Abstract. This paper presents the comparative analysis between fuzzy logic controller and neural network for DC-DC Buck converter. The major drawback in the conventional buck converter is when the input voltage or load change, the output voltage also changes which reduces the overall efficiency of the buck converter. So here we are using non linear controllers for buck converter which respond quickly for perturbations and maintains the fixed load voltage even when there are non-linearities. Fuzzy Logic controller and neural networks are the best features of Fuzzy Logic controller and neural networks. The Two implementations are analyzed in detail and simulated in MATLAB/SIMULINK environment and results presented. Proposed approach is implemented on DC to DC step down converter for an input of 230V and performance characteristics like maximum overshoot, settling time and efficiency of the converter are studied.

1 Introduction

The design of dc–dc buck converter is to maintain a constant output voltage under the different load current and unregulated input voltage. The transient overshoot and recovery time of the output voltage should be minimized for stable operation in many electronic applications, which is ensured by the controller in the closed loop [1]. Classical controllers like PWM control, proportional (P) controller, proportional integral (PI) controller, proportional integral derivative (PID) [3] controllers only provides results which is either true or false. These controllers don’t provide adequate results when there is non-linearity in parameters or load. Recently, several methods have been proposed in the literature to alleviate the deficiency of the classical linear controllers for power converters. So non-linear controllers like fuzzy logic controllers and neural network etc are most widely used.

Now a days we are facing situations where we are unable to determine whether the state is true or false. Term “fuzzy” describes something that is non-linear or indefinite. Fuzzy logic is based on the observation that people make decisions based on imprecise or non numerical information. Neural networks are the set of algorithms inspired by the functioning of the human brain. So we are using non linear controllers for controlling the non-linearity’s in the load because it responds faster to a transient condition, easy to design and implementation [4]. So here proposed controllers are used to stabilize buck converter’s load voltage in transient state conditions [6].

2 Buck converter

The DC-DC buck converters are efficiently reduces the voltage levels as per our requirement. The basic circuit diagram of the Buck converter is shown in Fig.1. Here the MOSFET is controlled by duty cycles which are given by the non-linear controllers.

![Fig 1. Circuit Diagram of DC-DC Buck Converter](image)

Here, V₀ is the output voltage, V_L is the inductor current, I_C is the capacitor current, V_C is the voltage across the capacitor.

The modes of operation of buck converter are explained below.

Mode 1: When switch is closed, the current in the load and the charge of a capacitor is increase gradually because the energy also being stored in inductor. Throughout this
the diode gets reverse biased because there will be a positive voltage across the cathode.

So the voltage across inductor is \( V_L = V_S - V_0 \) \quad \text{(1)}

**Mode 2:** When switch is opened, the polarity of the inductor voltage changes so the diode gets forward biased but current flows in the same direction. Once the inductor returned the large part of its stored energy to the circuit, the charge stored in capacitor becomes the main source of current flowing in the circuit until the next ON period begins.

The voltage across inductor is \( V_L = -V_0 \) \quad \text{(2)}

So, the output voltage is,

\[ V_0 = D \times V_S \] \quad \text{(3)}

Where, \( D = T_{ON}/T \)

### 3 Controller design

#### 3.1 Fuzzy logic controller:

![Fig.2. Block diagram of Fuzzy logic controller (FLC) for buck converter](image)

Fig. 2 shows the block diagram of the FLC for buck converter. Fuzzy logic is a mathematical logic which is based "degree of truth" unlike classical "true or false". It handles with imprecise or uncertain data. Fuzzy logic controller [8] is easy develop and design and can operate at wider operating conditions. Fuzzy logic controller is utilized in different industrial automation & household appliances.

\[ (\text{If-then statements}) \]

![Rule base](image)

**Rule base:** Rule base is a combination of different types of rules. The rules applied in fuzzy logic algorithm are generally “if and then” statements. In this, ‘if’ means the condition & ‘then’ means conclusion.

- If the load voltage of buck converter is more than the required voltage then duty cycle should be minimized.
- If the load voltage of buck converter is less than the \( V_{\text{ref}} \) then the duty cycle should be increased.

**Inference mechanism:** In this the decision is made for different situations and generate a control signal which is given to the plant.

