Received October 22, 2020; revised October 29, 2020; accepted October 30, 2020

Abstract—A series of 1,3-disubstituted ureas containing a lipophilic adamantane moiety tethered to the ureido group by a methylene bridge were synthesized by the reaction of 1-(isocyanatomethyl)adamantane with monohalo- and dihaloanilines in yields of up to 92%. The synthesized ureas are target oriented inhibitors of human soluble epoxide hydrolase (sEH).

Keywords: adamantane, isocyanate, urea, halogen-containing anilines, soluble epoxide hydrolase, sEH

DOI: 10.1134/S1070428021020020

INTRODUCTION

Urea derivatives are known to exhibit broad-spectrum biological activity. For example, ethyl 2-(4-R-1,4-diazepane-1-carboxamido)benzoates are potential antiviral RNA viruses, such as SARS-CoV, HIV-1, and ARVI [2]. Such compounds as 1-(3-chloro-4-methylphenyl)-3-(4-phenylbutan-2-yl)urea, which contain halogenated benzene moieties, are active against Staphylococcus aureus and Klebsiella pneumoniae (Friedlander’s wand). As known, some Klebsiella bacterial strains are fully resistant to antibacterial drugs, as well as to the anthrax causative agent, Bacillus anthracis [3].

Proceeding with the research on the synthesis of soluble epoxide hydrolase (sEH, E.C. 3.3.2.10), an enzyme of the arachidonic cascade enzyme [4–7], involved in the metabolic transformation of epoxy fatty acids to vicinal diols, we performed targeted modification of the lipophilic part of inhibitor molecules. It was found that the separation of the adamantyl from ureido/thioureido group with a methylene bridge enhances the inhibitory activity against sEH by a factor of 2–4, and also has a positive effect on water solubility [8–10].

The choice of the structure of the starting compounds is explained by that they contain both an aromatic fragment, which can enter hydrophobic interactions with the target, and fluorine and chlorine atoms, which are H-bond acceptors. The presence of such groups can ensure additional bonding in the enzyme active site and thus enhance inhibitory activity and affect the water solubility and melting point of the synthesized compounds.

RESULTS AND DISCUSSION

The well-known Curtius synthesis of 1-(isocyanatomethyl)adamantane (3) from (adamantan-1-yl)acetic acid involves the intermediate synthesis of (adamantan-1-yl)acetyl chloride, followed by the reaction of the latter with sodium azide [11]. A significant disadvantage of this method is that it makes use of a toxic thionyl chloride and an explosive sodium azide. Therefore, in this work, isocyanate 3 was synthesized by a one-step procedure using diphenylphosphoryl azide (DPPA) as a source of the acylazido group (Scheme 1).

To this end, we prepared (adamantan-1-yl)acetic acid (2) from 1-bromoadamantane (1) in a yield of 93%. Acid 2 was further treated with equimolar amounts of DPPA...
and Et$_3$N to obtain 1-(isocyanatomethyl)adamantane (3) in a yield of 85%.

Isocyanate 3 was reacted with mono- and dihaloanilines 4a–4o to prepare 1,3-disubstituted ureas 5a–5o (Scheme 2).

The synthesis was performed in dry DMF for 12 h at room temperature. The yields were 10–92%.

The structure of the synthesized compounds was confirmed by NMR spectroscopy and mass spectrometry. The $^1$H NMR spectra contain two characteristic urea NH proton signals. The signal at 5.68–6.81 ppm corresponds to the proton of the NH group proximate to the adamantyl fragment, whereas the signal at 7.75–8.64 ppm, to the proton of the NH group linked to the aromatic ring.

Analysis of the $^{19}$F NMR signals showed the dependence of the shifts of the signals of the F atom on their position in the aromatic ring. Thus, the signals of F atoms in the R$_1$ positions of the aromatic rings appear at −119.08 to −133.10 ppm (5c, 5d, 5f, 5k, 5m, and 5n); the signals of F atoms in the R$_2$ and R$_4$ are at −110.01 to −137.77 ppm (5a, 5e–5g, and 5l); and the signals of the F atoms in the R$_3$ and R$_5$ positions, at −120.52 to 148.57 ppm (5b, 5e, 5i, and 5j) and −116.70 to −119.08 ppm (5d), respectively. In the $^{19}$F NMR spectrum of compound 5o, the trifluoromethyl fluorine atoms give one signal at −61.33 ppm. The chemical shifts of the fluorine atoms are also dependent on whether there are other F and Cl substituents in the aromatic ring.

