Interior Controllability of a Timoshenko Type Equation

Hanzel Lárez, Hugo Leiva*, Darwin Mendoza
Departamento de Matemática, Universidad de Los Andes, Mérida, 5101, Venezuela

Abstract In this paper we prove the interior controllability of the following Timoshenko Type Equation

\[
\begin{align*}
    u_{tt} - c \nu_{tt} + \alpha \Delta^2 u - \Delta u_t &= f_1(t, x) \text{ in } (0, \tau) \times \Omega, \\
    -c \nu_{tt} + \gamma \nu_{tt} + \delta \Delta^2 \nu - \Delta \nu_t &= f_2(t, x) \text{ in } (0, \tau) \times \Omega, \\
    u + \Delta u = v = \Delta v &= 0 \text{ on } (0, \tau) \times \partial \Omega,
\end{align*}
\]

where \( \Omega \) is a sufficiently regular bounded domain in \( \mathbb{R}^N (N \geq 1) \), \( \alpha > 0, \delta > 0, \gamma > 0 \) and \( c > 0 \) such that \( \gamma > c^2, \omega \) is an open nonempty subset of \( \Omega \), \( 1_{\omega} \) denotes the characteristic function of the set \( \omega \) and the distributed control \( f_i \in L^2([0, \tau]; L^2(\Omega)), i = 1, 2 \).

Specifically, we prove the following statement: For all \( \tau > 0 \) the system is approximately controllable on \([0, \tau]\). Moreover, we exhibit a sequence of controls steering the system from an initial state to a final state in a prefixed time \( \tau > 0 \).

Keywords Interior Controllability, Timoshenko Type Equation, Strongly Continuous Semigroups

1. Introduction

The Timoshenko beam theory was developed by Ukrainian-born scientist Stephen Timoshenko in the beginning of the 20th century. The model takes into account shear deformation and rotational inertia effects, making it suitable for describing the behavior of short beams, sandwich composite beams or beams subject to high-frequency excitation when the wavelength approaches the thickness of the beam. The resulting equation is of 4th order, but unlike ordinary beam theory - i.e. Bernoulli-Euler theory, there is also a second order spatial derivative present. Physically, taking into account the added mechanisms of deformation effectively lowers the stiffness of the beam, while the result is a larger deflection under a static load and lower predicted eigenfrequencies for a given set of boundary conditions. The latter effect is more noticeable for higher frequencies as the wavelength becomes shorter, and thus the distance between opposing shear forces decreases.

This paper has been motivated by the works in[2],[8],[9],[10],[12] and[13], where a new technique is used to prove the approximate controllability of some diffusion process.

Following[2],[9] and[13], in this paper we study the interior approximate controllability of the following Timoshenko Type Equation

\[
\begin{align*}
    u_{tt} - c \nu_{tt} + \alpha \Delta^2 u - \Delta u_t &= f_1(t, x) \text{ in } (0, \tau) \times \Omega, \\
    -c \nu_{tt} + \gamma \nu_{tt} + \delta \Delta^2 \nu - \Delta \nu_t &= f_2(t, x) \text{ in } (0, \tau) \times \Omega, \\
    u + \Delta u = v = \Delta v &= 0 \text{ on } (0, \tau) \times \partial \Omega
\end{align*}
\]

Where \( \Omega \) is a sufficiently regular bounded domain in \( \mathbb{R}^N (N \geq 1) \), \( \alpha > 0, \delta > 0, \gamma > 0 \) and \( c > 0 \) such that \( \gamma > c^2, \omega \) is an open nonempty subset of \( \Omega \), \( 1_{\omega} \) denotes the characteristic function of the set \( \omega \) and the distributed control \( f_i \in L^2([0, \tau]; L^2(\Omega)), i = 1, 2 \).

Specifically, we prove the following statement: For all \( \tau > 0 \) the system is approximately controllable on \([0, \tau]\). Moreover, we exhibit a sequence of controls steering the system from an initial state to a final state in a prefixed time \( \tau > 0 \).

