Abstract: This paper deals with uncertainty, asymmetric information, and risk modelling in a complex power system. The uncertainty is managed by using probability and decision theory methods. Multiple-criteria decision making (MCDM) is a very effective and well-known tool to investigate fuzzy information more effectively. However, the selection of houses cannot be done by utilizing symmetry information, because enterprises do not have complete information, so asymmetric information should be used when selecting enterprises. In this paper, the notion of soft set (S) and interval-valued T-spherical fuzzy set (IVT-SFS) are combined to produce a new and more effective notion called interval-valued T-spherical fuzzy soft set (IVT-SFS). It is a more general concept and provides more space and options to decision makers (DMs) for making their decision in the field of fuzzy set theory. Moreover, some average aggregation operators like interval-valued T-spherical fuzzy soft weighted average (IVT-SFSWA) operator, interval-valued T-spherical fuzzy soft ordered weighted average (IVT-SFSOWA) operator, and interval-valued T-spherical fuzzy soft hybrid average (IVT-SFSHA) operators are explored. Furthermore, the properties of these operators are discussed in detail. An algorithm is developed and an application example is proposed to show the validity of the present work. This manuscript shows how to make a decision when there is asymmetric information about an enterprise. Further, in comparative analysis, the established work is compared with another existing method to show the advantages of the present work.

Keywords: interval-valued T-spherical fuzzy soft set; average aggregation operators; multiple-criteria decision making

1. Introduction

Multi-criteria decision making (MCDM) is a process that can give the ranking results for the finite alternatives according to the attribute values of different alternatives, and it is an important aspect of decision sciences. In recent years, the development of enterprises and social decision making in all aspects is related to the issue of MCDM, so it is widely applied in all kinds of fields. In the real decision-making process, an important problem is how to express the attribute value more efficiently and accurately. In the real world, because of the complexity of decision-making problems and the fuzziness of decision-making environments, it is not enough to express attribute values of alternatives by exact
values. For this, the concept of fuzzy set (FS) was proposed by Zadeh [1], and many extensions have been established by researchers and many new notions were developed over time. Since FS only deals with membership grade (MG) “\(a\)” with the condition that \(0 \leq a \leq 1\), which is the limited idea, so the idea of FS was further generalized into an interval-valued fuzzy set (IVFS). In many practical examples, we have to deal not only with MG but also consider the non-membership grade (NMG) “\(\gamma\)”. Since in FS the NMG is not under consideration, which is a drawback of FS, the concept of intuitionistic fuzzy set (IFS) was established by Atanassov [3] having the characteristics that \(0 \leq a + \gamma \leq 1\). In addition, some prioritized IF aggregation operators are discussed in [4]. Moreover, IF interaction aggregation operators and IF hybrid arithmetic and geometric aggregation operators are established in [5,6]. To provide more space to DMs, Atanassov [7] generalized IFS into IVIFS, and some IVIF aggregation operators are given in [8]. Aggregation operators are a valuable tool to deal with the fuzzy information because it converts the whole data into a single value which is helpful in the decision-making process. When DMs provide “0.6” as MG and “0.5” as NMG, then IFS fails to deal with such types of information. To overcome this issue, the idea of IFS was further extended into Pythagorean fuzzy set \((P,F_S)\) [9] having the condition that \(0 \leq a^2 + \gamma^2 \leq 1\). It is a stronger apparatus and it can tackle fuzzy information more effectively. Based on Einstein’s t-norm and t-co norm, some generalized fuzzy geometric aggregation operators are given by Garg et al. [10]. This idea is further extended into \(q\)-rung orthopair fuzzy set (q-ROFS) established by Yang et al. [19] having the necessary condition that \(0 \leq a^q + \gamma^q \leq 1\). Some \(q\)-ROF point weighted aggregation operators are explored in [13]. Some IVq-ROF Archimedean Muirhead Mean operators are discussed in [14]. Molodtsov [15] established the idea of a soft set \((S,F)\) which is a parameterization structure to deal with uncertainty in data. Maji et al. [16] explored some new operations and proposed application of \(S,F)\). Ali et al. [17] explored the application of \(S,F)\) in decision-making problems. Since the idea of \(S,F)\) has been established, some new notions are established like a fuzzy soft set \((F,S,F)\) established by Maji et al. [18], which is the combination of FS and \(S,F)\). Some considerable extensions have been developed keeping in view the idea of \(F,S,F)\) and then IVFS and \(S,F)\) are combined by Yang et al. [19] to introduce the new idea called IVIFS. Since \(F,S,F)\) is a limited structure, so notions of IF soft set \((F,S,F)\) [20] have been developed. Moreover, generalized and group-based generalized intuitionistic fuzzy soft sets with their applications in decision making have been explored in [21,22]. In addition, due to the drawback of \(F,S,F)\), the further idea of \(F,S,F)\) has been extended into a Pythagorean fuzzy soft set \((P,F,S,F)\) [23]. Further \(q\)-rung orthopair fuzzy soft set \((q - ROFS,F)\) proposed by Hussain et al. [24] developed the notion of \(P,F,S,F)\) and also explored some \(q - ROFS,F,W,A\), \(q - ROFS,F,OW,A\) and \(q - ROFS,F,HA\) operators.

From the mentioned literature, it is clear that all the fuzzy information deals with only MG and NMG. Sometimes, DMs consider the obstinacy grade AG “\(\beta\)” along with MG “\(a\)” and NMG “\(\gamma\)” in their information, and there are many practical examples which can be provided in this regard, so due to this reason, the idea of picture fuzzy set (PFS) [25] has been developed, which also considers the AG, which is more general information and provides more space to deal with vagueness in data with condition that \(0 \leq a + \beta + \gamma \leq 1\). Similarly, as the idea of IFS is generalized into \(P,F_S\), the notion of PFS is extended into the spherical fuzzy set (SFS) by Mahmood et al. [26] with condition that \(0 \leq a^2 + \beta^2 + \gamma^2 \leq 1\). Moreover, Ashraf et al. [27] established the spherical fuzzy Dombi aggregation and proposed their application in group decision-making problems. SFS is a limited idea because if DMs provide “0.9” as an MG, 0.8 as an NMG, and 0.7 as an AG, then both PFS and SFS fail to deal with such types of information, so to overcome this complexity, the notion of T-spherical fuzzy set (T-SFS) has been established by
Ullah et al. [28] with condition that $0 \leq \alpha^q + \beta^q + \gamma^q \leq 1$ and exploring some similarities measures based on T-SFNs. Some T-SF power Muirhead mean operators based on novel operational law have been developed in [29]. Further, Quek et al. [30] established the generalized T-spherical fuzzy weighted aggregation operators on neutrosophic sets. Correlation coefficients for T-SFS and their application in clustering and multi-attribute decision making have been established by Ullah et al. [31] and a note on geometric aggregation operators in the T-SF environment is given in [32]. Furthermore, Ullah et al. [33] proposed T-SF Hamacher aggregation operators. Some T-SF Einstein hybrid aggregation operators and their application in multi-attribute decision-making problems have been proposed by Munir et al. [34]. Based on improved interactive aggregation operators, an algorithm for T-SF multi-attribute decision making has been established by Garg et al. [35]. The idea of T-SFS has been extended to interval-valued T-spherical fuzzy set (IVT-SFS) established by Ullah et al. [36] and they have explored the evaluation of investment policy based on multi-attribute decision making using IVT-SF aggregation operators. Keeping in view the idea of $FS_{TFS},IFS_{TFS},P_{SFS}$, the notion of PF soft set $(PFS_{TFS})$ has been proposed by Yang et al. [37], which generalizes all the above literature due to parameterization structure. The idea of a multi-valued picture fuzzy soft set was proposed by Jan et al. [38]. The study of aggregation operators and their application in decision making can be seen in [39,40]. Perveen et al. [41] extended the idea of $PFS_{TFS}$ into the spherical fuzzy soft set $(SFS_{TFS})$, which is the combination of $S_{TFS}$ and SFS. Since T-SFS is more general than SFS, so the concept of $SFS_{TFS}$ is further extended into a T-spherical fuzzy soft set $(T - SFS_{TFS})$ proposed by Guleria et al. [42]. Moreover, some new operations on interval-valued picture fuzzy soft set $(IVPFS_{IF})$ are discussed in [43] and interval-valued spherical fuzzy weighted arithmetic means (IVSFWAM) and interval-valued spherical fuzzy weighted geometric mean (IVSFWGM) operators are established in [44].

The notion of interval-valued T-spherical fuzzy sets and soft sets is very closely related to the notion of symmetry. Based on symmetry, we can talk about the mixture of both theories. We can extend the notion of interval-valued T-spherical fuzzy to interval-valued T-spherical fuzzy soft sets, especially when determining the aggregate interval-valued T-spherical fuzzy soft number estimated by several experts and in a situation where there is imperfect knowledge (when one party has different information to another).

MCDM is a very effective and well-known tool to investigate fuzzy information more effectively. Thus, from the mentioned literature, it is clear that the interval-valued structures are more general and gain more attention in decision-making problems. To the best of our knowledge, there is no work on combining the notion of IVT-SFS and $S_{TFS}$. Hence, in this paper, the notion of $S_{TFS}$ and IVT-SFS are combined to produce a new notion called the $IVT - SFS_{TFS}$. It is a more general concept and provides more space to DMs for making their decision in the field of fuzzy set theory. Moreover, some new average aggregation operators like $IVT - SFS_{TFS}WA$ operator and $IVT - SFS_{TFS}OWA$ operators are explored. $IVT - SFS_{TFS}WA$ can only find the $IVT - SFS_{TFS}$ values and $IVT - SFS_{TFS}OWA$ weight the ordered position. Hence, due to this drawback, the $IVT - SFS_{TFS}HA$ operators are explored, as they can account for both aspects. Furthermore, the properties of these operators are discussed in detail. An algorithm is developed, and an application example is proposed to show the validity of the proposed work. In a comparative analysis, the present work is compared with another existing method to show the advantages the present work offers.

The manuscript is structured as follows: Section 2 deals with basic notions of PFS, SFS, T-SFS, $S_{TFS}, PFS_{TFS}, SFS_{TFS}$ and $T - SFS_{TFS}$. Moreover, their operations are discussed. Section 3 deals with the basic notion of $IVT - SFS_{TFS}$ and some fundamental operations on this notion are discussed in detail. In Section 4, we have established some new operators called $IVT - SFS_{TFS}WA, IVT - SFS_{TFS}OWA$ and $IVT - SFS_{TFS}HA$ operator. In Section 5, we have established an algorithm and an illustrative example is given to show the
validity of the present work. In addition, we have provided a comparative analysis of the present work to demonstrate its advantages compared to the approaches from the literature. Finally, Section 6 provides concluding remarks.

2. Preliminaries

This section deals with the basic notion of SFS, T-SFS, $S_{\varnothing}S, S_{\varnothing}S_{\varnothing}$ and $T-S_{\varnothing}S$. Moreover, their basic properties are discussed which will help us in further sections.

**Definition 1.** [26] An SFS for a non-empty set $X$ is given by

$$P = \{ (x, \alpha(x), \beta(x), \gamma(x)) | x \in X \}$$

where $\alpha(x): X \rightarrow [0,1]$ is the MG, $\beta(x): X \rightarrow [0,1]$ is the AG and $\gamma(x): X \rightarrow [0,1]$ is the NMG with condition that $0 \leq \alpha(x)^2 + \beta(x)^2 + \gamma(x)^2 \leq 1$.

**Definition 2.** [26] A T-SFS for a non-empty set $X$ is given by

$$P = \{ (x, \alpha(x), \beta(x), \gamma(x)) | x \in X \}$$

where $\alpha(x): X \rightarrow [0,1]$ is the MG, $\beta(x): X \rightarrow [0,1]$ is the AG and $\gamma(x): X \rightarrow [0,1]$ is NMG with the condition that $0 \leq (\alpha(x))^q + (\beta(x))^q + (\gamma(x))^q \leq 1$.

**Definition 3.** [15] Let $\mathbb{U}$ be a fixed set and $E$ be a set of parameters and $H \subseteq E$, then the pair $(F, H)$ is said to be $S_{\varnothing}S$ over the universal set $\mathbb{U}$, where $F$ is the map given by $F: H \rightarrow P(\mathbb{U})$, where $P(\mathbb{U})$ is the power set of $\mathbb{U}$.

**Definition 4.** [18] Let $\mathbb{U}$ be a fixed set and $E$ be a set of parameters and $H \subseteq E$, then the pair $(F, H)$ is said to be $F_{\varnothing}S$ over the universal set $\mathbb{U}$, where $F$ is the map given by $F: H \rightarrow FS^{(0)}$, where $FS^{(0)}$ is the family of all FS over $\mathbb{U}$ given as

$$F(s_j) = \{ x_\alpha \alpha_j(x_\alpha) | x \in \mathbb{U} \}$$

With condition that $0 \leq (\alpha_j(x_\alpha))^2 + (\beta_j(x_\alpha))^2 + (\gamma_j(x_\alpha))^2 \leq 1$.

**Definition 5.** [41] Let $\mathbb{U}$ be a fixed set and $E$ be a set of parameters and $H \subseteq E$, then the pair $(F, H)$ is said to be $S_{\varnothing}S_{\varnothing}$ over the universal set $\mathbb{U}$, where $F$ is the map given by $F: H \rightarrow SFS^{(0)}$, where $SFS^{(0)}$ is the family of all SFS over $\mathbb{U}$ given as

$$F(s_j) = \{ x_\alpha \alpha_j(x_\alpha), \beta_j(x_\alpha), \gamma_j(x_\alpha) | x \in \mathbb{U} \}$$

With condition that $0 \leq (\alpha_j(x_\alpha))^q + (\beta_j(x_\alpha))^q + (\gamma_j(x_\alpha))^q \leq 1$.

**Definition 6.** [42] Let $\mathbb{U}$ be a fixed set and $E$ be a set of parameters and $H \subseteq E$, then the pair $(F, H)$ is said to be $T-S_{\varnothing}S_{\varnothing}$ over the universal set $\mathbb{U}$, where $F$ is the map given by $F: H \rightarrow T-SFS^{(0)}$, where $T-SFS^{(0)}$ is the family of all SFS over $\mathbb{U}$ given as

$$F(s_j) = \{ x_\alpha \alpha_j(x_\alpha), \beta_j(x_\alpha), \gamma_j(x_\alpha) | x \in \mathbb{U} \}$$

With condition that $0 \leq (\alpha_j(x_\alpha))^q + (\beta_j(x_\alpha))^q + (\gamma_j(x_\alpha))^q \leq 1$.

**Definition 7.** [36] An IVT-SFS for a non-empty set $X$ is given by

$$P = \{ (x, \alpha(x), \beta(x), \gamma(x)) | x \in X \}$$

where $\alpha(x): X \rightarrow [0,1]$ such that $\alpha(x) = [\alpha^L(x), \alpha^U(x)]$ is the MG, $\beta(x): X \rightarrow [0,1]$ such that $\beta(x) = [\beta^L(x), \beta^U(x)]$ is the AG and $\gamma(x): X \rightarrow [0,1]$ such that $\gamma(x) = [\gamma^L(x), \gamma^U(x)]$ is NMG with the condition that $0 \leq \left( (\alpha^U(x))^q + (\beta^U(x))^q + (\gamma^U(x))^q \right) \leq 1$. 
Definition 8. [36] Let \( F_1 = \left( [\alpha_{l_1}, \alpha_{u_1}], [\beta_{l_1}, \beta_{u_1}], [y_{l_1}, y_{u_1}] \right) \), \( F_2 = \left( [\alpha_{l_2}, \alpha_{u_2}], [\beta_{l_2}, \beta_{u_2}], [y_{l_2}, y_{u_2}] \right) \) and \( F = \left( [\alpha_{l}, \alpha_{u}], [\beta_{l}, \beta_{u}], [y_{l}, y_{u}] \right) \) be three IVT-SFN and \( K > 0 \). Let ‘\( \lor \)’ denote the maximum and ‘\( \land \)’ denote the minimum. Then basic operation on IVT-SFN is defined by

1. \( F_1 \subseteq F_2 \) iff \( \alpha_{l_1} \leq \alpha_{l_2} \), \( \alpha_{u_1} \leq \alpha_{u_2} \), \( \beta_{l_1} \leq \beta_{l_2} \), \( \beta_{u_1} \leq \beta_{u_2} \) and \( \gamma_{u_1} \geq \gamma_{u_2} \).

