \right).$$

If

$$\text{dist} \left[ h; \text{supp}[\varphi] \right] < \varepsilon,$$

then, in accordance with (4.4),

$$E_\varepsilon(h)[\varphi](x) = \varphi(x) = 0 \text{ for a.a. } x \in \mathbb{R}^d, \text{dist}[x, \text{supp}[\varphi]] > 3\varepsilon.$$
In particular, it follows from (4.5) that if \( \varphi \) is compactly supported in an open set \( \Omega \subset \mathbb{R}^d \), then so is \( E_\varepsilon(h)[\varphi] \) provided \( \varepsilon > 0 \) is small enough. Finally, by virtue of Jensen’s inequality,

\[
\left| \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \varphi \, dz \right|^p \leq \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} |\varphi|^p \, dz, \quad 1 \leq p < \infty.
\]

Consequently, we deduce

\[
E_\varepsilon(h)[\varphi] = \varphi + \mathbb{1}_{B_\varepsilon(h)^c} e_\varepsilon h, \quad \|e_\varepsilon h\|_{L^p(\mathbb{R}^d)} \lesssim \|\varphi\|_{L^p(B_\varepsilon(h))}, \quad 1 \leq p \leq \infty. \tag{4.6}
\]

Summarizing we conclude that for any \( u \in C_c^1([0, T) \times \Omega; \mathbb{R}^d) \), the function \( E_\varepsilon(h)[\varphi] \) is an admissible test function in the momentum equation (2.12). Below, we derive the necessary error estimates on the spatial and time derivatives in Sobolev norms.

4.1.1. Spatial derivatives

Given \( h \in \mathbb{R}^d \), the spatial derivatives of \( E_\varepsilon(h)[\varphi] \) can be computed directly using formula (4.2):

\[
\nabla_x E_\varepsilon(h)[\varphi](x) = \nabla_x \varphi(x) H\left(\frac{|x - h|}{\varepsilon} - 1\right) + \left(\varphi(x) - \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \varphi \, dz\right) H'\left(\frac{|x - h|}{\varepsilon} - 1\right) \frac{1}{\varepsilon} \frac{x - h}{|x - h|}, \tag{4.7}
\]

where we have used that

\[
H'\left(\frac{|x - h|}{\varepsilon} - 1\right) = H'\left(2 - \frac{|x - h|}{\varepsilon}\right).
\]

4.1.2. Uniform bounds

Seeing that

\[
H'\left(\frac{|x - h|}{\varepsilon} - 1\right) \neq 0 \iff \frac{5}{4} \leq |x - h| \leq \frac{7}{4} \varepsilon,
\]

we deduce

\[
\left| \left(\varphi(x) - \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \varphi \, dx\right) H'\left(\frac{|x - h|}{\varepsilon} - 1\right) \frac{1}{\varepsilon} \frac{x - h}{|x - h|} \right| \lesssim \|\nabla_x \varphi\|_{L^\infty(B_\varepsilon(h)^c)} \mathbb{1}_{B_\varepsilon(h)}.
\]

Consequently, we deduce from (4.7) the error estimates

\[
\nabla_x E_\varepsilon(h)[\varphi] = \nabla_x \varphi + e_\varepsilon^1 h, \quad |e_\varepsilon^1 h| \lesssim \|\nabla_x \varphi\|_{L^\infty(B_\varepsilon(h)^c; \mathbb{R}^d)} \mathbb{1}_{B_\varepsilon(h)} \tag{4.8}
\]

(4.8)
**4.1.3. \(L^p\)-estimates on spatial derivatives**

Our goal is to show boundedness of the operator \(E_e(h)\) in the Sobolev norms \(W^{1,p}\). In view of formula (4.7), it is enough to control

\[
\left( \varphi(x) - \frac{1}{|B_e(h)|} \int_{B_e(h)} \varphi \, dz \right) H' \left( \frac{|x - h|}{\varepsilon} - 1 \right) \frac{1}{\varepsilon |x - h|}
\]

on the annulus

\[
\frac{5}{4} \varepsilon \leq |x - h| \leq \frac{7}{4} \varepsilon
\]

in terms of the \(L^p\) norm of \(\nabla_x \varphi\) on the same set. Without loss of generality, we may assume \(h = 0\). Thus our goal is to show the bound

\[
\left\| \varphi \right\|_{L^p(\mathbb{R}^d)} \lesssim \int_{B_{\frac{1}{4}}} \left| \varphi \right| \, dz
\]

This is equivalent, after rescaling, to the estimate

\[
\left\| \varphi \right\|_{L^p(\mathbb{R}^d)} \lesssim \left\| \nabla_x \varphi \right\|_{L^p(\mathbb{R}^d)}
\]

which, in turn, follows from Poincaré inequality

\[
\left\| \varphi \right\|_{L^p(\mathbb{R}^d)} \lesssim \left\| \nabla_x \varphi \right\|_{L^p(\mathbb{R}^d)} + \left| \int_{B_{\frac{1}{4}}} \varphi \, dz \right|
\]

Thus, together with (4.8), we conclude

\[
\nabla_x E_e(h)[\varphi] = \nabla_x \varphi + 1_{B_{\frac{1}{2}}(h)} e_e h, \ \left\| e_e h \right\|_{L^p(\mathbb{R}^d)} \lesssim \left\| \nabla_x \varphi \right\|_{L^p(\mathbb{R}^d)} \ 1 \leq p \leq \infty.
\]

**4.1.4. Derivative with respect to the parameter \(h\)**

Similarly to the preceding part, we compute

\[
\nabla_h E_e(h)[\varphi](x) = \nabla_h \left( \frac{1}{|B_e(h)|} \int_{B_e(h)} \varphi \, dz \right) H' \left( 2 - \frac{|x - h|}{\varepsilon} \right)
\]

\[
- \left( \varphi(x) - \frac{1}{|B_e(h)|} \int_{B_e(h)} \varphi \, dz \right) H' \left( \frac{|x - h|}{\varepsilon} - 1 \right) \frac{1}{\varepsilon |x - h|},
\]

where, furthermore,

\[
\nabla_h \left( \frac{1}{|B_e(h)|} \int_{B_e(h)} \varphi \, dz \right) = \frac{1}{|B_e(h)|} \int_{B_e(h)} \nabla_x \varphi \, dz.
\]
We therefore obtain
\[
\nabla_h E_\varepsilon(h)[\varphi](x) = \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \nabla_x \varphi \, dz H\left(2 - \frac{|x - h|}{\varepsilon}\right) \nabla_x \varphi \left(\varphi(x) - \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \varphi \, dz \right) H'\left(\frac{|x - h|}{\varepsilon} - 1\right) \frac{1}{\varepsilon} \frac{x - h}{|x - h|}.
\]

which can be also written as a commutator
\[
\nabla_h E_\varepsilon(h)[\varphi](x) = \frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \nabla_x \varphi \, dz H\left(2 - \frac{|x - h|}{\varepsilon}\right) + H\left(\frac{|x - h|}{\varepsilon} - 1\right) \nabla_x \varphi - \nabla_x E_\varepsilon(h)[\varphi] - \nabla_x E_\varepsilon(h)[\varphi].
\]