But, before proving this result, we study the approximate controllability of the following Timoshenko type equation with the controls acting in the whole set \( \Omega \) using some result from[8].

\[
\begin{align*}
    u_{tt} - c \nu_{tt} + \alpha \Delta^2 u - \Delta u_t &= f_1(t, x) \text{ in } (0, \tau) \times \Omega, \\
    -c \nu_{tt} + \gamma \nu_{tt} + \delta \Delta^2 \nu - \Delta \nu_t &= f_2(t, x) \text{ in } (0, \tau) \times \Omega, \\
    u + \Delta u = v = \Delta v &= 0 \text{ on } (0, \tau) \times \partial \Omega
\end{align*}
\]

Where \( f_i \in L^2([0, \tau]; L^2(\Omega)), i = 1, 2 \).

Of course, the interior approximate controllability of this equation is more interesting problem from the applications point of view since the control is acting only in a subset or part of \( \Omega \). Our technique is simple and rests on the shoulders of the following fundamental results:

Theorem 1.1.[10] The eigenfunctions of \( -\Delta \) with Dirichlet boundary condition on \( \Omega \) are real analytic functions.

Theorem 1.2.[1] Suppose \( \Omega \subset \mathbb{R}^n \) is an open, nonempty and connected set, and \( f \) is a real analytic function in \( \Omega \) with \( f \equiv 0 \) on a non-empty open subset \( \omega \) of \( \Omega \). Then \( f \equiv 0 \) in \( \Omega \).

2. Abstract Formulation of the Problem
Let $Z = L^2(\Omega)$ and consider the linear unbounded operator

$$A : D(A) \subset Z \to Z$$

defined by $A\phi = -\Delta \phi$, where

$$D(A) = H^1_0(\Omega) \cap H^2(\Omega) \quad (3)$$

The operator $A$ has the following very well known properties: the spectrum of $A$ consists of only eigenvalues

$$0 < \lambda_1 < \lambda_2 < \cdots < \lambda_n \to \infty,$$

each one with multiplicity $\gamma_n$ equal to the dimension of the corresponding eigenspace.

a) There exists a complete orthonormal set $\{\phi_{n,k}\}$ of eigenvectors of $A$.

b) For all $z \in D(A)$ we have

$$Az = \sum_{n=1}^{\infty} \lambda_n \sum_{k=1}^{\gamma_n} < z, \phi_{n,k}> = \sum_{n=1}^{\infty} \lambda_n E_n z \quad (4)$$

where $\langle \cdot, \cdot \rangle$ is the inner product in $X$ and $E_n z = \sum_{k=1}^{\gamma_n} < z, \phi_{n,k}> \phi_{n,k}$.

So, $\{E_n\}$ is a family of complete orthogonal projections in $Z$ and

$$z = \sum_{n=1}^{\infty} E_n z, \quad z \in Z \quad (6)$$

c) $-A$ generates an analytic semigroup $T(t)_{t \geq 0}$ given by

$$T(t)z = \sum_{n=1}^{\infty} e^{-\lambda_n t} E_n z \quad (7)$$

d) The fractional powered spaces $X^r$ are given by:

$$X^r = D(A^r) = \{ x \in X : \sum_{n=1}^{\infty} \lambda_n^r \| E_n x \|^2 < \infty \}, \quad r \geq 0,$$

with the norm

$$\| x \|_r = \| A^r x \| = \left\{ \sum_{n=1}^{\infty} \lambda_n^{2r} \| E_n x \|^2 \right\}^{1/2}, \quad x \in X^r.$$ 

And

$$A^r x = \sum_{n=1}^{\infty} \lambda_n^r E_n x \quad (8)$$

Also, for $r \geq 0$ we define $Z^r = X^r \times X \times X^r \times X$, which is a Hilbert Space with norm given by

$$\left\| \begin{bmatrix} u \\ v \\ w \\ z \end{bmatrix} \right\|_r^2 = \| u \|^2 + \| v \|^2 + \| w \|^2 + \| z \|^2.$$ 

Hence, the equations (1) and (2) can be written as abstract systems of ordinary differential equations in the Hilbert space

$$Z_1 = X^1 \times X \times X^1 \times X$$

as follows:

$$y' = A_y + B_w F, \quad y \in Z_1, \quad t \geq 0,$$

$$y' = A_y + B_F \phi, \quad y \in Z_1, \quad t \geq 0, \quad (10)$$

where

$$y = \begin{bmatrix} u \\ v \\ w \\ z \end{bmatrix} ; \quad B_w = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

and

$$A = \begin{bmatrix} -\gamma \frac{d}{d} A^2 & -\gamma \frac{d}{d} A & -c \frac{d}{d} A & -\frac{c}{d} A \\ 0 & -c \frac{d}{d} A & -\frac{c}{d} A & -\frac{c}{d} A \\ -\gamma \frac{d}{d} A & -\gamma \frac{d}{d} A & -\frac{d}{d} A^2 & -\frac{d}{d} A \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad (12)$$

