EXPERIMENTAL SECTION

General Considerations. All manipulations were carried out using standard Schlenk or glovebox techniques under a N₂ or Ar atmosphere. Unless otherwise noted, solvents were deoxygenated and dried by thoroughly sparging with Ar gas, followed by passage through an activated alumina column. Nonhalogenated solvents were tested with a standard purple solution of sodium benzophenone ketyl in THF in order to confirm effective oxygen and moisture removal. All reagents were purchased from commercial vendors and used without further purification unless otherwise stated. (acriPNP)Ni•C₁₀H₈ (1•C₁₀H₈), (acriPNP)NiH (3) and NaBArF₄ were prepared according to the literature procedures.¹ Elemental analyses of 2-Na, 4-Ph, 4-Naph, 4-Anth, 4-oTol, 4-mTol, 4-pTol and (acriPNP)Ni(benzyl) were carried out at KAIST Analysis Center for Research Advancement on a Thermo Scientific FLASH 2000 series or Flash EA 1112 instrument and 2-K, 2-Li and 5 at the Organic Chemistry Research Center in Sogang University on a Thermo Scientific Flash EA 1112 instrument. Deuterated solvents were purchased from Euriso-top or Deutero, degassed, and dried over activated 4 Å molecular sieves prior to use.

X-ray Crystallography. The diffraction data of 4-Naph was collected on ADSC Quantum-210 detector at 2D SMC at the Pohang Accelerator Laboratory, Korea. A suitable size and quality of crystal was coated with Paratone-Oil and mounted on a Dual-Thickness MicroLoops LD purchased from MiTeGen. The data was collected with Si(111) double crystal monochromated synchrotron radiation (λ = 0.70000 Å) at 100 K. The ADSC Q210 ADX program was used for data collection and HKL3000sm (Ver. 703r) was used for cell refinement, reduction and absorption correction. The diffraction data of 2, 4-Ph, 4-Anth, 4-oTol, 4-mTol, 4-pTol, and (acriPNP)Ni(benzyl) were collected on a Bruker SMART 1000. The data were collected with graphite-monochromated MoKα radiation (λ = 0.71073 Å) under a stream of N₂ (g) at 120 K. Cell parameters were determined and refined by SMART program.² Data reduction was performed using SAINT software.³ An empirical absorption correction was applied using the SADABS program.⁴ The structures were solved by direct methods, and all non-hydrogen atoms were subjected to anisotropic refinement by full-matrix least squares on F² by using the SHELXTL/PC package.⁵ Unless otherwise noted, hydrogen atoms were placed at their geometrically calculated positions and refined riding on the corresponding carbon atoms with isotropic thermal parameters. The diffraction data of 5 was collected on a Rigaku XtaLAB PRO at National Center for Inter-University Research Facilities. The data was collected with Cu Kα radiation (λ = 1.54184 Å) at –180 °C. CrysAlisPro was used for cell refinement, reduction and absorption correction. Full crystallographic details can be obtained free of charge from the Cambridge Crystallographic Data Center via www.ccdc.cam.ac.uk/data_request/cif (CCDC 1968048-1968055 for 2, 4-Ph, 4-Naph, 4-Anth, 4-oTol, 4-mTol, 4-pTol and (acriPNP)Ni(benzyl) and 2078589 for 5).

Spectroscopic Measurements. A Bruker AVHD-400 and a Varian-400 spectrometer were used to measure \(^1\)H, \(^{13}\)C and \(^{31}\)P NMR spectra. The chemical shifts for \(^1\)H NMR spectra were quoted in part per million (ppm) referenced to residual solvent peaks. \(^{13}\)C NMR chemical shifts were quoted in part per million (ppm) referenced to internal solvent peaks. The chemical shifts for \(^{31}\)P NMR spectra were quoted in parts per million (ppm) referenced to external phosphoric acid. Coupling constants, \(J\), were reported in hertz unit (Hz). The following abbreviations were used to describe peak splitting patterns when appropriate: \(s\) = singlet, \(d\) = doublet, \(t\) = triplet, \(q\) = quartet, \(m\) = multiplet. Diffusion NMR experiments for 2, 4-Ph, 4-Naph and \(\{\text{acriPNP}\}Ni\)\(_2\)-m-CO\(_2\)-k\(^2\)C\(_{10}\)O\(_6\) were conducted using a Bruker AVANCE III HD 850 spectrometer at National Center for Inter-
University Research Facilities. The data were collected in THF-$d_8$ at 298 K with the bipolar pulse pairs stimulated echo pulse sequence (ledbpgp2s). Solid-state $^{23}$Na magic angle spinning (MAS) NMR experiments were acquired at Bruker AVANCE II+ 400 MHz NMR system (in KBSI Seoul Western Center). The chemical shifts for $^{23}$Na NMR spectra were quoted in part per million (ppm) referenced to external NaCl. The pulse field gradient was incremented from 0 to 48 G cm$^{-1}$ with 24 steps. UV-vis spectra were measured by an Agilent Cary 60 UV-vis spectrophotometer using a 1 cm two-window quartz spectrophotometer cell sealed with a screw-cap purchased from Hellma Analytics (117.100-QS). Infrared spectra were recorded in KBr pellets by Bruker VECTOR 33 and PerkinElmer Spectrum Two FT-IR Spectrometer. Frequencies are given in reciprocal centimeters (cm$^{-1}$) and only selected absorbances were reported. All EPR measurements were carried out at Korea Basic Science Institute (KBSI) in Seoul, Korea. CW X-band EPR spectra were collected on a Bruker EMX plus 6/1 spectrometer equipped with an Oxford Instrument ESR900 liquid He cryostat using an Oxford ITC 503 temperature controller. Spectra were collected with the following experimental parameters: microwave frequency, 9.6 GHz; microwave power, 0.93 mW; modulation amplitude, 10 G; modulation frequency, 100 kHz; temperature, 10 K.

