General Methods

All the reactions and manipulation were performed under protective Argon atmosphere; using the standard Schlenk technique or Glovebox MBraun equipped with a gas purification and recirculation unit. Hexane was dried over alumina column of Solvent Purification System (a MBraun MBSPS 5) and stored over activated 4Å molecular sieves collection and under argon atmosphere. Tetrahydrofuran were dried over sodium and benzophenone ketyl and purified by distillation under argon atmosphere, after the collection it was stored over activated 4 Å molecular sieves and argon atmosphere. Ph₂Si(NHAr*)₂ [[Ph₂Si(NHAr*)(NAr*)K]∞ were prepared as reported in literature.¹,²

NMR spectra were performed in J. Young’s NMR tube, prior oven dried and flushed with argon. NMR spectra were recorded using a Bruker AV 400 spectrometer operating at 400.13 MHz for ¹H and ¹⁹F, 100.62 MHz for ¹³C{¹H} or a Bruker AV 400 spectrometer operating at 300 MHz for ¹H and ¹⁹F, 75 MHz for ¹³C{¹H}. ¹H and ¹³C{¹H} NMR spectra were calibrated against the appropriate solvent signal. All the deuterated solvents for NMR were dried and distilled over NaK₂.₈ and stored over activated 4 Å molecular sieves and argon atmosphere.

Synthetic Procedures

Synthesis of ZnTMP₂

2.72 mL of 2,2,6,6-tetramethylpiperidine (16 mmol) were solubilized in 10 mL of THF and then 10 mL of nBuLi solution (1.6 M in hexane) were added drop by drop affording a yellow solution. 1.09 g of ZnCl₂ (8 mmol) were added, instantaneously a white precipitate was formed. The mixture was allowed to stir at room temperature for 1h. All the volatiles were removed under reduced pressure affording a yellow waxy solid. 30 mL of Hexane were added affording a white suspension. The suspension was filtered through celite and the mother liquor was evaporated furnishing Zn(TMP)₂ as white solid (2700 mg 98%). The solid can be further purified via sublimation as reported in the literature.³

¹³C{¹H}-NMR (75.5 MHz, D₈-THF, 298 K) δ(ppm): 53.3 (C₆₂₆), 39.8 (β-CH₂), 36.8 (α-CH₃) 19.7 (γ-CH₂)

Synthesis of [{Ph₂Si(NHAr*)₂Zn(TMP)}⁻{K(THF)₆}⁺⁺ (1)

572 mg of freshly prepared [{Ph₂Si(NHAr*)(NAr*)K]∞ (I)² (1 mmol) and 346 mg of Zn(TMP)₂ (1 mmol) were solubilized in 10 mL of THF and the solution was allowed to stir at reflux overnight. Volatiles were removed under
vacuum, the white residue was dissolved in 5 mL of hexane and 2 mL of THF, affording a pale-yellow solution. Storage in freezer (-33°C) for two days furnished colourless crystal of 1 (641.6 mg 67%).

**Synthesis of [{Ph\text{\textit{2}}Si(NAr*)\text{\textit{2}}Zn(CH\text{\textit{2}}\text{SiMe}_3)}\text{\textbar}{K(THF)_{\text{4}}}]^{-} (2)**

126 mg of KCH\text{\textit{3}}\text{SiMe}_3 (1mmol), 346 mg of ZnTMP \text{\textit{2}} (1mmol) and 10 mL of hexane were added to a flushed Schlenk tube. The white suspension was left stirring for 2 hours until it becomes a fine suspension to which 1 mmol of Ph\text{\textit{2}}Si(NHAr*)\text{\textit{2}} (530 mg) and 1 mL of THF were added, the yellowish suspension was gently heated and allowed to stir overnight. Volatiles were removed under vacuum and to the white residue 7 mL of hexane and 0.7 mL of THF was added, affording a pale-yellow suspension. The mixture was heated under reflux and let slowly cool down at room temperature depositing a crop of colourless crystals of 2 after 24h at room temperature. (550 mg, yield 76%). The synthesis of this compound can be achieved using a different procedure reported in literature before.\[2\]

General Experimental Procedure for the $^1$H NMR Monitoring of the Zn-H Exchange Reactions

In a glovebox, a J. Young’s NMR tube was filled with 78 mg of 1 (0.1 mmol), 16 mg of hexamethylbenzene (0.09 mmol) as internal standard and 0.45 mL of D$_8$-THF. The initial ratio of base calculated by integration in $^1$H-NMR spectrum relative to the Hexamethylbenzene. 0.1 mmol of fluoroarene was introduced and the mixture was heated at 69°C in an oil bath (when needed). The reactions times were measured from this point in regular intervals of time until full conversion by $^1$H NMR spectrum. All the yields were calculated by integration of the products relative to the hexamethylbenzene in the $^1$H NMR spectrum.

