Abstract

New synonymies and new combinations are proposed, based mainly on the study of type materials. They are as follows: Helina sarmentosa Fang & Fan, 1993 = H. dianica Qian & Feng, 2005, syn. n.; Helina dianxia Xue and Li, 2002 = H. aureolicolorata Feng & Xue, 2002, syn. n.; Myospila lenticeps (Thomson, 1869) = H. magnimaculata Feng, 1995, syn. n.; Spiogona angulisurstyla (Xue & Xiang, 1998), comb. n.; Spiogona apicicauda (Xue, Wang & Tong, 2003), comb. n.; Hebecnema arcuatiabdomina (Feng & Fan, 2001), comb. n.

Keywords

New synonymies, new combinations, Helina, Myospila, Spiogona, Hebecnema, Muscidae

Introduction

The genus Helina Robineau-Desvoidy, 1830 is the second largest genus in the dipteran family Muscidae. It occurs in all zoogeographic regions of the world and comprises over 520 species (Pont 1980, 1986, Carvalho et al. 2005, Wang et al. 2008). According to present data, over 230 species of Helina have been found in China (Xue and Chao 1998, Xue et al. 2005, Wang et al. 2004, 2005a, 2005b, 2006a, 2006b, 2008). Early taxonomists, like Stein (1907, 1915), studied Helina from Taiwan and Northwest China, which formed the basis for further research on this genus in the Chinese fauna. Further impetus was provided by Emden’s (1965) work on Muscidae for the Fauna of India series. The major references dealing with Chinese Helina are Hennig
Helina includes so many species that it is an intimidating task to undertake research on, or even to identify the species correctly. Furthermore, many specialists consider that Helina is a “catch-all” repository for species that cannot be assigned elsewhere (Hennig 1965, Wang et al. 2008). The genus needs to be fully revised. In this paper, new synonymies and new combinations are proposed, based mainly on the study of type materials.

Material and methods

This study has been based on materials from the following museums:

IESNU Institute of Entomology, Shenyang Normal University, Shenyang, Liaoning Province, China
IMEAMMS Institute of Microbiology and Epidemiology, Academy of Military Medical Sciences, Beijing, China
IZCAS Institute of Zoology, Chinese Academy of Sciences, Beijing, China
SEMCAS Shanghai Entomological Museum, Chinese Academy of Sciences, Shanghai, China

Morphological terms follow McAlpine (1981), except the “postpedicel” and “prealar setae” follows Stuckenberg (1999) and Fan (1992), respectively. Absolute measurements are used for body length in millimeters (mm). The following abbreviations are used in this article: acr: acrostichal setae; dc: dorsocentral setae; ia: intra-alar setae; pra: prealar setae; ad: anterodorsal setae; av: anteroventral setae; p: posterior setae and pv: posteroventral setae.

Taxonomy

Helina sarmentosa Fang & Fan, 1993
http://species-id.net/wiki/Helina_sarmentosa

Helina sarmentosa Fang & Fan, 1993: 1239; Xue and Chao 1998: 2283; Wang et al. 2004: 297; Xue et al. 2005: 40; Xue and Wang 2006: 178.

Helina dianica Qian & Feng, 2005: 260. Syn. n.

Redescription. MALE. Body length 8.5–9.5mm. Eye with dense and long hairs; frons about 1.3–2.0 times as wide as the width of anterior ocellus; frontal setae reaching ocellar triangle; fronto-orbital plate and parafacial with silveryish-grey pollinosity; parafacial bare, about 1.5–2.0 times as wide as postpedicel; antenna black, postpedicel about
2.6–3.0 times as long as broad, about 1.8 times as long as pedicel, arista plumose, the
longest hair about equal or slightly longer than postpedicel width; gena and postgena
with black hairs, gena with 5 rows of subvibrissal setae in anterior margin, genal height
about 2/5 times of eye height; proboscis stout, prementum about 2.0 times as long
as height; palpus black, slightly flat in distal half. Thorax ground-color black, scutum
with four dark vittae in posterior view, acr 0+1, 9 rows of irregular fine setae between
two dc rows, dc 2+4, ia 0+2, pra absent; anepisternum with hairs around anepisternal
setae, meron with hairs around the lower margin of posterior spiracle, scutellum with
black hairs in the lateral margin; basisternum, proepisternum, anepimeron, katepimer-
on bare; katepisternal setae 2+2, spiracles dark brown. Wing hyaline, brownish, with
heavier color in the basal part and around veins; costal spine inconspicuous, radial
node bare; veins R_{4+5} and M conspicuously diverging distally, crossveins r-m and dm-cu
lightly clouded, crossvein m-m sinuate; calypteres yellowish; halteres brownish-yellow.
Legs black; fore tibia with 2–4 p; basal half of mid femur with row of 8–10 pv (stout
towards distally), distal half with 2 or 3 slender setae, mid tibia with 1 or 2 ad and 6 or
7 developed p, the length of longest seta about 3/5 of width of tibia; hind coxa bare on
rear surface, hind femur with 5–7 strong setae on distal half, hind tibia with 7–10 av,
3–5 developed ad and 6–9 p. Abdomen ground-color black, with dense greyish-blue
pollinosity, tergites 2 to 4 with one large dark lateral patch on each side, tergites 4 and 5
with posterior marginal setae, tergite 5 with irregular discal setae, sternite 1 with hairs.