**Defuzzification:** This is opposite process of fuzzification. It aggregates all decisions (which are been taken) into a one single crisp value which is given to the buck converter through PWM generator [11].

**Table 1:** Rule base for DC-DC buck converter using fuzzy logic

| \( e \) | NB | NM | NS | Z | PS | PM | PB |
|---|---|---|---|---|---|---|---|
| NB | NB | NB | NB | NM | NS | Z |
| NM | NB | NB | NB | NM | NS | Z | PS |
| NS | NB | NB | NM | NS | Z | PS | PS |
| Z  | NB | NM | NS | Z  | PS | PM | PM |
| PS | NM | NS | Z  | PS | PM | PB | PB |
| PM | NS | Z  | PS | PM | PB | PB | PB |
| PB | Z  | PS | PM | PB | PB | PB | PB |

The membership functions like triangular & trapezoidal are used to reduce the calculations. Fig. 4 to 6 shows the membership functions of error and change in error and output.

![Fig.4. Input error membership function](image)
3.2 Neural network:

![Neural network block diagram](image)

Figure 7 shows the block diagram of the neural network (NN) for DC-DC buck converter. The plant identification NARMA L2 controller is used for this model. The main purpose of this model is to change the nonlinear parameters into linear parameters by deleting the nonlinearity's in the system. The training of the neural network is done by input from model and output from open loop model. The plant identification model for NARMA L2 controller is shown in fig. 8.

![Plant identification NARMA L2 model](image)

Table 2: DC-DC buck converter parameters

| Parameters         | Values |
|--------------------|--------|
| Output Power       | 300W   |
| Inductor           | 56mH   |
| Capacitor          | 13uF   |
| Input Voltage      | 230V   |
| Output Voltage     | 120V   |
| PWM Frequency      | 2KHz   |

4 Simulation results

The designed Fuzzy logic controller and NARMA L2 controller for Buck Converter is implemented in Simulink. The circuit parameters are shown in below table.
Fig. 11. Proposed simulation diagram of fuzzy logic controller for DC-DC Buck Converter

Fig. 12. Proposed simulation diagram of NARMA L2 controller for DC-DC Buck Converter

Fig. 13. Open loop diagram of DC-DC Buck Converter

Fig. 14. The waveforms output load voltage and inductor current of the DC-DC Buck Converter using Fuzzy Logic Controller (FLC) for 120V

Fig. 15. Waveforms output load voltage and inductor current of the DC-DC Buck Converter using NARMA L2 Controller for 120V

Table 3. Comparison of proposed models for different reference voltages

| Reference Voltage | Fuzzy Output | NN output |
|-------------------|--------------|-----------|
| 100V              | 99.3V        | 99.1V     |
| 130V              | 129V         | 129.4V    |
| 140V              | 139.4V       | 139.6V    |

Table 4. Comparison of proposed models for different loads

| Load   | Fuzzy Output | NN output |
|--------|--------------|-----------|
| 10Ω    | 119.5V       | 119.6V    |
| 48Ω    | 120V         | 120.1V    |
| 50Ω    | 120.1V       | 120V      |
Table 5. Comparison of proposed models for different input voltages

| Input Voltage | Fuzzy Output | NN output |
|---------------|--------------|-----------|
| 150V          | 118.9V       | 119V      |
| 180V          | 119.3V       | 119.8V    |
| 250V          | 120.4V       | 120V      |

From the above, we can conclude that when the load or input voltage parameters or the reference voltage changes the proposed model controls the duty cycle of the buck converter and gives the required output value.

Table 6. Comparison of proposed models

|                         | Fuzzy logic controller | Neural network |
|-------------------------|------------------------|----------------|
| Settling time (sec)     | 0.28                   | 0.15           |
| Maximum overshoot (%)   | 57.9%                  | 2.58%          |

5 Conclusion

In this paper, the comparative analysis of fuzzy logic controller and neural network for DC-DC buck converter is studied and implemented in MATLAB/Simulink. The main purpose of this research is to understand the different smart control methods for buck converter operation. The simulations results proves both models gives the desired output but the model developed using neural network controller approach performed slightly better compared to fuzzy logic controller in terms of maximum overshoot, less steady state error and it take less time to settle down when there are non linearity’s in the system. Therefore, these controllers are effectively handles the perturbations in the system thus increases the overall performance and efficiency of the buck converter.
