Abstract:
In this paper, the Azzallini’s method used to find a weighted distribution derived from the standard Pareto distribution of type I (SPDTI) by inserting the shape parameter (θ) resulting from the above method to cover the period (0, 1] which was neglected by the standard distribution. Thus, the proposed distribution is a modification to the Pareto distribution of the first type, where the probability of the random variable lies within the period \([k\theta, \infty)\), \(k > 0, \theta \geq 1\). The properties of the modified weighted Pareto distribution of the type I (MWPDTI) as the probability density function, cumulative distribution function, Reliability function, Moment and the hazard function are found. The behaviour of probability density function for MWPDTI distribution by representing the values of \(x = \frac{k}{\theta}\) This means, the probability density function of this distribution treats the period (0,1] which is ignore in SPDTI.

Key words: Azzallini’s method, Cumulative distribution function, Modified weighted Pareto distribution type I(MWPDTI), Reliability function, Standard Pareto distribution type I(SPDTI).

Introduction:
The weighted statistical distributions were established in (1934)(1) by Fisher, who pointed to develop and circulate standard statistical distributions to match biased data samples, which are often shown through medical science data and some aspects of biology and other fields of science. Khatree (1989)(1) studied the statistical properties of some weighted length distributions and compared them with the properties of their standard distributions.

The defect in the random sample selection of the population leads to bias in sample size and length, which leads to the failure of standard statistical distributions in the treatment and interpretation of these samples.

In (1978), Patil and Rao (2) presented some concepts on how to use weighted distributions to correct the probability of events in biased samples and apply them to environmental models and human populations. Azzallini (1985)(2) introduced a new technique to find weighted distribution from standard distribution summarized as follows:

\[ f_w(x) = \frac{1}{P_r(x < x_1)} f(x_1) F(\theta x_1) \]  

Such that \(f_w(x)\) is the probability density function for the weighted distribution, \(f(x_1)\) and \(F(\theta x_1)\) are the probability density function and cumulative distribution function of the standard distribution respectively.

Gupt and Kundu (2009)(3) used the Azzallini’s method to find the shape parameter for exponential distribution, resulting in a new type of exponential distribution with two parameters.

In (2013) (4) Mervat. M. studied the weighted of the Weibull distribution and found its properties.

Shakhatreh (2012) (5) studied weighted exponential distribution in two properties.

Improvement of the Azzallini’s method was achieved in (2014) (6) by Badmus et al. which was used in the weighted Weibull model.

In (2015) (7) A. Mahdavi introduced two new classes of weighted distributions by using the Azzallini’s method.

Iden H. H. and Shayma G. S.(2017) (8) studied the methods to estimate the parameters for the Maxwell –Boltzmann distribution.

Filippo and Bozidar V. (2018) (9) studied the expansion of the Azilini’s method on two dependent random variables of different distributions.
The standard Pareto distribution type I (SPDTI) has the probability density function (pdf) and cumulative distribution function (cdf) are given respectively by (10):
\[
f(x; \alpha, k) = \frac{ak^\alpha}{x^{\alpha+1}}, \quad x \geq k > 0, \alpha > 0
\]

\[
F(x; \alpha, k) = 1 - k^\frac{x}{\alpha}, \quad x \geq k > 0, \alpha > 0
\]

The mean and the variance of (PDTI) are respectively given by:
\[
\mu_X = E(x) = \frac{ak}{(\alpha-1)}, \quad \alpha > 1
\]
\[
V(x) = \frac{a^2k^2}{(\alpha-2)(\alpha-3)}, \quad \alpha > 2
\]

**Main Result:** Azzlini’s technique will be used to find weighted distribution derived from Pareto distribution type I, called Modified Weighted Pareto distribution type I (MWPTDI), and study the statistical properties as mean, variance, standard deviation, cumulative distribution function, Reliability function, hazard rate function, Skewness, Kurtosis and ordered statistics of the MWPTDI. The MWPTDI treated the period (0,1] which was neglected by the SPDTI, such that the value of the random variable is \(\frac{k}{\theta}\), in this treatment the calculate probability values of the random variable by using two parameters \(k, \theta\). Thus, the MWPTDI includes the period \(\left[\frac{k}{\theta}, \infty\right), x \geq k > 0, \theta > 1\).