2. \( F_1 = F_2 \) iff \( F_1 \subseteq F_2 \) and \( F_2 \subseteq F_1 \).

3. \( F_1 \cup F_2 = \left[ \lor \left( \alpha_{l_1}, \alpha_{l_2} \right), \lor \left( \alpha_{u_1}, \alpha_{u_2} \right) \right], \land \left( \beta_{l_1}, \beta_{l_2} \right), \land \left( \gamma_{l_1}, \gamma_{l_2} \right) \right] \).

4. \( F_1 \cap F_2 = \left[ \land \left( \alpha_{l_1}, \alpha_{l_2} \right), \land \left( \alpha_{u_1}, \alpha_{u_2} \right) \right], \lor \left( \beta_{l_1}, \beta_{l_2} \right), \lor \left( \gamma_{l_1}, \gamma_{l_2} \right) \right] \).

5. \( F^c = ([y_l, y_u], [\beta_l, \beta_u], [\alpha_l, \alpha_u]) \).

6. \( F_1 \oplus F_2 = \left( \left[ \left[ \sqrt{q} (\alpha_{l_1})^q + (\alpha_{l_2})^q - (\alpha_{l_1})^q (\alpha_{l_2})^q \right], \left[ \sqrt{q} (\alpha_{u_1})^q + (\alpha_{u_2})^q - (\alpha_{u_1})^q (\alpha_{u_2})^q \right] \right], \left[ \sqrt{q} (\beta_{l_1})^q + (\beta_{l_2})^q - (\beta_{l_1})^q (\beta_{l_2})^q \right], \left[ \sqrt{q} (\gamma_{l_1})^q + (\gamma_{l_2})^q - (\gamma_{l_1})^q (\gamma_{l_2})^q \right] \right) \).

7. \( F_1 \otimes F_2 = \left( \left[ \left[ \sqrt{q} (\gamma_{l_1})^q + (\gamma_{l_2})^q - (\gamma_{l_1})^q (\gamma_{l_2})^q \right], \left[ \sqrt{q} (\gamma_{u_1})^q + (\gamma_{u_2})^q - (\gamma_{u_1})^q (\gamma_{u_2})^q \right] \right], \left[ \sqrt{q} (\beta_{l_1})^q + (\beta_{l_2})^q - (\beta_{l_1})^q (\beta_{l_2})^q \right], \left[ \sqrt{q} (\alpha_{l_1})^q + (\alpha_{l_2})^q - (\alpha_{l_1})^q (\alpha_{l_2})^q \right] \right) \).

8. \( F^K = \left( \left[ (\alpha_{l})^K, (\alpha_{u})^K \right], \left[ (\beta_{l})^K, (\beta_{u})^K \right], \left[ \sqrt{q} \left( 1 - (\gamma_{l})^K \right)^q, \sqrt{q} \left( 1 - (\gamma_{u})^K \right)^q \right] \right) \).

9. \( KF = \left( \left[ \sqrt{q} \left( 1 - (\alpha_{l})^K \right)^q, \sqrt{q} \left( 1 - (\alpha_{u})^K \right)^q \right], \left[ (\beta_{l})^K, (\beta_{u})^K \right], \left[ (\gamma_{l})^K, (\gamma_{u})^K \right] \right) \).

3. Interval-Valued T-Spherical Fuzzy Soft Set (IVT − SFS\(_f\)S)

This section deals with the fundamental notion of IVT − SFS\(_f\)S. Furthermore, some basic operations are defined according to this new notion. Moreover, we define score function (SF) and accuracy function (AF) based on IVT − SFS\(_f\) numbers.

Definition 9. Consider a soft set \((U, E)\) and \(H \subseteq E\). A pair \((F, H)\) is said to be an Interval-valued T-spherical fuzzy soft set \((\text{IVT} \rightarrow \text{SFS}\(_f\)S)\) over the universal set \(U\), where \(F\) is the map given by \(F : H \rightarrow \text{IVT} \rightarrow \text{SFS}\(_f\)S\(_U\), which is defined to be

\[
F_j(x_i) = \{ (x_i, [\alpha_{l_j}(x_i), \alpha_{u_j}(x_i)], [\beta_{l_j}(x_i), \beta_{u_j}(x_i)], [y_{l_j}(x_i), y_{u_j}(x_i)] ) \mid x_i \in U \} \]

where IVT − SFS\(_U\) represent the collection of all interval-valued T-spherical fuzzy sets over \(U\). Here \([\alpha_{l_j}(x_i), \alpha_{u_j}(x_i)], [\beta_{l_j}(x_i), \beta_{u_j}(x_i)], [y_{l_j}(x_i), y_{u_j}(x_i)]\) represent the membership grade, obstinacy grade, and non-membership grade of an object \(x_i \in U\) to a set \(F_j\), respectively, with the condition that \(0 \leq \left[ (\alpha_{l_j}(x_i))^q + (\beta_{l_j}(x_i))^q + (y_{l_j}(x_i))^q \right] \leq 1\). For the sake of simplicity \(F_j(x_i) = \{ (x_i, [\alpha_{l_j}(x_i), \alpha_{u_j}(x_i)], [\beta_{l_j}(x_i), \beta_{u_j}(x_i)], [y_{l_j}(x_i), y_{u_j}(x_i)] ) \}\) is denoted by...
\[ F_{ij} = \left[ [x^l_j(x_i), x^u_j(x_i)], [\beta^l_j(x_i), \beta^u_j(x_i)], [\gamma^l_j(x_i), \gamma^u_j(x_i)] \right], \text{ which is called interval-valued } T\text{-Spherical fuzzy soft number (IVT} - \text{SFS}_{rN}). \text{ Moreover, refusal degree is defined by } \delta_{F_{ij}} = \frac{\left[ q - \left( a^l_j(x_i) \right)^q + \left( \beta^l_j(x_i) \right)^q + \left( \gamma^l_j(x_i) \right)^q \right]^q}{\left[ q - \left( a^u_j(x_i) \right)^q + \left( \beta^u_j(x_i) \right)^q + \left( \gamma^u_j(x_i) \right)^q \right]^q}. \]

**Definition 10.** Let \( F_{s_{11}} = \left( [a^l_{11}, a^u_{11}], [\beta^l_{11}, \beta^u_{11}], [\gamma^l_{11}, \gamma^u_{11}] \right), F_{s_{12}} = \left( [a^l_{12}, a^u_{12}], [\beta^l_{12}, \beta^u_{12}], [\gamma^l_{12}, \gamma^u_{12}] \right), \) and \( F = ([a^l, a^u], [\beta^l, \beta^u], [\gamma^l, \gamma^u]) \) be three IVT - SFSNs and \( K > 0. \) Then basic operation on IVT - SFSNs are defined by:

1. \( F_{s_{11}} \subseteq F_{s_{12}} \iff a^l_{11} \leq a^l_{12}, a^u_{11} \leq a^u_{12}, \beta^l_{11} \leq \beta^l_{12}, \beta^u_{11} \leq \beta^u_{12}, \text{ and } \gamma^l_{11} \geq \gamma^l_{12}, \gamma^u_{11} \geq \gamma^u_{12}. \)
2. \( F_{s_{11}} = F_{s_{12}} \iff F_{s_{11}} \subseteq F_{s_{12}} \text{ and } F_{s_{12}} \subseteq F_{s_{11}}. \)
3. \( F_{s_{11}} \cup F_{s_{12}} = \left( \left\{ [\nu(a^l_{11}, a^l_{12}), \nu(a^u_{11}, a^u_{12})], \lambda(y^l_{11}, y^l_{12}), \lambda(y^u_{11}, y^u_{12}) \right\} \right). \)
4. \( F_{s_{11}} \cap F_{s_{12}} = \left( \left\{ [\lambda(a^l_{11}, a^l_{12}), \lambda(a^u_{11}, a^u_{12})], \nu(y^l_{11}, y^l_{12}), \nu(y^u_{11}, y^u_{12}) \right\} \right). \)
5. \( F^c = ([\gamma^l, \gamma^u], [\beta^l, \beta^u], [a^l, a^u]). \)
6. \( F_{s_{11}} \oplus F_{s_{12}} = \left( \left\{ [\nu (a^l_{11}, a^l_{12}) + (\beta^l_{11}, \beta^u_{12})q - (\alpha^l_{11}, \alpha^u_{12})q, \nu (a^l_{11}, a^l_{12}) + (\gamma^l_{11}, \gamma^u_{12})q - (\alpha^l_{11}, \alpha^u_{12})q, \nu (a^l_{11}, a^l_{12}) + (\beta^l_{11}, \beta^u_{12})q - (\gamma^l_{11}, \gamma^u_{12})q, \nu (a^l_{11}, a^l_{12}) + (\gamma^l_{11}, \gamma^u_{12})q - (\beta^l_{11}, \beta^u_{12})q] \right\} \right). \)
7. \( F_{s_{11}} \otimes F_{s_{12}} = \left( \left\{ [\nu (a^l_{11}, a^l_{12})q + (\alpha^l_{11}, a^u_{12})q, \nu (a^l_{11}, a^l_{12})q + (\alpha^u_{11}, a^u_{12})q, \nu (a^l_{11}, a^l_{12})q + (\alpha^l_{11}, a^u_{12})q, \nu (a^l_{11}, a^l_{12})q + (\alpha^u_{11}, a^u_{12})q] \right\} \right). \)
8. \( F^K = \left( \left\{ [(a^l)^K, (a^u)^K], [(\beta^l)^K, (\beta^u)^K], \left\{ q - \left( 1 - \frac{(a^l)^q}{q} \right)\left( 1 - \frac{(a^u)^q}{q} \right) \right\} \right\} \right). \)
9. \( KF = \left( \left\{ [(a^l)^K, (a^u)^K], [(\beta^l)^K, (\beta^u)^K], \left\{ q - \left( 1 - \frac{(a^l)^q}{q} \right)\left( 1 - \frac{(a^u)^q}{q} \right) \right\} \right\} \right). \)

**Example 1.** Suppose a coach of a German team wants to select the best football player from a set of alternatives given as \( \mathcal{U} = \{x_1, x_2, x_3, x_4, x_5\} \). Suppose \( E = \{s_1 = \text{fitness}, s_2 = \text{experience}, s_3 = \text{performance record}, s_4 = \text{consistency} \} \) be the corresponding set of parameters. Using the above given information, the decision maker assesses the alternatives according to their parameter values and gives information in the form of IVT - SFSNs given in Table 1.

Definition 11. For $IVT - SFS_f Ns$, the score function (SF) is defined by

$$SC(F_{s1}) = \frac{(a_{11})^\alpha (1 - (b_{11})^\beta - (y_{11})^\gamma) + (a_{11})^\alpha (1 - (b_{11})^\beta - (y_{11})^\gamma)}{3}$$

Note that $SC(F_{s1}) \in [-1, 1]$.

Definition 12. Let $F_{s1} = ((a_{11}, a_{11}^U), [b_{11}, b_{11}^U], [y_{11}, y_{11}^U])$, $F_{s2} = ((a_{12}, a_{12}^U), [b_{12}, b_{12}^U], [y_{12}, y_{12}^U])$ be two $IVT - SFS_f Ns$.

1. If $SC(F_{s1}) > SC(F_{s2})$, then $F_{s1} > F_{s2}$.
2. If $SC(F_{s1}) < SC(F_{s2})$, then $F_{s1} < F_{s2}$.
3. If $SC(F_{s1}) = SC(F_{s2})$, then $F_{s1} = F_{s2}$.

Theorem 1. Let $F_{s1} = ((a_{11}, a_{11}^U), [b_{11}, b_{11}^U], [y_{11}, y_{11}^U])$, $F_{s2} = ((a_{12}, a_{12}^U), [b_{12}, b_{12}^U], [y_{12}, y_{12}^U])$ be two $IVT - SFS_f Ns$ and $K > 0$. Then the following properties hold.

1. $F_{s1} + F_{s2} = F_{s2} + F_{s1}$.
2. $K(F_{s1} + F_{s2}) = (KF_{s1}) + (KF_{s2})$.
3. $(K_1 + K_2)(F_{s1}) = (K_1 F_{s1}) + (K_2 F_{s1})$.
4. $(F_{s1})^{K_1 + K_2} = (F_{s1})^{K_1} \otimes (F_{s1})^{K_2}$.
5. $(F_{s1})^{K_1} \otimes (F_{s1})^{K_2} = (F_{s1} \otimes F_{s1})^K$.

Proof. Proofs are straightforward. □

4. Interval-Valued T-Spherical Fuzzy Soft Average ($IVT - SFS_f A$) Aggregation Operator

In this section, the detailed study of $IVT - SFS_f WA$, $IVT - SFS_f OWA$ and $IVT - SFS_f HA$ operators is discussed and further, we will discuss the properties of these operators.

4.1. Interval-Valued T-Spherical Fuzzy Soft Weighted Average ($IVT - SFS_f WA$) Aggregation Operators

Here, we discuss the detailed structure of $IVT - SFS_f WA$ operators and their properties are discussed in detail.

Definition 13. Let $F_{sij} = ((a_{i,j}^L, a_{i,j}^U), [b_{i,j}^L, b_{i,j}^U], [y_{i,j}^L, y_{i,j}^U])$ for $i = 1, 2, ..., n$ and $j = 1, 2, ..., m$, be the family of $IVT - SFS_f Ns$. $\sigma = \{\sigma_1, \sigma_2, ..., \sigma_m\}$ denote the weight vector (WV) of the experts and $p = \{p_1, p_2, ..., p_m\}$ denote the WV of parameters $s_j$ with condition $\sigma_j, p_j \in [0, 1]$ with $\sum_{i=1}^m \sigma_i = 1$ and $\sum_{i=1}^m p_i = 1$, then $IVT - SFS_f WA$ operator is the function defined as $IVT - SFS_f WA: Q^n \rightarrow Q$, where $Q$ is the family of all $IVT - SFS_f Ns$.

$$IVT - SFS_f WA(F_{s1}, F_{s2}, ..., F_{sm}) = \oplus_{j=1}^m p_j (\oplus_{i=1}^n \sigma_i F_{sij}).$$

Theorem 2. Let $F_{sij} = ((a_{i,j}^L, a_{i,j}^U), [b_{i,j}^L, b_{i,j}^U], [y_{i,j}^L, y_{i,j}^U])$ for $i = 1, 2, ..., n$ and $j = 1, 2, ..., m$, be the family of $IVT - SFS_f Ns$. Then the aggregated result for $IVT - SFS_f WA$ operator is given as...
\[ IVT - SFS_{fr}WA(F_{s_{11}}, F_{s_{12}}, ..., F_{s_{nm}}) = \bigoplus_{j=1}^{m} p_j \left( \bigoplus_{i=1}^{n} \sigma_i F_{s_{ij}} \right) \]

\[ = \left( \left\{ \intertext{where } \sigma = \{ \sigma_1, \sigma_2, ..., \sigma_n \} \text{ denote the WV of e_i experts and } p = \{ p_1, p_2, ..., p_m \} \text{ denote the WV of parameters } s_j \text{ with condition } \sigma_i, p_j \in [0, 1] \text{ with } \sum_{i=1}^{n} \sigma_i = 1 \text{ and } \sum_{j=1}^{m} p_i = 1. \right. \]

**Proof.** We will use the mathematical induction method to prove this result. We know by the operational laws that

\[ F_{s_{11}} \oplus F_{s_{12}} = \left( \sqrt{\left(1 - (\alpha_i L)q_1\right)^q} \right) \left( \sqrt{\left(1 - (\alpha_i U)q_1\right)^q} \right) \]

\[ = \left( \left[ \sqrt{1 - (\alpha_i L)q_1} \right] \left( \sqrt{1 - (\alpha_i U)q_1} \right) \right) \]

