$q$–DIFFERENCE EQUATIONS CONCERNING WITH
$q$–GAMMA FUNCTION

ZHI-BO HUANG*, RAN-RAN ZHANG*

ABSTRACT

We consider a family of solutions of $q$–difference Riccati equation, and prove the meromorphic solutions of $q$–difference Riccati equation and corresponding second order $q$–difference equation are concerning with $q$–gamma function. The growth and value distribution of differences on solutions of $q$–difference Riccati equation are also investigated.

Keywords: $q$–difference Riccati equation; $q$–difference equation; $q$–gamma function

MSC(2010): Primary:39B32; Secondary:30D35

1. INTRODUCTION

Let $q \in \mathbb{C}$ be such that $0 < |q| < 1$. It is well know that $q$-Gamma function $\Gamma_q(x)$ is defined by

$$\Gamma_q(x) := \frac{(q; q)_\infty}{(q^x; q)_\infty} (1 - q)^{1-x},$$

where $(a; q)_\infty = \prod_{k=0}^{\infty} (1 - aq^k)$. It is a meromorphic function with poles at $x = -n \pm 2\pi ik/\log q$, where $k$ and $n$ are non-negative integers, see [1].

By defining

$$\gamma_q(z) := (1 - q)^{x-1} \Gamma_q(x), \quad z = q^x,$$

and $\gamma_q(0) := (q; q)_\infty$, we obtain that $\gamma_q(z)$ is a meromorphic function of zero order with no zeros, having its poles at $\{q^k\}_{k=0}^{\infty}$.

We easily conclude that the first order linear $q$-difference equation

$$h(qz) = (1 - z)h(z)$$

is solved by the function $\gamma_q(z)$.

We then consider that a general first order linear $q$-difference equation

$$h(qz) = a(z)h(z), \quad (1.1)$$

*Corresponding author:
where \( a(z) \) is a rational function. If \( a(z) \equiv a \) is a constant, equation (1.1) is solvable in terms of rational functions if and only if \( \log_q a \) is an integer. If \( a(z) \) is nonconstant rational function, let \( \alpha_i, i = 1, 2, \ldots, n \) and \( \beta_j, j = 1, 2, \ldots, m \) be the zeros and poles of \( a(z) \), respectively, repeated according to their multiplicities. Then \( a(z) \) can be written in the form

\[
a(z) = \frac{c(1 - z/\alpha_1)(1 - z/\alpha_2) \cdots (1 - z/\alpha_n)}{(1 - z/\beta_1)(1 - z/\beta_2) \cdots (1 - z/\beta_m)},
\]

where \( c \neq 0 \) is a complex number depending on \( a(z) \). Thus, equation (1.1) is solved by

\[
h(z) = z^{\log_q c} \frac{\gamma_q(z/\alpha_1)\gamma_q(z/\alpha_2) \cdots \gamma_q(z/\alpha_n)}{\gamma_q(z/\beta_1)\gamma_q(z/\beta_2) \cdots \gamma_q(z/\beta_m)},
\]

which is meromorphic if and only if \( \log_q c \) is an integer.

In this paper, we are concerned with the \( q \)-difference Riccati equation

\[
f(qz) = \frac{A(z) + f(z)}{1 - (q - 1)zf(z)},
\]

and second order linear \( q \)-difference equation

\[
\Delta_q^2 y(z) + \frac{A(z)}{(q - 1)z} y(z) = 0,
\]

where \( q \in \mathbb{C}\setminus\{0\}, |q| \neq 1 \), \( A(z) \) is meromorphic function. Here, for a meromorphic function \( y(z) \), the \( q \)-difference operator \( \Delta_q \) is defined by \( \Delta_q y(z) = \frac{y(qz) - y(z)}{(q - 1)z} \) and \( \Delta_q^{n+1} y(z) = \Delta_q (\Delta_q^n y(z)) \), \( n = 1, 2, \ldots \) [1, pp.488].

Throughout this paper, we assume that the reader is familiar with the fundamental results and the standard notations of Nevanlinna’s value distribution theorem of meromorphic function, see, e.g., [12].

Recently, a number of papers, see e.g. [7, 8, 10, 13, 14, 15, 17, 19, 20, 21], focused on complex difference equations and difference analogues of Nevanlinna theory. \( q \)-difference counterparts are also investigated [3, 19, 22]. But there are only few papers concerning with the properties of meromorphic solutions of \( q \)-difference equations, see e.g. [16, 18, 23].

The remainder of the paper is organized as follows. A system of solutions of \( q \)-difference Riccati equation (1.3) is stated in section 2. Section 3 contains the relationships between \( q \)-difference equations and \( q \)-gamma function. The growth and value distribution of differences on solutions of \( q \)-difference Riccati equation (1.3) is investigated in Section 4.
2. A system of solutions of $q$–difference Riccati equation

Let $f_1, f_2, f_3$ be distinct meromorphic solutions of differential Riccati equation

$$w'(z) + w(z)^2 + A(z) = 0, \quad (2.1)$$

Then (2.1) possesses a one parameter family of meromorphic solutions $(f_c)_{c \in \mathbb{C}}$, see e.g., [2, pp.371-373].

Ishizaki extended this property to the difference Riccati equation

$$\Delta f(z) + \frac{f(z)^2 + A(z)}{f(z) - 1} = 0, \quad (2.2)$$

and obtained the following difference analogue of this property.

