Representation of \((p, q)\)-Bernstein polynomials in terms of \((p, q)\)-Jacobi polynomials

F Soleyman¹, I Area²*, M Masjed-Jamei¹ and JJ Nieto³

Abstract
A representation of \((p, q)\)-Bernstein polynomials in terms of \((p, q)\)-Jacobi polynomials is obtained.

MSC: Primary 34B24; secondary 39A70

Keywords: \((p, q)\)-Bernstein polynomials; \((p, q)\)-Pearson difference equation; \((p, q)\)-orthogonal solutions; \((p, q)\)-difference operator

1 Introduction
Classical univariate Bernstein polynomials were introduced by Bernstein in a constructive proof for the Stone-Weierstrass approximation theorem [1], and they are defined as [2]

\[ b_n^i(x) = \binom{n}{i} x^i (1 - x)^{n-i}, \quad i = 0, 1, \ldots, n. \]

They form a basis of polynomials and satisfy a number of important properties as non-negativity \((b_n^i(x) \geq 0 \text{ for } 0 \leq x \leq 1)\), partition of unity \((\sum_{i=0}^{n} b_n^i(x) = 1)\) or symmetry \((b_n^i(x) = b_n^{n-i}(1 - x))\).

For a given real-valued defined and bounded function \(f\) on the interval \([0, 1]\), the \(n\)th Bernstein polynomial for \(f\) is

\[ B_n(f)(x) = \sum_{k=0}^{n} b_n^k(x)f\left(\frac{k}{n}\right). \]

Then, for each point \(x\) of continuity of \(f\), we have \(B_n(f)(x) \to f(x)\) as \(n \to \infty\). Moreover, if \(f\) is continuous on \([0, 1]\) then \(B_n(f)\) converges uniformly to \(f\) as \(n \to \infty\). Also, for each point \(x\) of differentiability of \(f\), we have \(B_n'(f)(x) \to f'(x)\) as \(n \to \infty\) and if \(f\) is continuously differentiable on \([0, 1]\) then \(B_n'(f)\) converges to \(f'\) uniformly as \(n \to \infty\).

Bernstein polynomials have been generalized in the framework of \(q\)-calculus. More precisely, Lupaş [3] initiated the application of \(q\)-calculus in area of the approximation theory, and introduced the \(q\)-Bernstein polynomials. Later on, Philips [4] proposed and studied other \(q\)-Bernstein polynomials. In both the classical case and in its \(q\)-analogs, expansions

of Bernstein polynomials have been obtained in terms of appropriate orthogonal bases [5, 6].

Mursaleen et al. [7] recently introduced first the concept of \((p, q)\)-calculus in approximation theory and studied the \((p, q)\)-analogue of Bernstein operators. The approximation properties for these operators based on Korovkin’s theorem and some direct theorems were considered [8]. Also, many well-known approximation operators have been introduced using these techniques, such as Bleimann-Butzer-Hahn operators [9] and Szász-Mirakyan operators [10]. Very recently Milovanović et al. [11] considered a \((p, q)\)-analogue of the beta operators and using it proposed an integral modification of the generalized Bernstein polynomials. \((p, q)\)-analogs of classical orthogonal polynomials have been characterized in [12].

The main aim of this work is to obtain a representation of \((p, q)\)-Bernstein polynomials in terms of suitable \((p, q)\)-orthogonal polynomials, where the connection coefficients are proved to satisfy a three-term recurrence relation. For this purpose, we have divided the work in two sections. First, we present the basic definitions and notations. Later, in Section 3 we obtain the main results of this work relating \((p, q)\)-Bernstein polynomials and \((p, q)\)-Jacobi orthogonal polynomials.

2 Basic definitions and notations

Next, we summarize the basic definitions and results which can be found in [13–18] and the references therein.

