1.Introduction

The theory of special functions comprises a major part of mathematics. In the last three centuries, the essential of solving the problems taking place in the fields of classical mechanics, hydrodynamics, and control theories motivated the development of the theory of special functions. This field also has wide applications in both pure mathematics and applied mathematics. The interested readers may consult the literature [1–4].

Throughout this article, let \( \mathbb{C}, \mathbb{R}^+, \mathbb{Z}^-, \) and \( \mathbb{N} \) be the sets of complex numbers, positive real numbers, negative integers, and natural numbers, respectively.

2. Preliminaries

This section contains some basic definitions and mathematical preliminaries. We begin with the well-known Mittag-Leffler function.

In [17], Gosta Mittag-Leffler introduced the following Mittag-Leffler function which is defined by

\[
E_\theta (z) = \sum_{n=0}^{\infty} \frac{z^n}{\Gamma(\theta n + 1)}, \quad z \in \mathbb{C}, \quad \Re(\theta) > 0.
\]  

(1)

In [18], a generalization of Mittag-Leffler function \( E_\theta (z) \) is given by

\[
E_{\theta, \vartheta} (z) = \sum_{n=0}^{\infty} \frac{z^n}{\Gamma(\theta n + \vartheta)}, \quad z, \vartheta \in \mathbb{C}, \quad \Re(\theta) > 0.
\]  

(2)

In [6], Prabhakar proposed the following three parameters of Mittag-Leffler function, which is defined by

\[
E_{\theta, q} (z) = \sum_{n=0}^{\infty} \frac{z^n(\vartheta q)_n}{\Gamma(\theta n + \vartheta q) n!}, \quad z, \vartheta, q \in \mathbb{C}, \quad \Re(\theta) > 0,
\]  

(3)
where \((q)_n\) is the well-known Pochhammer’s symbol defined as follows (see [19]). For \(q \in \mathbb{C}\),
\[
(q)_n = q(q + 1)(q + 2) \cdots (q + n - 1), \quad \text{for } n \in \mathbb{N},
\]
\[
(q)_0 = 1, \quad \text{for } n = 0.
\]

**Definition 1.** In [20], Gehlot introduced the two parameters Pochhammer’s symbol and two parameters of gamma \((p, k)\)-function.

Let \(k, p > 0\), \(\xi \in \mathbb{C}\) with \(\Re(\xi) > 0\), and \(n \in \mathbb{N}\). Then, the Pochhammer \((p, k)\)-symbol \(\xi^{(n,k)}\) is defined as
\[
\xi^{(n,k)} = \frac{(\xi p)^{n}}{k^n} \prod_{i=1}^{n}(\xi i p + k)\cdot
\]
and the gamma \((p, k)\)-function is defined by
\[
\Gamma_{p,k}(\xi) = \frac{1}{n!} \lim_{n \to \infty} \frac{p^{n+1}(np)^{\xi/k}}{\xi^{(n,k)}}\cdot
\]

**Definition 2.** The gamma \((p, k)\)-function is also represented by the following forms:
\[
\Gamma_{p,k}(\xi) = \int_{0}^{\infty} e^{-t/p} t^{\xi-1} dt,\quad p > 0\]
\[
\Gamma_{p,k}(\xi) = \left(\frac{k}{p}\right)^{\xi/k} \Gamma_{p}(\xi) = \frac{p^{\xi/k}}{k^{\xi/k}}\Gamma_{p}(\xi).\quad (8)
\]

Also, the relationship between the Pochhammer \((p, k)\)-symbol, Pochhammer \(k\)-symbol, and the classical Pochhammer’s symbol is represented by [4]
\[
\xi^{(n,k)} = \left(\frac{p}{k}\right)^{n} \xi^{(n)} = \frac{p^{n+k}}{n!} \xi^{(n)}.
\]

The gamma \((p, k)\)-function \(\Gamma_{p,k}(\xi)\) satisfies the following relation:
\[
\Gamma_{p,k}(\xi + nk) = \frac{p^{nk}}{k^{nk}} \Gamma_{p,k}(\xi),
\]
where
\[
\Gamma_{p,k}(\xi + k) = \left(\frac{k}{p}\right)^{\xi/k} \Gamma_{p,k}(\xi).
\]

**Definition 3.** In [21], the Mittag-Leffler \(k\)-function is defined by
\[
E_{\theta,\beta}^{\theta}(z) = \sum_{n=0}^{\infty} \frac{\theta^{n}z^{n}}{\beta^{n}(\beta n + \theta)^{n}}.
\]
where \(k \in \mathbb{R}, \, \theta, \, \beta \in \mathbb{C}, \, \Re(\theta) > 0, \) and \(\Re(\beta) > 0.\)

Recently, Cerutti et al. [22] introduced the following Mittag-Leffler \((p, k)\)-function is defined as follows.