**Theorem 2.1** [17, Proposition 2.1]. Suppose that (2.2) possesses three distinct meromorphic solutions $f_1(z), f_2(z)$ and $f_3(z)$. Then any meromorphic solution $f(z)$ of (2.2) can be represented by

$$f(z) = \frac{f_1(z)f_2(z) - f_2(z)f_3(z) - f_1(z)f_2(z)Q(z) + f_1(z)f_3(z)Q(z)}{f_1(z) - f_3(z) - f_2(z)Q(z) + f_3(z)Q(z)}, \quad (2.3)$$

where $Q(z)$ is a periodic function of period 1. Conversely, if for any periodic function $Q(z)$ of period 1, we define a function $f(z)$ by (2.3), then $f(z)$ is a meromorphic solution of (2.2).

We then extend these properties to the $q$–difference Riccati equation (1.3) and obtained a $q$–difference analogue of these properties as follows.

**Theorem 2.A** [17]. Suppose that (1.3) possesses three distinct meromorphic solutions $f_1(z), f_2(z)$ and $f_3(z)$. Then any meromorphic solution $f(z)$ of (1.3) can be represented by

$$f(z) = \frac{f_1(z)f_3(z) - f_1(z)f_2(z) + f_1(z)f_2(z)\phi(z) - f_2(z)f_3(z)\phi(z)}{f_3(z) - f_2(z) - f_3(z)\phi(z) + f_1(z)\phi(z)}, \quad (2.4)$$

where $\phi(z)$ is a meromorphic function satisfying $\phi(qz) = \phi(z)$. Conversely, if for any meromorphic function $\phi(z)$ satisfying $\phi(qz) = \phi(z)$, we define a function $f(z)$ by (2.4), then $f(z)$ is a meromorphic solution of (1.3).

**Proof of Theorem 2.1.** Using a similar proof of Theorem 2 in [10]. Let $h_j(z), j = 1, 2, 3, 4$ be distinct meromorphic functions. We denote a cross ratio of $h_j(z), j = 1, 2, 3, 4$ by

$$R(h_1, h_2, h_3, h_4; z) := \frac{h_4(z) - h_1(z)}{h_4(z) - h_2(z)} : \frac{h_3(z) - h_1(z)}{h_3(z) - h_2(z)}.$$ 

We first show that $f(z)$, distinct from $f_1(z), f_2(z)$ and $f_3(z)$, is a meromorphic solution of (1.3) if and only if $R(qz) = R(z)$, where
\[ R(z) = R(f_1, f_2, f_3; f; z) \]. Thus, we conclude from (1.3) that

\[
R(qz) = \frac{f(qz) - f_1(qz)}{f(qz) - f_2(qz)} : \frac{f_3(qz) - f_1(qz)}{f_3(qz) - f_2(qz)} = \frac{\{qz\} + A(3z) - 1}[f(qz) - f_1(qz)]
\]

On the other hand, if \( R(qz) = R(z) \), then

\[
\frac{f(qz) - \frac{A(z) + f_1(z)}{1 - (q-1)z f_1(z)}}{f(qz) - \frac{A(z) + f_2(z)}{1 - (q-1)z f_2(z)}} : \frac{\frac{A(z) + f_3(z)}{1 - (q-1)z f_3(z)} - \frac{A(z) + f_1(z)}{1 - (q-1)z f_1(z)}}{\frac{A(z) + f_3(z)}{1 - (q-1)z f_3(z)} - \frac{A(z) + f_2(z)}{1 - (q-1)z f_2(z)}} = \frac{f(z) - f_1(z)}{f(z) - f_2(z)} : \frac{f_3(z) - f_1(z)}{f_3(z) - f_2(z)},
\]

and so,

\[
\frac{f(qz) - \frac{A(z) + f_1(z)}{1 - (q-1)z f_1(z)}}{f(qz) - \frac{A(z) + f_2(z)}{1 - (q-1)z f_2(z)}} : \frac{\{q(z)\} + A(z) - 1}[f(qz) - f_1(z)]
\]

We then conclude from (2.5) that \( f(qz) = \frac{A(z) + f_1(z)}{1 - (q-1)z f_1(z)} \), which shows that \( f(z) \) satisfies (1.3).

Thus, for any meromorphic function \( \phi(z) \) satisfying \( \phi(qz) = \phi(z) \), we define \( f(z) \) by

\[ R(f_1, f_2, f_3; f; z) = \phi(z). \]

Then \( f(z) \) is represented by (2.4), and also satisfies (1.3). The proof of Theorem 2.1 is completed.

It is difficult for us to detect the properties of meromorphic solutions since the parameter function \( Q(z) \) in Theorem 2.1 and \( \phi(z) \) in Theorem 2.1 appear more than one time. Furthermore, we note that \( f(z) \neq f_2(z) \) in Theorem 2.1. This shows that the representation of (2.4) cannot represent all meromorphic solutions of \( q \)-difference Riccati equation (1.3). Thus, we can use a new method used in [9 Theorem 8.3.4], and prove a family of solutions of \( q \)-difference Riccati equation (1.3).

**Theorem 2.2.** Let \( q \in \mathbb{C}\setminus\{0\}, |q| \neq 1, \) and \( A(z) \) be meromorphic function with \( A(z) \neq -\frac{1}{(q-1)z} \). If \( q \)-difference Riccati equation (1.3) possesses three distinct meromorphic solutions \( f_0(z), f_1(z) \) and \( f_2(z) \), then all meromorphic solutions of \( q \)-difference Riccati equation (1.3)
constitute a one parameter family
\[
\left\{ f_0(z), \; f(z) = \frac{(f_1(z) - f_0(z))(f_2(z) - f_0(z))}{\phi(z)(f_2(z) - f_1(z)) + (f_2(z) - f_0(z))} + f_0(z) \right\},
\]
(2.6)
where \(\phi(z)\) is any constant in \(\mathbb{C}\), or any non-zero meromorphic function with \(\phi(qz) = \phi(z)\), as \(\phi(z) \equiv 0\), \(f(z) = f_1(z)\); as \(\phi(z) \equiv -1\), \(f(z) = f_2(z)\).

