Case Report

ABSTRACT

Aims: Pregnant mothers with SARS-CoV2 infection are postulated to transfer anti-COVID antibodies to their fetus, which may lead to cytokine storm and fetal inflammatory syndrome, similar to multisystem inflammatory syndrome in children (MIS-C). Manifestations of this newly emerging entity are not elucidated, but MIS in Newborn (MIS-NB) must be suspected whenever a neonate born to COVID positive mother is presenting with unusual symptoms.

Clinical Description: We report a preterm, low birth weight, Monochorionic Diamniotic (MCDA) twin neonate born to COVID positive mother who developed abdominal distension in first few hours.

of life, initially suspected to have small bowel atresia. Baby had elevated inflammatory panel and given IVIG, suspecting MIS-NB. Intraoperatively the baby was noted to have gangrenous bowel, which required extensive surgical resection, but baby succumbed postoperatively.

**Conclusion:** This report highlights possible intestinal manifestations of possible COVID-19 related fetal inflammatory syndrome.

Keywords: Bowel gangrene; COVID-19 mother; FIRS; COVID-19 antibodies; Necrotising enterocolitis.

1. **INTRODUCTION**

COVID-19, a rapidly spreading lethal pandemic across nations, has not spared the pregnant mothers or their new-borns from complications, with increased incidence of intrauterine infections being reported in medical literature [1-3]. Newborns born to COVID-19 mothers can exhibit multisystem symptoms secondary to passive transfer of antibodies similar to fetal inflammatory response syndrome (FIRS) [4,5]. Gastrointestinal manifestations are seen either during the acute phase of COVID illness or in the post-viral inflammatory phase (MIS-C) [6,7]. We describe a premature baby born to a SARS-CoV2 infected mother with acute gastrointestinal symptoms from first day of life. The baby was initially suspected to have small bowel atresia, but intraoperatively diagnosed with inflammatory colonic gangrene.

2. **PRESENTATION OF CASE**

Second born male neonate who was appropriate for gestational age, MCDA twin with birth weight of 1.75kg. He was born to COVID-19 mother with moderate illness, at 32weeks of gestation via vaginal route. Mother is a known case of rheumatic heart disease with mild mitral stenosis, on oral metoprolol, frusemide and penicillin prophylaxis since past 1year. Twin gestation was given, gradually stepped up feeds and was discharged after 10days. First day investigations revealed positive CRP (44mg/dL) with total leucocyte counts of 7000 with Absolute neutrophil count - 5600 and the baby was started on first line antibiotics.

With progressive distension of abdomen, respiratory distress was noted at 16hrs of life. Which required non-invasive continuous positive pressure support. Baby could pass meconium post rectal stimulation. Nasopharyngeal swab for SARS-CoV2 RT-PCR sent at 24hrs of life was negative. Subsequent x-rays showed multiple air fluid levels along with dilated bowel loops. Contrast barium enema confirmed distal dilated bowel loops with obstruction. (Fig. 2) Inflammatory panel was performed suspecting MIS-NB. Trial of IVIG at 2g/kg was given in view of elevated d-dimers (2361ng/mL) and S. Ferritin (456ng/mL). Total Anti-COVID-19 antibodies also turned out to be positive. Baby was taken up for emergency explorative laparotomy and intraoperatively found to have dilated gangrenous transverse colon. (Fig 3) Multiple clots were noted along the supplying vasculature suggestive of vascular insult. The gangrenous bowel of 6cm was surgically resected and colostomy was performed. Because of limited resources during COVID times could not send the sample for Histopathology. Baby was ventilated postoperatively and required multiple inotropes gradually. Baby succumbed at 20hours post-surgery inspite of extensive measures.

As the Twin 2 had stormy course, COVID inflammatory markers and antibodies to twin 1 were sent. No significant elevation in d-Dimer 452 ng/ml, CRP 1.2mg/dl and S.Ferritin 205ng/ml. Only Total Anti COVID 19 antibodies was positive. Baby remained asymptomatic throughout its NICU course. Preterm care was given, gradually stepped up feeds and was discharged after 10days.
3. DISCUSSION

COVID-19 infection is known in causing vascular and thrombotic events in adults. It has been recently observed to cause isolated gastrointestinal involvement with minimal respiratory symptoms in adults as well as in pediatric population [6-8]. Although there is uncertainty regarding the extent of vertical transmission of SARS-CoV2 infection, COVID-19 has been reported to cause fetal inflammatory response syndrome (FIRS) [4,5]. Zeng H et al studied trans placental transfer of Antibodies in infants born to COVID 19 Mothers [6]. Also Gupta.K et al. Reported a case on Gastric perforation and Necrotising enterocolitis associated with COVID antibodies [7].

The incidence of gastrointestinal manifestations in newborn of SARS-CoV2 mother is unknown. Hyper-coagulability induced by systemic inflammatory state, endothelial activation, hypoxia could lead to mesentric vascular thrombosis or direct viral infection acting on ACE-2 receptor could cause bowel and vascular endothelial damage [8] COVID-19 associated intestinal ischemia has been reported to occur with or without involvement of major arteries in adults [9]. Kenchappa et al, reported a 10year old girl with acute abdomen, SARS-CoV2 RT-PCR positive, operated for small bowel gangrene [10].

The baby described had gangrene of transverse colon which presented clinically as intestinal obstruction. Baby had elevated inflammatory markers suggestive of systemic coagulopathy and possible intrauterine fetal inflammatory syndrome resulting from maternal COVID-19. Kalyanshettar et al, have reported arterial thrombus and gangrene of lower extremity in a SARS-CoV2 positive newborn, treated with anticoagulants [11]. Amulya GI et al reported a 10 day old neonate with Multisystem inflammatory syndrome with prenatal exposure to COVID 19 [12]. Another study done on 29 COVID positive mothers and their babies showing Intestinal manifestation [13]. Being a novel entity, not much is known regarding the varied manifestations and treatment options available in newborns. Role of anticoagulants and IVIG in such cases of MIS-NB needs further validation.

4. CONCLUSION

We hope this case report draws attention towards intestinal gangrene could be a novel possible presentation of FIRS/MIS-NB in newborns born to COVID-19 Mothers.

CONSENT
As per international standard or university standard, patients’ written consent has been collected and preserved by the author(s).

ETHICAL APPROVAL
As per international standard or university standard written ethical approval has been collected and preserved by the author(s).
ACKNOWLEDGEMENT

We thank our professors and colleagues at Bowring & Lady Curzon Hospital for their support. We thank SNCU nodal officer at Government HSIS Gosha Hospital, Dr. Shanthakumar A. We also thank the department of paediatric surgery at BMCRI-Super Speciality Hospital for associated patient care.

COMPETING INTERESTS

Authors have declared that no competing interests exist.