is a linear unbounded operator with domain

$$D(A) = D(A^2) \times D(A) \times D(A^2) \times D(A) \quad \text{and}$$

$$d = \left[ \begin{array}{cc} 1 & -c \\ c & \gamma \end{array} \right]$$

Now, using the following Lemma from[11] we can prove that the linear unbounded operator $A$ given by the linear equation (9) generates a strongly continuous semigroup which decays exponentially to zero.

Lemma 2.1. Let $Z$ be a separable Hilbert space and $\{A_n\}_{n \geq 1}, \{P_n\}_{n \geq 1}$ two families of bounded linear operators in $Z$ with $\{P_n\}_{n \geq 1}$ being a complete family of orthogonal projections such that

$$A_n P_n = P_n A_n, \quad n = 1, 2, 3, ... \quad (13)$$

Define the following family of linear operators

$$T(t)z = \sum_{n=1}^{\infty} e^{A_n t} P_n z, \quad t \geq 0. \quad (14)$$

Then

a) $T(t)$ is a linear bounded operator if

$$\| e^{A_n t} \| \leq g(t), \quad n = 1, 2, 3, ... \quad (15)$$

for some continuous real-valued function $g(t)$.

b) Under the condition (15) $T(t)_{t \geq 0}$ is a $C_0$-semigroup in the Hilbert space $Z$ whose infinitesimal generator $A$ is given by

$$A = \sum_{n=1}^{\infty} A_n P_n z, \quad z \in D(A) \quad (16)$$

With

$$D(A) = \{ z \in Z : \sum_{n=1}^{\infty} \| A_n P_n z \|^2 < \infty \} \quad (17)$$

c) The spectrum $\sigma(A)$ of $A$ is given by

$$\sigma(A) = \bigcup_{n=1}^{\infty} \sigma(A_n), \quad (18)$$

Theorem 2.2. The operator $A$ given by (12) is the infinitesimal generator of a strongly continuos semigroup $T(t)_{t \geq 0}$ represented by

$$T(t)z = \sum_{n=1}^{\infty} e^{A_n t} P_n z, \quad z \in Z_1, \quad t \geq 0. \quad (19)$$

Where $\{P_n\}_{n \geq 1}$ is a complete family orthogonal projections in the Hilbert space $Z_1$ given by

$$P_j = \begin{bmatrix} E_j & 0 & 0 & 0 \\ 0 & E_j & 0 & 0 \\ 0 & 0 & E_j & 0 \\ 0 & 0 & 0 & E_j \end{bmatrix} ; \quad j = 1, 2, ..., (20)$$

and

$$A_j = R_j P_j, \quad A_j = \begin{bmatrix} 0 & \frac{\gamma a}{d} \frac{d}{d} A & \frac{\gamma c}{d} \frac{d}{d} A & \frac{c}{d} A \\ -\frac{\gamma a}{d} \frac{d}{d} A & 0 & 0 & \frac{c}{d} A \\ -\frac{\gamma c}{d} \frac{d}{d} A & -\frac{c}{d} A & 0 & \frac{c}{d} A \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad (21)$$

Where $j = 1, 2, ...$

Therefore, $e^{A_j t} = e^{\tilde{A}_j t} P_j$, the eigenvalues

$$\sigma_1(j), \sigma_2(j), \sigma_3(j), \sigma_4(j), \text{of } R_j \text{ are simple and}$$

$$\sigma_1(j) = -\lambda_j \rho_j; \quad \sigma_2(j) = -\lambda_j \rho_j;$$

$$\sigma_3(j) = -\lambda_j \rho_j; \quad \sigma_4(j) = -\lambda_j \rho_j.$$ 

Where $\rho_i > 0, \quad i = 1, 2, 3, 4$ are the roots of the characteristic equation

$$\gamma - c^2 z^4 + (1 + \gamma) z^3 + (\delta + \gamma \alpha + 1) z^2 + (\delta + \alpha) z + \frac{\alpha \delta}{\alpha} = 0,$$

and this semigroup decays exponentially to zero; that is to say,

$$\| T(t) \| \leq Me^{-\mu t}, \quad t \geq 0,$$

where

$$\mu = \lambda_1 \rho_1$$

and
To this end, for all the definition of approximate controllability for this system. But, before we shall give controllability of the system (10). But, before we shall give the following gap condition plays an important role in this paper:

\[ 0 < \rho_1 < \rho_2 < \rho_3 < \rho_4 \text{ and } \frac{\nu_{i+1}}{\nu_1} > \frac{\nu_i}{\rho_1}, \quad j = 1, 2, 3, 4. \] (22)

