ABSTRACT

The article about the results of the experiment, which provided to definite of biological efficacy the microbial preparations - Kiloca, Fast Kiloca, based on the fungi metarrhizium anisoplia. The experiments carried out in laboratory condition to control of Maroccan locust (daciastaurus moroccanus Thunb.) where collected from pastures of Guzar and Nishan provinces of Kashkhadarya region of the Republic of Uzbekistan.

KEYWORDS

locust crops, biopesticides, microbiopesticides, moroccan.

INTRODUCTION

In the world, harmful locusts require constant attention from industry experts. Only in the countries of the Caucasus and Central Asia, failure to control harmful herd locusts, such as Moroccan, Italian and Asian locusts, by causing damage to pasture lands on an area of more than 25 million hectares, as well as agricultural crops, leads to loss of received from them products. As a result, more than 20 million people could left without agricultural products.

The development and improvement of evidence-based control measures against these pests and their timely implementation in foothill, pasture and steppe zones is one of the most important tasks of almost all countries of the world where locusts are
common. In particular, studies have conducted in the United States, Europe, Australia, China, the CIS countries, Africa and various regions of other Asian countries where harmful locusts are common. However, studies on the creation of conditions for microbiological control of harmful locusts, the creation of a complex for the application of modern methods and means against them, the determination of the causes of the spread of non-herd locust crops around crops, and the development of effective control measures against them.

In the Republic, some types of harmful locusts are dangerous not only for pasture plants, but also for all crops. To constantly ensure the needs of the population in dairy and meat products, an important task is to protect the vegetation of foothill, pasture and steppe zones from harmful locusts. The Development Strategy of the Republic of Uzbekistan in 2017-2021 noted that the priority tasks of agriculture are "... the development and implementation of measures to protect plants from diseases and pests." In this regard, in order to prevent mass reproduction and create a danger to crops, it is necessary to identify the main harmful species of locusts found in the foothills, pasture and steppe zones, study the features of their development, as well as create and implement a set of effective, environmentally friendly measures and means.

Currently, the focus in the control against pest locusts is the use and spread of ecologically safe biopesticides. In particular, it has been studied that the microbiostates of Green Guard SC Premium against moroccan locust and Italian locust (Calliptamus italicus L.) has a biological effect controlled near 80.0%, this is effectively score in Uzbekistan and Georgia [1,4,5].

In Tibet, 2,3x10^5, 2,3x10^6, 2,3x10^7, 2,3x10^8, 2,3x10^9 colonization of pests, when controlled Metarrhizium anisopliae against Locusta migratoria tibetensis, it was 71%-100% effective [4,6].

MATERIAL AND METHODS

One such biopesticide is Xin Jiang MOER Chemscence Co., China Ltd., Kiloca m.sus.k based on Metarrhizium anisopliae fungi produced by Consumption of biopesticide (1: 20x10^8) 1.0-1.5l / ha as well as in order to increase the initial effect of this biopesticide, the chemical-acting compound betacypermethrin belongs to the group of pyrethroids of the Metarrhizium anisopliae fungus (1:20x10^8) + 1% Fast Kiloca o.sc.k. the experiments were carried out to study the biological effectiveness of biopesticides in laboratory conditions against Moroccan locust, which produces a pile of the main pest locusts spread in the Republic in 2013 in the amount of 1,0 l/ha.

The study of the biological efficacy of biopreparates used in experiments was calculated in [2] method and make a dispersion analysis of the results of the conducted experiments by the method [3].

RESULTS AND DISCUSSION

Our experiments were conducted with the creation of natural conditions for locusts in specially made boxes. On average, each of the box put nymph of healthy II-III young Moroccan locusts of 30-40 (1-picture).
1-picture. Special boxes were used for laboratory experiments.

The nymph of this locust were collected from the Guzor and Nishon districts of Kashkadarya region.

For the template, the Green Guard SC-0,5 l/ha biopesticide was used (2-table). During the accounting period of our experiments, temperatures were also monitored and the average temperature was 28-300C. In experiments with Kiloca biopesticide-spreading on 1,0 l/m in the 2 day of the calculation observation in the variant used in 52,1%, if on 4 day gave 55,3%, on 6 day 62,5%, on 8 day 69,7%, on 21 day 83,4% biological effect, in the variant used to spend 1,5 l/ha, the calculation gave a biological effect of 64,6% on the 2 day of observation, 71,8% on the 4 day, 74,0% on the 6 day, 75,0% on the 4 day, 76,0% on the 6 day, 75,0% on the 8 day, and 92,0% on the 32 day.

2-table.

**Fast Kiloca m.shut up.the G. (Metarrhizium anisopliae +1% betacypermetrin) biopesticide to moroccan locust’s nymph**

injection biological efficiency. (Laboratory experience, hand sprayer (120 l/ha), 25.04.2013)
As well as, in experiments with biopesticide treated with a chemical compound Fast Kiloca 1,5 l/ha biopesticide, the calculation was made on 2 days of observation 91,0%, on 4 days 93,7%, on 6,8,10 days 93,7% -93,7% -94,5% biological efficiency, it gained 26% biological efficiency in 98,0 days, 32% in 100 days. The Green Guard SC-0,5 l/ha variant used in variant was found to have a biological effect of 26,6% on the 2 day of the follow-up, 35,6% on the 4 day, 40,0% on the 6 day, and 91,0% on the 32 day of the follow-up (2- table). In both experiments, locust's nymph did not controlled, which were put under control, was not observed.

CONCLUSIONS

1. According to the results of the experiment, the maximum biological effect of using Kiloca biopesticide at 1.0l / ha in the control against Moroccan locusts was 88.4%, with the highest biological efficiency of 1.5 l / ha., 8%.
2. Fast Kiloca also records the highest 100.0% bio-efficiency of microbiological and chemical pesticides at 1.0l / d to accelerate initial effects to improve microbial biopesticides effects.
3. At the expense of these Kiloca-1.0-1.5 l / ha and Fast Kiloca-1.0 l / L, it is recommended to use these biopreparations against common locust for the purpose of saving ecological environment.
