Biological activity

ABSTRACT

Objective: To determine the chemical composition of essential oils and lipid constituents of Ballota andreuzziana (B. andreuzziana), Teucrium zanonii (T. zanonii) and Verbena tenuisecta (V. tenuisecta) growing in Libya, and to test the antibacterial activity of different extracts of Teucrium zanonii.

Methods: The volatile oils of all plants were extracted by hydrodistillation method and analyzed by GC/MS method. The lipid constituents of plants were obtained by extraction with petroleum ether and fractionated into fatty alcohols, fatty acids and unsaponifiable matters. Antibacterial activity of T. zanonii extracts and antioxidant activity of different extracts of T. zanonii were also studied.

Results: The volatile oil of B. andreuzziana was found to consists of 20 compounds in which caryophyllin is the main one (63.1%), the volatile oil of T. zanonii consists of 74 compounds in which germacrene-D was the main compound, while the volatile oil of V. tenuisecta consists of 13 compounds with 1-octen-3-ol as a major constituent (52.87%). The study of antimicrobial activity of different extracts of V. tenuisecta showed that, both methanol and butanol extracts exhibited the highest activity against Mycobactirium phlei (M. phlei) and Candida albicans (C. albicans) respectively, while petroleum ether, fatty alcohols and unsaponifiable fractions had no antimicrobial activity against all the tested microorganisms.

Investigation of the antioxidant activity of different extracts of T. zanonii using DPPH method proved that, the ethyl acetate and butanol fractions showed the highest activity where the inhibition percentage (I%) are 93.6 and 92.1 respectively.

Conclusions: This is the first report about the volatile oils of these plants where T. zanonii have the highest content and the highest number of the identified compounds. The study of antioxidant T. zanonii extracts proved that, the ethyl acetate, butanol and aqueous extracts have the highest antioxidant activity. Methanol and butanol extracts of V. tenuisecta exhibited the highest activity against M. phlei and C. albicans respectively.

1. Introduction

The genus Ballota and Teucrium belongs to family Labiatae (Lamiaceae), it comprises thirty five species in the world and is represented by four species in Libya[1]. Many compounds like volatile oils, diterpenoids and various polyphenols including phenylpropanoid derivatives and natural phenolics (flavonoids and phenolic acids) have been isolated and identified from Ballota genus[2,3]. Plants of this genus possess antiulcer, antispasmodic, diuretic, antiinflammatory, antispasmodic and hepatoprotective properties, and have been used traditionally and in modern medicine for treatment of wounds, burns, suppress cough, upper respiratory system inflammation, neurosedative[4-11].

Teucrium zanonii (T. zanonii) belongs to the same family as Ballota genus, and is represented by 13 species in the flora of Libya. Both of the two plants are endemic Libyan plants. Teucrium species are rich source of volatile oils and neoclerodane diterpenoids, in addition to furano oditerpenoids and flavonoids. The genus Teucrium is the most abundant natural source for these compounds; therefore
Teucrium species are accepted as chemotaxonomic markers for neo-clerodanes. Chemical investigation of this genus showed that some of species also contain sesquiterpenes, triterpenes, sterols, flavonoids, iridoïds, phenolic acids and some alkamides. Many Teucrium extracts are used for more than 2000 years as medicinal plants. They exhibited some interesting biological activities like diuretic, diaphoretic, anisepetic, antipyretic, anti-spasmodic, anti-ulcer, anti-rheumatic, antibacterial, antioxidant, hypoglycemic, antifeedant. Besides, some Teucrium extracts are used in folk medicine to treat various ailments such as stomach and intestinal troubles, rheumatism, hemorrhoids and renal inflammatory, asthma, an infusion of the leaves and flowers is used as a hop substitute for flavouring beer[12-16].

Verbena tenuisecta (V. tenuisecta) is introduced from South America[17] as an ornamental plant growing in many region of Libya. The phytochemical information on Verbena genus has been published and various constituents vis. volatile oil, sterol and triterpenoids, some lipid classes, iridoïds and many phenolic compounds[18-25]. In course of our studies on Verbena genus, the plant has been extensively used as popular herb in folk for the treatment of rheumatism, also widely used to cure fever, tonsillitis, gastrointestinal disorders and some sexually transmitted diseases in South America; and in modern medicine as antimicrobial, antioxidant, anti-inflammation, neurosedative and diuretic agents[26-29]. In this paper we aimed to investigate some chemical constituents of the three plants like (volatile oils, lipid constituents) in addition to their biological activity.