3. Controllability of the System (10)

In this section we shall prove the approximate controllability of the system (10). But, before we shall give the definition of approximate controllability for this system. To this end, for all \( y_0 \in Z \) and \( F \in L^2([0, \tau]; U) \) the initial value problem

\[
\begin{align*}
y'(t) &= A y + B F, \quad y \in Z, \\
y(0) &= y_0,
\end{align*}
\] (23)

were \( U = L^2(\Omega) \times L^2(\Omega) \), admits only one mild solution given by

\[ y(t) = T(t) y_0 + \int_0^t T(t-s) B F(s) ds, \quad t \in [0, \tau]. \] (24)

Definition 3.1. (Approximate Controllability) The system (10) is said to be approximately controllable on \([0, \tau]\) if for every \( y_0, y_1 \in Z \), \( \epsilon > 0 \) there exists \( F \in L^2([0, \tau]; U) \) such that the solution \( y(t) \) of (23) corresponding to \( F \) verifies:

\[ y(0) = y_0 \quad \text{and} \quad \|y(\tau) - y_1\| < \epsilon. \]

Definition 3.2. For the system (10) we define the following concepts:

a) The controllability mapping \( B^* : L^2(0, \tau; U) \to Z \) is defined by

\[ B^* F = \int_0^\tau T(s) B F(s) ds. \] (25)

b) The grammian mapping \( L_{B^*} : Z \to Z \) is given by

\[ L_{B^*} = B^* B^* \] that is to say

\[ L_{B^*} = \int_0^\tau T(s) B B^* T'(s) ds. \]

Theorem 3.3. The system (10) is approximately controllable on \([0, \tau]\) if, and only if, one of the following statements holds:

i). \( \text{Ker}(B^{**}) = \{0\} \)

ii). \( \langle L_B z, z \rangle > 0, z \neq 0 \text{ and } \text{en} Z. \)

iii). \( B^* T' z = 0 \Rightarrow z = 0. \)

iv). \( \text{Ran}(B^{**}) = Z. \)

Proposition 3.4. The following equality holds:

\[ P_j B B^* = B B^* P_j, \quad j = 1, 2, ..., \] (26)

Prof. From (11) we know that \( B = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix} \). Then, \( B^* = \begin{bmatrix} 0 & I_x \\ 0 & 0 \end{bmatrix} \). Therefore,

\[ P_j B B^* = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}, \quad j = 1, 2, ..., \]

\[ P_j B B^* = \begin{bmatrix} E_j & 0 \\ 0 & E_j \end{bmatrix}, \quad j = 1, 2, ... \]

On the other hand,

\[ P_j B B^* = \begin{bmatrix} E_j & 0 \\ 0 & E_j \end{bmatrix}, \quad j = 1, 2, ..., \]

Remark 3.1. If \( \omega \) is a nonempty open sub set of \( \Omega \) such that \( \omega \neq \Omega \), then

\[ P_j B_o B^{o*}_o \neq B_o B^{o*}_o P_j, \quad j = 1, 2, ..., \]

Now, we shall use the equality (26) in order to characterize the approximate control ability of the system (10) in terms of the following family of finite dimensional control problems,

\[ y' = A_j y + B_j F(t), \quad t \geq 0, \quad j = 1, 2, ..., \] (27)

where \( B_j = P_j \) and \( F \in L^2([0, \tau]; U) \).