**Electrochemistry.** Electrochemical measurements were carried out in a glovebox under a N$_2$ atmosphere using an Autolab PGSTAT12 potentiostat. A glassy carbon electrode was used as the working electrode and a platinum wire was used as the auxiliary electrode. The reference electrode was Ag/AgNO$_3$ in an electrolyte solution. Solution of 0.3 M tetra-$n$-butylammonium hexafluorophosphate in THF was used as an electrolyte solution. The solutions of reference electrode, electrolyte and analyte were also prepared under an inert atmosphere. The ferrocene couple FeCp$_2$/FeCp$_2^+$ was used as an external reference.

**Computational Details.** Single point calculations, geometry optimizations and frequency calculations were performed with the Gaussian09$^7$ with the B3LYP functional$^{8-10}$ theory. The 6-311+g** basis set was used for all other atoms. The initial geometries for computational models of (acriPNP)NiCl,$^1$ 4-Naph, 4-Anth, 4-$o$Tol, 4-$m$Tol, 4-$p$Tol, (acriPNP)Ni(benzyl) and 5 were obtained from its corresponding X-ray crystal structure. The initial geometries for computational models of (acriPNP)Ni(1-naphthyl), (acriPNP)Ni(1-anthracenyl) and (acriPNP)Ni(9-anthracenyl) were obtained from X-ray crystal structure of those analogous compounds. Optimized structures were verified using frequency calculations to confirm the absence of any imaginary frequency.
Synthesis of {[^{acri}PNP]}Ni–(N$_2$)–Na(THF)$_2$)$_2$ (2). After sodium (106 mg, 4.61 mmol) was added to a solution of naphthalene (118 mg, 0.918 mmol) in 5 mL of THF, the reaction mixture was stirred for 3 hrs at room temperature. The resulting sodium naphthalide solution was filtered away from remaining sodium and added dropwise to a solution of ([^{acri}PNP]}NiC$_6$H$_5$ (599 mg, 0.914 mmol) in 10 mL of THF at -35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from reddish brown to red. After stirring for additional 30 min, the reaction mixture was filter through Celite, and the volatiles were removed under vacuum. The resulting residue was dissolved in 50 mL of pentane/THF (5:1), and the solution was cooled to -35°C. A red crystalline solid was precipitated out after two days. An resulting product {[^{acri}PNP]}Ni–(N$_2$)–Na(THF)$_2$)$_2$ (2, 475 mg, 0.358 mmol, 78.3%) was obtained after washing with cold pentane and drying under vacuum. $^1$H NMR (400 MHz, THF-d$_8$) $\delta$ 7.02 (s, 4H, Ar-H), 6.86 (t, $J$ = 7.2 Hz, 4H, Ar-H), 2.39 – 2.34 (m, 8H, CH(CH$_3$)$_2$), 2.20 (s, 12H, Ar-CH$_3$), 1.45 (s, 12H, Ar$_2$C(CH$_3$)$_2$), 1.25 (q, $J$ = 7.2 Hz, 24H, CH(CH$_3$)$_2$), 1.09 (q, $J$ = 7.2 Hz, 24H, CH(CH$_3$)$_2$). $^{13}$C NMR (101 MHz, THF-d$_8$) $\delta$ 156.76 (t, $J$ = 14.1 Hz, Ar-C), 130.50 (t, $J$ = 5.1 Hz, Ar-C), 130.26 (s, Ar-C), 129.78 (s, Ar-C), 124.96 (t, $J$ = 3.0 Hz, Ar-C), 119.01 (t, $J$ = 16.2 Hz, Ar-C), 36.84 (s, Ar$_2$C(CH$_3$)$_2$), 32.94 (s, Ar$_2$C(CH$_3$)$_2$), 26.37 (s, CH(CH$_3$)$_2$), 20.84 (s, Ar-CH$_3$), 20.00 (t, $J$ = 3.0 Hz, CH(CH$_3$)$_2$), 18.83 (s, CH(CH$_3$)$_2$). $^{31}$P NMR (162 MHz, THF-d$_8$) $\delta$ 48.1 (s). Anal. Calcd. for C$_{44}$H$_{120}$Na$_2$Ni$_2$O$_4$P$_4$: C, 61.51; H, 8.37; N, 5.82. Found: C, 61.35; H, 8.57; N, 4.56.

Elemental analysis data were reproducibly low in nitrogen, due to modest lability of the N$_2$ ligand of 2 under strong vacuum. UV-vis [THF, nm (L mol$^{-1}$ cm$^{-1}$)]: 354 (21,000), 390 (sh, 6,600), 480 (sh, 780). IR (KBr Pellet, cm$^{-1}$): $\nu_{\text{NN}}$ = 1944. X-ray quality crystals were grown by slow evaporation of pentane to a saturated THF solution of 2 at -35°C.

Reaction of 2 with benzene. After 2 (20 mg, 0.014 mmol) was dissolved in 5 mL of benzene, the reaction mixture was stirred at room temperature. The red color of 2 was immediately disappeared and the reaction mixture was turned to yellow. The reaction mixture was stirred for 15 min, resulting in a conversion of 2 to 3 (51%) and 4-Ph (49%). The reaction mixture was further stirred for 24 hrs, and the product ratio changes to give lower concentration of 3 (5%) and higher concentration of 4-Ph (95%). The identity of the products was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3 and 4-Ph.