**Definition 4.** For \(p, k \in \mathbb{R}, \, \theta, \beta, \theta \in \mathbb{C}, \, \Re(\theta) > 0, \) and \(\Re(\beta) > 0,\)
\[
\frac{p^{\theta}}{p^{\theta,k,\beta}}(z) = \sum_{n=0}^{\infty} \frac{p^{n}z^{n}}{(\beta n + \theta)^{n}},
\]
where \(p^{n}z^{n}\) is the Pochhammer \((p, k)\)-symbol given by (5) and \(\Gamma_{p,k}(\xi)\) is gamma \((p, k)\)-function given by (6).

In [23], Pochhammer \((p, s, k)\)-symbol \(p^{i}n_{s,k}\) is defined as follows.

**Definition 5.** For \(p, k, \xi \in \mathbb{R}, \, 0 < s < 1, \) and \(n \in \mathbb{N},\)
\[
p^{i}n_{s,k} = \left[\frac{p^{s}}{k} + s \left[\frac{p^{s}}{k} + s \cdots \right] \right], \quad \xi^{(n,k)} = \prod_{i=0}^{n} \left(\frac{p^{s} + s}{k}\right)
\]
where
\[
[n_{s,k}] = \frac{1}{1 - s}, \quad \forall \xi \in \mathbb{R}.
\]
The following identities are satisfied:

1. \([\xi + y]_{s} = [\xi]_{s} + s[y], \forall \xi, y \in \mathbb{R}\)
2. \([0]_{s} = 1\)
3. \([\xi y]_{s} = [\xi]_{s} y, \forall \xi, y \in \mathbb{R}\)
4. \([0]_{s} = 0\)

**Definition 6.** In [23], the gamma \((p, s, k)\)-function in term of \(s\)-series is given by
\[
p^{i}n_{s,k}(\xi) = \frac{p^{i}n_{s,k}(\xi + nk)}{p^{i}n_{s,k}(\xi)}.
\]

The relationship between \(p^{i}n_{s,k}\) and \(p^{i}n_{s,k}(\xi)\) is given by [23]
\[
p^{i}n_{s,k} = \frac{p^{i}n_{s,k}(\xi)}{p^{i}n_{s,k}(\xi)}.
\]

The beta \((p, k)\)-function is defined by
\[
p^{i}B_{s,k}(\xi, y) = \frac{p^{i}n_{s,k}/\xi}{p^{i}n_{s,k}/y}, \quad \Re(\xi) > 0, \, \Re(y) > 0.
\]

**Definition 7.** The beta \((p, k)\)-function is represented by the following integral:
\[
p^{i}B_{s,k}(\xi, y) = \frac{1}{k} \int_{0}^{1} t^{(\xi/k) - 1} (1 - t)^{(y/k) - 1} e^{pt} dt.
\]

**Definition 8.** The well-known Laplace transform of piecewise continuous function \(f: \mathbb{R} \to \mathbb{R}\) is defined by
\[
\mathcal{L}(f(\theta)) = \int_{0}^{\infty} e^{-st} f(\theta) d\theta, \quad \Re(s) > 0.
\]
3. Applications and Properties of the Pochhammer \((p, s, k)\)-Symbol \(p\xi[n,k,s]\) and Gamma \((p, s, k)\)-Function \(\Gamma_{p}(\xi)\)

In this section, we define gamma \((p, s, k)\)-function \(\Gamma_{p}(\xi)\) in terms of limit function and give its integral representation. Also, we define beta \((p, s, k)\)-function \(B_{p}(\xi, y)\) and its integral representation. Furthermore, we prove some identities of the Pochhammer \((p, s, k)\)-symbol \(p\xi[n,k,s]\) and the gamma \((p, s, k)\)-function \(\Gamma_{p}(\xi)\).