Proposition 3.5. The operator

\[ L_{B_j^*} = \int_0^\tau T(s) B_j^* T'(s) ds \]

can be written as follows

\[ L_{B_j^*} = \sum_{j=1}^{\infty} L_{B_j} P_j \]

where,

\[ L_{B_j} y = \int_0^\tau e^{A_j t} B_j^* e^{A_j^* y} ds, \quad y \in \text{Ran}(P_j) \]

Proof. From condition (26) and the representation (19) of T(t) we obtain

\[ L_{B_j^*} = \int_0^\tau \sum_{j=1}^{\infty} e^{A_j t} P_j B B^* e^{A_j^* t} P_j ds \]

\[ L_{B_j^*} = \int_0^\tau \sum_{j=1}^{\infty} e^{A_j t} B_j^* e^{A_j^* t} P_j ds \]

\[ L_{B_j^*} = \int_0^\tau \sum_{j=1}^{\infty} e^{A_j t} B_j B_j^* e^{A_j^* t} P_j ds \]

\[ L_{B_j^*} = \sum_{j=1}^{\infty} \int_0^\tau e^{A_j t} B_j B_j^* e^{A_j^* t} P_j ds \]

\[ L_{B_j^*} = \sum_{j=1}^{\infty} \int_0^\tau e^{A_j t} B_j B_j^* e^{A_j^* t} P_j ds \]

\[ L_{B_j^*} = \sum_{j=1}^{\infty} \int_0^\tau e^{A_j t} B_j B_j^* e^{A_j^* t} P_j ds \]

\[ L_{B_j^*} = \sum_{j=1}^{\infty} \int_0^\tau e^{A_j t} B_j B_j^* e^{A_j^* t} P_j ds \]
Hence,
\[ L_{B_j}z = \sum_{j=1}^{n} L_{B_j}^r P_j z, \]
where,
\[ L_{B_j}^r = \int_0^\tau e^{A_s} B_j B_j^r e^{A_s} P_j ds. \]

Theorem 3.6(a) The system (10) is approximately controllable on \([0, \tau] \text{if, and only if, each of the following system} \]
\[ y' = A_j y + B_j \mathcal{F}, \ y(t) \in \text{Range}(P_j), \ t \geq 0, \ j = 1, 2, \ldots \tag{28} \]
is approximately controllable.

b) The system (10) is approximately controllable on \([0, \tau] \text{if, and only if,} \]
\[ (L_{B_j}y, y) > 0, \forall \ y \neq 0 \in \text{Range}(P_j), \ j = 1, 2, \ldots \]
Proof. a) For the purpose of contradiction, let us assume that system (10) is approximately controllable on \([0, \tau] \text{and there exists} \]
\( j \) such that the system
\[ z' = A_j z + B_j u(t); \ z \in \text{Range}(P_j), \]
is not approximately controllable on \([0, \tau] \). Then, there exists \( z_j \in \text{Range}(P_j) \) such that:
\[ B_j^* e^{A_j t} z_j = 0, \ t \in [0, \tau] \text{and} \ z_j \neq 0. \tag{29} \]

On the other hand, from part (iii) of Theorem 3.3 we have that:
\[ B_j^* T_j(t) z = 0, \ \forall t \in [0, \tau] \Rightarrow z = 0. \]
Now, letting \( z = P_j z_j = z_j \), we obtain:
\[ B_j^* T_j(t) z_j = B_j^* \sum_{l=1}^{n} e^{A_l t} P_l z_j = B_j^* e^{A_j t} P_j z_j = (B_j^*) e^{A_j t} t P_j z_j = 0. \]
This implies that \( z_j = 0 \), which contradicts the assumption. Therefore, (28) is approximately controllable for all \( j \).

b) follows immediately from (a) and Theorem 3.3.

Next, we shall use the following result: Consider the following finite dimensional control system
\[ y' = Ay(t) + Bu(t), \ t > 0, \ z \in \mathbb{R}^n, u \in \mathbb{R}^l, \tag{30} \]
where \( A \) and \( B \) are matrices of dimensions \( n \times n \) and \( n \times l \) respectively.

Theorem 3.7. (see [Lee and Marcus (1967)]). (Kalman) The system (30) is controllably on \([0, \tau]\) if, and only if,
\[ \text{Rank}[B : AB : \cdots : A^{n-1}B] = n. \]
That is to say,
\[ S_p \{ A^j B \mathbb{R}^m : j = 0, 1, 2, \ldots, n - 1 \} = \mathbb{R}^n, \]
where \( \text{Rank}(C) = \dim[\text{Range}(C)] \) and \( \text{Sp}(C) \) is the vector space generated by \( C \).