The \((p, q)\)-power is defined as

\[
((a, b); (p, q))_r = \prod_{j=0}^{k-1} (ap^j - bq^j) \quad \text{with } ((a, b); (p, q))_0 = 1. \tag{1}
\]

The \((p, q)\)-hypergeometric series is defined as

\[
\Phi_r \left( \begin{array}{c}
(a_1, a_{1q}), \ldots, (a_r, a_{rq}) \\
(b_1, b_{1q}), \ldots, (b_r, b_{rq})
\end{array} \middle| (p, q); z \right)
= \sum_{j=0}^{\infty} \frac{((a_1, a_{1q}), \ldots, (a_r, a_{rq}); (p, q))_j}{((b_1, b_{1q}), \ldots, (b_r, b_{rq}); (p, q); (p, q))_j} z^j \frac{((-1)^{j} (q/p)^{\frac{r-j}{2}})^{1-r}}, \tag{2}
\]

where

\[
((a_1, a_{1q}), \ldots, (a_r, a_{rq}); (p, q))_j = \prod_{s=1}^{r} ((a_s, a_{sq}); (p, q))_j,
\]

and \(r, s \in \mathbb{Z}_+\) and \(a_1, a_{1q}, \ldots, a_r, a_{rq}, b_1, b_{1q}, \ldots, b_r, b_{rq} \in \mathbb{C}\).

The \((p, q)\)-difference operator is defined as (see e.g. [14])

\[
(D_{p,q}f)(x) = \frac{L_{pq}f(x) - L_{pq}f(0)}{(p-q)x}, \quad x \neq 0, \tag{3}
\]

where the shift operator is defined by

\[
L_{pq}h(x) = h(ax), \tag{4}
\]

and \((D_{p,q})f(0) = f'(0)\), provided that \(f\) is differentiable at 0.
The \((p, q)\)-Bernstein polynomials are defined as

\[
b^n_i(x; p, q) = p^{n-i} \sum_{i=0}^{n} \binom{n}{i} p^i q^{n-i} x^i (1, x; (p, q))_{n-i}.
\] (5)

and can be expanded in the basis \(\{x^k\}_{k \geq 0}\) as

\[
b^n_i(x; p, q) = \sum_{k=0}^{n} (-1)^{k-i} q^{k-\binom{k}{2}} p^{\binom{k}{2}} \binom{n}{i} p^i q^{n-i} x^k.
\] (6)

From the definition of \((p, q)\)-Bernstein polynomials it is possible to derive the basic properties of \((p, q)\)-Bernstein polynomials.

(1) Partition of unity

\[
\sum_{i=0}^{n} b^n_i(x; p, q) = 1.
\]

(2) End-point properties

\[
b^n_0(0; p, q) = \begin{cases} 1, & i = 0, \\ 0, & \text{otherwise}, \end{cases} \quad b^n_1(1; p, q) = \begin{cases} 1, & i = n, \\ 0, & \text{otherwise}. \end{cases}
\]

The \((p, q)\)-Jacobi polynomials are defined by

\[
P_n(x; \alpha, \beta; p, q) = \Phi \left( \begin{pmatrix} (p^{-1}, q^{-1}), (p^\alpha q^{\beta + n}, q^\alpha), (p, q) \end{pmatrix} \left| \frac{xq^{-\alpha}}{p} \right. \right),
\] (7)

and they satisfy the second order \((p, q)\)-difference equation

\[
\frac{q(xq - p)}{p^2} \left( D_{p,q}^2 y \right)(x) + \left( x(p^{\alpha+2} q^{-\alpha + \beta - q^2} - p^{\beta+2} q^\alpha + pq) p^2(p - q) \right) \nabla_p \left( \frac{q(xq - p)}{p^2} \left( D_{p,q} y \right)(x) \right)
\]

\[
+ [n]_{p,q} \left( \frac{q p^{\alpha+1} q^{-\alpha + \beta} - p^{\beta+1} q^\alpha \beta}{p - q} \right) \nabla_{p,q} y(x) = 0.
\] (8)

The \((p, q)\)-Jacobi polynomials satisfy the three-term recurrence relation

\[
P_0(x; \alpha, \beta; p, q) = 1, \quad P_1(x; \alpha, \beta; p, q) = x - B_0(\alpha, \beta; p, q),
\]

\[
P_{n+1}(x; \alpha, \beta; p, q) = (x - B_n(\alpha, \beta; p, q)) P_n(x; \alpha, \beta; p, q) - C_n(\alpha, \beta; p, q) P_{n-1}(x; \alpha, \beta; p, q),
\]

where

\[
B_n(\alpha, \beta; p, q) = \frac{p^{\beta+2} q^{\alpha+1}}{(p - q)^2 \alpha + \beta + 2n \alpha + \beta + 2n + 2]_{p,q}}
\]