And

\[ KF_{s_{11}} = \left( \left( \sqrt{1 - (\alpha_i L)q_1} \right)^q \right) \left( \left( \sqrt{1 - (\alpha_i U)q_1} \right)^q \right) \]

We will use the mathematical induction method to prove this result. We know by the operational laws that

First of all, we will show that Equation (1) is true for \( n = 2 \) and \( m = 2 \), so we have

\[ IVT - SFS_{fr}S(F_{s_{11}}, F_{s_{12}}) = \bigoplus_{j=1}^{2} p_j \left( \bigoplus_{i=1}^{2} \sigma_i F_{s_{ij}} \right) \]

\[ = p_1 \left( \left[ \sqrt{1 - (\alpha_i L)q_1} \right] \left( \sqrt{1 - (\alpha_i U)q_1} \right) \right) \]

\[ \oplus p_2 \left( \left[ \sqrt{1 - (\alpha_i L)q_2} \right] \left( \sqrt{1 - (\alpha_i U)q_2} \right) \right) \]

\[ = p_1 \left( \left[ \sqrt{1 - (\alpha_i L)q_1} \right] \left( \sqrt{1 - (\alpha_i U)q_1} \right) \right) \]

\[ \oplus p_2 \left( \left[ \sqrt{1 - (\alpha_i L)q_2} \right] \left( \sqrt{1 - (\alpha_i U)q_2} \right) \right) \]

\[ = p_1 \left( \left[ \sqrt{1 - (\alpha_i L)q_1} \right] \left( \sqrt{1 - (\alpha_i U)q_1} \right) \right) \]

\[ \oplus p_2 \left( \left[ \sqrt{1 - (\alpha_i L)q_2} \right] \left( \sqrt{1 - (\alpha_i U)q_2} \right) \right) \]
\[
\begin{align*}
\oplus \ p_2 \\
&= \left[ q \left( 1 - \prod_{i=1}^{2} \left( 1 - \alpha_{i2}^q \right) \right) \right]^{\omega_t} \\
&\quad \cdot \left[ q \left( 1 - \prod_{i=1}^{2} \left( 1 - \alpha_{u_{i2}}^q \right) \right) \right]^{\omega_i} \\
&= \left[ q \left( 1 - \prod_{i=1}^{2} \left( 1 - \alpha_{i1}^q \right) \right) \right]^{\omega_t} \\
&\quad \cdot \left[ q \left( 1 - \prod_{i=1}^{2} \left( 1 - \alpha_{u_{i1}}^q \right) \right) \right]^{\omega_i} \\
&\quad \cdot \left[ \prod_{i=1}^{2} \left( \beta_{l_{i2}} \omega_t \right) \right]^{p_1} \\
&\quad \cdot \left[ \prod_{i=1}^{2} \left( \beta_{u_{i2}} \omega_i \right) \right]^{p_1} \\
&\quad \cdot \left[ \prod_{i=1}^{2} \left( \gamma_{l_{i2}} \omega_t \right) \right]^{p_2} \\
&\quad \cdot \left[ \prod_{i=1}^{2} \left( \gamma_{u_{i2}} \omega_i \right) \right]^{p_2} \\
&\quad \cdot \left[ \prod_{j=1}^{2} \left( \beta_{l_{ij}} \omega_t \right) \right]^{p_j} \\
&\quad \cdot \left[ \prod_{j=1}^{2} \left( \beta_{u_{ij}} \omega_i \right) \right]^{p_j} \\
&\quad \cdot \left[ \prod_{j=1}^{2} \left( \gamma_{ij} \omega_t \right) \right]^{p_j} \\
&\quad \cdot \left[ \prod_{j=1}^{2} \left( \gamma_{ij} \omega_i \right) \right]^{p_j}
\end{align*}
\]

Hence the result is true for \( n = 2 \) and \( m = 2 \).

Next, suppose that Eq. (1) is true for \( n = z_1 \) and \( m = z_2 \).
Further, suppose that Equation (1) is true for $n = z_1 + 1$ and $m = z_2 + 1$. Hence it is true for all $m, n \geq 1$. □

Remark 1.
1. Using $q = 1$, then established $IVT - SFS_{f,t}A$ operator will reduce to $IVPFS_{f,t}A$ operator.
2. Using $q = 2$, then established $IVT - SFS_{f,t}A$ operator will reduce to $IVSFS_{f,t}A$ operator.
3. If we neglect the obstinacy grade that is $\beta_{ij} = 0$, and using $q = 2$, the proposed $IVT - SFS_{f,t}A$ operator will reduce to $IVP_{2,f}FS_{f,t}A$ operator.
4. If we neglect the obstinacy grade that is $\beta_{ij} = 0$, and using $q = 1$, the proposed $IVT - SFS_{t}WA$ operator will reduce to an interval-valued intuitionistic fuzzy soft weighted average ($IVIFS_{t}WA$) operator.

5. Moreover, if we put only one parameter that is $s_1$ (mean $m = 1$), then $IVT - SFS_{t}WA$ operator reduces to an interval-valued T-spherical fuzzy weighted average (IVT-SFWA) operator.

Hence it is clear that $IVPF_{SA}, IVS_{SA}, IVP_{SA}, IVIFS_{t}WA$ and IVT-SFWA operators are the special cases of $IVT - SFS_{t}WA$ operator. The present work is more general.

**Example 2.** A person desires to buy a car from a set of five car brands as alternatives $\mathcal{U} = \{x_1 = BMW, x_2 = Suzuki, x_3 = Tata, x_4 = Hyundai Motors, x_5 = Mercedes\}$. Let $E = \{s_1 = Comfortability, s_2 = Good shape, s_3 = Reasonable price, s_4 = Automatic system\}$. Let the set $\sigma = \{0.25, 0.15, 0.14, 0.3, 0.16\}$ denote the weight vector of "$e_i$" experts and $p = \{0.27, 0.19, 0.29, 0.25\}$ denote the weight vector of "$s_j$" parameters. The experts provide their information in the form of $IVT - SFS_{t}NSs$ as given in Table 2.

| $s_1$ | $s_2$ | $s_3$ | $s_4$ |
|-------|-------|-------|-------|
| $x_1$ | $[0.2, 0.6], [0.3, 0.8]$ | $[0.1, 0.3], [0.2, 0.4]$ | $[0.6, 0.6], [0.6, 0.7]$ | $[0.3, 0.5], [0.4, 0.5]$ |
| $x_2$ | $[0.5, 0.5], [0.3, 0.4]$ | $[0.1, 0.6], [0.2, 0.7]$ | $[0.2, 0.3], [0.2, 0.6]$ | $[0.2, 0.6], [0.3, 0.5]$ |
| $x_3$ | $[0.6, 0.7]$ | $[0.3, 0.4]$ | $[0.2, 0.5]$ | $[0.4, 0.45]$ |
| $x_4$ | $[0.3, 0.5], [0.4, 0.5]$ | $[0.2, 0.6], [0.3, 0.7]$ | $[0.3, 0.5], [0.4, 0.5]$ | $[0.4, 0.5], [0.3, 0.7]$ |
| $x_5$ | $[0.5, 0.8], [0.4, 0.6]$ | $[0.1, 0.3], [0.1, 0.3]$ | $[0.4, 0.6], [0.3, 0.6]$ | $[0.2, 0.6], [0.4, 0.5]$ |

By using Equation (1), we have

$$IVT - SFS_{t}WA(F_{x_1}, F_{x_2}, \ldots, F_{x_5})$$

By using Equation (1), we have

$$IVT - SFS_{t}WA(F_{x_1}, F_{x_2}, \ldots, F_{x_5})$$

$$= \left( \begin{array}{c}
q \left( 1 - \prod_{j=1}^{m} \left( \prod_{i=1}^{n} \left( 1 - (\alpha^{k}_{ij})^{q_i} \right) \right) \right)
\prod_{j=1}^{m} \left( \prod_{i=1}^{n} \beta^{j}_{ij} \right)^{p_j} \prod_{j=1}^{m} \left( \prod_{i=1}^{n} \beta^{u}_{ij} \right)^{p_j} \\
\prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\gamma^{k}_{ij})^{q_i} \right) \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\gamma^{u}_{ij})^{q_i} \right) \end{array} \right)$$

$$= \left( \begin{array}{c}

**Theorem 3.** Let \( F_{si} = ([\alpha^i_{sj}, \alpha^u_{sj}], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}]) \) for \( i, j = 1, 2, ..., n \) and \( j = 1, 2, ..., m \), be the family of IVT – SFS\(_{f}\)Ns, \( \sigma = (\sigma_1, \sigma_2, ..., \sigma_n)^T \) denote the weight vector of \( e_i \) experts and \( p = (p_1, p_2, ..., p_m)^T \) denote the weight vector of parameters \( s_j \) with condition \( \sum_{i=1}^{n} \sigma_i = 1 \) and \( \sum_{i=1}^{n} p_i = 1 \). Then IVT – SFS\(_{f}\)WA operator holds the following properties:

1. (Idempotency). Let \( F_{sj} = ([\alpha^L_{ij}, \alpha^U_{ij}], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}]) = F_s \) for all \( i = 1, 2, ..., n \) and \( j = 1, 2, ..., m \), where \( F_s = ([\alpha^L, \alpha^U], [\beta^L, \beta^U], [\gamma^L, \gamma^U]) \), then IVT – SFS\(_{f}\)WA (\( F_{s_1}, F_{s_2}, ..., F_{s_m} \)) = \( F_s \).

2. (Boundedness). If \( F_{sj}^- = \left( \left[ \min_{\alpha^L_{ij}}, \min_{\alpha^U_{ij}} \right], \left[ \max_{\beta^L_{ij}}, \max_{\beta^U_{ij}} \right], \left[ \gamma^L_{ij}, \gamma^U_{ij} \right] \right) \) and \( F_{sj}^+ = \left( \left[ \max_{\alpha^L_{ij}}, \max_{\alpha^U_{ij}} \right], \left[ \min_{\beta^L_{ij}}, \min_{\beta^U_{ij}} \right], \left[ \gamma^L_{ij}, \gamma^U_{ij} \right] \right) \), then \( F_{sj}^- \leq \text{IVT} – \text{SFS}_{f}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_m}) \leq F_{sj}^+ \).

3. (Monotonicity). Let \( F_{sj} = ([\alpha^L_{ij}, \alpha^U_{ij}], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}]) \) be any other collection of IVT – SFS\(_{f}\)Ns for all \( i = 1, 2, ..., n \) and \( j = 1, 2, ..., m \) such that \( \alpha^L_{ij} \leq \alpha^L_{ij}, \alpha^U_{ij} \leq \alpha^U_{ij}, \beta^L_{ij} \geq \beta^L_{ij}, \beta^U_{ij} \geq \beta^U_{ij} \) and \( \gamma^L_{ij} \geq \gamma^L_{ij}, \gamma^U_{ij} \geq \gamma^U_{ij} \), then...
4. (Shift Invariance). If \( F_\omega = ([\alpha_1,\alpha_2^t], [\beta_1,\beta_2^t], [\gamma_1,\gamma_2^t]) \) is another \( IVT - SFS_{\omega} \), then
\[
IVT - SFS_{\omega} (F_\omega, F_\omega^1, F_\omega^2, \ldots, F_\omega^n) = IVT - SFS_{\omega} (F_\omega, F_\omega^1, F_\omega^2, \ldots, F_\omega^n) + F_\omega.
\]

5. (Homogeneity). For any real number \( K > 0 \)
\[
IVT - SFS_{\omega} (KF_\omega, KF_\omega^1, KF_\omega^2, \ldots, KF_\omega^n) = K \left( IVT - SFS_{\omega} (F_\omega, F_\omega^1, F_\omega^2, \ldots, F_\omega^n) \right)
\]

Proof.
1. (Idempotency). Let \( F_{\omega_{ij}} = ([\alpha_{ij}^1,\alpha_{ij}^u], [\beta_{ij}^1,\beta_{ij}^u], [\gamma_{ij}^1,\gamma_{ij}^u]) = F_\omega \) for all \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \), where \( F_\omega = ([\alpha^1,\alpha^u], [\beta^1,\beta^u], [\gamma^1,\gamma^u]) \), then from Theorem 1, we have
\[
IVT - SFS_{\omega} (F_{\omega_{ij}}, F_{\omega_{ij}}^1, F_{\omega_{ij}}^2, \ldots, F_{\omega_{ij}}^n) = (F_{\omega_{ij}}, F_{\omega_{ij}}^1, F_{\omega_{ij}}^2, \ldots, F_{\omega_{ij}}^n) = F_\omega.
\]

2. (Boundedness). As
\[
F_{\omega_{ij}}^+ = \left(\left[\min_{1 \leq i \leq n} (\alpha_{ij}^1), \min_{1 \leq i \leq n} (\alpha_{ij}^u)\right], \left[\max_{1 \leq i \leq n} (\beta_{ij}^1), \max_{1 \leq i \leq n} (\beta_{ij}^u)\right], \left[\max_{1 \leq i \leq n} (\gamma_{ij}^1), \max_{1 \leq i \leq n} (\gamma_{ij}^u)\right]\right)
\]
and
\[
F_{\omega_{ij}}^- = \left(\left[\max_{1 \leq i \leq n} (\alpha_{ij}^1), \max_{1 \leq i \leq n} (\alpha_{ij}^u)\right], \left[\min_{1 \leq i \leq n} (\beta_{ij}^1), \min_{1 \leq i \leq n} (\beta_{ij}^u)\right], \left[\min_{1 \leq i \leq n} (\gamma_{ij}^1), \min_{1 \leq i \leq n} (\gamma_{ij}^u)\right]\right).
\]
\[
\left(\left[\max, \max_i(a^L_{ij}), \max_j(a^U_{ij})\right], \left[\min, \min_i(b^L_{ij}), \min_j(b^U_{ij})\right]\right),
\]
then we have to prove that \( F_{ij} \leq \text{IVT} - \text{SPSWA}(F_{s_1}, F_{s_2}, \ldots, F_{s_m}) \leq F_{ij}^+ \).