Theorem 3.8. The system (10) is approximately controllably on \([0, \tau] \).
Proof. It is enough to prove the controllability of the finite dimensional system (28) with
\[ A_j = R_j P_j R_j = \begin{bmatrix} \frac{-\gamma_1}{d} & \frac{-c_1}{d} & 0 & 0 \\ \frac{-\gamma_2}{d} & \frac{-c_2}{d} & \frac{-\delta}{d} & \frac{-c_1}{d} \\ \frac{-\gamma_3}{d} & \frac{-c_3}{d} & \frac{-\delta}{d} & \frac{-c_2}{d} \\ \frac{-\gamma_4}{d} & \frac{-c_4}{d} & \frac{-\delta}{d} & \frac{-c_3}{d} \end{bmatrix}, \]
and
\[ B_j \mathcal{F} = P_j B_j \mathcal{F} = \begin{bmatrix} E_j & 0 & 0 & 0 \\ 0 & E_j & 0 & 0 \\ 0 & 0 & E_j & 0 \\ 0 & 0 & 0 & E_j \end{bmatrix}. \]
So,
\[ B_j \mathcal{F} = P_j B_j \mathcal{F} = \begin{bmatrix} E_j & 0 & 0 & 0 \\ 0 & E_j & 0 & 0 \\ 0 & 0 & E_j & 0 \\ 0 & 0 & 0 & E_j \end{bmatrix}. \]
Therefore, the controllability of the system (28) is equivalent to the controllability of each finite dimensional systems,
\[ y' = R_j y + D \mathcal{F} \tag{31} \]
where \( \mathcal{F} \in L^2(0, \tau; \mathbb{R}^n) \) and the system (31) is controllable if, and only if,
\[ \text{Rank} \left[ D : R_j; D : R_j^2 D : R_j^3 D \right] = 4, \]
which can be verified trivially. Therefore, system (31) is controllable, and consequently, system (10) is also approximately controllable applying Theorem 3.6.

4. Proof of the Main Theorem

In this section we shall prove the main result of this paper on the approximate controllability of the linear system (9).

To this end, we observe that the definition of controllability for system (9) is similar to the one given to system (10). And, for all \( y_0 \in Z_1 \) and \( \mathcal{F} \in L^2(0, \tau; U) \) the initial value problem
\[ \begin{cases} y' = Ay + B_\omega \mathcal{F}, \ y \in Z_1 \\ y(0) = y_0 \end{cases} \tag{32} \]
admits only one mild solution given by
\[ y(t) = T(t)y_0 + \int_0^t T(t-s)B(u,F(s))ds, \quad t \in [0,\tau]. \]

Consider the following bounded linear operator:
\[ G:L^2(0,\tau;U) \to Z_1, \quad Gu = \int_0^\tau T(\tau-s)B(u(s))ds. \]

Whose adjoint operator \( G^*:Z_1 \to L^2(0,\tau;U) \) is given by
\[ (G^*z)(s) = B^*_u T^*(\tau-s)z, \quad \forall z \in [0,\tau], \quad \forall \tau \in Z_1. \]

The following lemma is trivial:

Lemma 4.1. The equation (9) is approximately controllable on \([0,\tau]\) if, and only if, \( \text{Range}(\hat{G}) = Z \).

The following result is well known from linear operator theory:

Lemma 4.2. Let \( W \) and \( Z \) be Hilbert spaces and \( G^* \in L(Z, W) \) the adjoint operator of the linear operator \( G \in L(Z, W) \). Then, \( \text{Range}(\hat{G}) = Z \iff \text{Ker}(\hat{G}^*) = \{0\} \).

As a consequence of the foregoing Lemma one can prove the following result:

Lemma 4.3. Let \( W \) and \( Z \) be Hilbert spaces and \( G^* \in L(Z, W) \) the adjoint operator of the linear operator \( G \in L(Z, W) \). Then, \( \text{Range}(\hat{G}) = Z \) if, and only if, one of the following statements holds:

a) \( \text{Ker}(\hat{G}^*) = \{0\} \).

b) \( \langle GG^*z, z \rangle > 0, \quad z \neq 0; \text{in } Z \).

c) \( \lim_{\alpha \to 0} \alpha (a(1 + G^*G)^{-1} - I)z = 0 \).

d) \( \sup_{\alpha > 0} |\alpha(a(1 + G^*G)^{-1})| \leq 1 \).

The following theorem follows directly from (35), Lemma 4.1 and Lemma 4.3.

Theorem 4.4. (9) is approximately controllable on \([0,\tau]\) if, and only if,
\[ B^*_u T^*(t)z = 0, \quad \forall t \in [0,\tau], \quad \Rightarrow z = 0 \quad (36) \]

For the proof of the main theorem of this paper we shall use the following version of Lemma 3.14 from [3] and Lemma 4.4 from [2].