\[
\times \left( \left( p^\alpha + q^\beta \right)^{\alpha + \beta + 2n} - (p + q) \alpha \right) p^\beta q^{\alpha + \beta + 2n + 1}
\]

\[
+ \left( p^\alpha + q^\beta \right) p^\beta q^{\alpha + \beta + 2n + 1}
\] (9).
and
\[ C_n(x, \alpha, \beta; p, q) = \frac{p^{\beta+2n+1} q^{2n+\beta+2n+1} [n]_{p,q} [\alpha + n]_{p,q} [\beta + n]_{p,q} [\alpha + \beta + n]_{p,q}}{[\alpha + \beta + 2n - 1]_{p,q} ([\alpha + \beta + 2n]_{p,q})^2 [\alpha + \beta + 2n + 1]_{p,q}}. \] (10)

3 Representation of \((p, q)\)-Bernstein polynomials in terms of \((p, q)\)-Jacobi polynomials

**Lemma 3.1** The \((p, q)\)-Bernstein polynomials satisfy the following first order \((p, q)\)-difference equation:
\[(px - 1)x(D_{p,q} b^n)(x; p, q) + \left(-p^{1-\alpha}[n]_{p,q} x + p^{-1}[i]_{p,q}\right) b^n(px; p, q) = 0. \] (11)

**Proof** The result can be obtained by equating the coefficients in \(x^i\).

If we introduce the first order \((p, q)\)-difference operator
\[ L_{i,n} = (px - 1)x D_{p,q} + \left(-p^{1-\alpha}[n]_{p,q} x + p^{-1}[i]_{p,q}\right) \mathcal{L}_p, \] (12)
then
\[ L_{i,n} b^n(x; p, q) = 0. \]

**Lemma 3.2** The \((p, q)\)-Jacobi polynomials satisfy the following structure relation:
\[ x(px - 1) D_{p,q} (P_n(p^2 x; \alpha, \beta; p, q)) = [n]_{p,q} p^{n-2} P_{n+1}(p^3 x; \alpha, \beta; p, q) + \omega_1(n) P_n(p^3 x; \alpha, \beta; p, q) + \omega_2(n) P_{n+1}(p^3 x; \alpha, \beta; p, q), \] (13)
where
\[ \omega_1(n) = \frac{[n]_{p,q} (-p + q) a^{\alpha+\beta+2n+1} + q^{\alpha+\beta+2n+1} + q^{\alpha+\beta+2n+1}) [\alpha + \beta + n + 1]_{p,q}}{(p - q) [\alpha + \beta + 2n + 1]_{p,q}}, \]
\[ \omega_2(n) = \frac{q^{\alpha+\beta+2n+1} [n]_{p,q} [\alpha + n]_{p,q} [\beta + n]_{p,q} [\alpha + \beta + n + 1]_{p,q}}{[\alpha + \beta + 2n - 1]_{p,q} ([\alpha + \beta + 2n]_{p,q})^2 [\alpha + \beta + 2n + 1]_{p,q}}. \]

**Proof** The result follows from (7) by equating the coefficients in \(x^i\).

**Theorem 3.1** The \((p, q)\)-Bernstein polynomials defined in (5) have the following representation in terms of \((p, q)\)-Jacobi polynomials defined in (17):
\[ b^n(x; p, q) = \sum_{k=0}^{n} H_k(i, n; \alpha, \beta; p, q) P_k(p^2 x; \alpha, \beta; p, q), \] (14)
where the connection coefficients \(H_k(i, n; \alpha, \beta; p, q)\) satisfy the following three-term recurrence relation:
\[ H_{k-1}(i, n; \alpha, \beta; p, q) \Lambda_1(k - 1, i, n; \alpha, \beta; p, q) + H_k(i, n; \alpha, \beta; p, q) \Lambda_2(k, i, n; \alpha, \beta; p, q) + H_{k+1}(i, n; \alpha, \beta; p, q) \Lambda_3(k + 1, i, n; \alpha, \beta; p, q) = 0, \] (15)
valid for \(1 \leq k \leq n - 1\) with initial conditions

\[
H_{n+1}(i, n; \alpha, \beta; p, q) = 0, \quad (16)
\]

\[
H_k(i, n; \alpha, \beta; p, q) = (-1)^{n+1} q^{-1/2(k+1)/2} \sum_{i=0}^{n} \left[ \frac{n}{p, q} \right], \quad (17)
\]