Now for each \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \)
\[
\left[\min, \min_i(a^L_{ij}), \min_j(a^U_{ij})\right] \leq \left[\max, \max_i(a^L_{ij}), \max_j(a^U_{ij})\right]
\]
\[
\iff \left[1 - \max, \max_i(a^L_{ij})^q, 1 - \max_j(a^U_{ij})^q\right] \leq \left[\min, \min_i(a^L_{ij})^q, \min_j(a^U_{ij})^q\right]
\]
\[
\iff \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \max_i(a^L_{ij})^q)^{\omega_i} \right)^{p_j} \right], \left(\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \min_j(a^U_{ij})^q)^{\omega_i} \right)^{p_j}\right)
\]
\[
\leq \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \min_j(a^U_{ij})^q)^{\omega_i} \right)^{p_j} \right], \left(\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \max_j(a^L_{ij})^q)^{\omega_i} \right)^{p_j}\right)
\]
\[
\iff \left[1 - \max, \max_i(a^L_{ij})^q, 1 - \max_j(a^U_{ij})^q\right] \leq \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \max_i(a^L_{ij})^q)^{\omega_i} \right)^{p_j} \right] \leq \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \min_j(a^U_{ij})^q)^{\omega_i} \right)^{p_j}\right]
\]
\[
\iff [min, \min_i(a^L_{ij}), \min_j(a^U_{ij})] \leq \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \min_j(a^U_{ij})^q)^{\omega_i} \right)^{p_j} \right], \left(\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - \max_j(a^L_{ij})^q)^{\omega_i} \right)^{p_j}\right)
\]
Now for each \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \), we have

\[
\min_{i=1}^{n} \min_{i=1}^{n} (\beta_{ij}) \leq \max_{i=1}^{m} \max_{i=1}^{m} (\beta_{ij})
\]

\[
\Leftrightarrow \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\min_{i=1}^{n} (\beta_{ij}))^{\omega_j} \right)^{p_j} \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\min_{i=1}^{n} (\beta_{ij}))^{\omega_j} \right)^{p_j}
\]

\[
\leq \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\max_{i=1}^{m} (\beta_{ij}))^{\omega_j} \right)^{p_j} \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\max_{i=1}^{m} (\beta_{ij}))^{\omega_j} \right)^{p_j}
\]

\[
\Leftrightarrow \left( \min_{i=1}^{n} (\beta_{ij}) \right)^{\sum_{i=1}^{n} \omega_i} \left( \min_{i=1}^{n} (\beta_{ij}) \right)^{\sum_{j=1}^{m} p_j} \leq \left( \max_{i=1}^{m} (\beta_{ij}) \right)^{\sum_{i=1}^{n} \omega_i} \left( \max_{i=1}^{m} (\beta_{ij}) \right)^{\sum_{j=1}^{m} p_j}
\]

Moreover, for each \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \), we have

\[
\min_{i=1}^{n} \min_{i=1}^{n} (\gamma_{ij}) \leq \max_{i=1}^{m} \max_{i=1}^{m} (\gamma_{ij})
\]

\[
\Leftrightarrow \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\min_{i=1}^{n} (\gamma_{ij}))^{\omega_j} \right)^{p_j} \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\min_{i=1}^{n} (\gamma_{ij}))^{\omega_j} \right)^{p_j}
\]

\[
\leq \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\max_{i=1}^{m} (\gamma_{ij}))^{\omega_j} \right)^{p_j} \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\max_{i=1}^{m} (\gamma_{ij}))^{\omega_j} \right)^{p_j}
\]

\[
\Leftrightarrow \left( \min_{i=1}^{n} (\gamma_{ij}) \right)^{\sum_{i=1}^{n} \omega_i} \left( \min_{i=1}^{n} (\gamma_{ij}) \right)^{\sum_{j=1}^{m} p_j} \leq \left( \max_{i=1}^{m} (\gamma_{ij}) \right)^{\sum_{i=1}^{n} \omega_i} \left( \max_{i=1}^{m} (\gamma_{ij}) \right)^{\sum_{j=1}^{m} p_j}
\]
\[
\left[ \prod_{j=1}^{m} \left( \prod_{i=1}^{n} \left( y_{ij}^{L} \right)^{w_{i}} \right)^{p_j} \right] \subseteq \left[ \left( \max_{i} \max_{j} \left( y_{ij}^{L} \right)^{w_{i}} \right) \right]^{3 m+1 p_j} \nabla \left[ \left( \max_{i} \max_{j} \left( y_{ij}^{U} \right)^{w_{i}} \right) \right]^{3 m+1 p_j}
\]

\[
\left[ \min_{j} \min_{i} \left( y_{ij}^{L} \right) \right] \subseteq \left[ \min_{j} \min_{i} \left( y_{ij}^{U} \right) \right] \subseteq \left[ \max_{i} \max_{j} \left( y_{ij}^{L} \right) \right] \subseteq \left[ \max_{i} \max_{j} \left( y_{ij}^{U} \right) \right]
\]

Therefore from Equations (2)–(4), it is clear that

\[
\left[ \min_{j} \min_{i} \left( \alpha^{L} \left( y_{ij} \right) \right) \right] \subseteq \left[ \min_{j} \min_{i} \left( \alpha^{U} \left( y_{ij} \right) \right) \right] \subseteq \left[ \max_{i} \max_{j} \left( \alpha^{L} \left( y_{ij} \right) \right) \right]
\]

\[
\left[ \min_{j} \min_{i} \left( \beta^{L} \left( y_{ij} \right) \right) \right] \subseteq \left[ \min_{j} \min_{i} \left( \beta^{U} \left( y_{ij} \right) \right) \right] \subseteq \left[ \max_{i} \max_{j} \left( \beta^{L} \left( y_{ij} \right) \right) \right]
\]

And

\[
\left[ \min_{j} \min_{i} \left( y_{ij}^{L} \right) \right] \subseteq \left[ \min_{j} \min_{i} \left( y_{ij}^{U} \right) \right] \subseteq \left[ \max_{i} \max_{j} \left( y_{ij}^{L} \right) \right] \subseteq \left[ \max_{i} \max_{j} \left( y_{ij}^{U} \right) \right]
\]

Let \( \xi = IVT - SFS_{I}WA(F_{i_{1}}, F_{i_{2}}, \ldots, F_{i_{nm}}) = \left( \alpha^{L}_{\xi}, \alpha^{U}_{\xi} \right), \left( \beta^{L}_{\xi}, \beta^{U}_{\xi} \right), \left( y^{L}_{\xi}, y^{U}_{\xi} \right) \). then according to the definition of score function given in Definition 11, we obtain

\[
SC(\xi) = \frac{\left( \alpha^{L}_{\xi} \right)^{q} \left( 1 - \left( \beta^{L}_{\xi} \right)^{q} - \left( y^{L}_{\xi} \right)^{q} \right) + \left( \alpha^{U}_{\xi} \right)^{q} \left( 1 - \left( \beta^{U}_{\xi} \right)^{q} - \left( y^{U}_{\xi} \right)^{q} \right)}{3}
\]

\[
\leq \left( \max_{i} \max_{j} \left( \alpha^{L} \left( y_{ij} \right) \right)^{q} \left( 1 - \min_{j} \min_{i} \left( \beta^{L} \left( y_{ij} \right) \right)^{q} - \min_{j} \min_{i} \left( y^{L} \left( y_{ij} \right) \right)^{q} \right) \right)
\]

\[
+ \max_{i} \max_{j} \left( \alpha^{U} \left( y_{ij} \right) \right)^{q} \left( 1 - \min_{j} \min_{i} \left( \beta^{U} \left( y_{ij} \right) \right)^{q} - \min_{j} \min_{i} \left( y^{U} \left( y_{ij} \right) \right)^{q} \right)
\]

\[
= SC(F_{i_{ij}}^{+})
\]

\[
\Rightarrow Sc(\xi) \leq SC \left( F_{i_{ij}}^{+} \right)
\]

and
\[
Sc(\xi) = \left(\alpha^L_\xi\right)^q \left(1 - \left(\beta^L_\xi\right)^q - \left(y^L_\xi\right)^q\right) + \left(\alpha^U_\xi\right)^q \left(1 - \left(\beta^U_\xi\right)^q - \left(y^U_\xi\right)^q\right)
\]

\[
\frac{1}{3} \left(\min_{i,j} \left(\alpha^L_{ij}\right)^q \left(1 - \max_i \min_j \left(\beta^L_{ij}\right)^q - \max_i \max_j \left(y^L_{ij}\right)^q\right) + \min_{i,j} \left(\alpha^U_{ij}\right)^q \left(1 - \max_i \max_j \left(\beta^U_{ij}\right)^q - \max_i \max_j \left(y^U_{ij}\right)^q\right)\right)
\]

\[
= SC(F_{i_j})
\]

\[
\Rightarrow Sc(\xi) \geq SC\left(F_{i_j}\right).
\]

According to this condition, we have the following cases

Case i. If \(Sc(\xi) < SC\left(F_{i_j}\right)\) and \(Sc(\xi) > SC\left(F_{i_j}\right)\), then by Definition 12, we have

\[
\left(F_{i_j}\right) < IVT - SFS_T WA\left(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}\right) < \left(F_{i_j}\right)
\]

Case ii. If \(Sc(\xi) = SC\left(F_{i_j}\right)\), that is

\[
\left(\alpha^L_\xi\right)^q \left(1 - \left(\beta^L_\xi\right)^q - \left(y^L_\xi\right)^q\right) + \left(\alpha^U_\xi\right)^q \left(1 - \left(\beta^U_\xi\right)^q - \left(y^U_\xi\right)^q\right)
\]

\[
\frac{1}{3} \left(\max_i \max_j \left(\alpha^L_{ij}\right)^q \left(1 - \min_j \min_i \left(\beta^L_{ij}\right)^q - \min_j \max_i \left(y^L_{ij}\right)^q\right) + \max_i \max_j \left(\alpha^U_{ij}\right)^q \left(1 - \max_j \min_i \left(\beta^U_{ij}\right)^q - \max_j \max_i \left(y^U_{ij}\right)^q\right)\right)
\]

Then by using the above inequalities, we get

\[
[\alpha^L_\xi, \alpha^U_\xi] = \left[\max_i \max_j \left(\alpha^L_{ij}\right), \max_i \max_j \left(\alpha^U_{ij}\right)\right]
\]

and \([\beta^L_\xi, \beta^U_\xi] = \left[\min_j \min_i \left(\beta^L_{ij}\right), \min_j \min_i \left(\beta^U_{ij}\right)\right]\) and \([y^L_\xi, y^U_\xi] = \left[\min_j \max_i \left(y^L_{ij}\right), \min_j \max_i \left(y^L_{ij}\right)\right]\). Thus \(\delta_\xi^q = \delta_{x_{i_j}}^q\) implies that \(IVT - SFS_T WA\left(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}\right) = \left(F_{i_j}\right)\).

Case iii. If \(Sc(\xi) = SC\left(F_{i_j}\right)\), then

\[
Sc(\xi) \left(\alpha^L_\xi\right)^q \left(1 - \left(\beta^L_\xi\right)^q - \left(y^L_\xi\right)^q\right) + \left(\alpha^U_\xi\right)^q \left(1 - \left(\beta^U_\xi\right)^q - \left(y^U_\xi\right)^q\right)
\]

\[
\frac{1}{3} \left(\min_{i,j} \left(\alpha^L_{ij}\right)^q \left(1 - \max_i \max_j \left(\beta^L_{ij}\right)^q - \max_i \max_j \left(y^L_{ij}\right)^q\right) + \min_{i,j} \left(\alpha^U_{ij}\right)^q \left(1 - \max_i \max_j \left(\beta^U_{ij}\right)^q - \max_i \max_j \left(y^U_{ij}\right)^q\right)\right)
\]

Then by using the above inequalities, we obtain

\[
[\alpha^L_\xi, \alpha^U_\xi] = \left[\min_i \min_j \left(\alpha^L_{ij}\right), \min_i \min_j \left(\alpha^U_{ij}\right)\right]
\]

and \([\beta^L_\xi, \beta^U_\xi] = \left[\max_i \max_j \left(\beta^L_{ij}\right), \max_i \max_j \left(\beta^U_{ij}\right)\right]\) and \([y^L_\xi, y^U_\xi] = \left[\max_i \max_j \left(y^L_{ij}\right), \max_i \max_j \left(y^L_{ij}\right)\right]\). Thus \(\delta_\xi^q = \delta_{x_{i_j}}^q\) implies that
\[
IVT - SF_{s_{1}}WA(F_{s_{1}}, F_{s_{2}}, ..., F_{s_{m}}) = (F_{s_{ij}}^{-}).
\]

Hence it is proved that

\[
(F_{s_{ij}}^{-}) \leq IVT - SF_{s_{1}}WA(F_{s_{1}}, F_{s_{2}}, ..., F_{s_{m}}) \leq (F_{s_{ij}}^{+})
\]

3. (Monotonicity). \(\alpha^{L}_{ij} \leq \alpha^{L}_{ij}, \alpha^{U}_{ij} \leq \alpha^{U}_{ij}, \beta^{L}_{ij} \geq \beta^{L}_{ij}, \beta^{U}_{ij} \geq \beta^{U}_{ij}\) and \(\gamma^{L}_{ij} \geq \gamma^{L}_{ij}, \gamma^{U}_{ij} \geq \gamma^{U}_{ij}\) then

\[
[\alpha^{L}_{ij}, \alpha^{U}_{ij}] \leq [\alpha^{L}_{ij}, \alpha^{U}_{ij}] \Rightarrow [1 - \alpha^{L}_{ij}, 1 - \alpha^{U}_{ij}] \leq [1 - \alpha^{L}_{ij}, 1 - \alpha^{U}_{ij}]
\]

\[
[1 - \alpha^{L}_{ij}, 1 - \alpha^{U}_{ij}] \leq [1 - \alpha^{L}_{ij}, 1 - \alpha^{U}_{ij}]
\]

\[
\Rightarrow \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - (\alpha^{L}_{ij} q)^{\sigma_{l}}) p_{j}^{l}\right)\right]^{p_{j}} \leq \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - (\alpha^{U}_{ij} q)^{\sigma_{l}}) p_{j}^{l}\right)\right]^{p_{j}}
\]

\[
\Rightarrow \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - (\alpha^{L}_{ij} q)^{\sigma_{l}}) p_{j}^{l}\right)\right]^{p_{j}} \leq \left[\prod_{j=1}^{m} \left(\prod_{i=1}^{n} (1 - (\alpha^{U}_{ij} q)^{\sigma_{l}}) p_{j}^{l}\right)\right]^{p_{j}}
\]

with

\[
\prod_{j=1}^{q} \left[1 - \prod_{i=1}^{m} \left(\prod_{j=1}^{n} (1 - (\alpha^{L}_{ij} q)^{\sigma_{l}}) p_{j}^{l}\right)\right]^{p_{j}} \leq \prod_{j=1}^{q} \left[1 - \prod_{i=1}^{m} \left(\prod_{j=1}^{n} (1 - (\alpha^{U}_{ij} q)^{\sigma_{l}}) p_{j}^{l}\right)\right]^{p_{j}}
\]

and

\[
[\beta^{L}_{ij}, \beta^{U}_{ij}] \geq [\beta^{L}_{ij}, \beta^{U}_{ij}] \Rightarrow \left[\prod_{i=1}^{n} (\beta^{L}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{i}} \leq \left[\prod_{i=1}^{n} (\beta^{U}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{i}}
\]

with

\[
\prod_{j=1}^{m} \left[\prod_{i=1}^{n} (\beta^{L}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{j}} \leq \prod_{j=1}^{m} \left[\prod_{i=1}^{n} (\beta^{U}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{j}}
\]

Moreover,

\[
[\gamma^{L}_{ij}, \gamma^{U}_{ij}] \geq [\gamma^{L}_{ij}, \gamma^{U}_{ij}] \Rightarrow \left[\prod_{i=1}^{n} (\gamma^{L}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{i}} \leq \left[\prod_{i=1}^{n} (\gamma^{U}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{i}}
\]

with

\[
\prod_{j=1}^{m} \left[\prod_{i=1}^{n} (\gamma^{L}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{j}} \leq \prod_{j=1}^{m} \left[\prod_{i=1}^{n} (\gamma^{U}_{ij} q)^{\sigma_{l}} p_{i}^{l}\right]^{p_{j}}
\]
Let
\[ \xi_F = \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}) = \left( [a^L_{\xi_F}, a^U_{\xi_F}], [b^L_{\xi_F}, b^U_{\xi_F}], [y^L_{\xi_F}, y^U_{\xi_F}] \right) \] and
\[ \xi_F^* = \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}) = \left( [a^L_{\xi_F^*}, a^U_{\xi_F^*}], [b^L_{\xi_F^*}, b^U_{\xi_F^*}], [y^L_{\xi_F^*}, y^U_{\xi_F^*}] \right), \]
then from Equations (5)–(7), we obtain
\[ [a^L_{\xi_F}, a^U_{\xi_F}] \leq [a^L_{\xi_F^*}, a^U_{\xi_F^*}], \]
\[ [b^L_{\xi_F}, b^U_{\xi_F}] \geq [b^L_{\xi_F^*}, b^U_{\xi_F^*}] \] and
\[ [y^L_{\xi_F}, y^U_{\xi_F}] \geq [y^L_{\xi_F^*}, y^U_{\xi_F^*}] \]

Now, by using Definition 11 of the score function, we obtain
\[ Sc(\xi_F) \leq Sc(\xi_F^*). \]

Here, we have the following cases

**Case i.** If \( Sc(\xi_F) < Sc(\xi_F^*) \), then by using the comparison result of two \( \text{IVT} - \text{SFS}_{st}\text{Ns} \), we have
\[ \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}) < \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}). \]

**Case ii.** If \( Sc(\xi_F) = Sc(\xi_F^*) \), then
\[ Sc(\xi_F) = \frac{(a^L_{\xi_F})^q (1 - (b^L_{\xi_F})^q - (y^L_{\xi_F})^q) + (a^U_{\xi_F})^q (1 - (b^U_{\xi_F})^q - (y^U_{\xi_F})^q)}{3}. \]