In particular, if \(\phi(z)\) is any constant in \(\mathbb{C}\), we obtain

**Corollary 2.1.** Let \(q \in \mathbb{C}\backslash \{0\}, |q| \neq 1\), and \(A(z)\) be meromorphic function with \(A(z) \neq -\frac{1}{(q-1)z}\). If \(q\)-difference Riccati equation \((1.3)\) possesses three distinct rational solutions \(f_0(z), f_1(z)\) and \(f_2(z)\), then \(q\)-difference Riccati equation \((1.3)\) has infinitely many rational solutions.

We now list some preliminaries to prove Theorem 2.2.

**Lemma 2.1.** Let \(q \in \mathbb{C}\backslash \{0\}, |q| \neq 1\), and \(A(z)\) be meromorphic function with \(A(z) \neq -\frac{1}{(q-1)z}\). If \(f(z)\) is a meromorphic solution of \(q\)-difference Riccati equation \((1.3)\), then
\[
1 - (q - 1)zf(z) \neq 0 \text{ and } 1 + (q - 1)zf(qz) \neq 0.
\]

**Proof of Lemma 2.1.** If \((q - 1)zf(z) \equiv 0\), then \(f(z) = \frac{1}{(q-1)z}\). Now substituting \(f(z) = \frac{1}{(q-1)z}\) into \((1.3)\), and noting that \(A(z) \neq -\frac{1}{(q-1)z}\), we conclude that
\[
\frac{1}{(q-1)qz} = \frac{A(z) + \frac{1}{(q-1)z}}{1 - (q - 1)z \cdot \frac{1}{(q-1)z}} = \frac{(q - 1)zA(z) + 1} {0} = \infty.
\]
This yields that \(q = 0\) or \(q = 1\), a contradiction.

If \((q - 1)zf(qz) \equiv 0\), then \(f(qz) = -\frac{1}{(q-1)z}\) and \(f(z) = -\frac{q}{(q-1)z}\). Now substituting these into \((1.3)\), we deduce that \(A(z) = -\frac{1}{(q-1)z}\), a contradiction.

**Lemma 2.2.** Let \(q \in \mathbb{C}\backslash \{0\}, |q| \neq 1\), \(A_1(z)\) and \(A_0(z)\) be nonzero meromorphic functions. If \(q\)-difference equation
\[
A_1(z)g(qz) + A_0(z)g(z) = 0 \quad (2.7)
\]
has a nonzero meromorphic solution \(g_0(z)\), then all meromorphic solutions of \((2.7)\) constitute a one parameter family
\[
\{g(z) = \phi(z)g_0(z)\},
\]
where \(\phi(z)\) is any constant in \(\mathbb{C}\), or any nonzero meromorphic function with \(\phi(qz) = \phi(z)\).
Proof of Lemma 2.2. Since $y_0(z)$ is a nonzero meromorphic solution of $(2.7)$, we easily conclude that $y(z) = \phi(z)y_0(z)$ is also a meromorphic solution of $(2.7)$ for any constant $\phi(z)$ in $\mathbb{C}$, or any non-zero meromorphic function with $\phi(qz) = \phi(z)$.

On the other hand, if $y(z)$ is also meromorphic solution of $(2.7)$, we conclude from $(2.7)$ that

$$\frac{y(qz)}{y_0(qz)} = \frac{y(z)}{y_0(z)}.$$

Set $\phi(z) = \frac{y(z)}{y_0(z)}$. Then $\phi(z)$ is a constant in $\mathbb{C}$, or a nonzero meromorphic function with $\phi(qz) = \phi(z)$. This shows that $y(z) = \phi(z)y_0(z)$.

We now give the proof of Theorem 2.2.

Proof of Theorem 2.2. Since $f_0(z), f_1(z)$ and $f_2(z)$ are three distinct meromorphic solutions of $q$–difference Riccati equation $(1.3)$, we set

$$u_j(z) = \frac{1}{f_j(z) - f_0(z)}, \quad j = 1, 2. \tag{2.8}$$

Obviously, $u_1(z) \not\equiv u_2(z)$ and $f_j(z) = \frac{1}{u_j(z)} + f_0(z), \quad j = 1, 2.$

Now, substituting $f_j(z) = \frac{1}{u_j(z)} + f_0(z), \quad j = 1, 2$ into $(1.3)$, and noting that $f_0(z)$ is also a meromorphic solution of $(1.3)$, we conclude that

$$[1 + (q - 1)zf_0(qz)]u_j(qz) - [1 - (q - 1)zf_0(z)]u_j(z) + (q - 1)z = 0.$$

Set

$$\alpha_1(z) = 1 + (q - 1)zf_0(qz) \text{ and } \alpha_0(z) = (q - 1)zf_0(z) - 1.$$ 

Then we deduce from Lemma 2.1 that $\alpha_1(z) \not\equiv 0$ and $\alpha_0(z) \not\equiv 0$, and $u_j(z), \quad j = 1, 2$ are two distinct meromorphic solutions of $q$–difference equation

$$\alpha_1(z)u(qz) + \alpha_0(z)u(z) + (q - 1)z = 0. \tag{2.9}$$

Thus, $u_0(z) = u_1(z) - u_2(z)$ is a nonzero meromorphic solution of $q$–difference equation

$$\alpha_1(z)u(qz) + \alpha_0(z)u(z) = 0, \tag{2.10}$$

which is a corresponding linear homogeneous $q$–difference equation of $(2.9)$.