and

\[
\begin{align*}
\Lambda_1(k, i, n; \alpha, \beta; p, q) & = p^{-k-2}[k]_{p, q} - p^{n-2}[n]_{p, q}, \\
\Lambda_2(k, i, n; \alpha, \beta; p, q) & = p^{-i}[i]_{p, q} - p^{2-n}[n]_{p, q} B_k(\alpha, \beta; p, q) + \omega_1(k), \\
\Lambda_3(k, i, n; \alpha, \beta; p, q) & = -p^{-n-2}[n]_{p, q} C_k(\alpha, \beta; p, q) + \omega_2(k).
\end{align*}
\]

**Proof** In order to obtain the result we shall apply the so-called Navima algorithm (see e.g. [19, 20] and the references therein) for solving connection problems. If we apply the first order linear operator \(L_{i,n}\) defined in (12) to both sides of (14) we have

\[
0 = \sum_{k=0}^{n} H_k(i, n; \alpha, \beta; p, q)L_{i,n} P_k(p^2 x; \alpha, \beta; p, q)
\]

\[
= \sum_{k=0}^{n} H_k(i, n; \alpha, \beta; p, q)((px - 1)x D_{p, q}(P_k(p^2 x; \alpha, \beta; p, q))
\]

\[
+ (-p^{-n}[n]_{p, q} x + p^{-1}[i]_{p, q}) P_k(p^3 x; \alpha, \beta; p, q)).
\]

From the three-term recurrence relation for \((p, q)\)-Jacobi polynomials it yields

\[
(-p^{-n}[n]_{p, q} x + p^{-1}[i]_{p, q}) P_k(p^3 x; \alpha, \beta; p, q)
\]

\[
= -p^{n-2}[n]_{p, q} P_{k+1}(p^3 x; \alpha, \beta; p, q)
\]

\[
+ p^{2-n-i}(-p^{n+2}[i]_{p, q} + p^{n}[n]_{p, q} B_k(\alpha, \beta; p, q)) P_k(p^3 x; \alpha, \beta; p, q)
\]

\[
- p^{-n-2}[n]_{p, q} C_k(\alpha, \beta; p, q) P_{k-1}(p^3 x; \alpha, \beta; p, q).
\]

Therefore, by using the structure relation for \((p, q)\)-Jacobi polynomials (13) we have

\[
(px - 1)x D_{p, q}(P_k(p^2 x; \alpha, \beta; p, q)) + (-p^{n+2}[n]_{p, q} x + p^{-1}[i]_{p, q}) P_k(p^3 x; \alpha, \beta; p, q)
\]

\[
= \Lambda_1(k, i, n; \alpha, \beta; p, q) P_{k+1}(p^3 x; \alpha, \beta; p, q) + \Lambda_2(k, i, n; \alpha, \beta; p, q) P_k(p^3 x; \alpha, \beta; p, q)
\]

\[
+ \Lambda_3(k, i, n; \alpha, \beta; p, q) P_{k-1}(p^3 x; \alpha, \beta; p, q),
\]

where \(\Lambda_i(k, i, n; \alpha, \beta; p, q)\) are given in (18).

As a consequence,

\[
0 = \sum_{k=0}^{n} H_k(i, n; \alpha, \beta; p, q)(\Lambda_1(k, i, n; \alpha, \beta; p, q) P_{k+1}(p^3 x; \alpha, \beta; p, q)
\]

\[
+ \Lambda_2(k, i, n; \alpha, \beta; p, q) P_k(p^3 x; \alpha, \beta; p, q) + \Lambda_3(k, i, n; \alpha, \beta; p, q) P_{k-1}(p^3 x; \alpha, \beta; p, q)).
\]
By using the linear independence of \( \{P_k(p^k;\alpha,\beta;p,q)\} \) we obtain the three-term recurrence relation (15) for the connection coefficients \( H_k(i,n;\alpha,\beta;p,q) \), where the initial conditions are obtained by equating the highest power in \( x^k \).

4 Conclusions

In this work we have obtained a three-term recurrence relation for the coefficients in the expansion of \((p,q)\)-Bernstein polynomials in terms of \((p,q)\)-Jacobi polynomials. For our purposes some auxiliary results both for \((p,q)\)-Bernstein polynomials and \((p,q)\)-Jacobi polynomials have been derived.
