Asperivones A and B, Two New Flavones from a Gorgonian-Derived *Aspergillus candidus* Fungus

**Abstract**

Two new flavones, asperivones A (1) and B (2), were isolated from the fungus *Aspergillus candidus* cultured from the gorgonian coral *Anthogorgia ochracea* collected from the South China Sea. The structures of 1 and 2 were elucidated by NMR and MS methods and comparison with related known compounds. Only 2 showed slight inhibitory activity against alpha-glucosidase with an IC$_{50}$ value of 244 µg/mL. Compounds 1 and 2 were also evaluated for their cytotoxic and antibacterial activities.

**Keywords:** *Aspergillus candidus*, gorgonian coral, flavone, alpha-glucosidase

Experimental section

1.1. General experimental procedures

NMR spectra were recorded on a JEOL JEM-ECP NMR spectrometer (500 MHz for $^1$H and 125 MHz for $^{13}$C), using TMS as internal standard. The ESIMS was obtained from a Thermo MAT95XP High Resolution mass spectrometer. The HRESIMS was tested by UPLC-MS which was performed on a Waters ACQUITY UPLC H-Class system using a C$_{18}$ (ACQUITY UPLC, 1.7μm, 2.1×50 mm, 0.5 mL/min) column coupled with a Waters ACQUITY UPLC PDA and eλ PDA detector. Semi-preparative HPLC was performed on an Hitachi L-2000 system using a C$_{18}$ column [HPLC (Kromasil 250 × 10 mm, 5 μm, 2.0 mL/min)]. Silica gel (Qing Dao Hai Yang Chemical Group Co.; 200–300 mesh), octadecylsilyl silica gel (Unicorn; 45–60 μm), and Sephadex LH-20 (GE Healthcare) were used for column chromatography (CC). Precoated silica gel plates (Yan Tai Zhi Fu Chemical Group Co.; G60, F-254) were used for thin layer chromatography.

1.2. Fungus material and culture conditions

The fungus *Aspergillus candidus* RA16-10 with the Genbank (NCBI) accession number KU877713 was cultured from a gorgonian *Anthogorgia ochracea* (GX-BH-WZ-16) collected from the Weizhou coral reefs in the South China Sea in 2011. The strain was deposited at the Key Laboratory of Marine Drugs, the Ministry of Education of China, School of Medicine and Pharmacy, Ocean University of China, Qingdao, PR China. The fungus was grown stationary on sea water-added rice solid medium (fifty 1000 mL Erlenmeyer flasks, each containing 50 g of rice and 50 mL of sea water) at room temperature for 2 months.

1.3. Extraction and isolation

After 2 months of cultivation, the fermented rice substrate was extracted for three times with EtOAc to give an organic extract (12 g). The organic extract was eluted by a gradient of petroleum ether/EtOAc to EtOAc, and then MeOH to afford five fractions (Fr.1–Fr.5). Fr.3 was subjected to Sephadex LH-20 gel column chromatography (petroleum ether: chloroform: methanol = 2: 1: 1) and reverse phase silica gel column chromatography to get three components (Fr. 31, Fr. 32, Fr. 33). Then Fr. 33 was purified by semi-preparation HPLC (60:40 MeOH–H$_2$O, 2 mL/min)
to give compound 1 (6.5 mg) and compound 2 (5.8 mg).

Aspergivones A (1):
C_{19}H_{17}O_{7}Cl, Yellowish powder. $^1$H NMR (500 MHz, CDCl$_3$): 8.35 (1H, s, OH-2’), 7.69 (1H, d, $J$ = 7.0 Hz, H-6’), 7.56 (1H, d, $J$ = 6.8 Hz, H-4’), 7.04 (1H, t, $J$ = 6.7 Hz, H-5’), 6.44 (1H, s, H-6), 4.00 (3H, s, MeO-5 and MeO-7), 3.91 (3H, s, MeO-3). 3.86 (3H, s, MeO-8). $^{13}$C NMR (125 MHz, CDCl$_3$): 172.9 (C-4), 156.8 (C-7), 156.5 (C-5), 151.6 (C-2), 151.4 (C-8a), 151.0 (C-2’), 139.6 (C-3), 132.8 (C-4’), 130.6 (C-8), 128.3 (C-6’), 124.1 (C-3’), 121.0 (C-5’), 119.9 (C-1’), 109.1 (C-4a), 92.6 (C-6), 62.0 (CH$_3$, MeO-3). 61.6 (CH$_3$, MeO-8), 56.5 (CH$_3$, MeO-7), 56.3 (CH$_3$, MeO-5). ESIMS $m/z$ 393.1 [M + H]$^+$. HRESIMS $m/z$ 393.0736 [M + H]$^+$ (calcd for C$_{19}$H$_{18}$ClO$_7$, 393.0736).