Therefore, we deduce from Lemma 2.2 that all meromorphic solutions of $(2.10)$ constitute a one parameter family

$$H(y(z)) = \{y(z) = \phi(z)u_0(z)\},$$

where $\phi(z)$ is any constant in $\mathbb{C}$, or any non-zero meromorphic function with $\phi(qz) = \phi(z)$. This yields that $q$–difference equation $(2.9)$ has a
general solution
\[ u(z) = y(z) + u_1(z) = Q(z)u_0(z) + u_1(z) = Q(z)[u_1(z) - u_2(z)] + u_1(z) \]
\[ = \frac{Q(z)[f_2(z) - f_1(z)]}{[f_1(z) - f_0(z)][f_2(z) - f_0(z)]} + \frac{1}{f_1(z) - f_0(z)}. \tag{2.11} \]

We now suppose that \( f(z)(\neq f_0(z)) \) is a meromorphic solution of (1.3), and conclude from the argumentation of (2.9) that \( u(z) = \frac{1}{f(z) - f_0(z)} \) is also a meromorphic solution of (2.9). Thus, we deduce from (2.9), (1.3) and the assumption that \( \phi(z) \) is any constant in \( \mathbb{C} \), or any non-zero meromorphic function \( \phi(qz) = \phi(z) \) such that
\[ \frac{1}{f(z) - f_0(z)} = \frac{\phi(z)[f_2(z) - f_1(z)]}{[f_1(z) - f_0(z)][f_2(z) - f_0(z)]} + \frac{1}{f_1(z) - f_0(z)}. \]

Therefore, we obtain that
\[ f(z) = \frac{[f_1(z) - f_0(z)][f_2(z) - f_0(z)]}{\phi(z)[f_2(z) - f_1(z)] + [f_2(z) - f_0(z)]} + f_0(z), \tag{2.12} \]
where \( \phi(z) \) is any constant in \( \mathbb{C} \), or any non-zero meromorphic function with \( \phi(qz) = \phi(z) \). This shows that any meromorphic solution \( f(z)(\neq f_0(z)) \) of (1.3) has the form (2.12).

We then affirm that any meromorphic function \( f(z)(\neq f_0(z)) \) denoted by (2.12) must be a meromorphic solution of (1.3). In fact, we conclude from (2.11) and (2.12) that
\[ f(z) = \frac{1}{u(z)} + f_0(z), \tag{2.13} \]
where \( u(z) \) satisfies the \( q \)-difference equation (2.9). Thus, we further conclude from (2.9), (1.3) and the assumption that \( f_0(z) \) is a meromorphic solution of (1.3), that
\[ f(qz) = \frac{1}{u(qz)} + f_0(qz) = \frac{\alpha_1(z)}{-\alpha_0(z)u(z) - (q - 1)z} + f_0(qz) \]
\[ = \frac{1 + (q - 1)zf_0(qz)}{[1 - (q - 1)zf_0(z)]u(z) - (q - 1)z} + f_0(qz) \]
\[ = \frac{1 + [1 - (q - 1)zf_0(z)]u(z)f_0(qz)}{[1 - (q - 1)zf_0(z)]u(z) - (q - 1)z} \]
\[ = \left[1 + [A(z) + f_0(z)]u(z) \right] \cdot \frac{A(z) + f_0(z)}{[1 - (q - 1)zf_0(z)]u(z) - (q - 1)z} \]
\[ = \frac{1 + [A(z) + f_0(z)]u(z)}{[1 - (q - 1)zf_0(z)]u(z) - (q - 1)z}. \tag{2.14} \]
On the other hand, we can obtain from (2.13) that
\[
\frac{A(z) + f(z)}{1 - (q - 1)zf(z)} = \frac{A(z) + \frac{1}{u(z)} + f_0(z)}{1 - (q - 1)z \left[ \frac{1}{u(z)} + f_0(z) \right]}
= \frac{1 + [A(z) + f_0(z)]u(z)}{1 - (q - 1)zf_0(z)u(z) - (q - 1)z^2}.
\]

Therefore, we deduce from (2.14) and (2.15) that
\[
f(qz) = \frac{A(z) + f(z)}{1 - (q - 1)zf(z)},
\]
which shows that meromorphic function \( f(z) \neq f_0(z) \) denoted by (2.12) is a meromorphic solution of (1.3). The proof of Theorem 2.2 is completed.

If \( q \)-difference Riccati equation (1.3) possesses a rational solution \( f_0(z) \) such that \( f_0(z) \not\to 0 \) as \( z \to \infty \), we further obtain

**Theorem 2.3.** Let \( q \in \mathbb{C} \setminus \{0\}, |q| \neq 1 \), and \( A(z) \) be meromorphic function. If \( q \)-difference Riccati equation (1.3) possesses a rational solution \( f_0(z) \) such that \( f_0(z) \not\to 0 \) as \( z \to \infty \), then \( q \)-difference Riccati equation (1.3) has at most two rational solutions.

**Proof of Theorem 2.3.** Contrary to the assumption, we suppose that (1.3) has three distinct rational solutions \( f_0(z), f_1(z) \) and \( f_2(z) \), where \( f_0(z) \not\to 0 \) as \( z \to \infty \).