NMR monitoring of the reaction of 1 with 1,3,5 trifluorobenzene

75.7 mg of 1 (0.1 mmol) and 18.6 mg of hexamethylbenzene were solubilized in 0.5 mL of D$_8$-THF together with a precise amount of Hexamethylbenzene (used as internal standard) in a Young j tube. 9.8 μL of 1,3,5 trifluorobenzene (2a) were added to the mixture. $^1$H-NMR spectrum was recorded 5’ minutes after the addition of the fluoroarene (Figure S 1). The mixture was heated for 3 hours at 69°C in an oil bath. New NMR spectrum was recorded after the heating (Figure S 2). The amount of the component of the mixture were calculated against the mass of the internal standard according to the following equation:

$$n_c = \frac{\text{signal}}{N_N} \times \frac{m_{\text{hex.}}}{MM_{\text{hex.}}}$$

$n_c$= number of moles of the compounds $N_N$= number of the proton assigned to the chosen resonance $m_{\text{hex.}}$= mass of hexamethylbenzene $MM_{\text{hex.}}$= molecular mass of hexamethylbenzene

Reaction of 1 with 1,3,5 trifluorobenzene (2a) in presence of [2.2.2]cryptand

38 mg of 1 (0.05 mmol) and 8.8 mg of hexamethylbenzene (0.05 mmol), used as internal standard, were solubilised in 0.45 mL D$_8$-THF affording a light yellow mixture. 19.6 mg of [2.2.2]cryptand (0.05 mmol) and 5.4 µL of 1,3,5 trifluorobenzene (0.05 mmol) were added to the solution. The mixture was heated in a hot bath at 69°C for 3h. 3a was found formed in 96% yield, by integration against hexamethylbenzene in $^1$H-NMR spectrum.

Reaction of [(PMDETA)KZn(TMP)Et$_2$] with 2,4-difluoronitrobenzene

47 mg of [(PMDETA)KZn(TMP)Et$_2$] (0.1 mmol) freshly prepared, according to the method reported in the literature,[6] were solubilised in 0.45 mL of C$_6$D$_6$ affording a light yellow solution. 3 µL of hexafluorobenzene (0.025 mmol) and 7.7 mg of hexamethylbenzene (0.05 mmol) were added as internal standards. 11 µL of 2,4-difluoronitrobenzene (0.1 mmol) were added dropwise to the mixture. After the addition an insoluble dark precipitate appears instantaneously. The $^{19}$F-NMR spectrum shows two signals compatible with metalation in C3 position, their yield was calculated in 8% yield by integration against hexafluorobenzene. The $^1$H-NMR spectrum shows an intractable mixture of products.

Reaction of 1 with variable amounts of pentafluorobenzene

51 mg of 1 (0.07 mmol), were solubilised in 0.45 mL D$_8$-THF affording a light yellow mixture, 4.4 µL of α,α,α trifluorotoluene (0.036 mmol) and 8.8 mg of hexamethylbenzene (0.05 mmol) were added as internal standards. The solution was allowed to warm up at room temperature for 5 minutes before the analysis with multinuclear NMR spectroscopy was performed. The addition of pentafluorobenzene were repeated in total 3 times. The products are summarized in **Scheme S 2**

**Scheme S 2** *Metalation of the pentafluorobenzene using 1 as base.*

The addition of the first equivalent of pentafluorobenzene, leads to a complete conversion of 1 in 3h. The reaction proceeds with concomitant formation of TMP(H) (as shown in Figure S 5). The $^{19}$F-NMR
spectrum confirms the presence of only $3h$, as the major product of the reaction ($4$ and $[\text{K(THF)}_x\text{Zn(C}_6\text{F}_5)_3]$ are present only in traces) (Figure S 6)