**Weighted Pareto Type I Distribution (WPDTI)**

**Lemma 1:**

Let \(X_1, X_2\) are non negative independent random variables having Pareto type I probability density functions (pdf) \(f(x_1), f(x_2)\) respectively with parameters \(\alpha, k\), then the \(P_r(\theta x_1 > x_2) = \frac{2\theta^{\alpha-1}}{2\theta^\alpha}\), where \(\frac{2\theta^{\alpha-1}}{2\theta^\alpha}\) is weighted Pareto type I distribution.

**Proof:**
\[
P_r(x_2 < \theta x_1) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x_1)f(x_2)dx_2dx_1
\]

Since \(x_1\) and \(x_2\) are independent Pareto type I random variables and \(x \geq k, \theta \geq 1\) then
\[
\int_{-\infty}^{\infty} \int_{k}^{\infty} f(x_1)f(x_2)dx_2dx_1 = \int_{k}^{\infty} f(x_1) \left[ \int_{k}^{\infty} f(x_2)dx_2 \right]dx_1
\]

\[
= \int_{k}^{\infty} \frac{ak^\alpha}{x^{\alpha+1}} \left[ \int_{k}^{\infty} \frac{ak^\alpha}{x^{\alpha+1}} dx_2 \right]dx_1
\]

\[
= \int_{k}^{\infty} \frac{ak^\alpha}{x^{\alpha+1}} \left[ 1 - \frac{k^\alpha}{\theta^\alpha x_1^{\alpha+1}} \right]dx_1
\]

\[
= \int_{k}^{\infty} \frac{ak^\alpha}{x^{\alpha+1}} dx_1 - \int_{k}^{\infty} \frac{ak^\alpha}{x_1^{\alpha+1}} dx_1 = \frac{ak^\alpha}{\theta^\alpha x_1^{\alpha+1}} dx_1
\]

\[
= 1 - \frac{1}{2\theta^\alpha} \frac{2ak^2}{x_1^{\alpha+1}} dx_1 = \frac{2\theta^\alpha - 1}{2\theta^\alpha}, \quad \theta \geq 1
\]

\[
P_r(x_2 < \theta x_1) = \frac{2\theta^\alpha - 1}{2\theta^\alpha}, \quad \theta \geq 1
\]

**Lemma 2:**

The function \(f_w(x; \alpha, k, \theta) = \frac{2\theta^\alpha - 1}{2\theta^\alpha} (\theta^\alpha x^{\alpha-1})\) is a probability density function of the Pareto random variable \(X\).

**Proof:**
\[
f_k \int_{k}^{\infty} f_w(x)dx = \int_{k}^{\infty} \left( \frac{2\theta^\alpha - k^\alpha}{\theta^\alpha x^{\alpha-1}} \right) dx
\]

\[
= 2\theta^\alpha \int_{k}^{\infty} \frac{u du}{\theta^\alpha x^{\alpha-1}} = 2\theta^\alpha \cdot \frac{2\theta^\alpha}{2\theta^\alpha - 1} \int_{k}^{\infty} \left( 1 - \frac{2\theta^\alpha}{2\theta^\alpha - 1} \right) dx
\]

\[
= \frac{2\theta^\alpha}{2\theta^\alpha - 1} \left( \frac{\theta^\alpha x^{\alpha-1} - k^\alpha}{\theta^\alpha x^{\alpha-1}} \right) dx
\]

\[
= \frac{\theta^\alpha x^{\alpha-1} - k^\alpha}{\theta^\alpha x^{\alpha-1}} \left( \frac{\theta^\alpha x^{\alpha-1} - k^\alpha}{\theta^\alpha x^{\alpha-1}} \right) = 1
\]

\[
f_w(x; \alpha, k, \theta) = \frac{2\theta^\alpha - k^\alpha}{\theta^\alpha x^{\alpha-1}} \left( \frac{\theta^\alpha x^{\alpha-1} - k^\alpha}{\theta^\alpha x^{\alpha-1}} \right) = 1
\]

\[
\therefore f_w(x; \alpha, k, \theta) \text{ is a weighted probability density function (wpdf) of the Pareto distribution type I (PDTI).}
\]

The eq.(8) is called the weighted Pareto distribution Type I (WPDTI).