Single-pulse $^{31}$P NMR experiment for the quantification. To a solution of 3 (11 mg, 0.021 mmol) in 0.2 mL of C$_6$D$_6$, a solution of triphenylphosphine oxide (12 mg, 0.042 mmol) in 0.2 mL of C$_6$D$_6$. Single-pulse $^{31}$P NMR spectra was obtained, as shown in Figure S4.

Quantification of nickel complexes from the reaction of 2 with benzene-15 min. After 2 (21 mg, 0.014 mmol) was dissolved in 5 mL of benzene, the reaction mixture was stirred at room temperature. The red color of 2 immediately disappeared and the reaction mixture turned to brown. The reaction mixture was stirred for 15 min and the reaction mixture was filtered through Celite and dried under vacuum. To the reaction mixture, a triphenylphosphine oxide (16 mg, 0.057 mmol) solution in C$_6$D$_6$ was added and the yield of 3 (43%) and 4-Ph (57%) in the solution was confirmed by integration versus triphenylphosphine oxide in the single-pulse $^{31}$P NMR data.

Quantification of nickel complexes from the reaction of 2 with benzene-24 hrs. After 2 (21 mg, 0.014 mmol) was dissolved in 5 mL of benzene, the reaction mixture was stirred at room temperature. The red color of 2 immediately disappeared and the reaction mixture turned to yellow. The reaction mixture was stirred for 24 hrs and the reaction mixture was filtered through Celite and dried under vacuum. To the reaction mixture, a triphenylphosphine oxide (16 mg, 0.057 mmol)
solution in C₆D₆ was added and the yield of 3 (8%) and 4-Ph (91%) in the solution was confirmed by integration versus triphenylphosphine oxide in the single-pulse ³¹P NMR data.

**The reaction of 2 with benzene in pentane.** A solution of 2 (22 mg, 0.016 mmol) and benzene (31 µL, 0.31 mmol) in 10 mL of pentane was stirred at room temperature for 48 hrs. After the solution was dried under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite and the filtrate was dried under vacuum. To the reaction mixture, a solution of triphenylphosphine oxide (18 mg, 0.061 mmol) in C₆D₆ was added and the yield of 3 (48%) and 4-Ph (51%) in the solution was confirmed by a comparison of triphenylphosphine oxide in the single-pulse ³¹P NMR data.

**Synthesis of (acriPNP)NiPh (4-Ph).** A solution of PhMgBr (180 µL, 1.0 M in THF, 180 µmol) was added dropwise to a solution of (acriPNP)NiCl (99 mg, 176 µmol) in 5 mL of benzene at room temperature. The reaction mixture was stirred for 12 hrs resulting in a color change from green to yellow. After adding 1,4-dioxane the reaction mixture was stirred for 15 min, and volatiles were removed under vacuum. After the remained residue was dissolved in benzene the solution was filtered through Celite. The filtrate was dried under vacuum. The resulting product (acriPNP)NiPh (4-Ph, 98 mg, 163 µmol, 92.6%) was isolated as a yellow solid after washing with pentane and drying under vacuum.

**Synthesis of (acriPNP)NiPh-d₅ (4-C₆D₅s).** After 2 (156 µg, 0.107 mmol) was dissolved in 15 mL of benzene-d₅, the reaction mixture was stirred for 1 day at room temperature resulting in a color change from red to yellow. After the volatiles were removed under vacuum, the remaining yellow solid was dissolved in pentane. The solution was filtered through Celite, and the filtrate was dried under vacuum. The resulting product (acriPNP)NiPh-d₅ (4-C₆D₅s, 120 mg, 197 mmol, 92.1%) was isolated as a yellow solid after washing with pentane and drying under vacuum.

**Synthesis of (acriPNP)NiD (3-D).** To a solution of 2 (212 mg, 0.146 mmol) in 15 mL of THF, methanol-d₄ (6 µL, 0.148 mmol) was added dropwise at -35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from red to yellow. After stirring for 5 min the volatiles were removed under vacuum. The resulting residue was dissolved in pentane, and the solution was filtered through Celite. The filtrate was dried under vacuum to remove the volatiles. The resulting product (acriPNP)NiD (3-D, 136 mg, 0.257 mmol, 88.0%) was
isolated as a yellow solid after washing with pentane and drying under vacuum. $^1$H NMR (400 MHz, C$_6$D$_6$) δ 7.18 (d, $J$ = 4.0 Hz, 2H, Ar-$H$), 6.91 (t, $J$ = 4.2 Hz, 2H, Ar-$H$), 2.31 (s, 6H, Ar-$CH_3$), 2.17 – 2.12 (m, 4H, CH(CH$_3$)$_2$), 1.64 (s, 6H, Ar$_2$C(CH$_3$)$_2$), 1.26 (q, $J$ = 7.9 Hz, 12H, CH(CH$_3$)$_2$), 1.08 (q, $J$ = 7.1 Hz, 12H, CH(CH$_3$)$_2$). $^{31}$P NMR (162 MHz, C$_6$D$_6$) δ 61.4 (t, $J$ = 9.7 Hz). IR (KBr pellet, cm$^{-1}$): no νNi-H signal at 1842, νAr = 1589.

**Stability of 3 and 4-Ph.** A solution of 3 (12 mg, 0.022 mmol), 4-Ph (11 mg, 0.019 mmol), naphthalene (12 mg, 0.096 mmol) and triphenylphosphine oxide (11 mg, 0.038 mmol) in C$_6$D$_6$ was shaken at room temperature for 24 hrs. The reaction mixture was heated at 60 °C for 24 hrs and the solution was monitored by both $^1$H and $^{31}$P NMR spectroscopy.