Aspergivones B (2):
C$_{19}$H$_{18}$O$_7$, Yellowish powder. $^1$H NMR (500 MHz, CDCl$_3$): 8.04 (1H, s, OH-2’), 7.70 (1H, d, $J$ = 8.1 Hz, H-6’), 7.35 (1H, t, $J$ = 7.7 Hz, H-3’), 7.04 (2H, m, H-4’ and H-5’), 6.34 (1H, s, H-6), 3.90 (3H, s, MeO-5 and MeO-7), 3.78 (3H, s, MeO-8 and MeO-3). $^{13}$C NMR (125 MHz, CDCl$_3$): 173.3 (C-4), 157.1 (C-7), 156.9 (C-5), 155.6 (C-2), 153.0 (C-2’), 152.0 (C-8a), 139.6 (C-3), 133.3 (C-4’), 130.8 (C-8), 129.8 (C-6’), 121.1 (C-3’), 119.9 (C-5’), 118.5 (C-1’), 109.5 (C-4a), 92.7 (C-6), 62.3 (CH$_3$, MeO-3). 62.0 (CH$_3$, MeO-8), 57.0 (CH$_3$, MeO-7), 56.0 (CH$_3$, MeO-5). ESIMS $m/z$ 359.02 [M + H]$^+$, 739.16 [2M + Na]$^+$.

1.4. Bioactivity assays

1.4.1. Alpha-glucosidase Assays
Compounds 1 and 2 were assayed in vitro for alpha-glucosidase inhibiting activity. With deoxynojirimycin, acarbose, migltol as three positive controls. Alpha-glucosidase inhibition was determined spectrophotometrically using $\alpha$-D pyran glycosidase (PNPG) as substrate by classical enzyme inhibitors in vitro screening method (Yeh et al. 2003; Van et al. 2005). PNPG is maltose analogues, after alpha-glucosidase added, which will show yellow on nitrophenol and can be directly used in the detection of spectrophotometer. The result showed that 2 has a slight activity with IC$_{50}$ values of 244 $\mu$g/mL (deoxynojirimycin, IC$_{50}$ = 42.40 $\mu$g/mL; acarbose, IC$_{50}$ = 457 $\mu$g/mL; migltol, IC$_{50}$ > 500 $\mu$g/mL). 1 only showed 30% inhibitory rate at the concentration of 100 $\mu$g/mL.

1.4.2. Cytotoxic Assays
The cytotoxic activities were evaluated against the leukemia (K562), colon cancer
(HCT-116), cervical cancer (HeLa), non-small cell lung cancer (A549), human breast cancer (MCF-7), human pancreatic cancer (BXPC-3) cell lines with adriamycin as a positive control. Cells in the logarithmic phase (approximately $5 \times 10^4$ cells ml$^{-1}$) were seeded into 96-well plates and maintained at 37 °C overnight in an atmosphere of 10% CO$_2$. Compounds and adriamycin were diluted in DMSO at the indicated concentrations. After 72 h of incubation, 100 µL of neutral red (3-amino-7-dimethylamino-2-methyl-phenazine hydrochloride) medium was added into the 96-well plates and incubated for 2 h, then the OD absorbance was measured in a microplate reader at 540 nm and the IC$_{50}$ values were further calculated.

1.4.3. Antibacterial Assays

The antibacterial activity was evaluated by the conventional broth dilution assay (Pierce et al. 2008). Eight pathogenic bacterial strains, *Bacillus subtilis, Bacillus cereus, Candida albicans, Escherichia coli, Staphylococcus aureus, Staphylococcus epidermidis, Streptococcus hemolyticus* and *Micrococcus luteus* were used, and ciprofloxacin was used as a positive control.