2. Material and methods

2.1. Plants material

Ballota andreuzziana (B. andreuzziana) was collected in April 2006 during the flowering stage from Wadi El-Husaien, along the coastal of Ras El-Hilal to Shahat city road, Gebel Akhdar city, Teucrium zanonii (T. zanonii) was collected in April 2008 during the flowering stage from Aho–fakhrə region about 25 km from Benghazi city. The two plants were kindly identified by Dr. Mohamed Alsharif at Botany Department, Faculty of Science, Gariiones University, Benghaz city, Libya. While Verbena tenuisecta (V. tenuisecta) Briq. was collected from central garden of Sirte city, Libya in August 2007 during the flowering stage, the plant was kindly identified and authenticated by Dr. Mohamed N. Abohdabra Prof. of taxonomy at Botany Department, Faculty of Science, Al Fatih University, Tripoli, Libya. All the species specimens were deposited at the herbarium of Biology Department, Faculty of Scienle, Altahady University, Sirt, Libya.

2.2. Extraction of the volatile oils

About 350 g of fresh plant material (flower buds) of B. andreuzziana, T. zanonii and V. tenuisecta respectively was subjected to hydrodistillation method in all–glass apparatus for about three hours according to Gunther method[30]. The trapped oil in the side arm was removed separately and kept in refrigerator to GC/MS analysis after complete distillation and dry over anhydrous sodium sulphate to give a pale yellow oil (0.20%, 20.00% and 0.13% v/w respectively). Constituents of T. zanonii were extracted using a solvent of n–hexane–ether (50:50).

2.3. Extraction of lipids and related substances

About 800 g, 1.40 kg and 1.75 kg of the dried powdered plant of B. andreuzziana, T. zanonii and V. tenuisecta were extracted with petroleum ether (b.r. 40–60 °C) respectively in a continuous extractor (Soxhlet apparatus). The combined petroleum ether extract was passed through fuller’s earth to remove coloured pigments, filtered, dried over anhydrous sodium sulphate and evaporated in vacuo at 40 °C till dryness to give a pale yellow residue (6.0 g, 12.3 g and 10.1 g). These residues were dissolved in boiling acetone (250 mL) and left overnight at room temperature. Amorphous precipitates were filtered, washed with cold acetone and recrystallized from chloroform/methanol to give bright white crystals (1.95 g, 2.80 g and 1.27 g) of acetone insoluble fraction (Fatty Alcohols mixture). The filtrates (Acetone soluble fraction) were evaporated till dryness (3.85 g, 7.50 g, 8.02 g) and subjected to saponification process.

2.4. Saponification of acetone soluble fraction[31]

The acetone soluble fractions of the three plants (3.85 g, 7.50 g and 8.00 g) respectively were saponified (as in reference 31) to give a yellowish brown semisolid residue of unsaponified matter (0.84 g, 4.10 g and 2.96 g) and 0.44 g, 0.70 g and 1.31 g of the total fatty acids which were methylated and subjected to GLC.

2.5. Analysis and identification of the volatile oil and lipids constituents

The volatile oil and fatty alcohols mixtures were subjected to GC/MS using the same conditions while the unsaponifiable fraction and the fatty acids mixture were subjected to GLC as mentioned before[31].

2.6. Antimicrobial activity study of V. tenuisecta

The study of the antimicrobial activity of different extracts of V. tenuisecta was carried out using disc–diffusion modified– Kirby– Bauer and Streaking methods[32,33] against some selected microorganisms.

2.7. Tested microorganism

Staphylococcus aureus (S. aureus), Bacillus subtilis (B. subtilis), Mycobacterium phlei (M. phlei) and Candida albicans (C. albicans) were cultured and they were supplied by the Unit of the Chemistry of Natural and Microbial Products, Department of National Research Center, Cairo, Egypt and Biotech Center, Tripoli, Libya. The control agents used for antimicrobial and antifungl activity are tetracycline and metradinazol as antifungl. The microbiological media are Muller Hanton–Nutrient broth and Nutrient agar (Oxid, UK) and Sabouraud dextrose (Oxid, UK).
2.8. Antioxidant activity of different extracts of T. zanonii [34]

The DPPH test is a commonly employed assay in antioxidant studies because it offers a rapid technique to screen the RSA of pure synthetic compound, isolated natural compound, crude plant extracts and food.