Lemma 4.5. Let \( \{a(s)\}_{s \geq 0}, \{b(s)\}_{s \geq 0} \) be sequences of real numbers such that
\[ a(s) s < a(s), \quad s \leq 1 \]
\[ a(s) + 1 < a(s+1) \quad s \leq 1 \quad s \geq 1 \quad (37) \]

Then, for any \( \tau > 0 \) we have that
\[ \sum_{s=1}^{\infty} (a(s+1)-a(s))b_j = 0, \quad \forall \tau \in [0,\tau] \]

if, and only if,
\[ b_1 = b_2 = b_3 = \cdots = b_j = 0, \quad \forall j \geq 1. \quad (38) \]

Proof. (Lemma 4.5) By analytic extension we obtain
\[ \sum_{s=1}^{\infty} (a(s+1)-a(s))b_j + \sum_{s=1}^{\infty} e^{a(s)}b_j = 0, \quad \forall \tau \in [0,\tau] \]

and
\[ \sum_{s=1}^{\infty} e^{a(s)}b_j = 0, \quad \forall \tau \in [0,\tau] \]

Now, dividing this expression by \( e^{a(s)} \) we get
\[ b_1 + \sum_{s=1}^{\infty} e^{a(s)}b_j + \sum_{s=1}^{\infty} e^{a(s)}b_j = 0, \quad \forall \tau \in [0,\tau]. \]

Proof. (Lemma 4.5) By analytic extension we obtain
\[ \sum_{s=1}^{\infty} (a(s+1)-a(s))b_j = 0, \quad \forall \tau \in [0,\tau] \]

From (37) we have that \( a(s) - a(s+1) < 0 \) and \( a(s) - a(s+1) < 0 \).

Then, we have that
\[ \sum_{j=1}^{\infty} e^{a(s)}b_j + \sum_{j=1}^{\infty} e^{a(s)}b_j + \sum_{j=1}^{\infty} e^{a(s)}b_j + \cdots \]

\[ \sum_{j=1}^{\infty} e^{a(s)}b_j = 0, \quad \forall \tau \in [0,\tau]. \]

Proof. (Lemma 4.5) By analytic extension we obtain
\[ \sum_{s=1}^{\infty} e^{a(s)}b_j = 0, \quad \forall \tau \in [0,\tau] \]

From (38) we have that \( b_1 = b_2 = b_3 = \cdots = b_j = 0, \quad \forall \tau \geq 1. \]

Now, we are ready to formulate and prove the main theorem of this work.

Theorem 4.6. (Main Result) For all nonempty open subset \( \Omega \) of \( \Omega \) and \( \tau > 0 \) the system (9) is approximately controllable on \([0,\tau] \).

Moreover, a sequence of controls steering the system (9) from initial state \( y_0 \) to an \( \varepsilon \)-neighborhood of the final state \( y_1 \) at time \( \tau > 0 \) is given by
\[ u(t) = B^*_u T^*(t - \tau)(a(1 + G^*G)^{-1}(z_1 - T^*(t)y_0)), \quad \text{and the error of this approximation} \]
and, since the eigenvalues of the matrix \( A \) are simple, there exists a family of complete orthogonal projections \( \{ q_1(j), q_2(j), q_3(j), q_4(j) \} \) on \( \mathbb{R}^4 \) such that
\[
\begin{align*}
ed_j &= \begin{bmatrix} e^{a_j(t)} q_1(j) P_j^* + e^{a_{1j}(t)} q_2(j) P_j^* + e^{a_{2j}(t)} q_3(j) P_j^* + e^{a_{3j}(t)} q_4(j) P_j^* \end{bmatrix}.
\end{align*}
\]

Therefore,
\[
B_0^* T^*(t) x = \sum_{j=1}^{\infty} a_j e^{a_j(t)} P_j^* x = \sum_{j=1}^{\infty} a_{1j} e^{a_{1j}(t)} P_{s,j}^* x,
\]
where \( P_{s,j} = q_s(j) P_j = q_j P_s \).