Hence, by using the above inequality, we obtain
\[ [a^L_{\xi_F}, a^U_{\xi_F}] = [a^L_{\xi_F}, a^U_{\xi_F}], [b^L_{\xi_F}, b^U_{\xi_F}] = [b^L_{\xi_F}, b^U_{\xi_F}], \]
\[ [y^L_{\xi_F}, y^U_{\xi_F}] = [y^L_{\xi_F}, y^U_{\xi_F}], \]
So we obtain
\[ \delta_{\xi_F} = \delta_{\xi_F^*} \Rightarrow \left( [a^L_{\xi_F}, a^U_{\xi_F}], [b^L_{\xi_F}, b^U_{\xi_F}], [y^L_{\xi_F}, y^U_{\xi_F}] \right) = \left( [a^L_{\xi_F}, a^U_{\xi_F}], [b^L_{\xi_F}, b^U_{\xi_F}], [y^L_{\xi_F}, y^U_{\xi_F}] \right). \]

Hence it is proved that
\[ \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}) \leq \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1}, F_{s_2}, ..., F_{s_{nm}}). \]

4. **(Shift Invariance).** Let \( F_s = ([a^L, a^U], [\beta^L, \beta^U], [\gamma^L]) \) and \( F_{s_{ij}} = \left( \begin{array}{c} a_{ij}^L \\ a_{ij}^U \\ \beta_{ij}^L \\ \beta_{ij}^U \\ \gamma_{ij}^L \\ \gamma_{ij}^U \end{array} \right) \) be family of \( \text{IVT} - \text{SFS}_{st}\text{Ns} \), then
\[ F_{s_{ij}} \oplus F_s = \left( \begin{array}{c} a_{ij}^L (a^L)^q (1 - a^L)^q \\ a_{ij}^U (a^U)^q (1 - a^U)^q \\ \beta_{ij}^L (\beta^L)^q (1 - \beta^L)^q \\ \beta_{ij}^U (\beta^U)^q (1 - \beta^U)^q \\ \gamma_{ij}^L (\gamma^L)^q (1 - \gamma^L)^q \\ \gamma_{ij}^U (\gamma^U)^q (1 - \gamma^U)^q \end{array} \right) \]

Therefore,
\[ \text{IVT} - \text{SFS}_{st}\text{WA}(F_{s_1} \oplus F_s, F_{s_2} \oplus F_s, ..., F_{s_{nm}} \oplus F_s) = \bigoplus_{j=1}^{m} p_{ij} \left( \bigoplus_{i=1}^{n} \sigma_i \left( F_{s_{ij}} \oplus F_s \right) \right) \]
\[
\begin{align*}
\sqrt{q} \left[ 1 - \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (1-(\alpha^L_{ij})^{\omega_i}) (1-(\alpha^L)^{\omega_i})^{p_j} \right) \right], \\
\sqrt{q} \left[ 1 - \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (1-(\alpha^U_{ij})^{\omega_i}) (1-(\alpha^U)^{\omega_i})^{p_j} \right) \right], \\
= \sqrt{q} \left[ \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\beta^L_{ij})^{\omega_i} (\beta^L)^{\omega_i} \right)^{p_j} \right], \\
\prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\beta^U_{ij})^{\omega_i} (\beta^U)^{\omega_i} \right)^{p_j}, \\
\prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\gamma^L_{ij})^{\omega_i} (\gamma^L)^{\omega_i} \right)^{p_j}, \\
\prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\gamma^U_{ij})^{\omega_i} (\gamma^U)^{\omega_i} \right)^{p_j}, \\
= \sqrt{q} \left[ 1 - \left( 1-(\alpha^L)^q \right) \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (1-(\alpha^L_{ij})^{\omega_i}) \right)^{p_j} \right], \\
\sqrt{q} \left[ 1 - \left( 1-(\alpha^U)^q \right) \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (1-(\alpha^U_{ij})^{\omega_i}) \right)^{p_j} \right], \\
= \left[ \beta^L \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\beta^L_{ij})^{\omega_i} \right)^{p_j} \right], \\
\left[ \beta^U \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\beta^U_{ij})^{\omega_i} \right)^{p_j} \right], \\
\left[ \gamma^L \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\gamma^L_{ij})^{\omega_i} \right)^{p_j} \right], \\
\left[ \gamma^U \prod_{j=1}^{m} \left( \prod_{i=1}^{n} (\gamma^U_{ij})^{\omega_i} \right)^{p_j} \right],
\end{align*}
\]
\[\begin{align*}
\Theta([\alpha^L, \alpha^U], [\beta^L, \beta^U], [\gamma^L, \gamma^U]) & \quad = \bigoplus_{i=1}^{m} \left( \prod_{j=1}^{n} \left( \prod_{i=1}^{q} \left( 1 - \left( \alpha^L_{ij} \right)^{\omega_{ij}} \right) \right)^{p_j} \right) \\
& \quad \left( \prod_{j=1}^{m} \left( \prod_{i=1}^{n} \left( 1 - \left( \alpha^U_{ij} \right)^{\omega_{ij}} \right) \right)^{p_j} \right),
\end{align*}\]

Hence the required result is proved.

5. (Homogeneity). Let \( K \geq 0 \) be any real number and \( F_{s_{ij}} = \left( [\alpha^L_{ij}, \alpha^U_{ij}], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}] \right) \) be family of \( IVT - SFS_f, N_s \), then

\[\begin{align*}
KF_{s_{ij}} & \quad = \left( \left[ \sqrt[q]{\left( 1 - \left( 1 - \alpha^L_{ij} \right)^{q} \right)^K} \right], \left[ \sqrt[q]{\left( 1 - \left( 1 - \alpha^U_{ij} \right)^{q} \right)^K} \right], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}] \right).
\end{align*}\]

Now

\[\begin{align*}
IVT - SFS_f, WA(KF_{s_{11}}, KF_{s_{12}}, \ldots, KF_{s_{nm}}) & \quad = \bigoplus_{i=1}^{m} \left( \prod_{j=1}^{n} \left( \prod_{i=1}^{q} \left( 1 - \left( \alpha^L_{ij} \right)^{K \omega_{ij}} \right) \right)^{p_j} \right) \\
& \quad \left( \prod_{j=1}^{m} \left( \prod_{i=1}^{n} \left( 1 - \left( \alpha^U_{ij} \right)^{K \omega_{ij}} \right) \right)^{p_j} \right),
\end{align*}\]
Hence the result is proved. □

4.2. Interval-Valued T-Spherical Fuzzy Soft Ordered Weighted Average (IVT – SFS$_f$OWA) Operator

From the above discussion, it is clear that IVT – SFS$_f$OWA operator only weighted the value of IVT – SFS$_f$N$_s$. However, on the other hand, the IVT – SFS$_f$OWA operator weights the ordered position by scoring the IVT – SFS$_f$ values. Here, we will discuss the IVT – SFS$_f$OWA operator and also its properties.

**Definition 14.** Let $F_{s_{ij}} = ([\alpha^L_{ij}, \alpha^U_{ij}], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}])$ for $i = 1, 2, ..., n$ and $j = 1, 2, ..., m$, be the family of IVT – SFS$_f$N$_s$. $\alpha = [\alpha_1, \alpha_2, ..., \alpha_n]$ denote the weight vector of $e_i$ experts and $p = (p_1, p_2, ..., p_m)$ denote the weight vector of parameters $s_j$ with condition $\alpha_i, p_j \in [0, 1]$ and $\sum_{i=1}^{n} \alpha_i = 1$, $\sum_{j=1}^{m} p_j = 1$. Then IVT – SFS$_f$OWA operator is the mapping defined by IVT – SFS$_f$OWA: $Q^n \rightarrow Q$, where ($Q$ is the family of all IVT – SFS$_f$N$_s$)

$$IVT – SFS_fOWA(F_{s_{i1}}, F_{s_{i2}}, ..., F_{s_{in}}) = \bigoplus_{j=1}^{m} p_j \left( \bigoplus_{i=1}^{n} \alpha_i F_{s_{ij}} \right).$$

**Theorem 4.** Let $F_{s_{ij}} = ([\alpha^L_{ij}, \alpha^U_{ij}], [\beta^L_{ij}, \beta^U_{ij}], [\gamma^L_{ij}, \gamma^U_{ij}])$ for $i = 1, 2, ..., n$ and $j = 1, 2, ..., m$, be the family of IVT – SFS$_f$N$_s$. Then IVT – SFS$_f$OWA operator is given as

$$IVT – SFS_fOWA(F_{s_{i1}}, F_{s_{i2}}, ..., F_{s_{in}}) = \bigoplus_{j=1}^{m} p_j \left( \bigoplus_{i=1}^{n} \alpha_i F_{s_{ij}} \right)$$
**Proof.** The proof is similar to Theorem 2. □

**Remark 2.**

1. Using $q = 1$, then established $IVT - SFS_fOWA$ operator will reduce to $IPSF_fOWA$ operator.
2. Using $q = 2$, then established $IVT - SFS_fOWA$ operator will reduce to $IPF_fOWA$ operator.
3. If we neglect the obstinacy grade that is $\beta_{ij} = 0$, and using $q = 2$, the proposed $IVT - SFS_fOWA$ operator will reduce to $IPSF_fOWA$ operator.
4. If we neglect the obstinacy grade that is $\beta_{ij} = 0$, and using $q = 1$, the proposed $IVT - SFS_fOWA$ operator will reduce to an interval-value d intuitionistic fuzzy soft ordered weighted average (IVI$F_fOWA$) operator.
5. Moreover, if we put only one parameter that is $s_1$ (mean $m = 1$), then $IVT - SFS_fOWA$ operator reduces to the interval-valued $T$-spherical fuzzy ordered weighted average IVT-SFOWA operator.

Hence it is clear that $IPSF_fOWA, IVSF_fOWA, IPF_fOWA, IVIFS_fOWA$ and IVT-SFOWA operators are the special cases of $IVT - SFS_fOWA$ operator. The present work is more general.

**Example 3.** Consider the collection of $IVT - SFS_fN_{S_i} = \left( \left[ a^{L}_{ij}, a^{U}_{ij} \right], \left[ \beta^{L}_{ij}, \beta^{U}_{ij} \right], \left[ \gamma^{L}_{ij}, \gamma^{U}_{ij} \right] \right)$ as given in Table 2 of example 2, then tabular depiction of $F_{\delta_{ij}} = \left( \left[ a^{L}_{\delta_{ij}}, a^{U}_{\delta_{ij}} \right], \left[ \beta^{L}_{\delta_{ij}}, \beta^{U}_{\delta_{ij}} \right], \left[ \gamma^{L}_{\delta_{ij}}, \gamma^{U}_{\delta_{ij}} \right] \right)$ is given in Table 3.

| $s_1$ | $s_2$ | $s_3$ | $s_4$ |
|-------|-------|-------|-------|
| $x_1$ | $[0.6, 0.7], [0.4, 0.6]$ | $[0.5, 0.53], [0.5, 0.61]$ | $[0.6, 0.6], [0.6, 0.7]$ | $[0.5, 0.6], [0.4, 0.5]$ |
| $x_2$ | $[0.5, 0.8], [0.5, 0.5]$ | $[0.5, 0.7], [0.5, 0.72]$ | $[0.5, 0.6], [0.5, 0.5]$ | $[0.5, 0.7]$ |
| $x_3$ | $[0.6, 0.7], [0.3, 0.4]$ | $[0.5, 0.6], [0.4, 0.5]$ | $[0.3, 0.5], [0.5, 0.5]$ | $[0.5, 0.5]$ |
| $x_4$ | $[0.4, 0.5], [0.3, 0.2]$, | $[0.7, 0.3], [0.3, 0.71]$ | $[0.3, 0.5], [0.3, 0.71]$ | $[0.4, 0.45]$ |
| $x_5$ | $[0.4, 0.5], [0.2, 0.5]$ | $[0.3, 0.5], [0.3, 0.5]$ | $[0.4, 0.45]$ | $[0.3, 0.6]$ |

Now, by using Equation (8) of Theorem 4, we have

$$
IVT - SFS_fOWA(F_{s_1}, F_{s_2}, ..., F_{n_m})
$$
Consider the family of IVT – SFS$_T$N, $F_{ij} = \left[ \left( \alpha^t_{ij}, \alpha^u_{ij} \right), \left( \beta^l_{ij}, \beta^u_{ij} \right), \left( y^t_{ij}, y^u_{ij} \right) \right]$ for $i = 1, 2, \ldots, n$ and $j = 1, 2, \ldots, m$. Let $\sigma = \{\sigma_1, \sigma_2, \ldots, \sigma_n\}$ denote the weight vector of $e_i$ experts and $p = [p_1, p_2, \ldots, p_m]$ denote the weight vector of parameters $s_j$ with condition $\sigma_i, p_j \in [0, 1]$ and $\sum_{i=1}^n \sigma_i = 1$, $\sum_{i=1}^n p_i = 1$. Then IVT – SFS$_T$OWA operator has the following properties.

1. (Idempotency). Let $F_{sij} = \left[ \left( \alpha^t_{sij}, \alpha^u_{sij} \right), \left( \beta^l_{sij}, \beta^u_{sij} \right), \left( y^t_{sij}, y^u_{sij} \right) \right] = F_{\delta s}$ for all $i = 1, 2, \ldots, n$ and $j = 1, 2, \ldots, m$, where $F_{\delta s} = (\alpha^t, \alpha^u, \beta^l, \beta^u, [y^t, y^u])$, then IVT – SFS$_T$OWA$(F_{s_{11}}, F_{s_{12}}, \ldots, F_{s_{nm}}) = F_{\delta s}$. 

2. (Boundedness). If $F_{s_{ij}}$ is the weight vector of parameters $s_j$, then $\sum_{i=1}^n F_{s_{ij}} = 1$. Let $F_{s_{ij}} = \left[ \left( \alpha^t_{s_{ij}}, \alpha^u_{s_{ij}} \right), \left( \beta^l_{s_{ij}}, \beta^u_{s_{ij}} \right), \left( y^t_{s_{ij}}, y^u_{s_{ij}} \right) \right]$ and $F_{\delta s_{ij}} = \left[ \left( \min, \min, \min \right), \left( \max, \max, \max \right) \right]$, then $F_{\delta s_{ij}} \leq IVT – SFS$_T$OWA$(F_{s_{11}}, F_{s_{12}}, \ldots, F_{s_{nm}}) \leq F_{\delta s_{ij}}$. 

\[
\begin{align*}
F_{s_{ij}} &= \left[ \left( \alpha^t_{s_{ij}}, \alpha^u_{s_{ij}} \right), \left( \beta^l_{s_{ij}}, \beta^u_{s_{ij}} \right), \left( y^t_{s_{ij}}, y^u_{s_{ij}} \right) \right] \\
F_{\delta s_{ij}} &= \left[ \left( \min, \min, \min \right), \left( \max, \max, \max \right) \right]
\end{align*}
\]

\[
\begin{align*}
F_{s_{ij}} &= \left[ \left( \alpha^t_{s_{ij}}, \alpha^u_{s_{ij}} \right), \left( \beta^l_{s_{ij}}, \beta^u_{s_{ij}} \right), \left( y^t_{s_{ij}}, y^u_{s_{ij}} \right) \right] \\
F_{\delta s_{ij}} &= \left[ \left( \min, \min, \min \right), \left( \max, \max, \max \right) \right]
\end{align*}
\]

\[
\begin{align*}
F_{s_{ij}} &= \left[ \left( \alpha^t_{s_{ij}}, \alpha^u_{s_{ij}} \right), \left( \beta^l_{s_{ij}}, \beta^u_{s_{ij}} \right), \left( y^t_{s_{ij}}, y^u_{s_{ij}} \right) \right] \\
F_{\delta s_{ij}} &= \left[ \left( \min, \min, \min \right), \left( \max, \max, \max \right) \right]
\end{align*}
\]

\[
\begin{align*}
F_{s_{ij}} &= \left[ \left( \alpha^t_{s_{ij}}, \alpha^u_{s_{ij}} \right), \left( \beta^l_{s_{ij}}, \beta^u_{s_{ij}} \right), \left( y^t_{s_{ij}}, y^u_{s_{ij}} \right) \right] \\
F_{\delta s_{ij}} &= \left[ \left( \min, \min, \min \right), \left( \max, \max, \max \right) \right]
\end{align*}
\]

\[
\begin{align*}
F_{s_{ij}} &= \left[ \left( \alpha^t_{s_{ij}}, \alpha^u_{s_{ij}} \right), \left( \beta^l_{s_{ij}}, \beta^u_{s_{ij}} \right), \left( y^t_{s_{ij}}, y^u_{s_{ij}} \right) \right] \\
F_{\delta s_{ij}} &= \left[ \left( \min, \min, \min \right), \left( \max, \max, \max \right) \right]
\end{align*}
\]
3. (Monotonicity). Let \( F_{ij} = \left( [\alpha_i^L, \alpha_i^U], [\beta_i^L, \beta_i^U], [\gamma_i^L, \gamma_i^U] \right) \) be any other collection of IVT – SFS for all \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \) such that \( \alpha_{ij}^L \leq \alpha_{ij}^U, \beta_{ij}^L \leq \beta_{ij}^U, \gamma_{ij}^L \leq \gamma_{ij}^U \), then

\[
\text{IVT} - \text{SFS} \leq \text{IVT} - \text{SFS} \left( F_{ij} \right)
\]

4. (Shift Invariance). If \( F_\circ = (\circ_1, \circ_2, \ldots, \circ_m) \) is another family of IVT – SFS, then

\[
\text{IVT} - \text{SFS} \left( F_{ij} \right) = \text{IVT} - \text{SFS} \left( F_\circ \right)
\]

5. (Homogeneity). For any real number \( K \geq 0 \)

\[
\text{IVT} - \text{SFS} \left( K F_{ij} \right) = K \left( \text{IVT} - \text{SFS} \left( F_{ij} \right) \right)
\]

Proof. The proof is simple and follows from Theorem 3. □

4.3. Interval-Valued T-Spherical Fuzzy Soft Hybrid Aggregation (IVT – SFSf HA) Operator

In this section, we will discuss interval-valued T-spherical fuzzy soft hybrid aggregation operator which can deal with both aspects like measuring the values of IVT – SFSfNs and also considering the ordered position by “SF” of IVT – SFSf values.