Definition 9. Suppose that \(k, s, p > 0, \xi \in \mathbb{C}/k\mathbb{Z}^{\pm}\) with \(\mathfrak{R}(\xi) > 0, n \in \mathbb{N}\). Then, the gamma \((p, s, k)\)-function \(\Gamma_{p}(\xi)\) is given as

\[
\Gamma_{p,s,k}(\xi) = \frac{s}{k} \lim_{n \to \infty} n! p^{n+1}(snp)^{(\xi/k)-1} \frac{\ell}{p}(\xi)_{nk}. \tag{21}
\]

Theorem 1. Suppose that \(k, p, s, r, q > 0, \xi \in \mathbb{C}/k\mathbb{Z}^{\pm}\) with \(\mathfrak{R}(\xi) > 0, n \in \mathbb{N}\). Then, the following identities hold:

(1) \(p\xi[n,r,s] = p\xi[n] \tag{22}\)

(2) \(p\xi[n,r,s] = p\xi[n] \tag{23}\)

(3) \(p\xi[n,k,s] = p\xi[n,k] \tag{24}\)

(4) \(p\xi[n,k,s] = p\xi[n,k] \tag{25}\)

(5) \(p\xi[n,k,s] = p\xi[n,k] \tag{26}\)

(6) \(p\xi[n,k,s] = p\xi[n,k] \tag{27}\)

Proof. The properties (22), (23), and (24), respectively, follow from definition (11) and equations (2.8), (2.9), and (2.10) of [16]. The properties (25), (26), and (27), respectively, follow by using equation (21) and (2.11), (2.12), and (2.13) of [16].

Theorem 2. Let \(k, p, s, r > 0, \xi \in \mathbb{C}/k\mathbb{Z}^{\pm}\) with \(\mathfrak{R}(\xi) > 0, n \in \mathbb{N}\). Then, the following integral representation of gamma \((p, s, k)\)-function is defined by

\[
\Gamma_{p,s,k}(\xi) = \int_{0}^{\infty} e^{-t/2p} \xi t^{-1} \, dt. \tag{28}
\]

Proof. Consider the right hand side of (28). By applying ([8], page 2) Tannery theorem and using (21), we have

\[
\int_{0}^{\infty} e^{-t/2p} \xi t^{-1} \, dt = \lim_{n \to \infty} \int_{0}^{(snp)^{\xi/k}} \left(1 - \frac{t^k}{nsp}\right)^{n} \xi t^{-1} \, dt. \tag{29}
\]

Let \(C_{n}(\xi, i), i = 0, 1, \ldots, n, \) be given by

\[
C_{n}(\xi) = \lim_{n \to \infty} \int_{0}^{(snp)^{\xi/k}} \left(1 - \frac{t^k}{nsp}\right)^{n} \xi t^{-1} \, dt. \tag{30}
\]

After integrating by parts, we obtain

\[
C_{n}(\xi) = \frac{ki}{nspx} C_{n,-1}(\xi + k), \quad \forall i = 1, 2, \ldots, n. \tag{31}
\]

Also,

\[
C_{n,0}(\xi) = \frac{(snp)^{\xi/k}}{\xi} \tag{32}
\]

Therefore,

\[
C_{n,0}(\xi) = \frac{s}{k} \frac{n! p^{n+1}(snp)^{(\xi/k)-1}}{p(\xi)_{nk}}. \tag{33}
\]

Definition 10. Let \(\xi, y \in \mathbb{C}/k\mathbb{Z}^{\pm}, k, p, s, r \in \mathbb{R}^{\pm}, \) and \(\mathfrak{R}(\xi) > 0, n \in \mathbb{N}\). Then, the integral representation of \(\Gamma_{p,s,k}(\xi, y)\) is given by

\[
p_{B_{s,k}}(\xi, y) = \frac{1}{k} \left(1 - t^{(\xi/k)-1}\right) e^{-p(y-1)/t} \, dt. \tag{34}
\]

Theorem 3. The relation between three parameters, two parameters, and the classical Pochhammer’s symbol is given by

\[
p\xi[n,k,s] = s^n \left(\frac{sp}{k}\right)_{nk} \left(\frac{\xi}{k}\right)_{nk} = (sp)^{\xi/k} \frac{k}{\xi}. \tag{35}
\]

Proof. Using (14) and (9), we get the desired result.