**FEMALE.** Unknown.

**Remarks.** Both *Helina sarmentosa* and *H. dianica* can be easily separated from the
other *Helina* species by mid and hind tibiae with very long and stout setae. Having
examined the holotypes of both nominal species, we were unable to find differences
justifying their separation, which has led us to consider all the examined specimens to
be conspecific. Therefore, we synonymized *H. dianica* under *H. sarmentosa*.

**Material studied.** Holotype of *Helina sarmentosa*, ♂: China: Yunnan, Deqin,
Mt. Meili, alt. 4,300–4,680m a.s.l., 29.VII.1982, Coll. H.C. Cai (IZCAS); paratype of
*H. sarmentosa*, ♂: China: Yunnan, Deqin, Mt. Meili, alt. 4,300–4,680m a.s.l.,
28.VII.1982, Coll. X.Z. Zhang (SEMCAS). Holotype of *Helina dianica*, ♂: China:
Yunnan, Deqin, alt. 2,400m a.s.l., 29.VII.1991, Coll. unknown (IMEAMMS).

**Distribution.** China (Yunnan).

*Helina dianxiia* Xue & Li, 2002

http://species-id.net/wiki/Helina_dianxiia

*Helina dianxiia* Xue & Li, 2002: 78; Xue et al. 2005: 39; Xue and Wang 2006: 173.

*Helina aureolicolorata* Feng & Xue, 2002: 261; Xue et al. 2005: 39; Xue and Wang
2006: 172. **Syn. n.**

**Remarks.** The holotype of *H. dianxiia* is almost identical to *H. aureolicolorata*. The
only difference between these two species is that the body color of *H. dianxiia* is darker
than *H. aureolicolorata*. *Helina dianxiiia* and *H. aureolicolorata* are synonymized here because the two holotypes of these two nominal species characters are surprisingly consistent and genitalia are identical. Therefore, we synonymized *H. aureolicolorata* under *H. dianxiiia*.

**Material studied.** Holotype of *H. dianxiiia*, ♂: China: Yunnan, Lushui, alt. 2,000m a.s.l., 26.V.1992, Coll. F.H. Li (IESNU). Holotype of *H. aureolicolorata*, ♂: China: Sichuan, Ya’an, Mt. Zhougong, alt. 1,700m a.s.l., 24.VI.1985, Coll. Y. Feng (IMEAMMS).

**Distribution.** China (Sichuan, Yunnan).

*Myospila lenticeps* (Thomson, 1869)
http://species-id.net/wiki/Myospila_lenticeps

*Helina magnimaculata* Feng in Deng and Feng, 1995: 140; Xue et al. 2005: 39; Xue and Wang 2006: 176. **Syn. n.**

**Remarks.** There are more than fifty species of the genus *Myospila* found in China. The species *magnimaculata*, previously assigned to *Helina*, is in my opinion a *Myospila* due to the following characters: vein M distinctly curved forward at tip; cerci slender and the morphology of genitalia. At the same time, I consider it to be a synonym of *M. lenticeps* for these other reasons: scutum with 4 dc; costal spine short but distinct; most part of thorax brown with dense light yellow pollinosity and vein R 4+5 with fine hairs on the basal part in ventral view. Consequently, *H. magnimaculata* is a new subjective junior synonym of *M. lenticeps*.

**Distribution.** China (Guangdong, Guizhou, Hunan, Sichuan, Taiwan, Yunnan); Japan; Sri Lanka; India; Indonesia; Malaysia; Philippines; Thailand; Nepal; Kiribati (Christmas Island); Madagascar; Principe.

*Spilogona angulisurstyla* (Xue & Xiang, 1998), **comb. n.**
http://species-id.net/wiki/Spilogona_angulisurstyla

*Helina angulisurstyla* Xue & Xiang in Xue and Chao 1998: 1126; Xue et al. 2005: 45; Xue and Wang 2006: 171.

**Material studied.** Paratype, ♂: China: Xinjiang, Dong Kunlun, Kaerdong, alt. 4,300m a.s.l., 11.VII.1984, Coll. C.Q. Xiang (IESNU); paratype, ♂: China: Xinjiang, Hejing, alt. 3,000–3,500m a.s.l., 31.VII.1958, Coll. C.Q. Li (IZCAS).

**Remarks.** *Helina angulisurstyla* was described by Xue and Xiang in Xue and Chao (1998) and can be easily distinguished from other *Helina* species by the slightly shortened arista, *pra* absent, katepisternal setae 1+1, veins R 4+5 and M not diverging distally, abdomen with trapezoid patches, sternite 1 bare, sternite 5 broad and short, cerci long.
and distal sharpened, surstyli not expanded distally but sharp in lateral view. However, these diagnostic characters are practically identical with the generic characters of *Spilogona*. Our analysis of the paratypes of *H. angulisurstyla* revealed a similar external morphology; especially the male genital structures with species in the genus *Spilogona*. Consequently, we suggest the following new combination: *Spilogona angulisurstyla*.