Moreover, we will discuss the properties related to these operators.

Definition 15. Let \( F_{ij} = \left( [\alpha_i^L, \alpha_i^U], [\beta_i^L, \beta_i^U], [\gamma_i^L, \gamma_i^U] \right) \) for \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \), be the family of IVT – SFSfNs having weight vectors \( \bar{v} = (v_1, v_2, \ldots, v_m) \) denote the weight vector of experts and \( p = (p_1, p_2, \ldots, p_m) \) denote the weight vector of parameters \( s_j \) with condition \( v_j, p_j \in [0, 1] \) and \( \sum_{i=1}^{m} v_i = 1 \), \( \sum_{i=1}^{m} p_i = 1 \). Then IVT – SFSfHA operator is the function defined by IVT – SFSfHA: \( \mathbb{R}^n \rightarrow \mathbb{Q} \), where \( \mathbb{Q} \) is the family of all IVT – SFSfNs

\[
\text{IVT} - \text{SFS} \left( F_{ij} \right) = \bigoplus_{j=1}^{m} p_j \left( \bigoplus_{i=1}^{n} \omega_i \circ F_{ij} \right)
\]

Theorem 6. Let \( F_{ij} = \left( [\alpha_i^L, \alpha_i^U], [\beta_i^L, \beta_i^U], [\gamma_i^L, \gamma_i^U] \right) \) for \( i = 1, 2, \ldots, n \) and \( j = 1, 2, \ldots, m \), be the family of IVT – SFSfNs having weight vectors \( v = (v_1, v_2, \ldots, v_m) \) and \( \mu = (\mu_1, \mu_2, \ldots, \mu_n) \) with the condition \( v_j, \mu_j \in [0, 1] \) and \( \sum_{j=1}^{m} v_j = 1 \), \( \sum_{j=1}^{m} \mu_j = 1 \). Moreover, “n” represents the corresponding coefficient for the number of elements in the \( i \)th row, and the \( j \)th column connected with vectors \( \omega = (\omega_1, \omega_2, \ldots, \omega_n) \) denotes the weight vector of experts, and \( p = (p_1, p_2, \ldots, p_m) \) denotes the weight vector of parameters \( s_j \) with condition \( \omega_i, p_j \in [0, 1] \) and \( \sum_{i=1}^{n} \omega_i = 1, \sum_{j=1}^{m} p_i = 1. \) Then
Let \( \mathcal{F}_1 = \{\mathcal{L}, \mathcal{R}, \mathcal{M}\} \) be a family of intuitionistic fuzzy soft sets with \( \mathcal{L} = \{L_1, L_2, L_3, L_4, L_5\} \) and \( \mathcal{R} = \{R_1, R_2, R_3, R_4\} \).

**Proof.** The proof is similar to Theorem 1. \( \square \)

**Remark 3.**

1. Using \( q = 1 \), then established \( IVT - SFS_{nHA} \) operator will reduce to \( IVP_{qFS_{nHA}} \) operator.
2. Using \( q = 2 \), then established \( IVT - SFS_{nHA} \) operator will reduce to \( IVS_{qFS_{nHA}} \) operator.
3. If we neglect the obstinacy grade that is \( \beta_{ij} = 0 \), and using \( q = 2 \), the proposed \( IVT - SFS_{nHA} \) operator will reduce to \( IVP_{qFS_{nHA}} \) operator.
4. If we neglect the obstinacy grade that is \( \beta_{ij} = 0 \), and using \( q = 1 \), the proposed \( IVT - SFS_{nHA} \) operator will reduce to an interval-valued intuitionistic fuzzy soft hybrid average \( [IVI_{F_{nHA}}] \) operator.
5. Moreover, if we put only one parameter, that is \( s_1 \) (mean \( m=1 \)), then \( IVT - SFS_{nHA} \) operator reduces to the interval-valued T-spherical fuzzy hybrid average \( IVT-SFHA \) operator.
6. If \( v \mu = \left( \frac{1}{n}, \frac{1}{n}, \ldots, \frac{1}{n} \right) \), then the proposed \( IVT - SFS_{nHA} \) operator reduces to \( IVT - SFHA \) operator.
7. If \( \alpha \pi = \left( \frac{1}{n}, \frac{1}{n}, \ldots, \frac{1}{n} \right) \), then proposed \( IVT - SFS_{nHA} \) operator reduces to \( IVT - SFWA \) operator.

Hence it is clear that \( IVP_{qFS_{nHA}}, IVS_{qFS_{nHA}}, IVP_{qFS_{nHA}}, IVIF_{qFS_{nHA}}, IVT - SFHA, IVT - SFWA \) and \( IVT - SFWA \) operators are the special cases of \( IVT - SFS_{nHA} \) operator. The established work is more general.

**Example 4.** Consider the family of \( IVT - SFS_{nHA} \) as given in Table 2 with weight vector \( v = (0.17, 0.19, 0.12, 0.16, 0.36) \) and \( \mu = (0.23, 0.2, 0.29, 0.28) \) and having the associated vector as \( \alpha = (0.23, 0.18, 0.1, 0.27, 0.02) \) and \( p = (0.23, 0.24, 0.18, 0.35) \). Then by using Eq. (9) their score values are given in Table 4. The corresponding \( IVT - SFS_{nHA} \)
\[
\left( [\tilde{\alpha}_{ij}, \tilde{\alpha}^U_{ij}], [\tilde{\beta}_{ij}, \tilde{\beta}^U_{ij}], [\tilde{\gamma}_{ij}, \tilde{\gamma}^U_{ij}] \right) \text{ of the permutation of } i\text{th and } j\text{th largest object of the }
\]
family of \( i \times j \) \( IVT - SFS_F \) \( F_{ij} = \left( [\tilde{\alpha}_{ij}, \tilde{\alpha}^U_{ij}], [\tilde{\beta}_{ij}, \tilde{\beta}^U_{ij}], [\tilde{\gamma}_{ij}, \tilde{\gamma}^U_{ij}] \right) \) are given in Table 5.

### Table 4. Tabular depiction of score values of \( IVT - SFS_F \)

|       | \( S_1 \)       | \( S_2 \)       | \( S_3 \)       | \( S_4 \)       |
|-------|-----------------|-----------------|-----------------|-----------------|
| \( x_1 \) | (0.094904) | (0.041291) | (0.148938) | (0.101557) |
| \( x_2 \) | (0.110053) | (0.091309) | (0.072026) | (0.129129) |
| \( x_3 \) | (0.058903) | (0.058296) | (0.074272) | (0.077105) |
| \( x_4 \) | (0.126681) | (0.038849) | (0.121334) | (0.108737) |
| \( x_5 \) | (0.271802) | (0.186345) | (0.296199) | (0.278640) |

\[
F_{ij} = n\nu_j\mu_j F_{ij} = \left( \sqrt{\frac{q}{1 - (1 - (\alpha^L_{ij})^{-n\nu_j\mu_j})}}, \left( \sqrt{\frac{q}{1 - (1 - (\alpha^U_{ij})^{-n\nu_j\mu_j})}} \right)^{n\nu_j\mu_j}, \left( \sqrt{\frac{q}{1 - (1 - (\gamma^L_{ij})^{-n\nu_j\mu_j})}} \right)^{n\nu_j\mu_j}, \left( \sqrt{\frac{q}{1 - (1 - (\gamma^U_{ij})^{-n\nu_j\mu_j})}} \right)^{n\nu_j\mu_j} \right)
\] (10)

### Table 5. Tabular presentation of \( F_{ij} = n\nu_j\mu_j F_{ij} \)

|       | \( S_1 \)       | \( S_2 \)       | \( S_3 \)       | \( S_4 \)       |
|-------|-----------------|-----------------|-----------------|-----------------|
| \( x_1 \) | [0.03128, 0.09384] | [0.0136, 0.0408] | [0.11832, 0.11832] | [0.05712, 0.0952] |
| \( x_2 \) | [0.04692, 0.12522] | [0.0272, 0.0544] | [0.11832, 0.13804] | [0.07616, 0.0952] |
| \( x_3 \) | [0.06256, 0.0782] | [0.0136, 0.068] | [0.05916, 0.0986] | [0.0952, 0.0952] |
| \( x_4 \) | [0.0874, 0.0874] | [0.0156, 0.0912] | [0.04408, 0.06612] | [0.04256, 0.12768] |
| \( x_5 \) | [0.10488, 0.12236] | [0.0304, 0.1064] | [0.04408, 0.13224] | [0.06384, 0.11916] |

Now, by using Equation (10), we get
Theorem 7. Let $F_{s_{ij}} = \left(\left[\alpha_{ij}, \alpha_{ij}^U\right], \left[\beta_{ij}, \beta_{ij}^U\right], \left[\gamma_{ij}, \gamma_{ij}^U\right]\right)$ for $i = 1, 2, \ldots, n$ and $j = 1, 2, \ldots, m$, be the family of $IVT - SFS_{FS} N_s$ having weight vectors $\nu = \left[v_1, v_2, \ldots, v_n\right]^T$ and $\mu = \left[\mu_1, \mu_2, \ldots, \mu_n\right]^T$ with condition $v_i, \mu_j \in [0, 1]$ and $\sum_{i=1}^{n} v_i = 1$, $\sum_{j=1}^{n} \mu_j = 1$. Moreover, “$n$” represents the corresponding coefficient for the number of elements in $i$th row and $j$th column linked with vectors $\sigma = (\sigma_1, \sigma_2, \ldots, \sigma_n)^T$ denote the weight vector of $e_i$ experts and $p = (p_1, p_2, \ldots, p_m)^T$ denote the weight vector of parameters $s_j$ with condition $\sigma_v, p_j \in [0, 1]$ and $\sum_{i=1}^{n} \sigma_i = 1$, $\sum_{i=1}^{n} p_i = 1$. Then the $IVT - SFS_{FS} HA$ operator contains the subsequent properties

1. (Idempotency). Let $F_{s_{ij}} = \tilde{F}_s$ for all $i = 1, 2, \ldots, n$ and $j = 1, 2, \ldots, m$, where $\tilde{F}_s = n v \mu_j F_{s,y}$, then $IVT - SFS_{FS} HA(F_{s_{i1}}, F_{s_{i2}}, \ldots, F_{s_{im}}) = \tilde{F}_s$.

2. (Boundedness). If $F_{s_{ij}} = \left(\left[\min_i, \min_i (\tilde{a}_{ij}), \min_i (\tilde{b}_{ij}), \min_i (\tilde{c}_{ij})\right], \left[\max_i, \max_i (\tilde{a}_{ij}), \max_i (\tilde{b}_{ij}), \max_i (\tilde{c}_{ij})\right]\right)$, and $F_{s_{ij}} = \left(\left[\min_i, \min_i (\tilde{a}_{ij}), \min_i (\tilde{b}_{ij}), \min_i (\tilde{c}_{ij})\right], \left[\max_i, \max_i (\tilde{a}_{ij}), \max_i (\tilde{b}_{ij}), \max_i (\tilde{c}_{ij})\right]\right)$, then $\tilde{F}_{s_{ij}} \leq IVT - SFS_{FS} HA(F_{s_{i1}}, F_{s_{i2}}, \ldots, F_{s_{im}}) \leq F_{s_{ij}}^\ast$.

3. (Monotonicity). Let $F_{s_{ij}} = \left(\left[\alpha_{ij}, \alpha_{ij}^U\right], \left[\beta_{ij}, \beta_{ij}^U\right], \left[\gamma_{ij}, \gamma_{ij}^U\right]\right)$ be any other collection of $IVT - SFS_{FS} N_s$ for all $i = 1, 2, \ldots, n$ and $j = 1, 2, \ldots, m$ such that $\alpha_{ij} \leq \alpha_{ij}^U$, $\alpha_{ij} \leq \alpha_{ij}^U$, $\beta_{ij} \leq \beta_{ij}^U$, $\beta_{ij} \geq \beta_{ij}^U$ and $\gamma_{ij} \leq \gamma_{ij}^U$, $\gamma_{ij} \geq \gamma_{ij}^U$, then $IVT - SFS_{FS} HA(F_{s_{i1}}, F_{s_{i2}}, \ldots, F_{s_{im}}) \leq IVT - SFS_{FS} HA(F_{s_{i1}}, F_{s_{i2}}, \ldots, F_{s_{im}})$.

4. (Shift Invariance). If $F_s = \left(\left[\alpha^S, \alpha^S\right], \left[\beta^S, \beta^S\right], \left[\gamma^S, \gamma^S\right]\right)$ is another family of $IVT - SFS_{FS} N_s$, then $IVT - SFS_{FS} HA(F_{s_{i1}} \odot F_s, F_{s_{i2}} \odot F_s, \ldots, F_{s_{im}} \odot F_s) = IVT - SFS_{FS} HA(F_{s_{i1}}, F_{s_{i2}}, \ldots, F_{s_{im}}) \odot F_s$. 
5. (Homogeneity). For any real number \( K \geq 0 \)

\[
IVT - SFS_{ft} HA(KF_{s1}, KF_{s2}, \ldots, KF_{sn}) = K \left( IVT - SFS_{ft} HA(F_{s1}, F_{s2}, \ldots, F_{sn}) \right)
\]

**Proof.** The proof is simple and follows from Theorem 3. \( \square \)

5. An Algorithm for MCDM based on \( IVT - SFS_{ft} \) Information

MCDM approach is a well-known and very effective technique for the selection of the best alternative among the given and this approach has been used in different fields of fuzzy sets theory for the selection of the best alternative. About an alternative, the decision makers keep many aspects in their mind, such as the flexibility of the alternative, benefits, different features, and drawbacks. After the evaluation of all these aspects, they could decide which alternative is best and reach the best result. In this section, we will propose a stepwise algorithm for MCDM for the environment of \( IVT - SFS_{ft} Ns \).