The yields of ureas were directly related to the substrate structure. The highest yields (92%) were characteristic of the ureas containing one F atom in the aromatic ring. With the substrates containing two F atoms, the yields decreased to 10–82%. The lowest yield was obtained with urea 5d (10%), in which the F atoms are ortho to each other. The properties of the synthesized 1,3-disubstituted ureas 5a–5o are listed in the Table 1.

The calculated lipophilicity coefficients log $P$ of the synthesized compounds span the range 4.52–5.25, which is higher, on average, by 0.09 compared to those of the related compounds derived from unsubstituted 1-(isocyanato)adamantane [1] and lower by 0.17 compared to those of the related compounds derived from 1-(isocyanatoethyl)adamantane [12]. The log $P$ values of ureas 5a–5g, which contain no other substituents in the aromatic ring but fluorines, vary between 4.52 and 4.64, and, therefore, comply with the Lipinski’s rule [13]. The replacement of the fluorine substituent in the aromatic ring by chlorine increases the lipophilicity coefficient to 5.04–5.25. This change...
is likely to be associated with the lower electrophilicity of Cl compared to F. The C–F bond conjugated with a double bond acquires a double-bond character, as a result of which the radius of the covalent bond becomes even smaller, and, as a result, spatially the fluorine atom becomes almost indistinguishable from the hydrogen atom [14].

The melting points of the synthesized ureas, which contain a methylene bridge between the adamantane and urea fragments are lower by 49–122°C compared to those of the related compounds derived from unsubstituted 1-(isocyanato)adamantane. Lower melting points are a positive property of inhibitors, because this facilitates the manufacturing of dosage forms.

EXPERIMENTAL

3-Chloroaniline (99%, CAS 108-42-9), 3-chloro-4-fluoroaniline (98%, CAS 367-21-5), 3-(trifluoromethyl)aniline (≥ 99.5%, CAS 121-44-8), and DMF NMR spectrum (Anhydrous 99.8%, CAS 68-12-2) were purchased from Sigma–Aldrich; 3-fluoroaniline (99%, CAS 372-19-0), 4-fluoroaniline(99%,CAS371-40-4),2,4-difluoroaniline
(99%, CAS 367-25-9), 2,6-difluorooaniline (98%, CAS 5509-65-9), 3,4-difluorooaniline (98+%, CAS 3863-11-4), 2,5-difluorooaniline (99%, CAS 367-30-6), 3,5-difluorooaniline (98%, CAS 372-39-4), 2-chloro-4-fluorooaniline (97%, CAS 2106-02-7), 3-chloro-4-fluorooaniline (98%, CAS 367-21-5), 3-chloro-2-fluorooaniline (97%, CAS 2106-04-9), 4-chloro-2-fluorooaniline (98%, CAS 57946-56-2), and 2-chloro-6-fluorooaniline (97%, CAS 363-51-9) were obtained from Alfa Aesar and used as received.

The structure of the synthesized compounds was confirmed by $^1$H, $^{13}$C, and $^{19}$F NMR spectroscopy, gas chromatography–mass spectrometry, and elemental analysis. The mass spectra were run on an Agilent GC 7820/MSD 5975 system and an Advion Expression compact mass spectrometer in the full scan mode (ESI). The $^1$H, $^{13}$C, and $^{19}$F NMR spectra were measured on a Bruker Avance 600 spectrometer in DMSO-d$_6$; internal reference SiMe$_4$. The elemental analyses were obtained on a Perkin-Elmer Series II 2400 CHNS/O analyzer.

(Adamantan-1-yl)acetic acid (2). A three-necked reactor placed in an ice bath and equipped with a thermometer, a dropping funnel, and an overhead stirrer was charged, with stirring, with 540 mL of 98% H$_2$SO$_4$ and 12.5 mL of 65% HNO$_3$. The mixture was cooled to 0–2°C, after which 100 g (0.475 mol) of vinylidene chloride was added dropwise over the course of 1.5 h, maintaining the temperature at 0–2°C. The mixture was stirred at the same temperature for another 1 h and poured onto ice. After the ice had melted, the product was filtered off, washed with distilled water, and purified by reprecipitation. Yield 83.9 g (93%), mp 135–136°C. The structure of the synthesized compounds was confirmed by $^1$H, $^{13}$C, and $^{19}$F NMR spectroscopy, gas chromatography–mass spectrometry, and elemental analysis. The mass spectra were run on an Agilent GC 7820/MSD 5975 system and an Advion Expression compact mass spectrometer in the full scan mode (ESI). The $^1$H, $^{13}$C, and $^{19}$F NMR spectra were measured on a Bruker Avance 600 spectrometer in DMSO-d$_6$; internal reference SiMe$_4$. The elemental analyses were obtained on a Perkin-Elmer Series II 2400 CHNS/O analyzer.