The purpose of this paper is to expand the standard Pareto distribution of type I by adding the period in which the random variable lies within the
period (0,1] which was neglected by the standard Pareto distribution of type I which started from the random variable values \( x \geq k \geq 1 \). This treatment we call it MWPDTI. 

Test the function \( f_w(x) \) is a probability density function (pdf) over the suggested new interval \([\frac{k}{\theta}, \infty]\), \( x \geq \frac{k}{\theta} > 0, \theta \geq 1 \) as follows:

\[
\int_{\frac{k}{\theta}}^{\infty} f_w(x) \, dx = \int_{\frac{k}{\theta}}^{\infty} \frac{2\alpha\theta^a k^a x^{-a-1} \left(1 - \frac{k^a}{\theta^a x^a}\right)}{(2\theta^a - 1)} \, dx
\]

Let \( u = \left(1 - \frac{k^a}{\theta^a x^a}\right) \rightarrow du = \frac{ak^a x^{-a-1}}{\theta^a} \, dx \)

\[
= \frac{2\theta^{2a}}{2\theta^a - 1} \left[ \lim_{b \to -\infty} \int_{\frac{k}{\theta}}^{b} \left(1 - \frac{k^a}{\theta^a x^a}\right)^2 \, dx \right]
\]

\[
= \lim_{b \to -\infty} \left(\theta^a x^a - k^a\right)^2 \left[\frac{1}{2\theta^a - 1}\right]^{\frac{k}{\theta}}
\]

\[
= \frac{\theta^a}{2\theta^a - 1} \neq 1.
\]

\( \therefore f_w(x) \) is not a probability density function (pdf) over \([\frac{k}{\theta}, \infty]\) to make it a (pdf) Multiply eq. (8) by \( \frac{2\theta^a - 1}{2\theta^a} \) we get the modified weighted probability density function is \( f'_w(x; \alpha, k, \theta) \) given by:

\[
f'_w(x; \alpha, k, \theta) = \left(\frac{2\theta^a - 1}{\theta^{2a}}\right) f_w(x)
\]

\[
f'_w(x; \alpha, k, \theta) = \left(\frac{2\theta^a - 1}{\theta^{2a}}\right) f_w(x)
\]

\[
f'_w(x; \alpha, k, \theta) = \left(\frac{2\theta^a - 1}{\theta^{2a}}\right) f_w(x)
\]

\[
= \frac{2\alpha\theta^a k^a x^{-a-1} \left(1 - \frac{k^a}{\theta^a x^a}\right)}{\theta^a}
\]

\[
f'_w(x; \alpha, k, \theta) = \left(\frac{2\theta^a - 1}{\theta^{2a}}\right) f_w(x)
\]

\[
= \frac{2\alpha\theta^a k^a x^{-a-1} \left(1 - \frac{k^a}{\theta^a x^a}\right)}{\theta^a}, \alpha > 0, x \geq \frac{k}{\theta} > 0, \theta \geq 1, k > 0
\]

\[\text{Lemma 3:}\]

The function \( f'_w(x; \alpha, k, \theta) = \frac{2\alpha\theta^a k^a x^{-a-1} \left(1 - \frac{k^a}{\theta^a x^a}\right)}{\theta^a}, \alpha > 0, x \geq \frac{k}{\theta} > 0, \theta \geq 1, k > 0 \) is modified weighted probability density function of the Pareto distribution type I.

\[\text{Proof:}\]

(1) \( f'_w(x; \alpha, k, \theta) \geq 0 \)

(2) \( \int_{\frac{k}{\theta}}^{\infty} f'_w(x) \, dx \)

\[
= \frac{2\alpha\theta^a k^a x^{-a-1} \left(1 - \frac{k^a}{\theta^a x^a}\right)}{\theta^a} \left[\frac{1}{2\theta^a - 1}\right]^{\infty}_{\frac{k}{\theta}}
\]

\[
= 2\int \left(1 - \frac{k^a}{\theta^a x^a}\right)^2 \left[\frac{1}{2\theta^a - 1}\right]^{\infty}_{\frac{k}{\theta}}
\]

As shown in Fig. 1.