Now, suppose that \( B_0^* T^*(t) z = 0, \forall t \in [0, \tau] \). Then,
\[
B_0^* T^*(t) x = \sum_{j=1}^{\infty} a_j e^{a_j(t)} P_j^* x = \sum_{j=1}^{\infty} e^{a_{1j}(t)} B_0^* P_{s,j}^* z = 0
\]
\[
eq \sum_{j=1}^{\infty} e^{a_{1j}(t)} B_0^* P_{s,j}^* z, \forall x \in \Omega
\]

The assumption (22) implies that the sequence
\[
\{ a_j = \sigma_j, j \neq s \} = \{ -\lambda_j r_j; s = 1,2,3,4; j = 1,2, \ldots \}
\]
satisfies the conditions on Lemma 4.5. In fact, we have trivially that
\[
\lambda_{j+1} > \rho_k, 1 \leq s \leq 4; 0 \leq k \leq 4 - s.
\]

Therefore,
\[
-\lambda_{j+1} \rho_k < -\lambda_j \rho_k, 1 \leq s \leq 4; 0 \leq k \leq 4 - s.
\]
i.e.,
\[
\alpha_s(j) < \alpha_s(j+1), 1 \leq s \leq 4; 0 \leq k \leq 4 - s.
\]

Then, from Lemma 4.5 we obtain for all \( x \in \Omega \) that
\[
\lim_{n \to \infty} (B_0^* P_{s,j}^*) x = 0, \quad \forall x \in \Omega,
\]
\[
s = 1,2,3,4; j = 1,2, \ldots
\]
we obtain
\[
q_s(j) = \begin{bmatrix} a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} 
\end{bmatrix},
\]
we obtain that
\[
(B_0^* P_{s,j}^*) x = (B_0^* P_{s,j}) x = 0.
\]

Then,
\[
\begin{bmatrix} 0 & 1 & 1 & 0 \\
 0 & 0 & 0 & 1 \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 a_{1s} & a_{2s} & a_{3s} & a_{4s} \\
 \end{bmatrix}
\begin{bmatrix} E_1 & E_2 & E_3 & E_4 \\
 0 & 0 & 0 & 0 \\
 E_1 & E_2 & E_3 & E_4 \\
 0 & 0 & 0 & 0 \\
 E_1 & E_2 & E_3 & E_4 \\
 0 & 0 & 0 & 0 \\
 \end{bmatrix}
= \begin{bmatrix} 0 & 0 & 0 & 0 \\
 0 & 0 & 0 & 0 \\
 0 & 0 & 0 & 0 \\
 0 & 0 & 0 & 0 \\
 0 & 0 & 0 & 0 \\
 0 & 0 & 0 & 0 \\
 \end{bmatrix}
\]

The system (9) is equivalent to the approximate controllability of the system (10).

5. Remark

The result presented in this paper can be formulated in a more general setting. Indeed, we can consider the following Timoshenko Type Equation in a general Hilbert space \( Z \) and \( u, v \in Z \)
\[
\begin{align*}
\left\{ & u - cu + a(\lambda) \\\, \frac{d}{dt} u + au = C_1 f_1 (t), t \in [0, \tau] \quad (41) \\
- c u + \gamma v + \delta (\lambda) v + \delta v = C_2 f_2 (t), t \in [0, \tau] \\
\end{align*}
\]
where, \( A: D(A) \subset Z \to Z \) is an unbounded linear operator in \( Z \) with the spectral decomposition given by
\[
A Z = \sum_{j=1}^{\infty} \lambda_j Z \mid_{Z_j} \phi_j, k,
\]
with eigenvalues
\[
0 < \lambda_1 < \lambda_2 < \cdots < \lambda_n \to \infty,
\]
each one with multiplicity \( \{ \gamma_n \} \) equal to the dimension of the corresponding eigenspace.
a) There exists a complete orthonormal set \( \{ \emptyset_n \} \) of eigenvectors of \( A \).

b) For all \( z \in D(A) \) we have

\[
Az = \sum_{n=1}^{\infty} \lambda_n E_n z = \sum_{n=1}^{\infty} \lambda_n \sum_{k=1}^{N_n} < z, \phi_{n,k} > \phi_{n,k} = \sum_{n=1}^{\infty} \lambda_n E_n z
\]

The controls \( f_1, f_2 \in L^2(0, \tau; Z) \) and \( C_1, C_2: Z \rightarrow Z \) are linear and bounded. When \( Z = L^2(\Omega) \), the operators \( I \) and \( 1_{\omega} I \) are particular cases of \( C_1 \) and \( C_2 \).