3. Results

The obtained pale yellow oil of B. andreuzziana, T. zanonii, V. tenueisecta (0.20% v/w, 0.25% v/w, 0.13% v/w) was analyzed by GC/MS (Table 1). The GC/MS analysis of fatty alcohols mixtures obtained from B. andreuzziana, T. zanonii, V. tenueisecta were shown in Table 2. Study of unsaponifiable fraction and the total fatty acids obtained from the studied species were shown in Table 3 & 4. Antibacterial activity of T. zanonii extracts against S. aureus, B. subtilis, M. phlei, C.

4. Discussion

4.1. Pale yellow oil obtained from the three plants

The obtained pale yellow oil of B. andreuzziana (0.20% v/w) was analyzed by GC/MS. The results revealed that it consists of a mixture of twenty compounds (five of them constitute about 95.0%) belonging to many classes as saturated hydrocarbons, unsaturated hydrocarbons, alcohols, aldehydes, ketones, ester, oxides and aromatics. The sesquiterpene content was found the highest value (95.25%) of the oil, among which carophyllene (63.10%), cis-γ- bisabolene (26.30%) and α-Selinene (50.03%) are the most abundant compounds. The oxygenated sesquiterpenes constitute about 2.45% in which carophyllene oxide is the major one (2%). While the monoterpenes represents about 2.4% in which thujene, (bicyclic monoterpen 0.7%) is the main one. These data were in accordance with that reported by Couladis et al. in 2002[33] from B. pseudodictamnus and Bader et al. in 2003 from B. undulate[34].

The GC/MS data showed the hydrodistillation extraction of volatile oil of T. zanonii is a mixture of 80 compounds only 74 compounds were identified representing 92.98% of the total (nine of them constitute about 85%). The identified compounds represent several chemical classes, viz.: saturated hydrocarbons 16.08%, unsaturated hydrocarbons 60.94%, alcohols 0.91%, ketones 1.24%, esters 7.93% and about 13.10% unknown compounds with the germacrene-D, β-Pinene and linalyl acetate as the main components, (20.04%, 18.19% and 7.93% respectively).

The GC/MS analysis of V. tenuisecta volatile oil showed it is a mixture of thirteen compounds 98.64% (six of them constitute about 91.0%). The identified compounds represent several chemical classes, viz.: alcohols (60%), bicyclic monoterpenes (16.55%), monocyclic monoterpenes (11.95%), aromatics (6.69%), aldehydes (3.25%), acyclic monoterpenes (0.59%). Also, the results showed that 1-octen-3-ol (52.87%), bicyclo[3.2.0]heptan-2–one–6-hydroxy–5–methyl–6–vinyl (13.89%) and limonene (9.33%) are the main compounds. These data were in agreement with that reported by Mohammad et al[36] where they investigated the volatile oil of V. officinalis in 2003 and identified 1-octen-3-ol as one of the main compound, also Chalchat and Garry[37] were identified limonene in the volatile oil of the same plant in 1999.

4.2. Acetone insoluble fraction (fatty alcohols mixture)

The GC/MS analysis of fatty alcohols mixtures obtained from B. andreuzziana and V. tenuisecta revealed the presence of a mixture of 5 fatty alcohols. For B. andreuzziana, octadecanol being the main constituent (46.07%) while for V. tenuisecta, heptadecanol (46.07%) is the main one, but for T. zanonii it showed the presence of tricosanol (5.10%), tetracosanol (4.62%), pentacosanol (23.37%), nonacosanol (26.21%), triacontane (24.73%), tetracontane (15.95%).

4.3. Unsaponifiable fraction

The unsaponifiable fraction of the studied species was investigated by GLC. The results proved that it mainly contain a mixture of a series of n–alkanes, a sterols fraction and triterpene fraction. For B. andreuzziana the unsaponifiable fraction contain a series of hydrocarbons in which n–C–25 is the main one , sterols with cholesterol as the highest percentage and triterpene β–amyrin (2.29%), these data were in accordance with Ahmed et al[38] who reported that B. limbita contain β – sitosterol and oleanolic acid, while of T. zanonii the hydrocarbon fraction contain n–C3 ton–C32, the sterol fraction contain cholesterol, stigmastanol, β –sitosterol and campasterol in addition to β–amyrine (0.41%). Finally for V. tenuisecta, n–C16 (9.68%), sterols fraction of stigmastanol (16.59%) and β–amyrine (10.74%) are the main compounds respectively. These data were coincided with that reported by Makhboul in 1986[39] and Liu C and Liu Y in 2002[40].