1-(Adamantan-1-yl)methyl)-3-(3-fluorophenyl)urea (5a). 3-Fluorooaniline, 0.145 g (1.3 mmol), and 0.2 mL of triethylamine were added to 0.25 g (1.3 mmol) of isocyanate 3 in 5 mL of dry DMF. The reaction mixture was allowed to stand for 12 h at room temperature, after which 6 mL of 1 N HCl was added, and the resulting mixture was stirred for 1 h. The white precipitate that formed was filtered off, washed with water, and recrystallized from ethanol. Yield 0.364 g (92%), mp 87–88°C. $^1$H NMR spectrum (DMSO-d$_6$), $\delta$, ppm: 1.17–1.20 t (1H, Ad, $J$ = 11.9 Hz), 1.47 d (6H, Ad, $J$ = 2.6 Hz), 1.96 q (6H, Ad, $J$ = 6.0 Hz), 2.98 s (2H, CH$_2$). Mass spectrum, $m/z$ ($I_{rel}$, %): 191.2 (6.0) [M]$^+$, 149.2 (30.0) [M – NCO]$^+$, 135 (100.0) [Ad]$^+$. Found, %: C 75.33; H 8.99; N 7.35. C$_{12}$H$_{18}$O$_2$N. Calculated, %: C 75.35; H 8.96; N 7.32. M 191.27.

1-(Adamantan-1-yl)methyl)-3-(3-fluorophenyl)urea (5b). 3-Fluorooaniline, 0.145 g (1.3 mmol), and 0.2 mL of triethylamine were added to 0.25 g (1.3 mmol) of isocyanate 3 in 5 mL of dry DMF. The reaction mixture was allowed to stand for 12 h at room temperature, after which 6 mL of 1 N HCl was added, and the resulting mixture was stirred for 1 h. The white precipitate that formed was filtered off, washed with water, and recrystallized from ethanol. Yield 0.364 g (92%), mp 87–88°C. $^1$H NMR spectrum (DMSO-d$_6$), $\delta$, ppm: 1.17–1.20 t (1H, Ad, $J$ = 11.9 Hz), 1.47 d (6H, Ad, $J$ = 2.6 Hz), 1.96 q (6H, Ad, $J$ = 6.0 Hz), 2.98 s (2H, CH$_2$). Mass spectrum, $m/z$ ($I_{rel}$, %): 191.2 (6.0) [M]$^+$, 149.2 (30.0) [M – NCO]$^+$, 135 (100.0) [Ad]$^+$. Found, %: C 75.33; H 8.99; N 7.35. C$_{12}$H$_{18}$O$_2$N. 1-(Adamantan-1-ylmethyl)-3-(2-chloro-4-fluorophenyl)urea (5i) was prepared similarly to compound 5a, from 0.25 g of isocyanate 3 and 0.189 g of 2-chloro-4-fluorooaniline. Yield 0.315 g (72%), mp 161–162°C.
1-(Adamant-1-ylmethyl)-3-(3-chloro-4-fluorophenyl)urea (5j) was prepared similarly to compound 5a, from 0.25 g of isocyanate 3 and 0.189 g of 3-chloro-4-fluorouracil. Yield 0.320 g (73%), mp 115–116°C. 1H NMR spectrum (DMSO-d6), δ, ppm: 1.43 d (1H, Ad, J 2.8 Hz), 1.49 d (6H, Ad, J 2.9 Hz), 1.64 q (4H, Ad, J 11.3, J 11.0 Hz), 1.93 br.s (3H, Ad), 2.83 d (2H, CH2, J 5.7 Hz), 6.81 d (1H, NH–CH2–Ad, J 5.9 Hz), 7.10–7.22 m (1H, 5-Harom), 7.36 t.d (1H, 3-Harom, J1 8.7, J2 8.5, J3 3.0 Hz), 7.62–7.67 m (1H, 6-Harom), 8.14 d.d.d (1H, NH–Ph, J1 9.4, J2 5.9, J3 3.7 Hz). 19F NMR spectrum (DMSO-d6), δ, ppm: –120.52. Mass spectrum, m/z (Irel, %): 338 (1.2) [M + H]+, 355 (1.1) [M + H2O]+, 379 (1.0) [M + CAN + H]+, 420 (42.1) [M + 2ACN + H]+. Found, %: C 64.17; H 6.56; Cl 10.55; F 6.52; N 8.34. C18H22ClFN2O. Calculated, %: C 64.18; H 6.58; Cl 10.53; F 6.54; N 8.32. M 336.83.