4.1.5. Estimates on the time derivative

The time derivative of the restriction operator \(E_\varepsilon(h(t))[\varphi(t, \cdot)]\) can be computed by using formula (4.13):
\[
\partial_t (E_\varepsilon(h(t))[\varphi(t, \cdot)]) = E_\varepsilon(h(t))[\partial_t \varphi(t, \cdot)] + \nabla_h E_\varepsilon(h(t))[\varphi(t, \cdot)] \cdot \frac{d}{dt} h(t)
\]
\[
= E_\varepsilon(h(t))[\partial_t \varphi(t, \cdot)] + E_\varepsilon(h(t))[\nabla_x \varphi(t, \cdot)] \cdot Y(t) - \nabla_x E_\varepsilon(h(t))[\varphi(t, \cdot)] \cdot Y(t),
\]
where
\[
Y = \frac{d}{dt} h.
\]

We conclude this section by summarizing the basic properties of the restriction operator \(E_\varepsilon(h)\).

**Proposition 4.1.** The operator \(E_\varepsilon(h)[\varphi]\) is well defined for \(\varphi \in L^1_{\text{loc}}(\mathbb{R}^d)\). The following holds true:

- \(E_\varepsilon(h)[\varphi] = \left\{\begin{array}{ll}
\frac{1}{|B_\varepsilon(h)|} \int_{B_\varepsilon(h)} \varphi \, dx \text{ if } |x - h| < \varepsilon \\
\varphi \text{ if } |x - h| > 2\varepsilon
\end{array}\right.;
\)

- \(E_\varepsilon(h)[\varphi] = \varphi + 1_{B_\varepsilon(h)} e_0^0 \varepsilon, \|e_0^0 \varepsilon\|_{L^p(\mathbb{R}^d)} \lesssim \|\varphi\|_{L^p(B_\varepsilon(h))}, 1 \leq p \leq \infty;\)

- \(\nabla_x E_\varepsilon(h)[\varphi] = \nabla_x \varphi + 1_{B_\varepsilon(h)} e_1^1 \varepsilon, \|e_1^1 \varepsilon\|_{L^p(\mathbb{R}^d)} \lesssim \|\nabla_x \varphi\|_{L^p(B_\varepsilon(h)\setminus B_\varepsilon(0))}, 1 \leq p \leq \infty;\)

• if $\mathbf{h} = \mathbf{h}(t)$ is Lipschitz and $\varphi \in W^{1,1}_{\text{loc}}((0, T) \times \mathbb{R}^d)$, then

$$\partial_t (E_\varepsilon(h(t)) [\varphi(t, \cdot)]) = E_\varepsilon(h(t)) [\partial_t \varphi(t, \cdot)] + E_\varepsilon(h(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y(t) - \nabla_x E_\varepsilon(Y(t)) [\varphi(t, \cdot)] \cdot Y(t)$$

(4.18)

for a.a. $t \in (0, T)$, where

$$Y = \frac{d}{dt} h.$$

5. Restriction operator revisited

The drawback of the restriction operator $E_\varepsilon(h(t))$ is that it does not preserve the divergence of a vector valued function. To remedy this, we introduce a new vector-valued restriction operator $R_\varepsilon(h)$ acting on vector-valued functions.

5.1. Basic structure

We start by introducing the shift operator

$$S_h[f](x) = f(h + x).$$

Setting

$$E_\varepsilon = E_\varepsilon(0)$$

for the restriction operator introduced in the previous section, we check easily the relation

$$E_\varepsilon(h)[\varphi] = S_{-h}E_\varepsilon[S_h[\varphi]].$$

We compute

$$\nabla_h S_h[f](x) = \nabla_x f(h + x) = S_h[\nabla_x f],$$

(5.1)

which, in particular, yields the commutator formula (4.13).

5.2. Bogovskii operator

We use a particular version of Bogovskii operator constructed by Diening, Růžička, Schumacher [15]. The operator $B_{2\varepsilon, \varepsilon}$ is a branch of the inverse of the divergence operator defined on the annulus,

$$B_{2\varepsilon} \setminus B_\varepsilon.$$

The operator enjoys the following properties:

- $$B_{2\varepsilon, \varepsilon} : L^p_0(B_{2\varepsilon} \setminus B_\varepsilon) \to W^{1,p}_0(B_{2\varepsilon} \setminus B_\varepsilon),$$

(5.2)

$L^p_0$ denoting the space of $L^p$ functions with zero mean,
\[
\| \nabla_x B_{2,\varepsilon}[f] \|_{L^p(B_{2\varepsilon})} \lesi \| f \|_{L^p(B_{2\varepsilon})},
\]  
(5.3)
for any \(1 < p < \infty\), where the embedding constant is independent of \(\varepsilon\),
\[
\text{div}_x B_{2,\varepsilon}[f] = f \quad \text{in} \quad B_{2\varepsilon} \setminus B_{\varepsilon},
\]  
(5.4)

- If, in addition, \(f = \text{div}_x g \in L^d_0(B_{2\varepsilon} \setminus B_{\varepsilon})\), where \(g \in W^{1,d}(B_{2\varepsilon} \setminus B_{\varepsilon}), \quad g \cdot n|_{\partial(B_{2\varepsilon} \setminus B_{\varepsilon})} = 0\), then
\[
\| B_{2,\varepsilon}[\text{div}_x g] \|_{L^q(B_{2\varepsilon} \setminus B_{\varepsilon}; \mathbb{R}^d)} \lesi \| g \|_{L^q(B_{2\varepsilon} \setminus B_{\varepsilon}; \mathbb{R}^d)}
\]  
(5.5)

for \(1 < q < \infty\), where the embedding constant is independent of \(\varepsilon\).