**Reaction of 2 with phenol.** To a solution of 2 (57 mg, 0.039 mmol) in 5 mL of THF, phenol (7.5 mg, 0.080 mmol) in 5 mL of THF was added dropwise at –35°C resulting in an immediate color change from red to yellow. The reaction mixture was stirred for 10 min at room temperature resulting in conversion of 2 to 3. The identity of the product was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3. After 3 was washed out with pentane (3×5 mL), a white solid was isolated. The formation of sodium phenoxide was confirmed by its $^1$H NMR data.

**Reaction of 2 with aniline.** To a solution of 2 (52 mg, 36 μmol) in 5 mL of THF, aniline (7 μL, 77 μmol) was added at –35°C resulting in an immediate color change from red to yellow. The reaction mixture was stirred for 10 min at room temperature resulting in conversion of 2 to 3. The identity of the product was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3. After 3 was washed out with pentane (3×5 mL), a white solid was isolated. The formation of sodium anilide was confirmed by its $^1$H NMR data.

**Reaction of 2 with triphenylmethane.** A solution of 2 (21 mg, 15 μmol) and triphenylmethane (42 mg, 170 μmol) in 10 mL of pentane was stirred at room temperature for 2 days resulting in a color change from red to yellow. After all volatiles were removed under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite, and the filtrate was dried under vacuum. The formation of 3 (53%) and the corresponding (acriPNP)NiAr species (47%) was established with the $^1$H and $^{31}$P NMR spectroscopic data. The ratio of the species in the product mixture was determined by integration of the corresponding signals in the $^{31}$P NMR spectrum.

**Reaction of 2 with 1 equiv. of triphenylmethane.** A solution of 2 (38 mg, 26 μmol) and 1 equivalent of triphenylmethane (7 mg, 29 μmol) in 10 mL of pentane was stirred at room temperature for 2 days. After all volatiles were removed under vacuum, the remaining residue was dissolved in benzene-$d_6$ to quench the unreacted 2. The formation of 3 and 3-D (51%), the corresponding (acriPNP)NiAr species (8%) and 4-C$_6$D$_5$ (41%) was established with the $^1$H and $^{31}$P NMR spectroscopic data. The ratio of the species in the product mixture was determined by integration of the corresponding signals in the $^{31}$P NMR spectrum.

**Reaction of 2 with 2 equiv. of triphenylmethane.** A solution of 2 (36 mg, 25 μmol) and 2 equivalents of triphenylmethane (12 mg, 49 μmol) in 10 mL of pentane was stirred at room temperature for 2 days. After all volatiles were removed under vacuum, the remaining residue was dissolved in benzene-$d_6$ to quench the unreacted 2. The formation of 3 and 3-D (50%), the corresponding (acriPNP)NiAr species (7%) and 4-C$_6$D$_5$ (43%) was established with the $^1$H and $^{31}$P NMR spectroscopic data.
NMR spectroscopic data. The ratio of the species in the product mixture was determined by integration of the corresponding signals in the $^{31}$P NMR spectrum.

**Reaction of 2 with naphthalene.** A solution of 2 (20 mg, 0.014 mmol) and naphthalene (35 mg, 0.27 mmol) in 10 mL of pentane was stirred at room temperature for 40 hr resulting in a color change from red to yellow. After the volatiles were removed under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite and the filtrate was dried under vacuum. The formation of 3 (43%) and 4-Naph (57%) was observed. The identity of the products was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3 and 4-Naph.

**Quantification for the reaction of 2 with naphthalene.** A solution of 2 (21 mg, 0.014 mmol) and naphthalene (38 mg, 0.29 mmol) in 10 mL of pentane was stirred at room temperature for 48 hrs resulting in a color change from red to yellow. After the volatiles were removed under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite and the filtrate was dried under vacuum. To the reaction mixture, a solution of triphenylphosphine oxide (17 mg, 0.058 mmol) in 0.6 mL of C$_6$D$_6$ was added and the yield of 3 (45%) and 4-Naph (51%) in the solution was confirmed by a comparison of triphenylphosphine oxide in single-pulse $^{31}$P NMR data.

**Reaction of 2 with anthracene.** A solution of 2 (20 mg, 0.014 mmol) and anthracene (53 mg, 0.30 mmol) in 10 mL of pentane was stirred at room temperature for 40 hr resulting in a color change from red to yellow. After the volatiles were removed under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite and the filtrate was dried under vacuum. The formation of 3 (46%) and 4-Anth (54%) was observed. The identity of the products was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3 and 4-Anth.

**Quantification for the reaction of 2 with anthracene.** A solution of 2 (22 mg, 0.015 mmol) and anthracene (55 mg, 0.30 mmol) in 10 mL of pentane was stirred at room temperature for 48 hrs resulting in a color change from red to yellow. After the volatiles were removed under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite and the filtrate was dried under vacuum. To the reaction mixture, a solution of triphenylphosphine oxide (17 mg, 0.060 mmol) in 2 mL of THF was added. To a 0.4 mL of aliquots, few drops of C$_6$D$_6$ was added. The yield of 3 (56%) and 4-Anth (43%) in the solution was confirmed by a comparison of triphenylphosphine oxide in single-pulse $^{31}$P NMR data.