1-(Adamant-1-ylmethyl)-3-(3-chloro-2-fluorophenyl)urea (5k) was prepared similarly to compound 5a, from 0.25 g of isocyanate 3 and 0.189 g 3-chloro-2-fluorouracil. Yield 0.375 g (85%), mp 83–84°C. 1H NMR spectrum (DMSO-d6), δ, ppm: 1.43 d (1H, Ad, J 2.9 Hz), 1.47 d (6H, Ad, J 2.9 Hz), 1.64 q (4H, Ad, J 11.1, J1 11.2 Hz), 1.94 br.s (3H, Ad), 2.81 d (2H, CH2, J 5.2 Hz), 6.13 s (1H, NH–CH2–Ad), 7.24 t (1H, 5-Harom, J1 9.0, J2 9.0 Hz), 7.32 d (1H, 4-Harom, J 7.9 Hz), 7.73–7.80 m (1H, 6-Harom, J1 12.7, J2 6.8, J3 2.1 Hz), 7.96 s (1H, NH–Ph). 19F NMR spectrum (DMSO-d6), δ, ppm: –126.57. Mass spectrum, m/z (Irel, %): 318 (7.4) [M – H2O – H]+, 372 (2.1) [M + Cl]–. Found, %: C 64.13; H 6.53; Cl 10.58; F 6.59; N 8.34. C18H22ClFN2O. Calculated, %: C 64.18; H 6.58; Cl 10.53; F 6.54; N 8.32. M 336.83.

1-(Adamant-1-ylmethyl)-3-(4-chloro-3-fluorophenyl)urea (5l) was prepared similarly to compound 5a, from 0.25 g of isocyanate 3 and 0.189 g OF 4-chloro-3-fluoroaniline. 1H NMR spectrum (DMSO-d6), δ, ppm: 1.43 d (1H, Ad, J 2.9 Hz), 1.47 d (6H, Ad, J 2.9 Hz), 1.64 q (4H, Ad, J1 12.4, J2 10.6 Hz), 1.94 br.s (3H, Ad), 2.81 d (2H, CH2, J 5.8 Hz), 6.21 t (1H, NH–CH2–Ad, J1 6.1, J2 6.1 Hz), 7.20 d.d.d (1H, 5-Harom, J1 8.8, J2 2.5, J3 1.0 Hz), 7.37 t (1H, 2-Harom, J1 8.7, J2 8.7 Hz), 7.63 t.d. (1H, 6-Harom, J1 12.4, J2 12.1, J3 2.4 Hz), 7.96 s (1H, NH–Ph). 19F NMR spectrum (DMSO-d6), δ, ppm: –115.37. Mass spectrum, m/z (Irel, %): 318 (9.0) [M – H2O – H]+, 372 (2.0) [M + Cl]–. Found, %: C 64.14; H 6.55; Cl 10.50; F 5.69; N 8.35. C18H22ClFN2O. Calculated, %: C 64.18; H 6.58; Cl 10.53; F 5.64; N 8.32. M 336.83.

1-(Adamant-1-ylmethyl)-3-(4-chloro-2-fluorophenyl)urea (5m) was prepared similarly to compound 5a, from 0.25 g of isocyanate 3 and 0.189 g of 4-chloro-2-fluorouracil. Yield 0.335 g (76%), mp 109–110°C. 1H NMR spectrum (DMSO-d6), δ, ppm: 1.43 d (1H, Ad, J 2.9 Hz), 1.47 d (6H, Ad, J 2.9 Hz), 1.65 q (4H, Ad, J1 12.3, J2 12.2 Hz), 1.94 br.s (3H, Ad), 2.82 d (2H, CH2, J 5.7 Hz), 6.59 t (1H, NH–CH2–Ad, J1 6.0, J2 6.0 Hz), 7.14 d (1H, 5-Harom, J 8.9 Hz), 7.34 d.d.d (1H, 6-Harom, J1 2.4, J2 11.3 Hz), 8.18 t (1H, 3-Harom, J 8.2 Hz), 8.34 d (1H, NH–Ph, J 2.7 Hz). 19F NMR spectrum (DMSO-d6), δ, ppm: –128.09. Mass spectrum, m/z (Irel, %): 336 (3.8) [M – H]+, 372 (15.2) [M + Cl]–. Found, %: C 64.15; H 6.55; Cl 10.57; F 5.60; N 8.37. C18H22ClFN2O. Calculated, %: C 64.18; H 6.58; Cl 10.53; F 5.64; N 8.32. M 336.83.