**Figure S 12** $^1H$-NMR (D$_8$-THF, 300 MHz, 298 K) spectrum of reaction between $1$ and $3$eq. of pentafluorobenzene, after 5 minutes. ($* = 3h$, $* = 4$, $** = \text{Ph}_2\text{Si(NHAr*)}_2$, $*** = \text{hexamethylbenzene}$, $**** = \text{TMP(H)}$)
Adding a three fold excess of pentafluorobenzene 1 exhibits a polybasicity. 3h further reacts through the silyl bis(amido) ligand, generating 4 and Ph₂Si(NHar*)₂ (Figure S 7). Notably the reaction did not proceed stepwise and 4 and Ph₂Si(NHar*)₂ were generated with almost the same ratio. Pentafluorobenzene is still present in the mixture (Figure S 8) after 5 minutes due to the slower reactivity of [Ph₂Si(NHar*)₂]²⁻ towards protonation. After 16h the reaction goes to completion consuming all the pentafluorobenzene and having Ph₂Si(NHar*)₂ (Figure S 9) [K(THF)₃Zn(C₆F₅)₃] (Figure S 10) as only products.
**Figure S 14** $^1$H-NMR ($\text{D}_8$-THF, 300 MHz, 298 K) spectrum of reaction between 1 and 3eq. of pentafluorobenzene, after 16 hours. (*=Ph$_2$Si(NHAr*)$_2$, *=hexamethylbenzene, *= TMP(H))

Reaction of 1 with variable amount of 1,2,4,5-tetrafluorobenzene

34.2 mg of 1 (0.05 mmol), were solubilised in 0.45 mL D$_8$-THF affording a light yellow mixture, 4 µL of α,α,α trifluorotoluene (0.032 mmol) and 10.1 mg of hexamethylbenzene (0.06 mmol) were added as internal standards. The tube was placed in cold bath at -40°C and 5 µL of 1,2,4,5 tetrafluorobenzene (0.05 mmol, 1 eq.) were added to the mixture. The solution was allowed to warm up at room temperature for 5 minutes before the analysis with multinuclear NMR spectroscopy was performed. The addition of tetrafluorobenzene were repeated in total 3 times. The products are summarized in Scheme S 3.

Scheme S 3 Metalation of the 1,2,4,5 tetrafluorobenzene using 1 as base
Figure S 16 $^1$H-NMR (D$_8$-THF, 300 MHz, 298 K) spectrum of reaction between 1 and 1eq. of 1,2,4,5-tetrafluorobenzene, after 5 minutes. (*=3i, *=Ph$_2$Si(NAr*)$_2$, *=hexamethylbenzene, *= TMP(H))

Figure S 17 $^{19}$F-NMR (D$_8$-THF, 300 MHz, 298 K) spectrum of reaction between 1 and 1eq. of 1,2,4,5-tetrafluorobenzene, after 5 minutes. (*=3i, *= [K(THF)$_3$Zn(C$_6$F$_4$H)$_3$], *=trifluorotoluene, *= 1,2,4,5-tetrafluorobenzene)

The addition of the first equivalent of 1,2,4,5-tetrafluorobenzene, leads to a complete conversion of 1 in 3i. The reaction proceeds via liberation of TMP(H) (as shown in Figure S 11). The $^{19}$F-NMR spectrum confirms
the presence of 3i, as the principle product of the reaction ([K(THF),Zn(C,F,H)], and unreacted tetrafluorobenzene are present only in traces (Figure S 12)

Figure S 18 $^1$H-NMR (D$_8$-THF, 300 MHz, 298 K) spectrum of reaction between 1 and 3eq. of 1,2,4,5-tetrafluorobenzene, after 5 minutes. (*= 3i, *= [K(THF),Zn(Ph,Si(NHAr*)(NAr*))], *=Ph,Si(NHAr*), *=hexamethylbenzene, *= TMP(H))
Adding a threefold excess of 1,2,4,5-tetrafluorobenzene 1 exhibits a polybasicity, in fact 3i further reacts through the silyl bis(amido) ligand, generating $[\text{K(THF)}_x\text{Zn}\{\text{Ph}_2\text{Si(NHAr*)}(\text{NAr*})\}(\text{C}_6\text{F}_4\text{H})_2]$ and $\text{Ph}_2\text{Si(NHAr*)}_2$ (Figure S 13). 1,2,4,5-tetrafluorobenzene is still present in the mixture (Figure S 14) after 5 minutes due to the slower reactivity of $\text{Ph}_2\text{Si(NHAr*)}_2^{2-}$ towards protonation. After 16h the reaction goes to completion consuming most of the 1,2,4,5-tetrafluorobenzene and having $\text{Ph}_2\text{Si(NHAr*)}_2$ (Figure S 15) $[\text{K(THF)}_x\text{Zn}(\text{C}_6\text{F}_6)_3]$ (Figure S 16) as only products.