**Reaction of ($^{acri}$PNP)NiCl with 1-naphthyl lithium.** A solution of 1-naphthyl lithium (11 mg, 0.082 mmol) in 5 mL of Et$_2$O was added dropwise to a solution of ($^{acri}$PNP)NiCl (39 mg, 0.069 mmol) in 5 mL of Et$_2$O at –35°C with stirring. The reaction mixture was gradually warmed to room temperature and monitored for >12 hrs by $^{31}$P NMR spectra. No product was detected from the reaction between ($^{acri}$PNP)NiCl with 1-naphthyl lithium.

**Separate synthesis of ($^{acri}$PNP)Ni(2-naphthyl) (4-Naph).** A solution of 2-naphthyl lithium (61 mg, 0.46 mmol) in 5 mL of Et$_2$O was added dropwise to a solution of ($^{acri}$PNP)NiCl (225 mg, 0.399 mmol) in 5 mL of Et$_2$O at –35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from green to yellow. After stirring for 30 min the volatiles were removed under vacuum. The remained residue was dissolved in benzene, and the
solution was filtered through Celite. The filtrate was dried under vacuum. The resulting product \((\text{NPNP})\text{Ni}(2\text{-naphthyl}) (4\text{-Naph})\), 252 mg, 0.385 mmol, 96.5% was isolated as a yellow solid after washing with pentane and drying under vacuum. \(^1\)H NMR (400 MHz, C\text{D}_6) \(\delta 8.13\) (s, 1H, Ar-\(H\)), 7.94 (dd, \(J = 8.0, 1.2\) Hz, 1H, Ar-\(H\)), 7.71 (t, \(J = 8.8\) Hz, 2H, Ar-\(H\)), 7.57 (2, \(J = 8.4\) Hz, 1H, Ar-\(H\)), 7.32 (m, 1H, Ar-\(H\)), 7.22 (t, \(J = 7.6\) Hz, 1H, Ar-\(H\)), 6.82 (t, \(J = 4.7\) Hz, 2H, Ar-\(H\)), 2.27-2.15 (m, 4H, CH\(_2\)(CH\(_3\))\(_2\), Ar\(_2\)C(CH\(_3\))\(_2\)), 1.63 (d, 6H, Ar-CH\(_3\)), 1.08 (qd, \(J = 7.2, 2.8\) Hz, 12H, CH(CH\(_3\))\(_2\)), 0.93 (q, \(J = 2.8, 6H, CH(CH_3)_2\)), 0.86 (q, \(J = 2.8, 6H, CH(CH_3)_2\)). \(^{13}\)C NMR (101 MHz, C\text{D}_6) \(\delta 156.14\) (t, \(J = 13.8\) Hz, Ar-C), 150.45 (t, \(J = 30.6\) Hz, Ar-C), 137.58 (t, \(J = 2.6\) Hz, Ar-C), 136.81 (t, \(J = 4.1\) Hz, Ar-C), 133.72 (t, \(J = 2.7\) Hz, Ar-C), 131.14 (Ar-C), 130.90 (t, \(J = 5.5\) Hz, Ar-C), 130.58 (s, Ar-C), 129.63 (s, Ar-C), 125.92 (s, Ar-C), 125.47 (s, Ar-C), 124.85 (t, \(J = 3.2\) Hz, Ar-C), 124.45 (s, Ar-C), 123.32 (s, Ar-C), 116.99 (t, \(J = 17.3\) Hz, Ar-C), 36.40 (s, Ar\(_2\)C(CH\(_3\))\(_2\)), 34.45 (d, \(J = 35.5\) Hz, Ar\(_2\)C(CH\(_3\))\(_2\)), 22.86 (dt, \(J = 47.2, 12.5\) Hz, CH(CH\(_3\))\(_2\)), 20.95 (s, Ar-CH\(_3\)), 17.79 (s, CH(CH\(_3\))\(_2\)), 17.45 (s, CH(CH\(_3\))\(_2\)), 17.26 (s, CH(CH\(_3\))\(_2\)). \(^{31}\)P NMR (162 MHz, C\text{D}_6) \(\delta 39.7\) (s). X-ray quality crystals were grown by slow diffusion of toluene into a saturated THF solution of 4-Anth at −35°C.

Reaction of 2 with toluene. After 2 (20 mg, 0.014 mmol) was dissolved in 5 mL of toluene, the reaction mixture was stirred at room temperature. The red color of 2 immediately disappeared and the reaction mixture turned yellow. The reaction mixture was stirred for 15 min, resulting in a conversion of 2 to 3 (50%), 4-mTol (35%) and 4-pTol (15%). The reaction mixture was further
stirred for 24 hrs, and the product ratio changes to give lower concentration of 3 (6%) and higher concentration of 4-\textit{m}Tol (65%) and 4-\textit{p}Tol (29%). The identity of the products was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3, 4-\textit{m}Tol and 4-\textit{p}Tol.

**Quantification of nickel complexes from the reaction of 2 with toluene-15 min.** After 2 (22 mg, 0.015 mmol) was dissolved in 5 mL of toluene, the reaction mixture was stirred at room temperature. The red color of 2 immediately disappeared and the reaction mixture turned to brown. The reaction mixture was stirred for 15 min and the reaction mixture was filtered through Celite and dried under vacuum. To the reaction mixture, a solution of triphenylphosphine oxide (17 mg, 0.060 mmol) solution in 0.6 mL of C$_6$D$_6$ was added and the yield of 3 (48%), 4-\textit{m}Tol (38%) and 4-\textit{p}Tol (14%) in the solution was confirmed by a comparison of triphenylphosphine oxide in single-pulse $^{31}$P NMR data.