The operator \(B_{2,\varepsilon}\) was constructed by Diening et al. [15]. The remarkable property
that its norms are independent of \(\varepsilon\) follow from the fact that \(B_{2\varepsilon} \setminus B_{\varepsilon}\) are John domains
uniformly in \(\varepsilon\), see Diening et al. [15, Theorem 5.2], Lu and Schwarzacher
[12, Theorem 1.1].

5.3. Construction of restriction operator II

We define the operator
\[
R_{\varepsilon}[\varphi] = E_{\varepsilon}[\varphi] + B_{2,\varepsilon}\left[ (\text{div}_x \varphi - \text{div}_x E_{\varepsilon}[\varphi])|_{B_{2\varepsilon} \setminus B_{\varepsilon}} \right]
\]  
(5.6)

A priori the operator is defined for \(\varphi \in W^{1,q}(\mathbb{R}^d; \mathbb{R}^d)\). For the definition to be correct,
we have to verify that \((\text{div}_x \varphi - \text{div}_x E_{\varepsilon}[\varphi])\) has zero mean over the annulus \(B_{2\varepsilon} \setminus B_{\varepsilon}\). It is
enough if we consider the functions \(\varphi\) with the following properties:
\[
\varphi \cdot n|_{|x|=2\varepsilon} = E_{\varepsilon}[\varphi] \cdot n|_{|x|=2\varepsilon},
\]  
(5.7)

and
\[
\int_{|x|=\varepsilon} \varphi \cdot n \, d\sigma = \int_{|x|=\varepsilon} E_{\varepsilon}[\varphi] \cdot n \, d\sigma.
\]  
(5.8)

On the one hand, equality (5.7) obviously holds as \(\varphi = E_{\varepsilon}[\varphi]\) if \(|x|=2\varepsilon\). On the other
hand, we have
\[
\int_{|x|=\varepsilon} E_{\varepsilon}[\varphi] \cdot n \, d\sigma = 0
\]
as \(E_{\varepsilon}[\varphi]|_{B_{\varepsilon}}\) is constant. Thus for (5.8) to hold, it is enough to assume
\[
\text{div}_x \varphi|_{B_{\varepsilon}} = 0.
\]  
(5.9)

Finally, we set
\[
R_{\varepsilon}(h)[\varphi] = S_{-h} R_{\varepsilon}[S_h[\varphi]].
\]  
(5.10)

Summarizing the previous discussion, we get.
Proposition 5.1 (Continuity in $L^p$ spaces).

The operator $R_c(h)$ is well defined for any function $\varphi \in W^{1,p}(\mathbb{R}^d; \mathbb{R}^d)$ satisfying

$$\text{div}_x \varphi = 0 \text{ for all } x, \ |x-h| < \varepsilon. \quad (5.11)$$

Moreover,

$$\left\{ \begin{array}{ll}
1 \int_{B_r(h)} \varphi \, dx & \text{if } |x-h| < \varepsilon, \\
\varphi & \text{if } |x-h| > 2\varepsilon;
\end{array} \right. \quad (5.12)$$

$$\text{div}_x R_c(h)[\varphi] = \text{div}_x \varphi; \quad (5.13)$$

$$\|R_c(h)[\varphi]\|_{W^{1,p}(\mathbb{R}^d; \mathbb{R}^d)} \lesssim \|\varphi\|_{W^{1,p}(\mathbb{R}^d; \mathbb{R}^d)} \quad (5.14)$$

for any $1 < p < \infty$ independently of $\varepsilon > 0$.

5.4. Estimates in the negative norm

In order to estimate time derivatives, we need to find bounds on $R_c$ provided the argument is in the form

$$\varphi = \mathcal{B}[\text{div}_x g], \quad (5.15)$$

where $\mathcal{B}$ is some right inverse of the divergence operator, $\text{div}_x \circ \mathcal{B} = \text{Id}$, such that

$$\mathcal{B} \circ \text{div}_x \text{ is bounded in } L^q(\mathbb{R}^d; \mathbb{R}^d) \text{ for any } 1 < q < \infty,$$

and

$$g|_{B_r(h)} = 0.$$

If this is the case, then

$$\text{div}_x \varphi = \text{div}_x \mathcal{B}[\text{div}_x g] = \text{div}_x g = 0 \text{ on } B_r(h)$$

so the operator $R_c(h)[\varphi]$ is well defined. Below, we consider $\mathcal{B} = \nabla_x \Delta_x^{-1}$, however, $\mathcal{B}$ can be also the standard Bogovskii operator on some domain $\Omega \subset \mathbb{R}^d$.

Without loss of generality, we may assume

$$h = 0, \ R_c(h) = R_c, \ g|_{R_c} = \text{div}_x \varphi|_{R_c} = 0. \quad (5.16)$$

Our goal is to obtain $L^q$ estimates on $R_c[\varphi]$ in terms of the $L^q -$ norm of $g$. As $E_c$ is bounded as an operator on $L^q$, it is enough to check boundedness of the term
\[ B_{2\varepsilon,\varepsilon}[\text{div}_x \mathcal{B} \text{div}_x g] - \text{div}_x E_\varepsilon[\mathcal{B} \text{div}_x g] \]
\[ = B_{2\varepsilon,\varepsilon} [(E_\varepsilon[\text{div}_x \mathcal{B} \text{div}_x g] - \text{div}_x E_\varepsilon[\mathcal{B} \text{div}_x g]) + (\text{div}_x \mathcal{B} \text{div}_x g) - (E_\varepsilon[\text{div}_x \mathcal{B} \text{div}_x g])]. \] (5.17)

We get
\[
E_\varepsilon[\text{div}_x \mathcal{B} \text{div}_x g] - \text{div}_x E_\varepsilon[\mathcal{B} \text{div}_x g] \\
= E_\varepsilon[\text{div}_x g] - \text{div}_x \left( \mathcal{B} \text{div}_x g \right) H \left( \frac{|x|}{\varepsilon} - 1 \right) + H \left( 2 - \frac{|x|}{\varepsilon} \right) \frac{1}{|B_\varepsilon|} \int_{B_\varepsilon} B \text{div}_x g \, dx \\
= \text{div}_x g H \left( \frac{|x|}{\varepsilon} - 1 \right) - \text{div}_x g H \left( \frac{|x|}{\varepsilon} - 1 \right) - \frac{1}{\varepsilon} \mathcal{B} \text{div}_x g \left( H \left( \frac{|x|}{\varepsilon} - 1 \right) \right) \frac{x}{|x|} \\
+ \frac{1}{\varepsilon} \frac{x}{|x|} H' \left( 2 - \frac{|x|}{\varepsilon} \right) \frac{1}{|B_\varepsilon|} \int_{B_\varepsilon} B \text{div}_x g \, dx \\
= \frac{1}{\varepsilon} \frac{x}{|x|} H' \left( \frac{|x|}{\varepsilon} - 1 \right) \left( \frac{1}{|B_\varepsilon|} \int_{B_\varepsilon} B \text{div}_x g \, dx - \mathcal{B} \text{div}_x g \right). 
\] (5.18)