![Figure 1. (MWPDTI) pdf \( f'_w(x; \alpha, k, \theta) \)](image)

\[\begin{align*}
\alpha &= 1 & k &= 1 & \theta &= 1 \\
\alpha &= 1 & k &= 1 & \theta &= 1.5 \\
\alpha &= 1 & k &= 1 & \theta &= 2 \\
\alpha &= 1 & k &= 1 & \theta &= 3.3
\end{align*}\]
Showing that the graph of modified weighted Pareto is different from the Pareto distribution when entering the shape parameter and the curve of shape parameter (θ) is interest and process when \( x \geq \frac{k}{\theta} > 0 \). The MWPDTI take the value of \( x \geq k \) and SPDTI take the value of \( x \geq k \geq 1 \). As shown in Fig. 2.

**The Moments:**

**Lemma 4:**

Let \( X \) be the MWPDTI random variable, then the \( r^{th} \) moments of the (MWPDTI) is \( E_w(x^r) \) given by:

\[
E_w(x^r) = \frac{2\alpha^2k^r}{\theta^r(r - 2\alpha)(r - \alpha)} , \quad \alpha > r , k > 0
\]

**Proof:**

\[
E_w(x^r) = \int_{\frac{k}{\theta}}^{\infty} x^r f_w(x) dx
\]

\[
E_w(x^r) = \int_{\frac{k}{\theta}}^{\infty} \left( \frac{2\alpha^2k^r x^{-\alpha-1}}{\theta^\alpha} \left(1 - \frac{k^\alpha x^\alpha}{\theta^\alpha x^\alpha} \right) \right) dx
\]

\[
= \frac{1}{\theta^\alpha} \left( \int_{\frac{k}{\theta}}^{\infty} 2\alpha^2k^r x^{-\alpha-1} - \frac{1}{\theta^\alpha} \int_{\frac{k}{\theta}}^{\infty} 2\alpha^2k^r x^{-2\alpha-1} \right) dx
\]

\[
= \frac{1}{\theta^\alpha} \left[ \lim_{b \to \infty} \left( \int_{\frac{k}{\theta}}^{b} 2\alpha^2k^r x^{-\alpha-1} dx \right) \right]
\]

\[
- \frac{1}{\theta^\alpha} \left[ \lim_{b \to \infty} \left( \int_{\frac{k}{\theta}}^{b} 2\alpha^2k^r x^{-2\alpha-1} dx \right) \right]
\]

\[
= \frac{2\alpha^2k^r}{\theta^\alpha} \left[ \lim_{b \to \infty} \left( \frac{x^{r-\alpha}}{r - \alpha} \right) \right]_{\frac{k}{\theta}}^{b} - \frac{2\alpha^2k^r}{\theta^\alpha} \left[ \lim_{b \to \infty} \left( \frac{x^{r-2\alpha}}{r - 2\alpha} \right) \right]_{\frac{k}{\theta}}^{b}
\]

\[
= \frac{2\alpha^2k^r}{\theta^\alpha} \left[ \lim_{b \to \infty} \left( \frac{b^{r-\alpha} - k^{r-\alpha}}{\theta^{r-\alpha}} \right) \right] - \frac{2\alpha^2k^r}{\theta^\alpha} \left[ \lim_{b \to \infty} \left( \frac{b^{r-2\alpha} - k^{r-2\alpha}}{\theta^{r-2\alpha}} \right) \right]
\]

\[
E_w(x^r) = \frac{2\alpha^2k^r}{\theta^r(r - 2\alpha)(r - \alpha)} , \quad \alpha > r , k > 0
\]

(10)

**The mean, variance and standard deviation of the (MWPDTI)**

The mean of the (MWPDTI) is \( E^*_w(x) \) given by:

When \( r = 1 \) in eq. (10) we get the mean \( E^*_w(x) \)

\[
E^*_w(x) = \frac{2\alpha^2k}{\theta(1 - 2\alpha)(1 - \alpha)} , \quad \alpha > 1 , \theta \geq 1 , k > 0
\]

(11)

In the same way calculate \( E^*_w(x^2) \) when \( r = 2 \) in eq. (10).

\[
E^*_w(x^2) = \frac{2\alpha^2k^2}{\theta^2(2-2\alpha)(2-\alpha)} , \quad \alpha > 2 , \theta \geq 1 , k > 0
\]

(12)