Let \( U = \{x_1, x_2, x_3, \ldots, x_r \} \) be the set of \( "r" \) alternative, \( D = \{D_1, D_2, D_3, \ldots, D_n \} \) be the sets of \( "n" \) senior experts with \( E = \{s_1, s_2, s_3, \ldots, s_m \} \) which denotes the set of \( "m" \) parameters. Each alternative \( x_l (l = 1, 2, 3, \ldots, r) \) has been evaluated by a team of \( "n" \) experts corresponding to their parameters \( s_j (j = 1, 2, 3, \ldots, m) \). Suppose experts provide their evaluation in the shape of \( IVT - SFS_{ft} Ns, \) having weight vector \( \omega = (\omega_1, \omega_2, \ldots, \omega_n) \) and \( p = (p_1, p_2, \ldots, p_m) \) of experts and parameters \( s_j \) respectively with the condition that \( \sum_{i=1}^{n} \omega_i = 1, \sum_{i=1}^{m} p_i = 1 \). The matrix \( M = \left[ F_{sij} \right]_{n x m} \) denotes the overall information. After using the aggregation operator on the assessment value of the experts, the aggregated \( IVT - SFS_{ft} Ns \) for alternative \( x_l (l = 1, 2, 3, \ldots, r) \) is given by \( \psi_l = (\alpha_l, \beta_l, \gamma_l) \). Lastly, we will use the formula of score function for over aggregated \( IVT - SFS_{ft} Ns \) for alternatives and rank them according to their order and choose the best result.

The stepwise algorithm for overall above discussion is given as follows:

**Step 1.** Accumulate the evaluation information of all experts for each alternative according to their parameters and arrange it to construct an overall decision matrix \( M = [F_{sij}]_{n x m} \) given by

\[
M = \begin{bmatrix}
    [\alpha_{11}, \alpha_{u_{11}}] & [\alpha_{12}, \alpha_{u_{12}}] & \ldots & [\alpha_{1m}, \alpha_{u_{1m}}] \\
    [\beta_{11}, \beta_{u_{11}}] & [\beta_{12}, \beta_{u_{12}}] & \ldots & [\beta_{1m}, \beta_{u_{1m}}] \\
    [\gamma_{11}, \gamma_{u_{11}}] & [\gamma_{12}, \gamma_{u_{12}}] & \ldots & [\gamma_{1m}, \gamma_{u_{1m}}] \\
    [\alpha_{21}, \alpha_{u_{21}}] & [\alpha_{22}, \alpha_{u_{22}}] & \ldots & [\alpha_{2m}, \alpha_{u_{2m}}] \\
    [\beta_{21}, \beta_{u_{21}}] & [\beta_{22}, \beta_{u_{22}}] & \ldots & [\beta_{2m}, \beta_{u_{2m}}] \\
    [\gamma_{21}, \gamma_{u_{21}}] & [\gamma_{22}, \gamma_{u_{22}}] & \ldots & [\gamma_{2m}, \gamma_{u_{2m}}] \\
    \vdots & \vdots & \ddots & \vdots \\
    [\alpha_{n1}, \alpha_{u_{n1}}] & [\alpha_{n2}, \alpha_{u_{n2}}] & \ldots & [\alpha_{nm}, \alpha_{u_{nm}}] \\
    [\beta_{n1}, \beta_{u_{n1}}] & [\beta_{n2}, \beta_{u_{n2}}] & \ldots & [\beta_{nm}, \beta_{u_{nm}}] \\
    [\gamma_{n1}, \gamma_{u_{n1}}] & [\gamma_{n2}, \gamma_{u_{n2}}] & \ldots & [\gamma_{nm}, \gamma_{u_{nm}}] \\
\end{bmatrix}
\]

**Step 2.** Normalize the given information by interchanging of cost type parameter into the benefit type parameter if it is needed. The formula is given below:

\[
\rho_{ij} = \begin{cases} 
F_{sji} & \text{for cost type parameter} \\
F^{c}_{sji} & \text{for benefit type parameter} 
\end{cases}
\]

Where \( F^{c}_{sji} = \left( [\gamma_{L_{ij}}, \gamma_{u_{ij}}], [\beta_{L_{ij}}, \beta_{u_{ij}}], [\alpha_{L_{ij}}, \alpha_{u_{ij}}] \right) \) denote the complement of \( F_{sij} = \left( [\alpha_{L_{ij}}, \alpha_{u_{ij}}], [\beta_{L_{ij}}, \beta_{u_{ij}}], [\gamma_{L_{ij}}, \gamma_{u_{ij}}] \right) \).
Step 3. Aggregate the $IVT - SFS_{ft}NS_{s}$ by using the proposed aggregation operators for each alternative $s_i(l = 1, 2, ..., r)$ to get the aggregated $IVT - SFS_{ft}NS$ $\psi_l = ([a^L_{ij}, a^U_{ij}], [b^L_{ij}, b^U_{ij}], [y^L_{ij}, y^U_{ij}])$.

Step 4. Calculate the score values for each $\psi_l$ by using Definition 11.

Step 5. Organize the ranking result in explicit order for alternatives $x_i(l = 1, 2, 3, ..., r)$ and choose the preeminent result.

5.1. Application Steps for the Proposed Method

In this section, we will provide an example of the present work in detail to show its validity and advantages.

Let us have a team of experts on mobile phones consisting of five members $C = \{C_1, C_2, C_3, C_4\}$ with weight vectors $\pi = \{0.28, 0.25, 0.23, 0.24\}$. The experts will give their information about the set of different mobile phones as alternatives consisting of four members $\{x_1 = Lenovo, x_2 = Samsung, x_3 = LG, x_4 = Apple\}$ having parameters $s_1 = Best\ audio\ and\ video\ features, s_2 = Long\ battery\ timing, s_3 = reasonable\ in\ price, s_4 = Best\ camera\ features\}$. Let $p = \{0.29, 0.18, 0.22, 0.31\}$ denote the weight vectors of parameters’ $s_j$ ($j = 1, 2, 3, 4, 5$). Suppose all the experts provide their information in the form of $IVT - SFS_{ft}NS$. Now we use the proposed algorithm for the selection of the best mobile phone.

By using $IVT - SFS_{ft}WA$ operators:

Step 1. The experts present their information of each alternative in the shape of $IVT - SFS_{ft}NS$ according to their resultant parameters. This information is given in Tables 6–9 correspondingly.

Step 2. There is no requirement for normalization of $IVT - SFS_{ft}NS$ matrix since all the parameters are of a similar kind.

Step 3. The information of each expert for each alternative $x_i(i = 1, 2, 3, 4)$ is aggregated by using Equation (1), so we have

$$\psi_1 = ([0.3927, 0.6938], [0.3072, 0.5096], [0.2770, 0.5323]), \psi_2 = ([0.3797, 0.7396], [0.3002, 0.4690], [0.2464, 0.4950])$$

Table 6. $IVT - SFS_{ft}$ matrix for alternative $x_1$.

|       | $s_1$     | $s_2$     | $s_3$     | $s_4$     |
|-------|-----------|-----------|-----------|-----------|
| $C_1$ | [0.3, 0.5]| [0.4, 0.8]| [0.5, 0.7]| [0.2, 0.2]|
|       | [0.4, 0.6]| [0.2, 0.4]| [0.3, 0.6]| [0.5, 0.5]|

|     | \([0.3, 0.5]\), | \([0.5, 0.8]\), | \([0.2, 0.6]\), | \([0.1, 0.6]\), |

Table 9. IVT – SF\textsubscript{ft} matrix for alternative \(x_4\).

|    | \(s_1\)          | \(s_2\)          | \(s_3\)          | \(s_4\)          |
|----|------------------|------------------|------------------|------------------|
| \(C_1\) | \([0.1, 0.5]\), | \([0.2, 0.7]\), | \([0.5, 0.7]\), | \([0.2, 0.2]\), |
|     | \([0.3, 0.6]\), | \([0.4, 0.4]\), | \([0.3, 0.6]\), | \([0.5, 0.5]\), |
|     | \([0.4, 0.7]\), | \([0.3, 0.5]\), | \([0.3, 0.3]\), | \([0.2, 0.6]\), |
| \(C_2\) | \([0.2, 0.2]\), | \([0.8, 0.8]\), | \([0.2, 0.8]\), | \([0.1, 0.6]\), |
|     | \([0.5, 0.5]\), | \([0.2, 0.3]\), | \([0.3, 0.4]\), | \([0.3, 0.3]\), |
|     | \([0.2, 0.6]\), | \([0.5, 0.6]\), | \([0.1, 0.3]\), | \([0.2, 0.4]\), |
| \(C_3\) | \([0.2, 0.8]\), | \([0.3, 0.5]\), | \([0.7, 0.9]\), | \([0.1, 0.5]\), |
|     | \([0.3, 0.4]\), | \([0.4, 0.6]\), | \([0.3, 0.3]\), | \([0.3, 0.6]\), |
|     | \([0.1, 0.3]\), | \([0.2, 0.6]\), | \([0.4, 0.8]\), | \([0.4, 0.7]\), |
| \(C_4\) | \([0.1, 0.9]\), | \([0.4, 0.9]\), | \([0.3, 0.4]\), | \([0.3, 0.7]\), |
|     | \([0.3, 0.7]\), | \([0.5, 0.6]\), | \([0.4, 0.8]\), | \([0.2, 0.3]\), |
|     | \([0.5, 0.6]\), | \([0.3, 0.4]\), | \([0.4, 0.4]\), | \([0.3, 0.4]\), |

\(\psi_3 = ([0.4279, 0.7505], [0.2625, 0.4488], [0.3196, 0.5547])\), \(\psi_4 = ([0.4114, 0.7173], [0.3304, 0.4698], [0.2675, 0.4918])\)

**Step 4.** By using the formula of score function given in Definition 11, calculate the score values for each \(\psi_i (i = 1, 2, 3, 4, 5)\) in step 3, i.e.,
Step 5. Rank the score values and select the best alternative. Hence, we obtain the ranking result as

\[ Sc(\psi_3) > Sc(\psi_2) > Sc(\psi_4) > Sc(\psi_1) \]

Hence, from the above discussion, it is clear that “\(x_3\)” is the best alternative.

By using \(IVT - SFS_fOWA\) operators:

**Step 1.** Same as above.

**Step 2.** Same as above.

**Step 3.** The information of each expert for each alternative \(x_i (i = 1, 2, 3, 4)\) is aggregated by using Equation (8), so we have

\[
\psi_1 = ([0.4036, 0.7077], [0.3097, 0.5128], [0.2873, 0.5398])
\]
\[
\psi_2 = ([0.4001, 0.7451], [0.3141, 0.4783], [0.2695, 0.5048])
\]
\[
\psi_3 = ([0.4445, 0.7607], [0.2677, 0.4529], [0.3247, 0.5364])
\]
\[
\psi_4 = ([0.4263, 0.7323], [0.3337, 0.4771], [0.2737, 0.4997])
\]

**Step 4.** By using the formula of score function given in Definition 11, calculate the score values for each \(\psi_j (i = 1, 2, 3, 4, 5)\) in step 3, i.e.,

\[ Sc(\psi_1) = 0.6790, \ Sc(\psi_2) = 0.7217, \]
\[ Sc(\psi_3) = 0.7456, \ Sc(\psi_4) = 0.7205 \]

**Step 5.** Rank the score values and select the best alternative. Hence, we obtain the ranking result as

\[ Sc(\psi_3) > Sc(\psi_2) > Sc(\psi_4) > Sc(\psi_1) \]

Hence, it is noted that the aggregated result for \(IVT - SFS_fOWA\) operator is the same as the result obtained for \(IVT - SFS_fWA\) operator. Hence “\(x_3\)” is the best alternative.

By using \(IVT - SFS_fHA\) operators:

**Step 1.** Same as above.

**Step 2.** Same as above.

**Step 3.** The information of each expert for each alternative \(x_i (i = 1, 2, 3, 4)\) is to be aggregated by using Equation (8) with \(v = \{0.21, 0.22, 0.23, 0.44\}^T\) and \(\mu = \{0.25, 0.27, 0.28, 0.20\}^T\) be the weight vectors of \(E_{ij} = \left(\left[a^{ij}_1, a^{ij}_2\right], \left[\beta^{ij}_1, \beta^{ij}_2\right], \left[y^{ij}_1, y^{ij}_2\right]\right)\). Moreover, “\(n\)” represents the corresponding balancing coefficient for the number of elements in \(i\)th row and \(j\)th column. Let \(\sigma = (0.28, 0.25, 0.23, 0.24)^T\) denote the weight vector of \(e_i\) experts and \(p = (0.29, 0.18, 0.22, 0.31)^T\) denote the weight vector of parameters \(s_j\), so we get

\[
\psi_1 = ([0.4123, 0.7187], [0.3179, 0.5226], [0.2974, 0.5493])
\]
\[
\psi_2 = ([0.4225, 0.7323], [0.3224, 0.5055], [0.2767, 0.5225])
\]
Formula of score function  given in Definition 11, calculate the score values for each \( \varphi_i \) (i = 1, 2, 3, 4, 5) in step 3, i.e.,

\[
S_c(\varphi_1) = 0.6849, \quad S_c(\varphi_2) = 0.7095,
\]

\[
S_c(\varphi_3) = 0.7485, \quad S_c(\varphi_4) = 0.7006
\]

Step 5. Rank the score values and select the best alternative. Hence, we obtain the ranking result as

\[
S_c(\varphi_3) > S_c(\varphi_2) > S_c(\varphi_4) > S_c(\varphi_1)
\]

Hence, it is noted that the aggregated result for \( IVT-SFS_{f_1}HA \) operator is the same as the result obtained for \( IVT-SFS_{f_1}WA \) and \( IVT-SFS_{f_1}OWA \) operator. Hence “\( x_3 \)” is the best alternative.

5.2. Comparative Analysis

Here in this section, we will propose the comparative analysis of established work with other existing methods to prove the superiority of the present work. We will compare the present work with IVPFWA, IVPFOWA, IVPFHA, \( IVPS_{f_1}WA \), IVSFWA, IVSFOWA, IVSFHA, \( IVSF_{f_1}WA \), IVT-SFWA [36], IVT-SFOWA [36], IVT-SFHA [36], IVSFWAM [44], IVSFWGM [44], and \( IVPF_{f_1}S \) [43].

Example 5. A person plans to buy a house from a set of four alternatives \( \mathcal{U} = \{x_1, x_2, x_3, x_4\} \). Let \( E = \{s_1 = \text{beautiful}, s_2 = \text{reasonable price}, s_3 = \text{green surroundings}, s_4 = \text{suitable location}\} \) be a set of parameters. Let \( \sigma = \{0.25, 0.23, 0.24, 0.28\} \) denote the weight vector of “\( e_i \)” experts and \( p = \{0.26, 0.20, 0.29, 0.25\} \) denote the weight vector of “\( s_j \)” parameters. The experts provide their information in the form of \( IVPFS_{f_1}NS \) as given in Table 10.

| \( C_1 \) | \( x_1 \) | \( x_2 \) | \( x_3 \) | \( x_4 \) |
|---------|---------|---------|---------|---------|
| \([0.1, 0.2, 0.3]\), \([0.3, 0.4]\) | \([0.1, 0.2], [0.1, 0.1]\) | \([0.2, 0.5], [0.1, 0.1]\) | \([0.3, 0.4], [0.1, 0.2]\) |
| \([0.2, 0.4], [0.1, 0.1]\) | \([0.1, 0.2], [0.2, 0.3]\) | \([0.4, 0.5]\) | \([0.1, 0.2], [0.2, 0.3]\) |
| \([0.1, 0.2], [0.1, 0.2]\) | \([0.1, 0.4], [0.1, 0.3]\) | \([0.2, 0.3], [0.3, 0.5]\) | \([0.2, 0.3], [0.1, 0.3]\) |
| \([0.2, 0.3]\) | \([0.0, 0.2]\) | \([0.1]\) | \([0.1, 0.2]\) |
| \([0.1, 0.3], [0.1]\) | \([0, 0.2]\) | \([0.3, 0.5]\) | \([0.2, 0.4]\) |

We use IVPFWA, IVPFOWA, IVPFHA, \( IVPS_{f_1}WA \), IVSFWA, IVSFOWA, IVSFHA, \( IVSF_{f_1}WA \), IVT-SFWA [36], IVT-SFOWA [36], IVT-SFHA [36], IVSFWAM [44], IVSFWGM [44], and \( IVPF_{f_1}S \) [43] operators to compare with the present work and the evaluation results are shown in Table 11.

