Towards Tracking Opium Related Discussions in Social Media

Objective
We aim to develop an automated method to track opium related discussions that are made in the social media platform called Reddit. As a first step towards this goal, we use a keyword-based approach to track how often Reddit members discuss opium related issues.

Introduction
In recent years, the use of social media has increased at an unprecedented rate. For example, the popular social media platform Reddit (http://www.reddit.com) had 83 billion page views from over 88,000 active sub-communities (subreddits) in 2015. Members of Reddit made over 73 million individual posts and over 725 million associated comments in the same year [1].

We use Reddit to track opium related discussions, because Reddit allows for throwaway and unidentifiable accounts that are suitable for stigmatized discussions that may not be appropriate for identifiable accounts. Reddit members exchange conversation via a forum like platform, and members who have achieved a certain status within the community are able to create new topically focused group called subreddits.

Methods
First, we use a dataset archived by one of Reddit members who used Reddit’s official Application Programming Interface (API) to collect the data (https://www.reddit.com/r/datasets/comments/3bxlg7/i_have_every_publicly_available_reddit_comment/). The dataset is comprised of 239,772 (including both active and inactive) subreddits, 13,213,173 unique user IDs, 114,320,798 posts, and 1,659,361,605 associated comments that are made from Oct of 2007 to May of 2015. Second, we identify 10 terms that are associated with opium. The terms are ‘opium’, ‘opioid’, ‘morphine’, ‘opiate’, ‘hydrocodone’, ‘oxycodone’, ‘fentanyl’, ‘oxy’, ‘heroin’, ‘methadone’. Third, we preprocess the entire dataset, which includes structuring the data into monthly time frame, converting text to lower cases, and stemming keywords and text. Fourth, we employed a dictionary approach to count and extract timestamps, user IDs, posts, and comments containing opium related terms. Fifth, we normalized the frequency count by dividing the frequency count by the overall number of the respective variable for that period.

Results
According to our dataset, Reddit members discuss opium related topics in social media. The normalized frequency count of posters shows that less than one percent members, on average, talk about opium related topics (Figure 1). Although the community as a whole does not frequently talk about opium related issues, this still amounts to more than 10,000 members in 2015 (Figure 2). Moreover, members of Reddit created a number of subreddits, such as ‘oxycontin’, ‘opioid’, ‘heroin’, ‘oxycodon’, that explicitly focus on opioids.

Conclusions
We present preliminary findings on developing an automated method to track opium related discussions in Reddit. Our initial results suggest that on the basis of our analysis of Reddit, members of the Reddit community discuss opium related issues in social media, although the discussions are contributed by a small fraction of the members.

We provide several interesting directions to future work to better track opium related discussions in Reddit. First, the automated method needs to be further developed to employ more sophisticated methods like knowledge-based and corpus-based approaches to better extract opium related discussions. Second, the automated method needs to be thoroughly evaluated and measure precision, recall, accuracy, and F1-score of the system. Third, given how many members use social media to discuss these issues, it will be helpful to investigate the specifics of their discussions.