Set
\[
u_j(z) = \frac{1}{f_j(z) - f_0(z)}, \quad j = 1, 2.
\]
Obviously, \( u_1(z) \) and \( u_2(z) \) are rational functions with \( u_1(z) \neq u_2(z) \), and \( f_j(z) = \frac{1}{u_j(z)} + f_0(z), \quad j = 1, 2. \)

Now, substituting \( f_j(z) = \frac{1}{u_j(z)} + f_0(z), \quad j = 1, 2 \) into (1.3), and noting that \( f_0(z) \) is also a rational solution of (1.3), we conclude that
\[
[1 + (q - 1)zf_0(qz)]u_j(qz) - [1 - (q - 1)zf_0(z)]u_j(z) + (q - 1)z = 0, \quad j = 1, 2.
\]
This shows that \( u_1(z) \) and \( u_2(z) \) are two distinct rational solutions of \( q \)-difference equation
\[
[1 + (q - 1)zf_0(qz)]u(qz) - [1 - (q - 1)zf_0(z)]u(z) + (q - 1)z = 0, \quad j = 1, 2.
\]
and \( u_0(z) = u_2(z) - u_2(z) \) is a nonzero rational solution of
\[
[1 + (q - 1)zf_0(qz)]u(qz) - [1 - (q - 1)zf_0(z)]u(z) = 0. \quad (2.17)
\]
Since \( f_0(z) \not\to 0, z \to \infty \) and \( u_0(z) \) are both rational functions, we can set
\[
f_0(z) = \frac{P(z)}{Q(z)} \quad \text{and} \quad u_0(z) = \frac{U(z)}{V(z)},
\]
where \( P(z), Q(z), U(z) \) and \( V(z) \) are nonzero polynomials with \( \deg P(z) \geq \deg Q(z) \).

Now substituting \( f_0(z) = \frac{P(z)}{Q(z)} \) and \( u_0(z) = \frac{U(z)}{V(z)} \) into (2.17), we conclude that
\[
Q(z)Q(qz)U(qz)V(z) + (q - 1)zP(qz)Q(z)U(qz)V(z) - Q(z)Q(qz)U(z)V(qz) + (q - 1)zP(z)Q(qz)U(z)V(qz) = 0. \tag{2.18}
\]

We can obtain that
\[
\deg \{Q(z)Q(qz)U(qz)V(z)\} = \deg \{Q(z)Q(qz)U(z)V(qz)\} < \deg \{(q - 1)zP(qz)Q(z)U(qz)V(z)\} = \deg \{(q - 1)zP(z)Q(qz)U(z)V(qz)\},
\]
and at most one of the coefficient of power \( z^{\deg \{Q(z)Q(qz)U(qz)V(z)\}} \) and the coefficient of power \( z^{\deg \{(q - 1)zP(qz)Q(z)U(qz)V(z)\}} \) is zero. These all show that the degree of left hand side of (2.18) is greater than 1, and yield a contradiction.

Thus, (1.3) has at most two rational solutions. The proof of Theorem 2.3 is completed.

We now present two examples to show that Theorem 2.3 remain valid.

**Example 2.1.** Let \( q = \frac{1}{2} \). Then ration function \( f_0(z) = 2z + 4 \) solves the \( q \)-difference Riccati equation
\[
f \left( \frac{1}{2} z \right) = \frac{z^3 + 6z^2 + 7z + f(z)}{1 + \frac{z}{2} f(z)}. \tag{2.19}
\]
of type (1.3), and \( f_0(z) = 2z + 4 \to \infty \) as \( z \to \infty \). Suppose that \( f_1(z) \neq f_0(z) \) is another rational solution of (2.19). Set \( u_1(z) = \frac{1}{f_1(z) - f_0(z)} \). Then we conclude that \( u_1(z) \) satisfies the \( q \)-difference equation
\[
(z^2 + 4z - 2) u \left( \frac{z}{2} \right) + 2(z^2 + 2z + 1) u(z) + z = 0. \tag{2.20}
\]
According to the proof of Theorem 2.2, we note that all meromorphic solutions \( f(z) \) (except exceptional solution \( f_0(z) \)) of (2.19) and all solutions \( u(z) = \frac{1}{f(z) - f_0(z)} \) of (2.20) are one-one corresponding.

However, the \( q \)-difference equation, which is the corresponding homogeneous difference equation of (2.20),
\[
(z^2 + 4z - 2) u \left( \frac{z}{2} \right) + 2(z^2 + 2z + 1) u(z) = 0, \tag{2.21}
\]
has no nonzero rational solution. Otherwise, suppose that \( u(z) = \frac{P(z)}{Q(z)} \) is a nonzero rational solution of (2.21), where \( P(z) \) and \( Q(z) \) are
nonzero polynomials with degree \( \deg P(z) = p \) and \( \deg Q(z) = q \) respectively. Then we conclude from (2.21) that
\[
(z^2 + 4z - 2) P\left(\frac{z}{2}\right) Q(z) + 2(z^2 + 2z + 1) P(z) Q\left(\frac{z}{2}\right) = 0.
\] (2.22)

We can easily deduce that the degree of left hand side of (2.22) is great than 2 since \( P(z) \) and \( Q(z) \) are nonzero polynomials, and yields a contradiction. Hence, we obtain that (2.19) has at most two rational solutions \( f_0(z) = 2z + 4 \) and \( f_1(z) = \frac{1}{u_1(z)} + 2z + 4 \).

Example 2.2. Let \( q = \frac{1}{2} \) and \( A(z) = \frac{2(z+1)(z+2)}{z^2(z^2-2)} \). Then rational function \( f_0(z) = \frac{z+1}{z+1} \) solves the \( q \)-difference Riccati equation
\[
\frac{1}{2} f\left(\frac{1}{2} z\right) = \frac{A(z) + f(z)}{1 + \frac{z}{2} f(z)}
\] (2.23)
of type (1.3), and \( f_0(z) = \frac{z-1}{z+1} \) → 1 as \( z \to \infty \). Suppose that \( f_1(z)(\neq f_0(z)) \) is another rational solution of (2.22). Set \( u_1(z) = \frac{1}{f_1(z) - f_0(z)} \). Then we conclude that \( u_1(z) \) satisfies the \( q \)-difference equation
\[
(z^3 - 3z^2 - 8z - 4) u\left(\frac{z}{2}\right) + (z^3 - 3z^2 + 4z + 4) u(z) + z(z^2 + 3z + 2) = 0.
\] (2.24)

By using similar calculation of Example 2.1, the \( q \)-difference equation, which is the corresponding homogeneous difference equation of (2.24),
\[
(z^3 - 3z^2 - 8z - 4) u\left(\frac{z}{2}\right) + (z^3 - 3z^2 + 4z + 4) u(z) = 0,
\] (2.25)
has no nonzero rational solution. Thus, we obtain that (2.23) has at most two rational solutions \( f_0(z) = \frac{z-1}{z+1} \) and \( f_1(z) = \frac{1}{u_1(z)} + \frac{z-1}{z+1} \).