4.4. Fatty acids methyl esters

The study of the total fatty acids of B. andreuzziana
and revealed the presence of saturated fatty acids (35.28%) and unsaturated fatty acids (64.72%) in which palmitic and linoleic acids are the main compounds respectively, while \textit{T. zanonii} revealed the presence of lauric (1.36%), myristic (1.22%), palmitic (13.95%), stearic (15.05%), oleic (13.69%), linoleic (35.25%), linolenic (11.21%), arachidic (1.58%), erucic (1.58%), lignoceric (3.58%), tetracosenoic (1.90%).

The saturated and unsaturated fatty acids represents 36.74% and 63.27% respectively. Also stearic and lineoleic acids are the major acids. But for \textit{V. tenuisecta}, the results proved the presence of saturated and unsaturated fatty acids in percentages of 30.66% and 69.34% in which linoleic acid and palmitic acid are the major acids respectively. Also C_{16:2} and C_{18:3} constituted about 64.16% of fatty acids. These data were in accordance with that reported by Sonja et al\cite{19}.

The fatty acids fraction had high activity against \textit{M. phlei}, moderate activity against \textit{B. subtilis}, but had no effect against the \textit{S. aureus} and \textit{C. albicans}. The methanol extract showed high inhibition against \textit{M. phlei}, moderate activity against \textit{B. subtilis}, but had no effects on \textit{S. aureus}. Moreover had high activity against \textit{C. albicans} at concentration (c, b). But at the concentration (a) had no effect. The chloroform extract exhibited moderate activity against \textit{Staphylococcus aureus} at the high concentration (c) only. While Bacillus subtilis was affected at concentration (b, c) as a moderate activity. Whereas did not effect on both \textit{M. phlei} and \textit{C. albicans}.

The butanol extract showed a moderate inhibition against \textit{M. phlei}, \textit{C. albicans} and \textit{S. aureus}, but the cone. (a) did not affected with \textit{S. aureus}. The acetone extract had moderate activity against \textit{M. phlei} only in a concentration dependent mode and did not affect on the other microbes.

These results were coincided with that reported by El-Aziz et al\cite{32}, where they proved the antibacterial activity of butanol and ethyl acetate extracts of \textit{V. bipinnatifida}. Also, Gamboa and Castro in 2004\cite{33} reported about the antibacterial activity of some compounds isolated from \textit{V. littoralis}.

The studies of antioxidant activity of different extracts against DPPH showed that the ethyl acetate, butanol fractions and aqueous extract have the highest antioxidant activity. This activity may be mainly due to the presence of flavonoids (aglycones or glycosides) in these fractions. These observations were in accordance with that reported by Sonja et al\cite{34}.

4.5. Antimicrobial and antioxidant activity analysis

The results of antimicrobial activity of \textit{V. tenuisecta} extracts of different concentrations against some selected microorganisms showed that: The petroleum ether extract, fatty alcohols and unsaponifiable fraction had no antimicrobial activity against all the tested microorganisms. The fatty acids fraction had high activity against \textit{M. phlei}, moderate activity against \textit{B. subtilis}, but had no effect against the \textit{S. aureus} and \textit{C. albicans}. The methanol extract showed high inhibition against \textit{M. phlei}, moderate activity against \textit{B. subtilis}, but had no effects on \textit{S. aureus}. Moreover had high activity against \textit{C. albicans} at concentration (c, b). But at the concentration (a) had no effect. The chloroform extract exhibited moderate activity against \textit{Staphylococcus aureus} at the high concentration (c) only. While Bacillus subtilis was affected at concentration (b, c) as a moderate activity. Whereas did not effect on both \textit{M. phlei} and \textit{C. albicans}.

The butanol extract showed a moderate inhibition against \textit{M. phlei}, \textit{C. albicans} and \textit{S. aureus}, but the cone. (a) did not affected with \textit{S. aureus}. The acetone extract had moderate activity against \textit{M. phlei} only in a concentration dependent mode and did not affect on the other microbes.

These results were coincided with that reported by El-Aziz et al\cite{32}, where they proved the antibacterial activity of butanol and ethyl acetate extracts of \textit{V. bipinnatifida}. Also, Gamboa and Castro in 2004\cite{33} reported about the antibacterial activity of some compounds isolated from \textit{V. littoralis}.

The studies of antioxidant activity of different extracts against DPPH showed that the ethyl acetate, butanol fractions and aqueous extract have the highest antioxidant activity. This activity may be mainly due to the presence of flavonoids (aglycones or glycosides) in these fractions. These observations were in accordance with that reported by Sonja et al\cite{34}.

Conflict of interest statement

We declare that we have no conflict of interest.