**Distribution.** China (Xinjiang).

*Spilogona apicicauda* (Xue, Wang & Tong, 2003), comb. n.
http://species-id.net/wiki/Spilogona_apicicauda

*Helina apicicauda* Xue, Wang & Tong, 2003: 754; Xue and Wang 2006: 171.

**Material studied.** Holotype, ♂: China: Qinghai, Yushu, Batang, alt. 4,200–4,500m a.s.l., 15.VI.1964, Coll. S.Y. Wang (IZCAS).

**Remarks.** Diagnostic characteristics (arista short; pra absent; katepisternal setae 1+2; costa with distinct comb-like rows on the front margin, vein m-m straight; mid tibia with 2 ad and 2 p; tergites 3 and 4 with one pair dark patches, sternite 1 bare; surstyli slender, the lateral margin of cerci curved in distal half, apical of cerci sharp, sternite 5 broad and short) of the holotype indicate that it belongs to *Spilogona*.

**Distribution.** China (Qinghai).

*Hebecnema arcuatiabdomina* (Feng & Fan, 2001), comb. n.
http://species-id.net/wiki/Hebecnema_arcuatiabdomina

*Helina arcuatiabdomina* Feng & Fan, 2001: 188; Xue et al. 2005: 47; Xue and Wang 2006: 171.

**Description.** (Translated from Feng and Fan 2001.) MALE. Body length about 7.0mm. Eye bare, upper part slightly flattened, facets obviously expanded on anterior margin in upper part, frons at its narrowest point about 1/3 of the width of anterior ocellus, lower half of fronto-orbital plate with 3 frontal setae; ocelli mound-like; parafacial about half as wide as postpedicel; antennal scape and pedicel black, brown distally, postpedicel 2.5 times as long as broad, arista short plumose, the longest hairs slightly shorter than half of postpedicel width; face distally slightly raised, upper part with a flat facial ridge; gena and postgena with black hairs, front gena with subvibrissal setae into 2 rows, genal height about 1/10 of the eye height; prementum about as long as high; palpus dark. Thorax with thin greyish blue pollinosity, scutum without distinct longitudinal stripes, acr 3+5 (prescutellar acr short), dc 2+4, ia 0+2, pra absent; lateral and lower margins of scutellum bare; basisternum, notopleuron, meron, katepimeron and metanepisternum bare; spiracle dark brown, half-open; proepisternal setae 2, proepimeral setae 2, katepisternal setae 1+2. Tegula blackish-brown, basicosta brownish-yellow, costal spine incon-
spicuous; node of Rs bare, crossveins without a cloudy appearance, veins R₄,₅ and M slightly diverging in distal part; calypteres brownish, halteres dark reddish-brown. Coxae and trochanterers brownish-yellow; femora and tibiae brownish-yellow, tarsi black, distal part of tarsi with yellow rings; fore tibia without p; basal third of mid femur with 4 pv (short and stout distally), mid tibia with 3 p, distally with 1 p; hind coxa bare on posterior surface, hind femur with complete rows of av and p, 1 av distally. Abdomen slightly dark yellow, with thin pollinosity, without distinct stripes and round patches, syntergite 1+2, tergites 3 and 4 with narrow posterior marginal stripes, tergites 3 to 5 with median marginal setae; tergite 6 and sternite 1 bare, sternites 2 and 3 square-shaped.

FEMALE. Unknown.

Remarks. The genus Hebecnema Schnabl, 1889 resembles the genus Helina but differs from it by the following characters: abdomen always without paired spots; fronto-orbital plate narrow, always narrower than antenna width; head in lateral view slightly flat on upper part; surstyli always slender.

According to the original descriptions and illustrations of H. arcuatiaabdomina given by Feng and Fan (2001), we can confirm that this species belongs to Hebecnema.

Distribution. China (Sichuan).

Acknowledgements

I’m very grateful to Mr. Yan Feng (The Center for Disease Control and Prevention of Ya’an Municipal, Sichuan Province, China), who gave me invaluable help and extend my heartfelt gratitude to Drs. Jie Wu, Wei-bing Zhu and Xian-wei Liu (Shanghai Entomological Museum, Chinese Academy of Sciences, Shanghai, China); Prof. Ge-xia Qiao, Prof. Jun Chen, and Dr. Li-li Zhang (Institute of Zoology, Chinese Academy of Sciences, Beijing, China); Prof. Rong-man Xu (Institute of Microbiology and Epidemiology, Academy of Military Medical Sciences, Beijing, China) who gave us invaluable help with this study. I’m also extremely thankful to two anonymous reviewers for their constructive comments on the manuscript and Ms. April Gloury (University of Melbourne, Melbourne, Australia) for her assistance in proofreading of the manuscript. This study is supported by the National Nature Science Foundation of China (Grants No. 31071957, No. 31272347 and No. 30770252).