3. Relationships between \( q \)-difference equation and \( q \)-gamma function

In this section, we focus on the relationships between \( q \)-difference equation and \( q \)-gamma function, and firstly obtain the following result.

**Theorem 3.1.** Let \( q \in \mathbb{C} \) with \( 0 < |q| < 1 \). Suppose that \( q \)-difference Riccati equation (1.3) possesses two distinct rational solutions \( f_1(z) \) and \( f_2(z) \). Then all meromorphic solutions of \( q \)-difference Riccati equation (1.3) are concerned with \( q \)-gamma function.

**Proof of Theorem 3.1.** Since \( f_1(z) \) and \( f_2(z) \) are two distinct rational solutions of (1.3), we construct a Möbius translation
\[
f(z) = \frac{f_1(z) h(z) + f_2(z)}{h(z) + 1}.
\] (3.1)
Then $\sigma(h) = \sigma(f) = 0$. Substituting (3.1) into (1.3), we conclude that
\[ h(qz) = \frac{\frac{1}{1 - (q - 1)f_1(z)}}{1 - (q - 1)f_2(z)} h(z), \]
which is type of (1.1). Thus, meromorphic solution $h(z)$ of (3.2) has the form (1.2), which is concerned with $q-$gamma function. The proof of Theorem 3.1 is completed.

Now, we give an example to give a presentation for Theorem 3.1.

Example 3.1. Let $q = -\frac{1}{2}$, $A(z) = -\frac{6z}{(z+1)(z-2)}$ in (1.3). Then functions
\[ f_1(z) = \frac{1}{z+1} \quad \text{and} \quad f_2(z) = \frac{-2}{z+1} \]
satisfy the $q$-difference Riccati equation (1.3). Then, by using the transformation (3.1), we can switch $q$-difference Riccati equation (1.3) into the type (3.2) and conclude that
\[ h\left(-\frac{1}{2}z\right) = \frac{\left(1 - \frac{z}{\frac{3}{2}}\right)}{\left(1 - \frac{z}{\frac{1}{2}}\right)} h(z), \]
which is type of (1.1), and so
\[ h(z) = \frac{\gamma - \frac{1}{2} \left(-\frac{z}{\frac{3}{2}}\right)}{\gamma - \frac{1}{2} \left(-\frac{z}{\frac{1}{2}}\right)} = \frac{\gamma - \frac{1}{2} \left(-\frac{3z}{2}\right)}{\gamma - \frac{1}{2} (2z)}. \]

We then conclude from (3.1) and (3.3) that
\[ f(z) = \frac{\gamma - \frac{1}{2} \left(-\frac{3z}{2}\right) - 2\gamma - \frac{1}{2} (2z)}{(z+1) \left(\gamma - \frac{1}{2} \left(-\frac{3z}{2}\right) + \gamma - \frac{1}{2} (2z)\right)}, \]
which is concerned with $q-$gamma function.

We second show that solutions of second order $q-$difference equation are also concerning with $q-$gamma function. Thus, we investigate the passage between $q$-difference Riccati equation (1.3) and second order $q$-difference equation (1.4), and obtain the following result.

**Theorem 3.2.** The passage between $q$-difference Riccati equation (1.3) and second order $q$-difference equation (1.4) is
\[ f(z) = \frac{\Delta_q y(z)}{y(z)} = \frac{y(qz) - y(z)}{(q - 1)zy(z)}. \]

**Proof of Theorem 3.2.** We first prove that $f(z)$ defined as (3.5) is a meromorphic solution of (1.3) if $y(z)$ is a nontrivial meromorphic
solution of (1.4). In fact, we conclude from (3.5) that

\[
\Delta_q^2 y(z) = \Delta_q (\Delta_q y(z)) = \Delta_q (-f(z)y(z)) \\
= \frac{-f(qz)y(qz) + f(z)y(z)}{(q - 1)z} \\
= -f(qz)[y(z) - (q - 1)zf(z)y(z)] + f(z)y(z) \\
\frac{1}{(q - 1)z} \\
= -f(qz)y(z)[1 - (q - 1)zf(z)] + f(z)y(z). \\
\]  

(3.6)

Thus, we deduce from (1.4) and (3.6) that

\[-f(qz)y(z)[1 - (q - 1)zf(z)] + f(z)y(z) = -A(z)y(z),
\]

which implies the desired form of equation (1.3).

We second prove that a meromorphic function \( y(z) \) satisfying (3.5) is a meromorphic solution of (1.4) if \( f(z) \) defined as (3.5) is a meromorphic solution of (1.3).

In fact, we conclude from (3.6) and (1.3) that

\[
\Delta_q^2 y(z) = -f(qz)y(z)[1 - (q - 1)zf(z)] + f(z)y(z) \\
\frac{1}{(q - 1)z} \\
= -A(z)y(z),
\]

which implies the desired form of (1.4).