**Quantification of nickel complexes from the reaction of 2 with benzene-24 hrs.** After 2 (21 mg, 0.014 mmol) was dissolved in 5 mL of toluene, the reaction mixture was stirred at room temperature. The red color of 2 immediately disappeared and the reaction mixture turned to yellow. The reaction mixture was stirred for 24 hrs and the reaction mixture was filtered through Celite and dried under vacuum. To the reaction mixture, a solution of triphenylphosphine oxide (17 mg, 0.058 mmol) solution in 0.6 mL of C$_6$D$_6$ was added and the yield of 3 (28%), 4-\textit{m}Tol (50%) and 4-\textit{p}Tol (21%) in the solution was confirmed by a comparison of triphenylphosphine oxide in single-pulse $^{31}$P NMR data.

**The reaction of 2 with toluene in pentane.** A solution of 2 (22 mg, 0.015 mmol) and toluene (32 μL, 0.30 mmol) in 10 mL of pentane was stirred at room temperature for 48 hrs. After the solution was dried under vacuum, the remaining residue was dissolved in benzene. The solution was filtered through Celite and the filtrate was dried under vacuum. To the reaction mixture, a solution of triphenylphosphine oxide (17 mg, 0.060 mmol) in C$_6$D$_6$ was added and the yield of 3 (45%), 4-\textit{m}Tol (43%) and 4-\textit{p}Tol (11%) in the solution was confirmed by a comparison of triphenylphosphine oxide in the single-pulse $^{31}$P NMR data.

**Synthesis of ($\textit{ac}^{\text{r}}$PNP)Ni(o-tolyl) (4-oTol).** A solution of \textit{o}-tolylLi (56 mg, 0.58 mmol) in 5 mL of Et$_2$O was added dropwise to a solution of ($\textit{ac}^{\text{r}}$PNP)NiCl (320 mg, 0.568 mmol) in 5 mL of Et$_2$O at $-35^\circ$C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from green to yellow. After stirring for 30 min the volatiles were removed under vacuum. The remained residue was dissolved in benzene, and the solution was filtered through Celite. The filtrate was dried under vacuum. The resulting product ($\textit{ac}^{\text{r}}$PNP)Ni(o-tolyl) (4-oTol, 336 mg, 0.543 mmol, 95.6%) was isolated as a yellow solid after washing with pentane and drying under vacuum. $^1$H NMR (400 MHz, C$_6$D$_6$) δ 7.69 (d, 1H, Ar-H), 7.16 (m, 2H, Ar-H), 6.99 (m, 3H, Ar-H), 6.78 (t, J = 4 Hz, 2H, Ar-H), 2.95 (s, 3H, Ar-CH$_3$), 2.32-2.27 (m, 8H, CH(CH$_3$)$_2$, Ar-CH$_3$), 2.20-2.15 (m, 2H, CH(CH$_3$)$_2$), 1.69 (d, 3H, C(CH$_3$)$_2$), 1.51 (d, 3H, C(CH$_3$)$_2$), 1.06 (m, 12H, CH(CH$_3$)$_2$), 1.00 (q, J = 8 Hz, 6H, CH(CH$_3$)$_2$), 0.88 (q, J = 8 Hz, 6H, CH(CH$_3$)$_2$). $^{13}$C NMR (101 MHz, C$_6$D$_6$) δ 156.11 (t, J = 14.1 Hz, Ar-C), 151.23 (t, J = 30.3 Hz, Ar-C), 139.92 (t, J = 4.1 Hz, Ar-C), 136.06 (t, J = 12.0 Hz, Ar-C), 134.82 (t, J = 2.0 Hz, Ar-C), 130.84 (t, J = 6.1 Hz, Ar-C), 130.51 (s, Ar-C), 129.63 (s, Ar-C), 126.32 (t, J = 3.0 Hz, Ar-C), 124.68 (t, J = 3.0, Ar-C), 122.60 (t, J = 3.0, Ar-C), 117.06 (t, J = 17.2, Ar-C), 36.41 (s, Ar$_2$C(CH$_3$)$_2$), 34.48 (d, J = 29.3 Hz, Ar$_2$C(CH$_3$)$_2$), 22.69 (t, J = 13.1, CH(CH$_3$)$_2$), 21.95 (s, Ar-CH$_3$), 20.98 (s, Ar-CH$_3$), 17.75 (dt, J = 22.2, 2.0 Hz, CH(CH$_3$)$_2$), 17.33 (d, J = 7.1 Hz, CH(CH$_3$)$_2$). $^{31}$P NMR (162 MHz, C$_6$D$_6$) δ 37.4 (s).
Separate synthesis of (acriPNP)Ni(m-tolyl) (4-mTol). A solution of m-tolylLi (38 mg, 0.39 mmol) in 3 mL of Et₂O was added dropwise to a solution of (acriPNP)NiCl (210 mg, 0.373 mmol) in 5 mL of Et₂O at −35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from green to yellow. After stirring for 30 min the volatiles were removed under vacuum. The remaining residue was dissolved in benzene, and the solution was filtered through Celite. The filtrate was dried under vacuum. The resulting product (acriPNP)Ni(m-tolyl) (4-mTol, 215 mg, 0.348 mmol, 93.3%) was isolated as a yellow solid after washing with pentane and drying under vacuum. ¹H NMR (400 MHz, C₆D₆) δ 7.59 (s, 1H, Ar-H), 7.51 (d, J = 7.6 Hz, 1H, Ar-H), 7.07 (t, J = 7.6 Hz, 1H, Ar-H), 6.84 (t, J = 4.4 Hz, 2H, Ar-H), 6.78 (d, J = 7.6 Hz, 1H, Ar-H), 2.32 – 2.27 (m, 13H, CH₂(CH₃)₂, Ar-CH₃), 1.61 (d, 6H, Ar-CH₃), 1.11 (q, J = 7.6 Hz, 12H, CH(CH₃)₂), 1.01 (q, J = 7.6 Hz, 12H, CH(CH₃)₂). ¹³C NMR (101 MHz, C₆D₆) δ 156.11 (t, J = 14.1 Hz, Ar-C), 151.23 (t, J = 30.3 Hz, Ar-C), 139.92 (t, J = 4.1 Hz, Ar-C), 136.06 (t, J = 12.0 Hz, Ar-C), 134.82 (t, J = 2.0 Hz, Ar-C), 130.84 (t, J = 6.1 Hz, Ar-C), 130.51 (s, Ar-C), 129.63 (s, Ar-C), 126.32 (t, J = 3.0 Hz, Ar-C), 124.68 (t, J = 3.0, Ar-C), 122.60 (t, J = 3.0, Ar-C), 117.06 (t, J = 17.2, Ar-C), 36.41 (s, ArC(CH₃)₂), 34.48 (d, J = 29.3 Hz, ArC(CH₃)₂), 22.69 (t, J = 13.1, CH(CH₃)₂), 21.95 (s, Ar-CH₃), 20.98 (s, Ar-CH₃), 17.75 (dt, J = 22.2, 2.0 Hz, CH(CH₃)₂), 17.33 (d, J = 7.1 Hz, CH(CH₃)₂). ³¹P NMR (162 MHz, C₆D₆) δ 39.0 (s). Anal. Calcd. for C₃₆H₅₁NNiP₂: C, 69.92; H, 8.31; N, 2.26. Found: C, 69.55; H, 8.17; N, 2.32. UV-vis [THF, nm (L mol⁻¹ cm⁻¹)]: 344 (23,000), 352 (23,000), 396 (sh, 4,000), 466 (sh, 790). IR (KBr Pellet, cm⁻¹): ν_ar = 1604, 1591, 1572, 1556. X-ray quality crystals were grown by slow evaporation of a saturated Et₂O solution of 4-mTol at room temperature.