From the eqs (11) and (12) the variance of the MWPDTI is \( \text{Var}^*_w(x) \) given by:

\[
\text{Var}^*_w(x) = E^*_w(x^2) - [E^*_w(x)]^2
\]
\[
V ar_w(x) = \frac{(5\alpha - 1)\alpha^2k^2}{(\alpha - 2)(\alpha - 1)^2(2\alpha - 1)\theta^2}, \alpha > 2, \theta \geq 1, k > 0
\]

By eq.(13) The standard deviation of the modified weighted random variable \(X_w\) is \(Sd_w(x)\) given by:
\[
Sd_w(x) = \sqrt{V ar_w(x)} = \sqrt{\frac{(5\alpha - 1)\alpha^2k^2}{(\alpha - 2)(\alpha - 1)^2(2\alpha - 1)\theta^2}}
\]

The cumulative distribution function of the MWPDTI

**Lemma 5:**

The cumulative distribution function (cdf) of the MWPDTI is \(F_w(x)\) given by
\[
F_w(x) = \frac{\theta^2 x^\alpha - k^\alpha}{\theta^2 x^\alpha - k^\alpha}, x \geq \frac{k}{\alpha}, \alpha > 0, \theta > 0
\]

**Proof:**

\[
F_w(x) = \int_0^x f_w(t) \, dt
\]

The Reliability function of the MWPDTI

The reliability function of the MWPDTI is \(F_w^*(x)\) given by eq.(15):
\[
F_w^*(x) = 1 - F_w(x)
\]

\[
F_w^*(x) = 1 - \frac{\theta^2 x^\alpha - k^\alpha}{\theta^2 x^\alpha - k^\alpha}, \theta > 1, \alpha > 0, x \geq \frac{k}{\alpha} \geq 0
\]

**Hazard rate function of the MWPTI**

The hazard function of the MWPTI is \(h_w(x)\) given by eq.(9) and eq.(16):
\[
h_w(x) = \frac{f_w(x)}{F_w(x)}
\]

\[
h_w(x) = \frac{2ak^\alpha x^{-\alpha - 1}(1 - \frac{k^\alpha}{\theta^\alpha x^\alpha})}{\theta^\alpha x^\alpha - k^\alpha}, x \geq \frac{k}{\alpha} > 0, \alpha > 0, \theta \geq 1
\]

The accuracy of cumulative probability distribution depends on the values parameter \(\theta\) produced from the Azzalini’s method. If the values of \(\theta\) are increasing then the accurate of curve of cumulative distribution are increasing. As shown in Fig.3.

![Figure 3. The cdf function \(F_w(x)\) of the (MWPDTI)](image-url)
Mode of the MWPDTI

Lemma 6:
Let \( X \) be a nonnegative random variable having the MWPDTI probability density function, then the mode of \( X \) is
\[
\nu = \frac{k^{\alpha}(2\alpha + 1)}{\theta^{\alpha}(\alpha + 1)}, \quad \alpha > 0, \theta \geq 1.
\]

Proof:
\[
\frac{d}{dx} f_\nu(x) = 0
\]
\[
= \frac{d}{dx}\left(2\alpha k^\alpha x^{-\alpha-1}\left(1 - \frac{k^\alpha}{\theta^\alpha x^\alpha}\right)\right) = 0
\]
\[
\left(2(-\alpha - 1)\alpha k^\alpha x^{-\alpha-2}\left(1 - \frac{k^\alpha}{\theta^\alpha x^\alpha}\right) + \frac{2\alpha^2 k^2\alpha x^{-2\alpha-2}}{\theta^{2\alpha}}\right) = 0
\]
\[
-2\alpha k^\alpha((\alpha + 1)\alpha x^{-\alpha} - (2\alpha + 1)k^\alpha) = 0
\]
\[
-2\alpha k^\alpha \theta^\alpha x^\alpha(\alpha + 1) + 2\alpha k^2\alpha(2\alpha + 1) = 0
\]
\[
2\alpha^2 k^2\alpha(2\alpha + 1) - 2\alpha \theta^\alpha k^\alpha x^\alpha(\alpha + 1) = 0
\]
\[
2\alpha k^2\alpha(2\alpha + 1) = 2\alpha \theta^\alpha k^\alpha x^\alpha(\alpha + 1)
\]
\[
M_{\nu x}(t) = \lim_{b \to \infty} \left[ -\frac{2\alpha(-1)^\alpha k^\alpha t^\alpha(\Gamma(-\alpha, -tb)\theta^\alpha - \Gamma(-2\alpha, -tb)(-1)^\alpha k^\alpha t^\alpha)}{\theta^{2\alpha}} \right]_{k^\alpha}^b
\]
\[
= \frac{1}{\theta^\alpha} \left[ \int_k^\infty 2\alpha k^\alpha x^{-\alpha-1}e^{tx}dx - \int_k^\infty 2\alpha k^2\alpha x^{-2\alpha-1}e^{tx}dx \right]
\]