Theorem 4. The relation between gamma \((p, s, k)\)-function, gamma \((p, k)\)-function, gamma \(k\)-function, and classic gamma function is given by

\[
p\xi[n,k,s] = s^n \left(\frac{sp}{k}\right)^{\xi/k} \Gamma_{p}(\xi) = \left(\frac{sp}{k}\right)^{\xi/k} \Gamma_{p}(\xi). \tag{36}
\]

Proof. Using (21) and (8), we get the desired result.
Theorem 5. Given $\xi \in Ck^{-}, k, s, p \in \mathbb{R}^{+} \setminus \{0\}, \mathcal{R}(\xi) > 0$, and $n \in \mathbb{N}$, the recurrence relation for Pochhammer $(p, s, k)$-symbol is given by

$$p_{n}^{(\xi),k} = p_{n}^{(\xi),k+1} \times p_{n}^{(\xi)+jk,0}.$$  \hspace{1cm} (37)

\(\text{Proof.}\) Using the definition of Pochhammer $(p, s, k)$-symbol, we get the desired result. \(\square\)

4. Definition and Convergence Condition of the Mittag-Leffler $(p, s, k)$-Function $p^{E_{k,\theta,\varrho}} (z)$

In this section, we define a new generalization of the Mittag-Leffler $(p, s, k)$-function. Also, we check the convergence of the Mittag-Leffler $(p, s, k)$-function.

Definition 11. Suppose that $p, k \in \mathbb{R}, \theta, \varrho \in \mathbb{C}, \mathcal{R}(\theta) > 0, \mathcal{R}(\varrho) > 0$. Then, Mittag-Leffler $(p, s, k)$-function is defined by

$$p^{E_{k,\theta,\varrho}} (z) = \sum_{n=0}^{\infty} \frac{p[\xi]_{nk,k}z^{n}}{(\theta n + \varrho) n!}.$$  \hspace{1cm} (38)

where $p[\xi]_{nk,k}$ is Pochhammer $(p, s, k)$-symbol defined in (14), and $\Gamma^{\pi}_{s,k}(\xi)$ is defined in (21). The recurrence relation of gamma $(p, s, k)$-function $p^{\Gamma^{\pi}_{s,k}} (\xi)$ is given in [23] is

$$p^{\Gamma^{\pi}_{s,k}} (x + k) = \frac{\Gamma^{\pi}_{s,k}}{k} p^{\Gamma^{\pi}_{s,k}} (\xi).$$  \hspace{1cm} (39)

Now, some characteristics of the Mittag-Leffler $(p, s, k)$-function are presented. We show that the M-L $(p, s, k)$-function is an entire function. Also, its order and type are given.

Theorem 6. The Mittag-Leffler $(p, s, k)$-function, defined in (38), is an entire function of order $\rho$ and type $\sigma$ given by

$$\rho = \frac{k}{\text{Re}(\theta)},$$
$$\sigma = \left[\rho e^{\text{Re}(\theta)\ln(\theta/k)\rho}\right]^{-1}.$$  \hspace{1cm} (40)

\(\text{Proof.}\) Let $R$ denotes the radius of convergence of the Mittag-Leffler $(p, s, k)$-function. By considering the properties (5) and (8) and using the asymptotic expansions for the gamma function [1] and the asymptotic Stirling’s formula, we have

$$\Gamma(z) = (2\pi)^{1/2} z^{-(1/2)} e^{[1 + O(z^{-1})]} \cdot [\log(z) < \pi; |z| \longrightarrow \infty].$$  \hspace{1cm} (41)

In particular,

$$n! = (2\pi)^{1/2} n^{n} e^{-n} [1 + O(n^{-1})] \quad (n \in \mathbb{N}; n \longrightarrow \infty).$$  \hspace{1cm} (42)

and the following quotient expansion of two gamma functions at infinity is given as

$$\frac{\Gamma(z + a)}{\Gamma(z + b)} = z^{a-b} [1 + O(z^{-1})] \quad (|\arg(z) + a| < \pi; |z| \longrightarrow \infty).$$  \hspace{1cm} (43)

Series (38) can be written in the following forms:

$$p^{E_{k,0,\varrho}} (z) = \sum_{n=0}^{\infty} \frac{p[\xi]_{nk,k}z^{n}}{(\theta n + \varrho) n!}.$$  \hspace{1cm} (44)

since

$$R = \lim_{n \longrightarrow \infty} \sup \left| \frac{c_{n}}{c_{n+1}} \right|.$$  \hspace{1cm} (45)