Separate synthesis of (acriPNP)Ni(p-tolyl) (4-pTol). A solution of p-tolylLi (46 mg, 0.47 mmol) in 3 mL of Et₂O was added dropwise to a solution of (acriPNP)NiCl (248 mg, 0.440 mmol) in 5 mL of Et₂O at −35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from green to yellow. After stirring for 30 min the volatiles were removed under vacuum. The remaining residue was dissolved in benzene, and the solution was filtered through Celite. The filtrate was dried under vacuum. The resulting product (acriPNP)Ni(p-tolyl) (4-pTol, 260 mg, 0.420 mmol, 95.5%) was isolated as a yellow solid after washing with pentane and drying under vacuum. ¹H NMR (400 MHz, C₆D₆) δ 7.59 (m, 2H, Ar-H), 7.01 (d, J = 7.2 Hz, 2H, Ar-H), 6.84 (t, J = 4.4, 2H, Ar-H), 2.30 – 2.25 (m, 13H, CH(CH₃)₂, Ar-CH₃), 1.63 (s, 6H, Ar₂C(CH₃)₂), 1.11 (q, J = 7.6 Hz, 12H, CH(CH₃)₂), 1.00 (q, J = 7.6 Hz, 12H, CH(CH₃)₂). ¹³C NMR (101 MHz, C₆D₆) δ 156.14 (t, J = 15.7 Hz, Ar-C), 155.38 (t, J = 30.8 Hz, Ar-C), 138.89 (t, J = 3.3 Hz, Ar-C), 130.84 (t, J = 3.3 Hz, Ar-C), 130.15 (Ar-C), 130.29 (t, J = 2.4 Hz, Ar-C), 129.64 (s, Ar-C), 124.68 (t, J = 3.2 Hz, Ar-C), 117.15 (t, J = 17.0 Hz, Ar-C), 36.40 (t, J = 1.7 Hz, Ar₂C(CH₃)₂), 22.70 (t, J = 12.5 Hz, CH(CH₃)₂), 21.15 (s, Ar-CH₃), 20.96 (s, Ar-CH₃), 17.83 (t, J = 2.1 Hz, CH(CH₃)₂), 17.34 (s, CH(CH₃)₂). ³¹P NMR (162 MHz, C₆D₆) δ 39.1 (s). Anal. Calcd. for C₃₆H₅₁NNiP₂: C, 69.92; H, 8.31; N, 2.26. Found: C, 69.75; H, 8.52; N, 2.31. UV-vis [THF, nm (L mol⁻¹ cm⁻¹)]: 344 (23,000), 352 (23,000), 396 (sh, 4,000), 466 (sh, 790). IR (KBr Pellet, cm⁻¹): ν_ar = 1603, 1591, 1583, 1568. X-ray quality crystals were grown by slow evaporation of a saturated Et₂O solution of 4-pTol at room temperature.
Separate synthesis of (acriPNP)Ni(benzyl). To a solution of (acriPNP)NiCl (305 mg, 0.542 mmol) in 5 mL of Et₂O, a solution of benzyl magnesium chloride (390 μL, 1.4 M in THF, 0.546 mmol) was added at −35°C with stirring. The reaction mixture was gradually warmed to room temperature and stirred for 1 day resulting in a color change from green to red. After adding 1,4-dioxane (92 μL, 95 mg, 0.80 mmol) the reaction mixture was stirred for 30 min, and the volatiles were removed under vacuum. After the residue was dissolved in benzene, the solution was cooled to 35°C. A red crystalline solid was precipitated out after two days. A desired material [Na(18-crown-6)DME][C₁₀H₈] (32 mg, 0.063 mmol, 12%) was obtained after washing with cold pentane and drying under vacuum. After the residue was dissolved in benzene, the solution was stirred at room temperature. After stirring for additional 10 min, the reaction mixture was filter through Celite, and the volatiles were removed under vacuum. The resulting product (acriPNP)Ni(benzyl) (298 mg, 0.482 mmol, 88.9%) was isolated as an orange solid after washing with cold pentane and drying under vacuum. 1H NMR (400 MHz, C₆D₆) δ 7.62 (d, J = 4 Hz, 2H, Ar-H), 7.01 (t, J = 8 Hz, 1H, Ar-H), 6.91 (t, J = 4Hz, 2H, Ar-H), 2.29 (s, 6H, Ar-CH₃), 2.27 – 2.25 (br, 2H, PhCH₂), 2.04 – 1.99 (m, 4H, CH(CH₃)₂), 1.55 (s, 6H, Ar₂C(CH₃)₂), 1.21 (q, J = 8 Hz, 12H, CH(CH₃)₂), 1.14 (q, J = 8 Hz, 12H, CH(CH₃)₂). 13C NMR (101 MHz, C₆D₆) δ 156.29 (t, J = 13.1 Hz, Ar-C), 151.87 (t, J = 3.0 Hz, Ar-C), 130.81 (t, J = 5.1 Hz, Ar-C), 129.27 (s, Ar-C) 129.24 (s, Ar-C), 124.83 (t, J = 3.0 Hz, Ar-C), 123.06 (s, Ar-C), 117.52 (t, J = 18.2 Hz, Ar-C), 36.25 (t, J = 2.0 Hz, Ar₂C(CH₃)₂), 32.18 (s, Ar₂C(CH₃)₂), 24.24 (t, J = 11.1 Hz, CH(CH₃)₂), 21.04 (s, Ar-CH₃), 19.08 (t, J = 3.0 Hz, CH(CH₃)₂), 18.11 (s, CH(CH₃)₂), –0.84 (t, J = 22.2, Ni-C) 31P NMR (162 MHz, C₆D₆) δ 37.1 (s). Anal. Calcd. for C₃₆H₄₃NiP₂: C, 69.92; H, 8.31; N, 1.89. Found: C, 70.03; H, 8.41; N, 1.89. UV-vis [THF, nm (L mol⁻¹ cm⁻¹)]: 317 (sh, 15,000), 346 (24,000), 382 (sh, 6,000), 434 (sh, 1,400). IR (KBr Pellet, cm⁻¹): ν₀= 1591, 1570. X-ray quality crystals were grown by slow evaporation of a saturated pentane solution of (acriPNP)Ni(benzyl) at room temperature.