All measurements were made on a RIGAKU Synergy S area-detector diffractometer and Oxford Diffraction Gemini S or Xcalibur E using mirror optics monochromated Cu Kα radiation (λ = 1.54184 Å) or Mo Kα (λ = 0.71073 Å). The unit cell constants and an orientation matrix for data collection were obtained from a least-squares refinement of the setting angles of reflections in the range:

- 3.398° < θ < 73.102° for 1. A total of 2192 frames were collected using ω scans, with 1.335 second exposure time (15 s for high-angle reflections and 5.33 s for medium-angle reflections), a rotation angle of 1° per frame, a crystal-detector distance of 45.0 mm, at T = 123.35(10) K

- 3.7300° < θ < 73.1710° for [{Ph₂Si(NAr*)}₂Zn(TMP)]⁻{Na(THF)}₆⁺ A total of 2097 frames were collected using ω scans, with 1.53 second exposure time (15 s for high-angle reflections and 6.115 s for medium-angle reflections), a rotation angle of 1° per frame, a crystal-detector distance of 45.0 mm, at T = 123(2) K

- 4.3560° < θ < 72.5470° for 3a. A total of 1388 frames were collected using ω scans, with 2.71 second exposure time (35 s for high-angle reflections and 10.84 s for medium-angle reflections), a rotation angle of 1° per frame, a crystal-detector distance of 45.0 mm, at T = 123(2) K

- 3.8130° < θ < 73.1290° for [{Ph₂Si(NAr*)}₂Zn(C₆H₂F₃)]⁻{Na(THF)}₅⁺ A total of 2674 frames were collected using ω scans, with 1 second exposure time (9 s for high-angle reflections and 3 s for medium-angle reflections), a rotation angle of 1° per frame, a crystal-detector distance of 45.0 mm, at T = 123(2)K

- 3.4490° < θ < 71.4310° for 3b. A total of 3684 frames were collected using ω scans, with 0.5 second exposure time (2.75 s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 34.0 mm, at T = 100(2) K.

- 2.296° < θ < 76.484° for 3c. A total of 11258 frames were collected using ω scans, with 2 second exposure time (12 s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 34.0 mm, at T = 173.15(10)

- 3.487° < θ < 68.084° for 3d. A total of 3020 frames were collected using ω scans, with 5 second exposure time (12 s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 34.0 mm, at T = 84.8(6) K.

- 2.7800° < θ < 76.7790° for 3e. A total of 3332 frames were collected using ω scans, with 0.1 second exposure time (0.25 s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 34.0 mm, at T = 100.00(10) K.
- 3.098° < θ < 77.579° for 3b. A total of 6512 frames were collected using ω scans, with 0.7 second exposure time (4 s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 34.0 mm, at T = 100.0(5) K.

- 2.965° < θ < 79.598° for 3j. A total of 6306 frames were collected using ω scans, with 0.8 second exposure time (3 s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 34.0 mm, at T = 100.01(10) K.

- 2.860° < θ < 76.442° for 4 A total of 5894 frames were collected using ω scans, with 0.8 second exposure time (3.1s for high-angle reflections), a rotation angle of 0.5° per frame, a crystal-detector distance of 65.0 mm, at T = 173.00(10) K.

Data reduction was performed using the CrysAlisPro program[7]. The intensities were corrected for Lorentz and polarization effects, and an absorption correction based on the multi-scan method using SCALE3 ABSPACK in CrysAlisPro[7] was applied.

The structures were solved by direct methods using SHELXT[8], which revealed the positions of all non-hydrogen atoms of the title compound. All non-hydrogen atoms were refined anisotropically. H-atoms were assigned in geometrically calculated positions and refined using a riding model where each H-atom was assigned a fixed isotropic displacement parameter with a value equal to 1.2Ueq of its parent atom (1.5Ueq for methyl groups).

refinement of the structures was carried out on F² using full-matrix least-squares procedures, which minimized the function Σw(Fo² – Fc²)². The weighting scheme was based on counting statistics and included a factor to downweight the intense reflections. All calculations were performed using the SHELXL-2014/7[9] program in OLEX2.4[10]

The X-ray crystal structure determination service unit of the Department of Chemistry and Biochemistry of the University of Bern is acknowledged for measuring, solving, refining and summarizing the structures of compounds 3b, 3c 3d, 3e, 3h, 3j and 4. The Synergy diffractometer was partially funded by the Swiss National Science Foundation (SNF) within the R’Equip programme (project number 206021_177033).