Furthermore,
\[
\text{div}_x \mathcal{B} \text{div}_x g - E_\varepsilon[\text{div}_x \mathcal{B} \text{div}_x g] = \text{div}_x g - E_\varepsilon[\text{div}_x g] \\
= \text{div}_x g - \text{div}_x g H \left( \frac{|x|}{\varepsilon} - 1 \right) - H \left( 2 - \frac{|x|}{\varepsilon} \right) \frac{1}{|B_\varepsilon|} \int_{B_\varepsilon} \text{div}_x g \, dx \\
= \text{div}_x g - \text{div}_x g H \left( \frac{|x|}{\varepsilon} - 1 \right) \\
= \text{div}_x \left( g - g H \left( \frac{|x|}{\varepsilon} - 1 \right) \right) + \frac{1}{\varepsilon} g H' \left( \frac{|x|}{\varepsilon} - 1 \right) \frac{x}{|x|} 
\] (5.19)

Summing up the previous relations, we conclude
\[
B_{2\varepsilon,\varepsilon}[\text{div}_x \mathcal{B} \text{div}_x g] - \text{div}_x E_\varepsilon[\mathcal{B} \text{div}_x g] \\
= B_{2\varepsilon,\varepsilon} \left[ \frac{1}{\varepsilon} \frac{x}{|x|} H' \left( \frac{|x|}{\varepsilon} - 1 \right) \left( \frac{1}{|B_\varepsilon|} \int_{B_\varepsilon} B \text{div}_x g \, dx - \mathcal{B} \text{div}_x g \right) \\
+ \frac{1}{\varepsilon} g H' \left( \frac{|x|}{\varepsilon} - 1 \right) \frac{x}{|x|} \right] \\
+ B_{2\varepsilon,\varepsilon} \left[ \text{div}_x \left( g - g H \left( \frac{|x|}{\varepsilon} - 1 \right) \right) \right]. 
\] (5.20)

Seeing that \( g \big|_{B_\varepsilon} = 0 \) we may use the “negative” estimates (5.5) to deduce
\[
\left\| B_{2\varepsilon,\varepsilon} \left[ \text{div}_x \left( g - g H \left( \frac{|x|}{\varepsilon} - 1 \right) \right) \right] \right\|_{L^p(B_{2\varepsilon} \setminus B_{\varepsilon}; \mathbb{R}^d)} \lesssim \| g \|_{L^p(B_{2\varepsilon} \setminus B_{\varepsilon}; \mathbb{R}^d)}, \quad 1 < p < \infty. 
\] (5.21)
Finally, by means of the $L^p$ bounds (5.3),

$$\left\| \nabla \mathcal{B}_{2e,e} \left[ \frac{1}{\varepsilon} \frac{x}{|x|} H' \left( \frac{|x|}{\varepsilon} - 1 \right) \left( \frac{1}{|B|} \int_{B} \mathcal{B} \left[ \text{div}_x g \right] \ dx - \mathcal{B} \left[ \text{div}_x g \right] \right) + \frac{1}{\varepsilon} g H' \left( \frac{|x|}{\varepsilon} - 1 \right) \frac{x}{|x|} \right\| \right\|_{L^p(B_{2e} \setminus B_{e} ; \mathbb{R}^{d,d})} \lesssim \frac{1}{\varepsilon} \left\| \mathcal{B} \left[ \text{div}_x g \right] \right\|_{L^p(B_{2e} \setminus B_{e} ; \mathbb{R}^d)} + \left\| g \right\|_{L^p(B_{2e} \setminus B_{e} ; \mathbb{R}^d)} \lesssim \frac{1}{\varepsilon} \left\| g \right\|_{L^p(\mathbb{R}^d ; \mathbb{R}^d)}.$$  

(5.22)

Thus, by virtue of Poincaré inequality on $B_{2e} \setminus B_{e}$,

$$\left\| \mathcal{B}_{2e,e} \left[ \frac{1}{\varepsilon} \frac{x}{|x|} H' \left( \frac{|x|}{\varepsilon} - 1 \right) \left( \frac{1}{|B|} \int_{B} \mathcal{B} \left[ \text{div}_x g \right] \ dx - \mathcal{B} \left[ \text{div}_x g \right] \right) + \frac{1}{\varepsilon} g H' \left( \frac{|x|}{\varepsilon} - 1 \right) \frac{x}{|x|} \right\| \right\|_{L^p(B_{2e} \setminus B_{e} ; \mathbb{R}^d)} \lesssim \left\| g \right\|_{L^p(\mathbb{R}^d ; \mathbb{R}^d)}.$$  

(5.23)

We have obtained the following result.

**Proposition 5.2** (Continuity in the negative space). Let $\varphi \in W^{1,p}_{\text{loc}}(\mathbb{R}^d ; \mathbb{R}^d)$ can be written in the form

$$\varphi = \mathcal{B} \left[ \text{div}_x g \right], \ g \in L^q(\mathbb{R}^d ; \mathbb{R}^d), \ g|_{B_i(h)} = 0,$$

where $\text{div}_x \circ \mathcal{B} = \text{Id}$ and $\mathcal{B} \circ \text{div}_x$ bounded on $L^q(\mathbb{R}^d), \ 1 < q < \infty$.

Then

$$\|R_\varepsilon(h)[\mathcal{B}[\text{div}_x g]]\|_{L^q(\mathbb{R}^d ; \mathbb{R}^d)} \lesssim \left\| g \right\|_{L^q(\mathbb{R}^d ; \mathbb{R}^d)}, \ 1 < q < \infty$$

uniformly in $\varepsilon$.

**Remark 5.3.** The same result holds for general operators of the form

$$\varphi = \mathcal{L}[g],$$

provided

$$g|_{B_i(h)} = 0, \ \text{div}_x \mathcal{L}[g] = \text{div}_x g.$$

In particular, we may consider

$$\varphi = \nabla x \mathcal{B} |r| \cdot V, \ \text{with} \ g = r V, \ \varphi_i = \partial_i \mathcal{B} |r| V_j,$$

where $V \in \mathbb{R}^d$ is a constant vector.