In view of the properties (35) and (36) and using (III.9) of Theorem 1 in [22], we get

$$\left| \frac{c_{n}}{c_{n+1}} \right| = \left| \frac{p[\xi]_{nk,k}^{\Gamma^{\pi}_{s,k}(\theta(n + 1) + \varrho)(n + 1)!}}{p[\xi]_{nk,k}^{\Gamma^{\pi}_{s,k}(\theta n + \varrho)n!}} \right|$$

$$= \left( \frac{n + 1}{s} \right)^{\theta k} \left( \frac{\theta}{k} \right)^{\theta k} \longrightarrow 0.$$  \hspace{1cm} (46)

Thus, the Mittag-Leffler $(p, s, k)$-function is an entire function.

To obtain the order $\rho$ and the type $\sigma$, we apply the following definitions of $\rho$ and $\sigma$, respectively:

$$\rho = \lim_{n \longrightarrow \infty} \sup \left| \frac{n!}{\ln(n)} \right|,$$  \hspace{1cm} (47)

$$e^{-\sigma} = \lim_{n \longrightarrow \infty} \sup \left| \frac{n!}{\ln(n)} \right|^{|\rho(n)|}.$$  \hspace{1cm} (48)

Consider

$$\frac{1}{|c_{n}|} = \left| \frac{\Gamma^{\pi}_{s,k}(\varrho + \xi)_{nk,k}(\theta n + \varrho)n!}{\Gamma^{\pi}_{s,k}(\theta + \xi)(\theta n + \varrho)n!} \right|$$

$$= \left( \frac{\theta(n + 1) + \varrho}{\theta + \xi} \right)^{\theta k} \left( \frac{\theta}{k} \right)^{\theta k} \longrightarrow \infty.$$  \hspace{1cm} (49)

By using Theorem 1 equation (III.12) ([22]) and definition of $\rho$ (47), we get

$$\rho = \frac{k}{\text{Re}(\theta)},$$  \hspace{1cm} (50)

Similarly, by putting the value of $|c_{n}|$ in the definition of $\sigma$ (48) and simplify as the same in Theorem 1 in equation (III.14) ([22]), we obtain

$$\sigma = \left| \rho e^{\text{Re}(\theta)\ln(\theta/k)\rho} \right|^{-1}.$$  \hspace{1cm} (51)
5. Applications and Properties of the Mittag-Leffler \((p, s, k)\)-Function \(pE_{k,\vartheta,0}^{q,s}(z)\)

Some basic properties of Mittag-Leffler \((p, s, k)\)-function \(pE_{k,\vartheta,0}^{q,s}(z)\) are presented in this section.

**Theorem 7.** Suppose that \(p, k, s \in \mathbb{N}, \Theta, \vartheta, \varrho, q \in \mathbb{C} \) with \(\mathcal{R}(\Theta) > 0, \mathcal{R}(\vartheta) > 0\) and \(\mathcal{R}(\varrho) > 0\), then

\[
(1) \quad \left( \frac{d}{dz} \right)^m pE_{k,\vartheta,0}^{q,s}(z) = p\left[ \xi \right]_{m,k,s} pE_{k,\vartheta,0}^{q,m,k,s}(z).
\]

**Proof.** (1) Taking L.H.S of (42),

\[
\left( \frac{d}{dz} \right)^m pE_{k,\vartheta,0}^{q,s}(z) = \left( \frac{d}{dz} \right)^m \left( \sum_{n=0}^{\infty} \frac{p\left[ \xi \right]_{n,k,s} z^n}{\Gamma_{s,k}(\vartheta + \varrho)n!} \right)
\]

\[
= \sum_{n=m}^{\infty} \frac{p\left[ \xi \right]_{n,k,s} z^{n-m}}{\Gamma_{s,k}(\vartheta + \varrho)(n-m)!}
\]

\[
= \sum_{n=0}^{\infty} \frac{p\left[ \xi \right]_{n,m,k,s} z^n}{\Gamma_{s,k}(\vartheta + \varrho)n!}
\]

By using

\[
p\left[ \xi \right]_{n+j,k,s} = p\left[ \xi \right]_{j,k,s} \times p\left[ \xi + j \right]_{n,k,s},
\]

in the above equation, we get the desired result (52).