The median of the MWPDTI

Lemma 7:
Let \( X \) be a nonnegative random variable having the MWPDTI probability density function, then the median of \( X \) is \( m_\nu(x) \) given by:
\[
m_\nu(x) = \left[ \frac{\sqrt{2k^\alpha}}{\theta^\alpha(\sqrt{2} - 1)} \right]^\alpha, \quad \theta \geq 1, \alpha > 0
\]

Proof:
\[
m_\nu(x) = \int_{k^\alpha}^m f_\nu(x)dx = \frac{1}{2}
\]
\[
\int_{k^\alpha}^m \left(2\alpha k^\alpha x^{-\alpha-1}\left(1 - \frac{k^\alpha}{\theta^\alpha x^\alpha}\right)\right)dx = \frac{1}{2}
\]
\[
\left(1 - \frac{k^\alpha}{\theta^\alpha x^\alpha}\right)^m = \frac{1}{2}
\]
\[
\frac{\theta^2\alpha m^2\alpha - 2\theta^2\alpha k^\alpha m^\alpha + k^2\alpha}{\theta^2\alpha m^2\alpha} = \frac{1}{2}
\]
\[
\frac{2(\theta^\alpha m^\alpha - k^\alpha)^2}{\sqrt{2}\theta^\alpha} = \sqrt{2}\theta^2\alpha m^2\alpha
\]
\[
m^\alpha = \frac{\sqrt{2k^\alpha}}{\theta^\alpha(\sqrt{2} - 1)}, \quad \theta \geq 1, \alpha > 0
\]

The moment generating function

Lemma 8:
The moment generating function of the MWPDTI is \( M_{\nu x}(t) \) given by:
\[
M_{\nu x}(t) = \frac{2\alpha k^\alpha(2\alpha + 1)}{2\alpha k^\alpha \theta^\alpha(\alpha + 1)}
\]
\[
x^\alpha = \frac{k^{\alpha}(2\alpha + 1)}{\theta^{\alpha}(\alpha + 1)}
\]
\[
\nu = \frac{k^{\alpha}(2\alpha + 1)}{\theta^{\alpha}(\alpha + 1)}
\]
\[
x = \left[ \frac{k^{\alpha}(2\alpha + 1)}{\theta^{\alpha}(\alpha + 1)} \right]^\alpha, \quad \alpha > 0, \theta \geq 1
\]
\[
\begin{align*}
2ak^a & \int_0^\infty x^{-a-1}e^{tx}dx \\
&= -2ak^{2a} \int_k^\infty x^{-2a-1}e^{tx}dx
\end{align*}
\]

such that \( \Gamma \) is incomplete gamma function.

**The Characteristics Function**

Lemma 9:

\[
Q_w(x) = \lim_{b \to \infty} \left( -2ak^a \left( \theta^a(1 - \frac{3a}{\theta} \Gamma(-\alpha, -ib)) - k^a \Gamma(-2\alpha, -ib) \right) \right)_{\theta}^{b}, \quad \alpha > 1, t \neq 0
\]

Proof:

\[
Q_w(x) = E(e^{itx})
\]

\[
= \int_k^\infty e^{itx} \left( \frac{2ak^a x^{-a-1} \left( 1 - \frac{k^a}{\theta^a x^a} \right)}{\theta^a} \right) dx
\]

\[
= \frac{1}{\theta^a} \left[ \int_k^\infty 2ak^a x^{-a-1}e^{itx}dx \\
- \frac{1}{\theta^a} \int_k^\infty 2ak^{2a} x^{-2a-1}e^{itx}dx \right]
\]

\[
Q_w(x) = \lim_{b \to \infty} \left( -2ak^a \left( \theta^a(1 - \frac{3a}{\theta} \Gamma(-\alpha, -ib)) - k^a \Gamma(-2\alpha, -ib) \right) \right)_{\theta}^{b}, \quad \alpha > 1, t \neq 0
\]

Such that \( \Gamma \) is incomplete gamma function.