### 6. Pressure estimates

The well-known problem connected with the compressible fluid flow is the lack of integrability of the pressure term $p(g)$ in the $x-$ variable. If $\gamma > \frac{3}{2}$, then the relevant estimates are obtained considering the quantity

$$\varphi = R_\varepsilon(h_\varepsilon(t)) \left[ \nabla x \mathcal{A}_x^{-1} b(q_{ef}) \right]$$  

(6.1)
as a test function in the momentum equation (2.12), where

$$b(r) \geq 0, b(r) = 0 \text{ for all } 0 \leq r \leq 1, b(r) = r^\alpha \text{ for } r \geq 2, \alpha \in (0, \gamma),$$

and $\Delta_x^{-1}$ denotes the inverse of the Laplace operator on $\mathbb{R}^3$,

$$\Delta_x^{-1}[v] = \mathcal{F}^{-1}_{\xi \rightarrow x}\left[\frac{1}{|\xi|^2}\mathcal{F}_{\xi \rightarrow \xi}[v]\right], \mathcal{F} - \text{the Fourier transform.}$$

Note carefully that

$$\text{div}_x\left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})(t, \cdot)\right] = b(q_{\epsilon,f})(t, \cdot) = 0 \text{ on } B_{\epsilon,t}.$$  

In accordance with the uniform bounds (3.1),

$$\text{ess sup}_{t \in (0, T)} \|b(q_{\epsilon,f})(t, \cdot)\|_{L^r(\mathbb{R}^3)} \lesssim 1. \quad (6.2)$$

Moreover, evoking the standard elliptic estimates, we get

$$\nabla_x\left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] \text{ bounded in } L^\infty(0, T; L^r(\mathbb{R}^3; R^{3 \times 3})) \text{ for any } 1 < r \leq \frac{2}{\gamma},$$

$$\left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] \text{ bounded in } L^\infty(0, T; L^q(\mathbb{R}^3; R^3)) \text{ for any } \frac{3}{2} < q \leq \infty$$

provided $\frac{\gamma}{2} > 3$.

### 6.1. Equi-integrability of the pressure

Using $\varphi$ introduced in (6.1) as a test function in the momentum balance (2.12), we get

$$\int_0^T \int_{R^3} \psi(t) p(q_{\epsilon,f}) b(q_{\epsilon,f}) dx \, dt$$

$$= \int_0^T \int_{R^3} \psi(t) \text{div}_x R_c(h_c(t)) \left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] dx \, dt = \sum_{i=1}^5 I_{i,\epsilon}, \quad (6.4)$$

for any $\psi \in C^1([-1, T), \psi(0) = 1$, where

$$I_{1,\epsilon} = \int_0^T \int_{R^3} S(\nabla_x u_c) : \nabla_x R_c(h_c(t)) \left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] dx \, dt,$$

$$I_{2,\epsilon} = -\int_0^T \int_{R^3} q_{\epsilon,f} u_c \otimes u_c : \nabla_x R_c(h_c(t)) \left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] dx \, dt,$$

$$I_{3,\epsilon} = -\int_{R^3} q_{\epsilon,0} R_c(Y_c(0)) \left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})(0, \cdot)\right] dx,$$

$$I_{4,\epsilon} = \int_0^T \partial_t \psi \int_{R^3} q_{\epsilon,f} u_c \cdot R_c(h_c(t)) \left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] dx,$$

$$I_{5,\epsilon} = \int_0^T \psi \int_{R^3} q_{\epsilon,f} u_c \cdot \partial_t R_c(h_c(t)) \left[\nabla_x \Delta_x^{-1}b(q_{\epsilon,f})\right] dx.$$  

Our goal is to show that all integrals $I_{i,\epsilon}, i = 1, \ldots, 5$ are bounded uniformly for $\epsilon \to 0$ as soon as $\alpha > 0$ is chosen small enough. Accordingly, relation (6.4) together with the bound (3.1), yield equi-integrability of the pressure.
In order to evaluate the time derivative in $I_{5,\varepsilon}$, we have an analogue of formula (4.14) by using the relations (5.1) and (5.10): \[
\frac{\partial}{\partial t}R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla_x \Delta_x^{-1} b(q_{\varepsilon,f}) \right] = R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla_x \Delta_x^{-1} \partial_t b(q_{\varepsilon,f}) \right] \\
+ R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla_x \nabla_x \Delta_x^{-1} b(q_{\varepsilon,f}) \cdot Y_{\varepsilon} - \nabla_x R_{\varepsilon}(h_{\varepsilon}(t)) \right] \nabla_x \Delta_x^{-1} b(q_{\varepsilon,f}) \cdot Y_{\varepsilon},
\]
where $q_{\varepsilon,f}$ satisfies the renormalized equation of continuity,
\[
\nabla_x \Delta_x^{-1} \partial_t b(q_{\varepsilon,f}) = -\nabla_x \Delta_x^{-1} \text{div}_x (b(q_{\varepsilon,f})u_{\varepsilon}) + \nabla_x \Delta_x^{-1} \left[ (b(q_{\varepsilon,f}) - b'(q_{\varepsilon,f})q_{\varepsilon,f}) \text{div}_x u_{\varepsilon} \right].
\]

6.1.1. Viscosity and convective term
It follows from (5.14) and (6.3) that
\[
\left( \nabla_x R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla_x \Delta_x^{-1} b(q_{\varepsilon,f}) \right] \right)_{\varepsilon > 0} \text{ is bounded in } L^\infty(0; T; L^1(R^3 \times R^3)), \quad 1 < r \leq \frac{\gamma}{\alpha}.
\]
In particular, the integral $I_{1,\varepsilon}$ remains bounded uniformly for $\varepsilon \to 0$.

Similarly, in view of the energy estimates (3.2),
\[
(q_{\varepsilon,f} u_{\varepsilon} \otimes u_{\varepsilon})_{\varepsilon > 0} \text{ is bounded in } L^\infty(0; T; L^1(R^3 \times R^3)).
\]

Moreover, as $u_{\varepsilon}$ is bounded in $L^2(0; T; L^6(R^3; R^3))$ (see (6.6)), we get
\[
(q_{\varepsilon,f} u_{\varepsilon} \otimes u_{\varepsilon})_{\varepsilon > 0} \text{ bounded in } L^1(0; T; L^2(R^3 \times R^3)), \quad s > 1, \quad \frac{1}{s} = \frac{1}{3} + \frac{1}{\gamma}.
\]

Consequently, by interpolation,
\[
(q_{\varepsilon,f} u_{\varepsilon} \otimes u_{\varepsilon})_{\varepsilon > 0} \text{ is bounded in } L^q(0; T; L^m(R^3 \times R^3)) \text{ for any } q > 1, m > 1.
\]

In particular, $I_{2,\varepsilon}$ remains bounded uniformly for $\varepsilon \to 0$.