1-(Adamant-1-ylmethyl)-3-(6-chloro-2-fluorophenyl)urea (5n) was prepared similarly to compound 5a, from 0.25 g of isocyanate 3 and 0.189 g of 6-chloro-2-fluorouracil. Yield 0.348 g (79%), mp 113–114°C. 1H NMR spectrum (DMSO-d6), δ, ppm: 1.43 d (1H, Ad, J 2.5 Hz), 1.48 d (6H, Ad, J 2.9 Hz), 1.65 q (4H, Ad, J1 11.4, J2 11.4 Hz), 1.95 br.s (3H, Ad), 2.83 d (2H, CH2, J 5.8 Hz), 6.67 t (1H, NH–CH2–Ad, J1 6.0, J2 6.0 Hz), 7.09 d.d.d (1H, 3-Harom, J1 8.7, J2 4.2, J3 2.7 Hz), 7.20 d.d.d (1H, 4-Harom, J1 11.3, J2 8.7 Hz), 7.30 d.d (1H, 5-Harom, J1 11.1, J2 8.8 Hz), 7.96 s (1H, NH–Ph). 19F NMR spectrum (DMSO-d6), δ, ppm: –133.10. Mass spectrum, m/z (Irel, %): 336 (7.4) [M – H]+, 372 (11.8) [M + Cl]–. Found, %: C 64.17; H 6.56; Cl 10.52; F 5.69; N 8.36. C18H22ClFN2O. Calculated, %: C 64.18; H 6.58; Cl 10.53; F 5.64; N 8.32. M 336.83.

1-(Adamant-1-ylmethyl)-3-[3-(trifluoromethyl)phenyl]urea (5o) was prepared similarly to
compound 5a, from 0.25 g of isocyanate 3 and 0.211 g of 3-(trifluoromethyl)aniline. Yield 0.327 g (71%), mp 153–155°C. 1H NMR spectrum (DMSO-d$_6$), δ, ppm: 1.43 s (1H, Ad), 1.48 s (6H, Ad), 1.64 q (4H, Ad, J$_1$ 12.7, J$_2$ 11.3 Hz), 1.95 br.s (3H, Ad), 2.83 d (2H, CH$_2$, J 5.8 Hz), 6.19 s (1H, NH–CH$_2$–Ad), 7.20 d (1H, 4-H$_{arom}$, J 7.5 Hz), 7.33 d (1H, 5-H$_{arom}$, J 7.8 Hz), 7.53 t (1H, 6-H$_{arom}$, J 8.0, J 8.0 Hz), 7.62 d (1H, 2-H$_{arom}$, J 8.2 Hz), 7.98 s (1H, NH–Ph). 13C NMR spectrum (DMSO-d$_6$), δ, ppm: 28.26 (Ad), 33.98 (Ad), 37.14 (2C, Ad), 39.71 (3C, Ad), 40.74 (3C, Ad), 51.67 (2C, CH$_2$), 113.92 (2-C$_{arom}$), 114.98 (4-C$_{arom}$), 117.51 (CF$_3$), 118.87 (6-C$_{arom}$), 122.63 (5-C$_{arom}$), 130.18 (3-C$_{arom}$), 140.81 (1-C$_{arom}$), 159.14 [NH–C(O)–NH]. 19F NMR spectrum (DMSO-d$_6$), δ, ppm: –61.33 (3F, CF$_3$). Mass spectrum, m/z (I$_{rel}$, %): 351 (1.0) [M – H]$^-$, 387 (15.0) [M + Cl]$^-$. Found, %: C 64.71; H 6.56; F 16.19, N 7.91. C$_{19}$H$_{23}$F$_3$N$_2$O. Calculated, %: C 64.76; H 6.58; F 16.17; N 7.95. M$_3$ 352.39.

**CONCLUSIONS**

Methods of synthesis of adamantane-containing 1,3-disubstituted ureas with a methylene bridge between the adamantane and urea moieties are developed. The advantages of the developed methods include cheap starting materials and facile protocols of synthesis and isolation and purification of the products. An alternative, safer method of synthesis of 1-(isocyanato)adamantane (3). The synthesized compounds will be studied as human soluble epoxide hydrolase inhibitors.

**FUNDING**

The work was financially supported by the Russian Science Foundation (project no. 19-73-10002).

**CONFLICT OF INTEREST**

The authors declare no conflict of interest.