(2) Taking L.H.S of (43),

\[
\left( \frac{d}{dz} \right)^m pE_{k,\vartheta,0}^{q,s}\left( z^\vartheta \right) = \left( \frac{d}{dz} \right)^m \left( \sum_{n=0}^{\infty} \frac{p\left[ \xi \right]_{n,k,s} z^{n}(\vartheta + \varrho)\vartheta^{n-1}}{\Gamma_{s,k}(\vartheta + \varrho)n!} \right)
\]

\[
= \sum_{n=m}^{\infty} \frac{p\left[ \xi \right]_{n,k,s} z^{n}(\vartheta + \varrho)\vartheta^{n-1}}{\Gamma_{s,k}(\vartheta + \varrho)(n-m)!}
\]

\[
= \sum_{n=0}^{\infty} \frac{p\left[ \xi \right]_{n,m,k,s} z^{n+m}(\vartheta + \varrho)^{n-1}}{\Gamma_{s,k}(\vartheta + \varrho)n!}
\]

By using

\[
p\left[ \xi \right]_{m+j,k,s} = p\left[ \xi \right]_{j,k,s} \times p\left[ \xi + j \right]_{n,k,s},
\]

in the above equation, we get the desired result (53).

\[
\square
\]

6. The Euler-Beta Transform of the Mittag-Leffler \((p, s, k)\)-Function \(pE_{k,\vartheta,0}^{q,s}(z)\)

The well-known Euler-beta transform is defined by

\[
\mathcal{B}\{ f(\vartheta); a, b \} = \int_{0}^{1} \vartheta^{a-1}(1-\vartheta)^{b-1} f(\vartheta)d\vartheta,
\]

where \(a, b \in \mathbb{R}\) and \(\min\{\mathcal{R}(\vartheta), \mathcal{R}(\vartheta)\} > 0\).

Next, we define the beta transform of newly defined M-L function.

**Theorem 9.** Suppose that \(p, s, k > 0\) and \(\vartheta, \varrho, a, b \in \mathbb{C} \) with \(\mathcal{R}(\vartheta) > 0, \mathcal{R}(\varrho) > 0, \mathcal{R}(\varrho) > 0, \mathcal{R}(a) > 0, \mathcal{R}(b) > 0, \) then

\[
\int_{0}^{1} \vartheta^{a-1}(1-\vartheta)^{b-1} f(\vartheta)d\vartheta.
\]
Let the Laplace Transform of the Mittag-Leffler function be 

\[ \mathcal{L}\{ E_{p,k,0,\theta}^{s,t}(z) \} = \int_0^\infty e^{-z\lambda} E_{p,k,0,\theta}^{s,t}(\lambda z) \, d\lambda \]

(iii) If \( s = 1 \) and \( p = k \), then equation (64) coincides with the formula (11, 37) in [21].

After interchanging the integration and summation orders of the above equation and using the relation between the gamma \((p, s, k)\)-function and the classical gamma function given by (3.4), we have

After simplification, we obtain the desired result:

\[ \mathcal{L}\{ E_{p,k,0,\theta}^{s,t}(z) \} = k_p \Gamma_{s,k} (b) E_{p,k,0,\theta}^{s,t} (\lambda) . \]  

Remark 1.

(i) If \( s = 1 \), then equation (64) coincides with the result of [22], sec IV.2.

(ii) If \( s = 1 \) and \( p = k \), then equation (64) coincides with the formula (11, 37) in [21].

(iii) If \( s = p = k = 1 \), then equation (64) coincides with the formula (2.2.14) in [24].

7. The Laplace Transform of the Mittag-Leffler \((p, s, k)\)-Function \( E_{p,k,0,\theta}^{s,t}(z) \)

Theorem 10. Let \( p, s, k, c > 0 \) and \( \theta, \delta, \varrho \in \mathbb{C} \) with \( \Re (\theta) > 0, \Re (\delta) > 0, \) and \( \Re (\varrho) > 0 \). Then, the Laplace transform of \( E_{p,k,0,\theta}^{s,t}(z) \) is given by

\[ \mathcal{L}\{ E_{p,k,0,\theta}^{s,t}(z) \} = \int_0^\infty e^{-z\lambda} E_{p,k,0,\theta}^{s,t}(\lambda z) \, d\lambda \]