Thus, we deduce from Theorem 3.1 and 3.2 that

**Theorem 3.3.** Let \( q \in \mathbb{C} \) with \( 0 < |q| < 1 \). Suppose that \( q \)-difference Riccati equation (1.3) possesses two distinct rational solutions \( f_1(z) \) and \( f_2(z) \). Then all meromorphic solutions of second order \( q \)-difference equation (1.4) are concerned with \( q \)-gamma function.

4. **Value distribution of solutions of \( q \)-difference Riccati equations**

If \( g(z) \) is a transcendental meromorphic solution of equation

\[
g(qz) = R(z, g(z)), \tag{4.1}
\]

where \( q \in \mathbb{C}, |q| > 1 \), and the coefficients of \( R(z, g(z)) \) are small functions relative to \( g(z) \), Gundersen et al. [11] showed that the order of growth of equation (4.1) is equal to \( \log \deg_g(R)/\log |q| \), where \( \deg_q(R) \) is the degree of irreducible rational function \( R(z, g(z)) \) in \( g(z) \), which
means that all transcendental meromorphic solutions of $q$–difference Riccati equation (1.3) have zero order when $q \in \mathbb{C}, |q| > 1$.

On the other hand, second order $q$–difference equation (1.4) is equivalent to the second order linear $q$–difference equation

$$y(q^2 z) - (q + 1)y(qz) + q[1 + (q - 1)zA(z)]y(z) = 0.$$  \hspace{1cm} (4.2)

Bergweiler et al. \cite{4} pointed out that all transcendental meromorphic solutions of equation (1.2) satisfy $T(r, f) = O((\log r)^3)$ if $q \in \mathbb{C}$ and $0 < |q| < 1$. This indicates that all transcendental meromorphic solutions of equation (1.3) satisfy $T(r, f) = O((\log r)^2)$ if $q \in \mathbb{C}$ and $0 < |q| < 1$. Since (3.5) is a passage between (1.3) and (1.4), we deduce that all transcendental meromorphic solutions of $q$–difference Riccati equation (1.3) are of zero order if $q \in \mathbb{C}$ and $0 < |q| < 1$. Thus, we obtain the following result.

**Theorem 4.1.** All transcendental meromorphic solutions of $q$–difference Riccati equation (1.3) are of zero order for all $q \in \mathbb{C}\{0\}$ and $|q| \neq 1$.

Berweiler et al. \cite{3} first investigated the existence of zeros of $\Delta, f(z) = f(z + c) - f(z)$ and $\Delta f(z)$, where $c \in \mathbb{C}\{0\}$, and obtained many profound results (see \cite[Theorem 1.2–Theorem 1.4 and Theorem 1.6]{5}). Chen and Shon \cite{6} then extended these results of \cite{5} and proved a number of results concerned with the existence of zeros and fixed points of $\Delta, f(z) = f(z + c) - f(z)$ and $\Delta f(z)$, where $c \in \mathbb{C}\{0\}$ (see \cite[Theorem 1–Theorem 6]{6}). Zhang and Chen \cite{21} further considered the difference Riccati equation

$$f(z + 1) = \frac{p(z + 1)w(z) + q(z)}{w(z) + p(z)},$$  \hspace{1cm} (4.3)

where $p(z)$ and $q(z)$ are small functions relative to $f(z)$, and obtained the following results.

**Theorem 4.A** \cite[Theorem 1.1]{21}. Let $p(z), q(z)$ be meromorphic functions of finite order, and let $[p(z + 1)f(z) + q(z)]/[f(z) + p(z)]$ be an irreducible finite order meromorphic function of (1.3). Set $\Delta f(z) = f(z + 1) - f(z)$. Then

(i) $\lambda \left( \frac{1}{\Delta f(z)} \right) = \sigma(\Delta f(z)) = \sigma(f), \ \lambda \left( \frac{1}{\Delta f(z)} \right) = \sigma \left( \frac{\Delta f(z)}{f(z)} \right) = \sigma(f)$;

(ii) If $q(z) \neq 0$, then $\lambda \left( \frac{1}{f} \right) = \lambda(f) = \sigma(f)$;

(iii) If $p(z) \equiv p$ is a constant and $q(z) \equiv s(z)^2$, where $s(z)$ is a non-constant rational function, then $f(z)$ has no Borel exceptional value and $\lambda(\Delta f(z)) = \lambda \left( \frac{\Delta f(z)}{f(z)} \right) = \sigma(f)$. 

We now consider the value distribution of differences of transcendental meromorphic solutions of $q-$difference Riccati equation (1.3) as follows.

**Theorem 4.2.** Let $A(z)$ be a non-constant rational function, $q \in \mathbb{C}\setminus\{0\}$ and $|q| \neq 1$. Suppose that $f(z)$ is a transcendental meromorphic solution of $q-$difference Riccati equation (1.3). Set $\Delta_q f(z) = \frac{f(qz) - f(z)}{(q-1)z}$.

1. If $A(z) \neq -\frac{1}{(q-1)z}$, then $\Delta_q f(z)$ and $\Delta_q f(z) f(z)$ have infinitely many poles;
2. If $A(z) = -(q-1)z s(z)^2$, where $s(z)$ is a non-constant rational function, then $\Delta_q f(z) = \frac{f(qz) - f(z)}{(q-1)z}$ and $\Delta_q f(z) f(z)$ have infinitely many zeros.

**Remark 4.1** The similar result of Theorem 4.2(2) has been obtained in [18].

In order to prove to Theorem 4.2, we need some Lemmas.

**Lemma 4.1** [3, Theorem 1.2]. Let $f(z)$ be a non-constant zero-order meromorphic function, and $q \in \mathbb{C}\setminus\{0\}$. Then

$$m \left( r, \frac{f(qz)}{f(z)} \right) = o \left( T(r, f) \right)$$

on a set of logarithmic density 1.