Selected crystallographic data are presented in Table S1-S4 and full details in cif format can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.uk/data_request/cif.

Figure S 29 Crystal structure of 3e, ellipsoids are rendered with 50% probability. Hydrogen atoms and disordered components in THF are omitted, carbon atoms of Aryl and THF fragments are drawn as wireframe for clarity. Selected bond distances (Å) and angles (°): Zn1-C8 1.9648(16), N1-Zn1 1.9633(13), N2-Zn1 1.9536(14), K1-F1 2.7149(10), K1-O1 2.8946(13), K1-Caryl ranging from 3.1875(17) to 3.5912(16), Si1-N2-Zn1 90.52(6), N2-Zn1-N1 81.58(6), N1-Zn1-C8 129.41(6), N2-Zn1-C8 146.70(6), Si1-N1-Zn1 90.05(6)
Crystal Structure of 3h

**Figure S 30** Crystal structure of anionic moiety of 3h. Hydrogens atoms are omitted and carbon atoms (except for the pentafluoroaryl anion) are drawn as wireframe for clarity. Disorder components of fluorine atoms were omitted for clarity. The asymmetric unit is neutral by the presence of two half K(THF)$_6$ units, where both half occupied K atoms are sitting on a special position (inversion centre and a two fold axis) not shown here. Selected bond distances (Å) and angles (°): N1-Zn1 1.921(4), N2-Zn1 1.988(4), Zn1-C1 1.984(5), Si1-N1-Zn1 40.97(10), Si1-N2-Zn1 40.80(9), N1-Zn1-N2 81.75(16), N1-Zn1-C1 141.5(2), N2-Zn1-C1 135.1(2)

Crystal Structure of 3j

**Figure S 31** Crystal structure of 3j. Ellipsoids are rendered with 50% probability. Hydrogen atoms and disordered components in THF, iPr group and phenyl are omitted, carbon atoms of Ar (except for the tetrafluoro dianion) and THF fragments are drawn as wire frames for clarity. Symmetry transformations used to generate symmetrical atoms: 1-x, 1-y, 1-z. Selected bond distances (Å) and angles (°): N1-Zn1 1.9872(14), N2-Zn1 1.9474(14), Zn1-C1 1.9689(17), K1-F2 2.6792(13), K1-C$_{Ar}$-ranging from 3.080(2) to 3.2702(19), Si1-N1-Zn1 90.03(6), Si1-N2-Zn1 91.66(6), N1-Zn1-N2 81.12(6), N1-Zn1-C1 139.39(6), N2-Zn1-C1 138.88(7)
Crystal Structure of 4

**Figure S 32** Crystal structure of 4. Ellipsoids are rendered with 50% probability. Hydrogen atoms and disordered components in THF are omitted, and carbon atoms of Aryl and THF fragments are drawn as wire frames for clarity. Symmetry transformations used to generate symmetrical atoms: I: 1+x, y, z; II: 1-x, 1-y, 1-z; III: -1+x, y, z. Selected bond distances (Å) and angles (°): N1-Zn1 1.940(2), Zn1-C39 2.022(3), Zn1-C45 2.033(3), K1-F ranging from 2.681(3) to 3.436(3), K1-CAr ranging from 3.061(3) to 3.536(3), N1-Zn1-C39 123.11(11), N1-Zn1-C45 120.01(11), C39-Zn1-C45 116.69(12).

**Figure S 33** Polymeric structure of 4. Ellipsoids are rendered with 50% probability. Hydrogen atoms and disordered components in THF are omitted, fluorine and carbon atoms are drawn as wire frames for clarity. Symmetry transformations used to generate symmetrical atoms: 1-x, 1-y, -z; 1+x, y, z; 1-x, 1-y, 1-z; -x, 1-y, -z; x, y, 1+z; 2-x, 1-y, -z; 1+x, y, 1+z.