6.1.2. Momentum
In accordance with the bounds (3.3), (3.11), we obtain
\[
(q_{\varepsilon} u_{\varepsilon})_{\varepsilon > 0} \text{ is bounded in } L^\infty \left( 0; T; \left( L^{\frac{2\gamma}{\alpha}} + L^{\frac{2m}{\alpha}} \right)(R^3; R^3) \right).
\]

Moreover, the relation (6.3) gives
\[
\left( R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla_x \Delta_x^{-1} b(q_{\varepsilon,f}) \right] \right)_{\varepsilon > 0} \text{ is bounded in } L^\infty(0; T; L^q(R^3; R^3)) \text{ for any } \frac{3}{2} < q \leq \infty.
\]

Thus, we conclude that $I_{4,\varepsilon}$, and similarly, $I_{5,\varepsilon}$ remain bounded for $\varepsilon \to 0$.

6.1.3. Time derivative
In order to evaluate the time derivative in $I_{5,\varepsilon}$, we have an analogue of formula (4.14) by using the relations (5.1) and (5.10):
Now, in accordance with Proposition 5.2 and Remark 5.3, we get
\[ \| R_{\varepsilon}(h_{\varepsilon}(t)) \|_{L^1(R^3)} \lesssim M \| \nabla \phi \|_{L^1(R^3)} \lesssim 1, \]
\[ \| R_{\varepsilon}(h_{\varepsilon}(t)) \|_{L^q(R^3)} \lesssim \| \phi \|_{L^q(R^3)}, \]
for all \( 1 < q < \infty \).
\[ (6.9) \]

In addition,
\[ \| \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \|_{L^1(R^3)} \lesssim \| \nabla \phi \|_{L^1(R^3)} \lesssim 1, \]
\[ \| \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \|_{L^q(R^3)} \lesssim \| \phi \|_{L^q(R^3)}, \]
for all \( 1 < q < \infty \).
\[ (6.10) \]

Finally,
\[ \| \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \|_{L^s(R^3)} \lesssim \| \phi \|_{L^s(R^3)} \]
\[ \text{for all } 3 \leq s \leq \frac{3}{2}, \]
\[ (6.11) \]

Seeing that
\[ (\phi, u_{\varepsilon})_{\varepsilon>0} \text{ bounded in } L^\infty \left(0, T; \left( L^3 + L^2 \right)(R^3; R^3) \right), \]
\[ (\phi, u_{\varepsilon})_{\varepsilon>0} \text{ bounded in } L^2 \left(0, T; L^5(R^3; R^3) \right), \]
\[ (\phi, u_{\varepsilon})_{\varepsilon>0} \text{ bounded in } L^\infty \left(0, T; \left( L^3 + L^1 \right)(R^3) \right), \]
we may combine (6.9), (6.11) to obtain
\[ \int_0^T \int_{R^3} \phi_{\varepsilon} u_{\varepsilon} \cdot R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} \partial_t b(\phi_{\varepsilon}) \right] \ dx \ dt \text{ bounded uniformly for } \varepsilon \to 0. \]

We conclude by estimating
\[ \int_{R^3} \phi_{\varepsilon} u_{\varepsilon} \cdot \left[ R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} - \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} \right] \ dx \]
\[ = \int_{B_{2\varepsilon}(Y_i)} \phi_{\varepsilon} u_{\varepsilon} \cdot \left[ R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} - \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} \right] \ dx. \]
\[ (6.12) \]

This integral can be decomposed as follows:
\[ \int_{B_{2\varepsilon}(Y_i)} \phi_{\varepsilon} u_{\varepsilon} \cdot \left[ R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} - \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} \right] \ dx \]
\[ = \int_{B_{\varepsilon}(Y_i)} \phi_{\varepsilon} u_{\varepsilon} \cdot \left[ R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} - \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} \right] \ dx \]
\[ + \int_{B_{2\varepsilon}(Y_i)} \phi_{\varepsilon} u_{\varepsilon} \cdot \left[ R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} - \nabla x R_{\varepsilon}(h_{\varepsilon}(t)) \left[ \nabla x \Delta_x^{-1} b(\phi_{\varepsilon}) \right] \cdot Y_{\varepsilon} \right] \ dx. \]
\[ (6.13) \]
Now, in accordance with (6.9), (6.10),
\[
\left| \int_{B_\varepsilon(Y_\varepsilon)} q_{e,f} u_e \cdot \left[ R_\varepsilon(h_\varepsilon(t)) \left[ \nabla_x \nabla_x \Delta_x^{-1} b(q_{e,f}) \right] \cdot Y_\varepsilon - \nabla_x R_\varepsilon(h_\varepsilon(t)) \left[ \nabla_x \Delta_x^{-1} b(q_{e,f}) \right] \cdot Y_\varepsilon \right] \, dx \right| \\
\lesssim \| q_{e,f} \|_{L^1(R^3)} \| u_e \|_{L^3(R^3)} \| b(q_{e,f}) \|_{L^\infty(R^3)} \| Y_\varepsilon \| \varepsilon^{3s}, \ s = 1 - \frac{1}{\gamma} - \frac{\alpha}{\gamma} - \frac{1}{6}
\]

(6.14)

In view of (3.5),
\[
| Y_\varepsilon | \lesssim \varepsilon^{\frac{3}{2}(\beta-3)}, \ \beta > 2 \frac{3 - \gamma}{\gamma}.
\]

Consequently,
\[
| Y_\varepsilon | \varepsilon^{3s} \lesssim \varepsilon^{\frac{3}{2} \beta - \frac{3}{2} + 3 - \frac{3}{\gamma} - 1} - \frac{1}{2} - \frac{1}{2} = \frac{1}{2} \beta - \frac{3 - \gamma}{\gamma} - \frac{3\alpha}{\gamma} > 0
\]
as long as \( \alpha > 0 \) is small enough.