**Lemma 4.2** [19, Theorem 2.5]. Let $f(z)$ be a transcendental meromorphic solution of order zero of a $q-$difference equation of the form

$$U_q(z, f) P_q(z, f) = Q_q(z, f),$$

where $U_q(z, f) P_q(z, f)$ and $Q_q(z, f)$ are $q-$difference polynomials such that the total degree $\deg U_q(z, g) = n$ in $f(z)$ and its $q-$shifts, $\deg Q_q(z, g) \leq n$. Moreover, we assume that $U_q(z, g)$ contains just one term of maximal total degree in $f(z)$ and its $q-$shifts. Then

$$m(r, P_q(z, f)) = o \left( T(r, f) \right)$$

on a set of logarithmic density 1.

**Lemma 4.3** [3, Theorem 2.2]. Let $f(z)$ be a nonconstant zero order meromorphic solution of

$$P(z, f) = 0,$$

where $P(z, f)$ is a $q-$difference polynomials in $f(z)$. If $P(z, \alpha) \neq 0$ for a small function $\alpha(z)$ relative to $f(z)$, then

$$m \left( r, \frac{1}{f - \alpha} \right) = o \left( T(r, f) \right)$$

on a set of logarithmic density 1.
Proof of Theorem 4.2. (1) Since \( f(z) \) is a transcendental meromorphic solution of \( q \)-difference Riccati equation (1.3), we deduce from (1.3) that
\[
(q - 1)zf(qz)f(z) = f(qz) - f(z) - A(z).
\]
Thus, we conclude from Lemma 4.1, Lemma 4.2 and (4.4) that
\[
m(r, f(z)) \leq m\left(r, \frac{f(z)}{f(qz)}\right) - m(r, f(qz)) + o(T(r, f)) = o(T(r, f))
\]
on a set of logarithmic density 1, and so
\[
N(r, f) = T(r, f) + o(T(r, f)),
\]
(4.5)
\[
m(r, \Delta_q f(z)) \leq m\left(r, \frac{\Delta_q f(z)}{f(z)}\right) + m(r, f(z)) + o(T(r, f)) = o(T(r, f))
\]
on a set of logarithmic density 1.

We further conclude from (1.3) that
\[
\Delta_q f(z) = \frac{1}{(q - 1)z} \cdot A(z) + \frac{(q - 1)zf(z)^2}{1 - (q - 1)zf(z)}.
\]
(4.7)
Thus, we apply Valiron-Mohon'ko Theorem to (4.7) that
\[
T(r, \Delta_q f(z)) = 2T(r, f) + o(T(r, f)).
\]
(4.8)
We then obtain from (4.6) and (4.8) that
\[
N(r, \Delta_q f(z)) = 2T(r, f) + o(T(r, f))
\]
on a set of logarithmic density 1, and so \( \Delta_q f(z) \) has infinitely many poles.

We note that
\[
N\left(r, \frac{\Delta_q f(z)}{f(z)}\right) \geq N(r, \Delta_q f(z)) - N(r, f) = T(r, f) + o(T(r, f))
\]
on a set of logarithmic density 1, and so \( \frac{\Delta_q f(z)}{f(z)} \) has infinitely many poles.

(2) Let
\[
P(z, f) = (q - 1)zf(z)f(qz) - f(qz) + f(z) + A(z).
\]
(4.9)
We then affirm that \( P(z, s(z)) \not\equiv 0 \) or \( P(z, -s(z)) \not\equiv 0 \). Otherwise, if \( P(z, s(z)) \equiv 0 \) and \( P(z, -s(z)) \equiv 0 \), we can obtain from (4.9) that
\[
s(qz) = s(z).
\]
This is impossible since \( s(z) \) is a non-constant rational function. Without loss of generality, we assume that \( P(z, s(z)) \not\equiv 0 \). Thus, we obtain from Lemma 4.3, (1.3) and (4.9) that
\[
m\left(r, \frac{1}{f(z) - s(z)}\right) = o(T(r, f))
\]
on a set of logarithmic density 1, and so
\[ N \left( r, \frac{1}{f(z) - s(z)} \right) = T(r, f) + o(T(r, f)) \]  (4.10)
on a set of logarithmic density 1.

Since \( A(z) = -(q - 1)zs(z)^2 \), we can conclude from (1.3) and (4.7) that
\[ \Delta q f(z) = \frac{[f(z) + s(z)][f(z) - s(z)]}{1 - (q - 1)zf(z)}. \] (4.11)
If \( f(z_0) - s(z_0) = 1 - (q - 1)z_0f(z_0) = 0 \), then \( (q - 1)z_0s(z_0) = 0 \). If \( f(z_0) - s(z_0) = 0 \) and \( f(z_0) + s(z_0) = \infty \), then \( s(z_0) = \infty \). Thus, we deduce from (4.10) and (4.11) that
\[ N \left( r, \frac{1}{\Delta q f(z)} \right) = N \left( r, \frac{1 - (q - 1)zf(z)}{[f(z) + s(z)][f(z) - s(z)]} \right) \]
\[ = N \left( r, \frac{1}{f(z) - s(z)} \right) = T(r, f) + o(T(r, f)) \]
on a set of logarithmic density 1. This shows that \( \frac{1}{\Delta q f(z)} \) has infinitely many zeros.

We now obtain from (4.11) that
\[ \frac{\Delta q f(z)}{f(z)} = \frac{[f(z) + s(z)][f(z) - s(z)]}{1 - (q - 1)zf(z)f(z)}. \] (4.12)
By combining (4.5) and (4.12), and using similar method that \( \frac{1}{\Delta q f(z)} \) has infinitely many zeros, we can conclude that \( \frac{\Delta q f(z)}{f(z)} \) has infinitely many zeros. The proof of Theorem 4.2 is completed.