We have

\[ \mathcal{L}\{ E_{p,k,0,\theta}^{s,t}(z) \} = k_p \Gamma_{s,k} (b) E_{p,k,0,\theta}^{s,t} (\lambda) . \]

Proof. Applying the Laplace transform on the left hand side of (68), the Laplace transform of the potential function (see [1], equation (1.4.58)) and the generalized binomial formula is given by

\[ (1 - k\omega)^{-\theta/k} = \sum_{k=0}^\infty (\theta/k)^{\omega/k} \]

We have

\[ \mathcal{L}\{ E_{p,k,0,\theta}^{s,t}(z) \} = k_p \Gamma_{s,k} (b) E_{p,k,0,\theta}^{s,t} (\lambda) . \]
Now, using the relation between \( p, [q]_{n,k,s} \) and \( p (q)_{n,k} \), we have

\[
\mathcal{L} \left[ z^{(\theta k)} -1 \mathcal{P}_{k,\theta}^{p,\psi} \left( \pm (cz)^{\theta k} \right) \right] = \frac{k}{(sps)^{\frac{\theta}{\theta k}}} \sum_{n=0}^{\infty} c^n \frac{(n)!}{sps} \left( \frac{c}{sps} \right)^{\theta n^k}
\]

Writing the series in compact form, we have

\[
\mathcal{L} \left[ z^{(\theta k)} -1 \mathcal{P}_{k,\theta}^{p,\psi} \left( \pm (cz)^{\theta k} \right) \right] = \frac{k}{(sps)^{\frac{\theta}{\theta k}}} \left( 1 + ps \left( \frac{c}{k} \right)^{\theta} \right)^{-\theta k}.
\] (72)

Remark 2. (a) If \( s = 1 \) in the above theorem, then the result coincides with the formula of [22]

(b) If \( p = s = k = c = 1 \) in Theorem 10, then

\[
\mathcal{L} \left[ z^{\theta -1} \mathcal{P}_{1,\theta}^{p,\psi} \left( z^{\theta} \right) \right] = s^{\theta} \left( 1 - s^{-\theta} \right)^{-\theta},
\] (73)

which coincides with formula (11.13) of [25].

8. Conclusion

In this paper, we established a new extension of the Mittag-Leffler function and investigated some of its properties. We concluded as follows:

1. If \( s = 1 \), then we get the results of the Mittag-Leffler \( (p, s, k) \)-function defined in [22]

2. If \( p = 1 \) and \( s = 1 \), then we get the results of the Mittag-Leffler \( k \)-function defined in [21]

3. If \( k = 1 \) and \( s = 1 \), we get the results of the Mittag-Leffler \( k \)-function defined in [18]

4. If \( p = 1 \), \( k = 1 \), and \( s = 1 \), then we get the results of the Mittag-Leffler \( k \)-function defined in [17]

5. If \( p = 1 \), \( k = 1 \), \( s = 1 \), \( \theta = 1 \), and \( q = 1 \), then we get the results of the Mittag-Leffler \( k \)-function defined in [17]

6. If \( p = 1 \), \( k = 1 \), \( s = 1 \), \( \theta = 1 \), \( q = 1 \), and \( \theta = 1 \), then we get the exponential function

Recently, the Mittag-Leffler function is used to construct the fractional operators with nonsingular kernels [26, 27]. In [28, 29], the authors introduced the generalized fractional integrals and differential operators, which contain the Mittag-Leffler \( k \)-function in the kernels, and proved their various properties. Recently, Samraiz et al. [30] introduced the Hilfer Prabhakar \( (k; s) \)-fractional derivative by using the Mittag-Leffler \( k \)-function. They discussed its various properties and the generalized Laplace transform of the said operator. They also discussed the applications of Hilfer Prabhakar’s \( (k; s) \)-derivative in mathematical physics. In this study, we defined further generalization of the Mittag-Leffler and proved its various basic properties. Hence, it would be of great interest that the Mittag-Leffler function studied in this article will be utilized to generalize such classes of fractional and differential operators.

Data Availability

No data were used to support the findings of the study.

Conflicts of Interest

The authors declare that they have no conflicts of interest.

Authors’ Contributions

U.M. gave the main idea, and all other authors contributed equally to improve the final manuscript.

Acknowledgments

The author T. Abdeljawad would like to thank Prince Sultan University for funding this work through research group Nonlinear Analysis Methods in Applied Mathematics (NAMAM) (group number RG-DES-2017-01-17).