Finally,
\[
\left| \int_{B_\varepsilon(Y_\varepsilon)} q_{e,B} u_e \cdot \left[ R_\varepsilon(h_\varepsilon(t)) \left[ \nabla_x \nabla_x \Delta_x^{-1} b(q_{e,f}) \right] \cdot Y_\varepsilon - \nabla_x R_\varepsilon(h_\varepsilon(t)) \left[ \nabla_x \Delta_x^{-1} b(q_{e,f}) \right] \cdot Y_\varepsilon \right] \, dx \right| \\
\lesssim q_{e,B} | Y_\varepsilon | \| u_e \|_{L^3(R^3)} \| b(q_{e,f}) \|_{L^\infty(R^3)} \varepsilon^{3 \left( 1 - \frac{1}{\gamma} - \frac{3}{2} \right)}
\]

where
\[
q_{e,B} | Y_\varepsilon | \lesssim \varepsilon^{-\frac{1}{2}} \varepsilon^{-\frac{3}{2}}, \ \tilde{\beta} < 2.
\]

Thus if \( \alpha > 0 \) is small enough, we get
\[
q_{e,B} | Y_\varepsilon | \varepsilon^{3 \left( 1 - \frac{1}{\gamma} - \frac{3}{2} \right)} \to 0 \text{ as } \varepsilon \to 0.
\]

We have shown that the integrals \( I_{5,\varepsilon} \) remain bounded as \( \varepsilon \to 0 \), which completes the proof of the pressure estimates claimed in (6.6).

### 7. Convergence

Our ultimate goal is to perform the limit in the momentum equation (2.12). To this end, we consider a smooth function
\[
\varphi \in C^k_c([0, T) \times R^3; R^3), \ k \geq 2 \text{ and its restriction } E_\varepsilon(h_\varepsilon(t)))[\varphi(t, \cdot)],
\]
where the latter is an eligible test function in (2.12).
7.1. Time derivative

We start with the time derivative
\[
\int_0^T \int_{\mathbb{R}^3} \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot \partial_t (E_\varepsilon(h_\varepsilon(t))) [\varphi(t, \cdot)] \ dx \ dt.
\]

By virtue of formula (4.14),
\[
\int_0^T \int_{\mathbb{R}^3} \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot \partial_t (E_\varepsilon(h_\varepsilon(t))) [\varphi(t, \cdot)] \ dx \ dt = \int_0^T \int_{\mathbb{R}^3} \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot (E_\varepsilon(h_\varepsilon(t))) [\partial_t \varphi(t, \cdot)] \ dx \ dt
\]
\[
+ \int_0^T \int_{\mathbb{R}^3} \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx \ dt.
\]

(7.1)

In accordance with the convergence (3.13) and the estimate (4.6), we get
\[
\int_0^T \int_{\mathbb{R}^3} \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot (E_\varepsilon(h_\varepsilon(t))) [\partial_t \varphi(t, \cdot)] \ dx \ dt \to \int_0^T \int_{\mathbb{R}^3} \varrho \mathbf{u} \cdot \partial_t \varphi(t, \cdot) \ dx \ dt \text{ as } \varepsilon \to 0.
\]

(7.2)

As for the remaining integral in (7.1), we use (4.10) obtaining
\[
\int_{\mathbb{R}^3} \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx
\]
\[
= \int_{B_1}(h_\varepsilon) \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx
\]
\[
= \int_{B_1}(h_\varepsilon) \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx
\]
\[
+ \int_{B_1}(h_\varepsilon) \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx.
\]

(7.3)

By virtue of (4.10), (3.5), and hypothesis (2.10),
\[
\left| \int_{B_1}(h_\varepsilon) \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx \right|
\]
\[
\lesssim \int_{B_1}(h_\varepsilon) \sqrt{\varrho_\varepsilon} |\mathbf{u}_\varepsilon(t, \cdot)| \varepsilon^{-\frac{\gamma}{2}} \ dx.
\]

(7.4)

Thus, in view of the uniform bounds (3.6), we conclude
\[
\int_0^T \int_{B_1}(h_\varepsilon) \varrho_\varepsilon \mathbf{u}_\varepsilon(t, \cdot) \cdot [E_\varepsilon(h_\varepsilon(t)) [\nabla_x \varphi(t, \cdot)] \cdot Y_\varepsilon(t) - \nabla_x E_\varepsilon(h_\varepsilon(t)) [\varphi(t, \cdot)] \cdot Y_\varepsilon(t)] \ dx \ dt \to 0
\]

(7.5)

as \(\varepsilon \to 0\).

The second integral on the right-hand side of (7.3) can be handled by using (4.6) and (4.8):
\[ \| \varrho_{e,f} \mathbf{u}_e(t, \cdot) \cdot [E_e(h_e(t)) \nabla \mathbf{\phi}(t, \cdot)] : \mathbf{Y}_e(t) - \nabla_x E_e(h_e(t))[\mathbf{\phi}(t, \cdot)] : \mathbf{Y}_e(t) \|_{L^1(\mathbb{R}^3)} \]
\[ \lesssim \| \varrho_{e,f}(t, \cdot) \|_{L^1(\mathbb{R}^3)} \| \mathbf{u}_e(t, \cdot) \|_{L^p(\mathbb{R}^3)} \| \mathbf{Y}_e 1_{B_{\mathbb{R}^3}}(h_e) \|_{L^1(\mathbb{R}^3)} \| \nabla_x \mathbf{\phi} \|_{L^\infty(\mathbb{R}^3)} \frac{1}{\sqrt{\varepsilon}} + \frac{1}{6} + \frac{1}{s} = 1, \] (7.6)

Moreover, by virtue of (3.5),
\[ |\mathbf{Y}_e(t)| \leq \frac{1}{\sqrt{\varrho_{e,B}}} e^{\frac{C_1}{\sqrt{\varepsilon}}} e^{\frac{\mu_3}{\varepsilon}}. \] (7.7)

Thus, it follows from hypothesis (2.10) and a direct manipulation
\[ \int_0^T \int_{B_{\mathbb{R}^3}(h_e)} \varrho_{e,f} \mathbf{u}_e(t, \cdot) \cdot [E_e(h_e(t)) \nabla \mathbf{\phi}(t, \cdot)] : \mathbf{Y}_e(t) - \nabla_x E_e(h_e(t))[\mathbf{\phi}(t, \cdot)] : \mathbf{Y}_e(t) \, dx \, dt \]
\[ \rightarrow 0 \text{ as } \varepsilon \rightarrow 0. \] (7.8)

Summing up (7.2), (7.5), and (7.8) we conclude
\[ \int_0^T \int_{\mathbb{R}^3} \varrho_{e,f} \mathbf{u}_e(t, \cdot) \cdot \partial_t (E_e(h_e(t)))[\mathbf{\phi}(t, \cdot)] \, dx \, dt \rightarrow \int_0^T \int_{\mathbb{R}^3} \varrho \mathbf{u} \cdot \partial_t \mathbf{\phi}(t, \cdot) \, dx \, dt \text{ as } \varepsilon \rightarrow 0. \] (7.9)