**Skewness**

The skewness of the MWPDTI is \( C.S_w \) given by:

\[
C.S_w = E \left( \frac{x - E(x)}{\sigma(x)} \right)^3
\]

By using eq. (11) and (14) we have

\[
C.S_w = \left( \frac{2\sqrt{\alpha - 2\alpha(2\alpha - 1)}}{\sqrt{\alpha - 2\alpha(2\alpha - 1)}} \right)^3
\]

**Kurtosis**

Lemma 10:

The kurtosis of the MWPDTI is \( kurtosis_w[X] \) given by:

\[
kurtosis_w[X] = \frac{E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^4 \right)}{E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^2 \right)^2} - 3
\]

Proof:

\[
kurtosis_w[X] = \frac{E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^2 \right)^2}{E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^2 \right)^2}
\]

By eq.(11) we get

\[
E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^2 \right)^2 = \left( \frac{E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^2 \right)^2}{E \left( \left( \frac{x - E(x)}{\theta(1 - 2\alpha)(1 - \alpha)} \right)^2 \right)^2} - 3 \right)
\]
The order statistics of the MWPDTI
Lemma 11:

\[ g_w(x) = \left( n \left( \frac{2 \alpha k^a x^{-a-1} (1 - \frac{k^a}{\theta^a x^a})}{\theta^a} \right) \right) \left( \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{r-1} \left( 1 - \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{n-r} \quad \text{for } r = 1, 2, ..., n \]

**Proof:**

\[ f_{X(r)}(x) = \left( \frac{n!}{(r-1)! (n-r)!} \right) \left( \frac{2 \alpha k^a x^{-a-1} (1 - \frac{k^a}{\theta^a x^a})}{\theta^a} \right) \left( \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{r-1} \left( 1 - \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{n-r} \quad \text{for } r = 1, 2, ..., n \]

\[ g_w(x) = \left( \frac{n (2 \alpha k^a x^{-a-1} (1 - \frac{k^a}{\theta^a x^a}))}{\theta^a} \left( \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{r-1} \left( 1 - \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{n-r} \quad \text{for } r = 1, 2, ..., n \]  

**Conclusion:**

The modified weighted distribution of pareto distribution depends on the values of shape parameter \( \theta \) obtained from the method of this research which effect directly on the probability density function, survival function and hazard function. In this paper interduce new probability density function contains the shape parameter \( \theta \) which given a new weighted distribution for the Pareto distribution type I.

And study the statistical properties for the suggested modified weighted probability density function and other properties which appear by using Azzalini's method to weighted pareto distribution.

The suggested distribution deal with the interval \( [0, \frac{k}{\theta}] \) which neglects by standard Pareto distribution type I.

The modified weighted standard Pareto distribution type I can be used in a state of the standard Pareto distribution type I, in values for the random variable \( x \) less than 1 to near the value of \( x \) is 0, otherwise the standard Pareto distribution type I in which the values of \( x \) startup the value 1 to \( \infty \).

If \( X(1), X(2), ..., X(n) \) denotes the order statistics of a random sample \( x_1, x_2, ..., x_n \) from a continuous population with (pdf) \( f_X(x) \) and (pdf) \( f_{X(r)}(x) \), then the (pdf) of the \( r^{th} \) order statistics \( X(r) \) is \( g_w(x) \) in the form

\[ F_{W}^{X_X}(x) = \left( \frac{F_x(x)^{r-1}}{F_x(x)^{n-r}} \right) \left( \frac{n!}{(r-1)! (n-r)!} \right) \left( \frac{2 \alpha k^a x^{-a-1} (1 - \frac{k^a}{\theta^a x^a})}{\theta^a} \right) \left( \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{r-1} \left( 1 - \frac{(\theta^a x^a - k^a)^2}{\theta^{2a} x^{2a}} \right)^{n-r} \quad \text{for } r = 1, 2, ..., n \]

**Author's declaration:**

- Conflicts of Interest: None.
- I hereby confirm that all the Figures and Tables in the manuscript are mine. Besides, the Figures and images, which are not mine, have been given the permission for re-publication attached with the manuscript.
- Ethical Clearance: The project was approved by the local ethical committee in University of Baghdad.