Table 11. Comparative study of different methods.

| Methods | \( x_1 \) | \( x_2 \) | \( x_3 \) | \( x_4 \) | Ranking Results |
|---------|---------|---------|---------|---------|-----------------|
| IVPFWA | 0.4630 | 0.4885 | 0.5476 | 0.5094 | \( \psi_3 > \psi_4 > \psi_2 \) > \( \psi_1 \) |
From Table 11, we can see that we can use different methods to get different results under the same evaluation data. Notice that \( x_3 \) is the best alternative in all cases that shows the validity of proposed work. Moreover, proposed operators can consider the parameterization structure while the operators given as IVPFWA, IVPFOWA, IVPFHA, IVSFWA, IVSFOWA, IVSFHA, IVT-SFWA [36], IVT-SFOWA [36], IVT-SFHA [36], IVSF-WAM [44], IVSFWMG [44] cannot consider the parameterization structure. From the above analysis, it is clear that the present work is more general than existing methods.

Example 6. A person plans to buy a house from a set of four alternatives \( U = \{x_1, x_2, x_3, x_4\} \). Let \( E = \{s_1 = \text{beautiful}, s_2 = \text{reasonable price}, x_3 = \text{green surroundings}, s_4 = \text{location}\} \). Let \( \alpha = [0.25, 0.23, 0.24, 0.28] \) denote the weight vector of "e_i" experts and \( p = [0.26, 0.20, 0.29, 0.25] \) denote the weight vector of "s_i" parameters. The experts provide their information in the form of IVSF\(_{ftp}\)Ns as given in Table 12.

### Table 12. Information based on interval-valued spherical fuzzy soft numbers.

|     | \( x_1 \)                                   | \( x_2 \)                                   | \( x_3 \)                                   | \( x_4 \)                                   |
|-----|---------------------------------------------|---------------------------------------------|---------------------------------------------|---------------------------------------------|
| \( C_1 \) | \([0, 0.1], [0.2, 0.7]\)                    | \([0.2, 0.5], [0.4, 0.5]\)                  | \([0.2, 0.5], [0.3, 0.6]\)                  | \([0.2, 0.4], [0.1, 0.2]\)                  |
|     | \([0.3, 0.4]\)                              | \([0.2, 0.3]\)                              | \([0.2, 0.3]\)                              | \([0.2, 0.6]\)                              |
| \( C_2 \) | \([0.1, 0.4], [0.2, 0.4]\)                  | \([0.3, 0.4], [0.5, 0.6]\)                  | \([0.1, 0.3], [0.1, 0.5]\)                  | \([0.2, 0.3], [0.1, 0.4]\)                  |
|     | \([0.1, 0.3]\)                              | \([0.3, 0.5]\)                              | \([0.4, 0.6]\)                              | \([0.3, 0.4]\)                              |
| \( C_3 \) | \([0.3, 0.4], [0.2, 0.4]\)                  | \([0.2, 0.4], [0.1, 0.3]\)                  | \([0.2, 0.3], [0.5, 0.7]\)                  | \([0.3, 0.5], [0.4, 0.5]\)                  |
|     | \([0.1, 0.4]\)                              | \([0.4, 0.6]\)                              | \([0.3, 0.6]\)                              | \([0.1, 0.2]\)                              |
We still use IVPFWA, IVPFOWA, IVPFHA, \( IVPS_FWA \), IVSFWA, IVSFOWA, IVSFHA, \( IVSF_SWA \), IVT-SFWA [36], IVT-SFOWA [36], IVT-SFHA [36], IVSFWAM [44], IVSFWGM [44], and \( IVPF_SWA \) [43] to compare with the present work and the evaluation results are shown in Table 13.

**Table 13. Comparative study of different methods.**

| Methods | \( x_1 \) Score Values | \( x_2 \) | \( x_3 \) | \( x_4 \) | Ranking Results |
|---------|------------------------|---------|---------|---------|-----------------|
| IVPFWA  | Failed                 | Failed  | Failed  | Failed  | Cannot be calculated |
| IVPFOWA | Failed                 | Failed  | Failed  | Failed  | Cannot be calculated |
| IVPFHA  | Failed                 | Failed  | Failed  | Failed  | Cannot be calculated |
| **IVPS_FWA** | Failed                 | Failed  | Failed  | Failed  | Cannot be calculated |
| **IVPS_SWA** [43] | Failed                 | Failed  | Failed  | Failed  | Cannot be calculated |
| IVSFWAM [44] | 0.4157               | 0.4387  | 0.5342  | 0.5171  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVSFOWA [44] | 0.3962               | 0.4287  | 0.5142  | 0.5071  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVSFWA  | 0.4094                | 0.4330  | 0.5136  | 0.4370  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVSFOWA | 0.3905               | 0.4206  | 0.5449  | 0.4632  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVSFHA  | 0.4062                | 0.4687  | 0.5542  | 0.5371  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| **IVSFS_FWA** | 0.4356               | 0.4467  | 0.5756  | 0.5123  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVT-SFWA [36] | 0.4134               | 0.4356  | 0.5193  | 0.4398  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVT-SFOWA [36] | 0.4565               | 0.4862  | 0.5859  | 0.5549  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| IVT-SFHA [36] | 0.48033              | 0.4978  | 0.5945  | 0.5729  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| **IVT–SF_FWA** present work | 0.4423 | 0.4821  | 0.5625  | 0.5563  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| **IVT–SF_SWA** present work | 0.4324 | 0.4534  | 0.5867  | 0.5655  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |
| **IVT–SF_HA** present work | 0.4858 | 0.4914  | 0.5792  | 0.5489  | \( \psi_3 > \psi_4 > \psi_2 > \psi_1 \) |

It is clear from the above analysis that when decision makers provide information in the form of interval-valued spherical fuzzy soft numbers then the operator IVPFWA, IVPFOWA, IVPFHA, \( IVPS_FWA \) operator and \( IVPS_SWA \) [43] fail to tackle that kind of information but on the other hand the proposed work along with IVSFWA, IVSFOWA, IVSFHA, \( IVSF_SWA \), IVT-SFWA [36], IVT-SFOWA [36], IVT-SFHA [36], IVSFWAM [44], IVSFWGM [44], and \( IVPF_SWA \) [43] operators can handle this information. Moreover, it can be seen from Table 13 that all the ranking results are the same which shows the validity of the present work.
Example 7. A person plans to buy a house from a set of four alternatives \( \mathcal{U} = \{x_1, x_2, x_3, x_4\} \). Let \( E = \{s_1 = \text{beautiful}, s_2 = \text{reasonable price}, s_3 = \text{green surroundings}, s_4 = \text{location} \} \). Let \( \omega = [0.28, 0.25, 0.23, 0.24] \) denote the weight vector of "e_i" experts and \( p = [0.26, 0.20, 0.29, 0.25] \) denote the weight vector of "s_j" parameters. We still use IVPFWA, IVPFOWA, IVPFHA, IVPSfWAwA, IVSFWA, IVSFWA [36], IVT-SFWA [36], IVT-SFWA [36], IVSFHA [36], IVSFWAM [44], IVSFWMG [44], and IVPSfWAs [43] to compare with proposed work.

It is clear that when a DM provides \([0.3, 0.8], [0.3, 0.6], [0.3, 0.9]\), then the methods given as IVPFWA, IVPFOWA, IVPFHA, IVPSfWAwA, IVPSfWAs [43], IVSFWA, IVSFWA, IVSFWA, IVSFWA fail to handle this type of information because for this type of information \( \text{sum}(0.8, 0.6, 0.9) \notin [0, 1] \) and \( \text{sum}(0.8^2, 0.6^2, 0.9^2) \notin [0, 1] \). However, the proposed operators can handle such kinds of data along with the method given in [30]. Similarly, if data given in Tables 6–9 are considered, then all the above-given methods fail to handle all this information, while the present work along with the method given in [30] can easily handle this type of information. Hence, it is clear that the present work provides more space to DMs in making their decisions for MCDM problems. Hence, the present work is more general. For this, \( IVT-SFSfNs \) are aggregated and the overall decision matrix for different mobile phone brands \( x_i; i = 1, 2, 3, 4 \) by using WVs \( \omega = [0.28, 0.25, 0.23, 0.24] \) is given in Table 14. From Table 14, it is clear that all the information consists of \( IVT-SFSfNs \) and this information cannot be tackled by all the above-given methods, so we cannot calculate the score values for all the above given operators, while the presented operators can tackle this information along with the method given in [30] and also we can calculate the score values for all data given in Table 14. Now using this information, a comparative evaluation of all the above given aggregation operators with the present work is given together with their results in Table 15.

Table 14. Aggregated values of \( IVT-SFSfNs \) for \( x_i; i = 1, 2, 3, 4 \).

| Methods | \( x_1 \) | \( x_2 \) | \( x_3 \) | \( x_4 \) | Ranking Results |
|---------|---------|---------|---------|---------|----------------|
| IVPFWA  | Failed  | Failed  | Failed  | Failed  | Cannot be calculated |
| IVPFOWA | Failed  | Failed  | Failed  | Failed  | Cannot be calculated |
| IVPFHA  | Failed  | Failed  | Failed  | Failed  | Cannot be calculated |
From Table 15, note that \( x_3 \) is the best alternative, which shows the validity of the proposed work. Further, the characteristic evaluation of the present approach with all the above operators is given in Table 16. Hence, it is clear that IVPFWA, IVPFOWA, IVPFHA, IVSFWA, IVSFOWA, IVSFHA, IVSFWAM [44], IVSFWGM [44], IVT-SFWA [36], IVT-SFOWA [36], IVT-SFHA [36] cannot consider the parameterization structure. The main advantage of the present work is that it provides more space to DMs, generalizes many existing structures, and also considers parameterization structures to deal with real-life problems. Hence, the present work can be used in MCDM problems rather than using it for other operators in the \( IVT - SFS_{f_1} \) environment.

**Table 16.** Characteristic evaluation of different methods.

| Methods            | Fuzzy Data | Aggregate Parameter Data |
|--------------------|------------|--------------------------|
| IVPFWA             | Yes        | No                       |
| IVPFOWA            | Yes        | No                       |
| IVPFHA             | Yes        | No                       |
| IVPFS\(_{f_1}\)WA | Yes        | Yes                      |
| IVPFS\(_{f_1}\)S [43] | Yes | Yes                      |
| IVSFWAM [44]       | Yes        | No                       |
| IVSFOWA [44]       | Yes        | No                       |
| IVSFHA [36]        | Yes        | Yes                      |
| IVT-SFWA [36]      | Yes        | No                       |
| IVT-SFOWA [36]     | Yes        | No                       |
| IVT-SFHA [36]      | Yes        | No                       |
| IVSFWA             | Yes        | No                       |
5.3. Scientific Decision of the Proposed Works

The idea of IVT – SFS\textsubscript{f\textsubscript{1}}S is an important technique to cope with complicated and uncertain information in real-life issues. The idea of IVT – SFS\textsubscript{f\textsubscript{1}}S is the mixture of two different ideas such as IVT – SFS and S\textsubscript{f\textsubscript{1}}S, which contains the grade of truth, abstinence, and falsity with a rule that the sum of the upper parts of the q-powers of all grades is restricted to unit interval. The advantages of the proposed IVT – SFS\textsubscript{f\textsubscript{1}}S are discussed below:

1. If we choose the value of \( q = 2 \), then the proposed IVT – SFS\textsubscript{f\textsubscript{1}}S is converted for interval-valued spherical fuzzy soft sets.
2. If we choose the value of \( q = 1 \), then the proposed IVT – SFS\textsubscript{f\textsubscript{1}}S is converted for interval-valued picture fuzzy soft sets.
3. If we choose the value of abstinence is zero, then the proposed IVT – SFS\textsubscript{f\textsubscript{1}}S is converted for interval-valued q-rung orthopair fuzzy soft sets.
4. If we choose the value of abstinence is zero with \( q = 2 \), then the proposed IVT – SFS\textsubscript{f\textsubscript{1}}S is converted for interval-valued Pythagorean fuzzy soft sets.
5. If we choose the value of abstinence is zero with \( q = 1 \), then the proposed IVT – SFS\textsubscript{f\textsubscript{1}}S is converted for interval-valued intuitionistic fuzzy soft sets.

Similarly, in future, we will extend the proposed work IVT – SFS\textsubscript{f\textsubscript{1}}S for the following ideas:

1. Interval-valued T-spherical hesitant fuzzy soft sets.
2. Interval-valued T-spherical hesitant fuzzy soft rough sets.
3. Interval-valued T-spherical fuzzy soft rough sets.
4. T-spherical hesitant fuzzy soft sets.
5. T-spherical hesitant fuzzy soft rough sets.

In future, this work will be used in the environment of image segmentation, pattern recognition, medical diagnosis, and determination of the dangers of brain cancers.

6. Conclusions

MCDM approach is a well-known and very effective technique for the selection of the best alternative among the given and this approach has been used in different fields of fuzzy sets theory. Aggregation operators are an effective tool to deal with fuzzy information and desirable results for real-life problems can be obtained by these means. Here in this paper, we have combined two notions, IVT-SFS and SS, to generate the new notion called IVT – SFS\textsubscript{f\textsubscript{1}}S. It is a strong apparatus to deal with fuzzy information and also generalized many previous ideas such as PFS\textsubscript{f\textsubscript{1}}S, SFS\textsubscript{f\textsubscript{1}}S, TT – SFS\textsubscript{f\textsubscript{1}}S, IVPS\textsubscript{f\textsubscript{1}}S and IVSS\textsubscript{f\textsubscript{1}}S. Moreover, inspired by the parameterization property of soft set, we have established the operators such as IVT – SFS\textsubscript{f\textsubscript{1}}WA, IVT – SFS\textsubscript{f\textsubscript{1}}OWA and IVT – SFS\textsubscript{f\textsubscript{1}}HA operators and also their properties are discussed in detail. An algorithm is developed and an application example is proposed to show the validity and superiority of the proposed work. Further, in comparative analysis, the established work is compared with another existing method to show the superiority of the present work.
In the future, one can combine $T - SFS_{f}S$ and $IVT - SFS_{f}S$ to introduce a new notion called cubic T-spherical fuzzy soft set $CT - SFS_{f}S$. In addition, this notion can be used in many MCDM approaches and desirable results can be obtained. Moreover, numerous scholars have introduced the hybrid notion of rough set and other fuzzy sets theories and applied these notions to multi-attribute decision-making problems as given in [45–48]. Therefore, one can also use the established structure and rough set to introduce new hybrid notions like interval-valued T-spherical fuzzy soft set and soft rough interval-valued T-spherical fuzzy set, and then this notion can be used in many decision-making problems.

In future, we will extend the proposed idea to bipolar soft sets [49], complex T-spherical fuzzy sets [50,51], and complex neutrosophic sets [52]. This work will also be utilized in the environment of image segmentation [53], pattern recognition [54], medical diagnosis, and determination of the dangers of brain cancers.

**Abbreviations**

For the sake of clarity, the following table gives all the abbreviations used in this manuscript.

| Abbreviations | Complete Name                      |
|---------------|------------------------------------|
| MCDM          | Multiple-criteria decision making   |
| $S_{f}S$      | Soft set                           |
| $IVT - SFS$   | Interval-valued T-spherical fuzzy set |
| $IVT - SFS_{f}S$ | Interval-valued T-spherical fuzzy soft set |
| $DM$          | Decision-makers                    |
| $IVT - SFS_{f}WA$ | Interval-valued T-spherical fuzzy soft weighted averaging |
| $IVT - SFS_{f}OWA$ | Interval-valued T-spherical fuzzy soft ordered weighted averaging |
| $IVT - SFS_{f}HA$ | Interval-valued T-spherical fuzzy soft hybrid averaging |