### 7.2. Convective term and the viscous stress

Repeating the arguments of the previous section, we easily establish
\[ \int_0^T \int_{\mathbb{R}^3} \varrho_{e,f} \mathbf{u}_e(t, \cdot) \cdot \nabla_x [E_e(h_e(t))] [\mathbf{\phi}(t, \cdot)] \, dx \, dt \]
\[ = \int_0^T \int_{\mathbb{R}^3} \varrho_{e,f} \mathbf{u}_e(t, \cdot) \cdot \nabla_x [E_e(h_e(t))] [\mathbf{\phi}(t, \cdot)] \, dx \, dt \] (7.10)
\[ \rightarrow \int_0^T \int_{\mathbb{R}^3} \varrho \mathbf{u} \cdot \nabla_x \mathbf{\phi} \, dx \, dt \text{ as } \varepsilon \rightarrow 0, \]

and
\[ \int_0^T \int_{\mathbb{R}^3} \mathbf{S} (\nabla \mathbf{u}_e) : \nabla_x [E_e(h_e(t))] [\mathbf{\phi}(t, \cdot)] \, dx \, dt \]
\[ \rightarrow \int_0^T \int_{\mathbb{R}^3} \mathbf{S} (\nabla \mathbf{u}) : \nabla_x \mathbf{\phi} \, dx \, dt \text{ as } \varepsilon \rightarrow 0. \] (7.11)

Here, in view of the uniform bounds (6.7),
\[ \varrho_{e,f} \mathbf{u}_e(t) \rightarrow \varrho \mathbf{u} \text{ weakly in } L^p_{\text{loc}}([0, T] \times \mathbb{R}^3; \mathbb{R}^{3 \times 3}) \text{ for some } p > 1. \]

Our ultimate goal in the section is to prove the identity
\[ \varrho \mathbf{u} \otimes \mathbf{u} = \varrho \mathbf{u} \otimes \mathbf{u}. \] (7.12)

To this end, consider
\[ \mathbf{\phi} = E_e(h_e(t)) [\psi(t) \mathbf{\phi}(\cdot)], \psi \in C^1_c(0, T), \phi \in C^1_c(\mathbb{R}^3; \mathbb{R}^3) \]
as a test function in the momentum equation (2.12). We easily compute
\begin{equation}
\int_0^T \int_{\mathbb{R}^3} \left[ \frac{\partial_t (E_\varepsilon(h_\varepsilon(t))) \phi(t)}{\varepsilon} \right] \, dx \, dt = - \int_0^T \psi(t) \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx \, dt \nonumber \\
- \int_0^T \psi(t) \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx \, dt \\
+ \int_0^T \psi(t) \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx \, dt.
\end{equation}

(7.13)

Moreover, by virtue of formula (4.14),
\begin{equation}
\int_0^T \int_{\mathbb{R}^3} \left[ \frac{\partial_t (E_\varepsilon(h_\varepsilon(t))) \phi(t)}{\varepsilon} \right] \, dx \, dt \\
= \int_0^T \partial_t \psi(t) \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx \, dt \\
+ \int_0^T \psi(t) \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx \, dt \\
- \int_0^T \psi(t) \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx \, dt.
\end{equation}

(7.14)

If \( \phi \) is smooth \( (C^1_\varepsilon(\mathbb{R}^3; \mathbb{R}^3)) \), then the last two integrals in (7.14) can be handled exactly as their counterpart in (7.5), (7.8), specifically,
\begin{equation}
\left\| \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \right\|_{L^2(0, T)} \leq c(\|\phi\|_{C^1_\varepsilon}) \text{ independently of } \varepsilon \to 0.
\end{equation}

(7.15)

Combining (7.13)–(7.15), we may infer that the function
\begin{equation}
t \in [0, T] \mapsto \int_{\mathbb{R}^3} \frac{\partial_t \phi(t)}{\varepsilon} \, dx, \phi \in C^1_\varepsilon(\mathbb{R}^3; \mathbb{R}^3),
\end{equation}

(7.16)

is Hölder continuous with a positive exponent and norm depending solely on \( \|\phi\|_{C^1_\varepsilon(\Omega; \mathbb{R}^3)} \).

Finally, by virtue of the error estimates (4.10),
\( E_\varepsilon(h_\varepsilon(t))) \phi \to \phi \) in \( W^{1,2}(\mathbb{R}^3; \mathbb{R}^3) \) for any \( \phi \in W^{1,2}(\mathbb{R}^3; \mathbb{R}^3) \) uniformly in \( t \in (0, T) \),

and we deduce from (7.16) that
\begin{equation}
\frac{\partial_t \phi(t)}{\varepsilon} \text{ precompact in } L^2(0, T; W^{1,2}_{\text{loc}}(\mathbb{R}^3; \mathbb{R}^3)),
\end{equation}

(7.17)

which, together with (3.7) yields (7.12).
7.3. The pressure and strong convergence of the density

In view of the pressure estimates (6.6), it is easy to establish the limit

$$\int_0^T \int_{\mathbb{R}^3} p(q_{cf}) \text{div}_x E_c(h_c)[\varphi] \, dx \, dt \rightarrow \int_0^T \int_{\mathbb{R}^3} \overline{p(q)} \text{div}_x \varphi \, dx \, dt,$$

where $\overline{p(q)}$ stands for a weak limit of the sequence $(p(q_{cf}))_{\varepsilon > 0}$.

Thus the remaining issue is to establish the equality

$$p(q) = \overline{p(q)}$$

which is the standard and nowadays well understood problem in the theory of compressible fluids, see e.g., [16], Lions [13]. The proof requires $\varphi = \psi(t) \phi(x) \nabla_x \Delta^{-1}_x [b(q_{cf})]$ to be used as test functions in the momentum balance, where $b$ is a bounded functions and $\psi \in C^1_c(0, T)$, $\phi \in C^1_c(\mathbb{R}^3)$. In the present setting, similarly to the above, we use the quantity

$$\varphi = \psi E_c(h_c) \left[ \phi \nabla_x \Delta^{-1}_x [b(q_{cf})] \right],$$

which is a legal test function for the momentum balance (2.12). As shown above, the resulting error terms vanish in the asymptotic limit $\varepsilon \to 0$ and the proof of the strong convergence of the density is therefore the same as in the fluid without moving objects. Thus, exactly the same method as in [16, Chapter 6] can be used to complete the proof of Theorem 2.3.