Reaction of 2 with toluene followed by NMR and X-band EPR experiments. 2 (18 mg, 0.012 mmol) was treated with toluene/THF-d₈ (25:1) to bring the final volume to 5 mL (2.5 mM of 2). The reaction mixture was allowed to stir at room temperature. Aliquots were taken at 5 min, 25 min and 2 hrs to monitor the reaction by 31P NMR and X-band EPR spectroscopy.

Detection of sodium in the black solid residue with naphthalene. After 2 (366 mg, 0.253 mmol) was dissolved in 10 mL of benzene, the reaction mixture was stirred at room temperature. After stirring for 15 min, the reaction mixture was dried under vacuum. The sodium was isolated as a black solid after washing with pentane (5 × 5 mL). After a solution of naphthalene (54 mg, 0.42 mmol) and 18-crown-6 (106 mg, 0.401 mmol) in 5 mL of 1,2-dimethoxyethane (DME) was added to the isolated black powder, the color of the reaction mixture immediately turns to deep green. After stirring for additional 10 min, the reaction mixture was filter through Celite, and the volatiles were removed under vacuum. The resulting residue was dissolved in 3 mL of DME, and the solution was cooled to −35°C. A red crystalline solid was precipitated out after two days. A desired material [Na(18-crown-6)DME][C₁₀H₈] (32 mg, 0.063 mmol, 12%) was obtained after washing with cold pentane and drying under vacuum. UV-vis [THF, nm (L mol⁻¹ cm⁻¹)]: 322 (sh, 5,400), 327 (9,100), 409 (sh, 1,900), 442 (1,600), 455 (sh, 1,400), 469 (1,100), 695 (sh, 1,100), 789 (1,700), 875 (1,500). The UV-vis spectrum, as shown in Figure S69 reveals the formation of the naphthalenide species as reported.¹¹

Quantification of sodium with benzophenone radical. After 2 (106 mg, 0.0734 mmol) was dissolved in 10 mL of benzene, the reaction mixture was stirred at room temperature. After stirring for 15 min, the reaction mixture was dried under vacuum. The sodium was isolated as a black solid after washing with pentane (5 × 5 mL). To the isolated sodium powder, a benzophenone solution (14 mg, 0.77 mmol in 20 mL of THF) was introduced. After 1 mL of the resulting solution was diluted to 10mL, the concentration of the resulting benzophenone radical was spectroscopically
measured from the absorption at 682 nm (1.14), and the yield was 68%. The calibration curve was derived from the absorption measurement of a 3.68 mM of stock solution (Figure S92 and S93). Upon dilution of the stock solution (0.37, 0.18, 0.09 and 0.05 mM, respectively), the absorption at 628 nm was measured (1.88, 0.91, 0.47 and 0.25, respectively).

**Quantification of sodium with naphthalene and 1,1-diphenylethylene.** After 2 (118 mg, 0.0817 mmol) was dissolved in 10 mL of benzene, the reaction mixture was stirred at room temperature. After stirring for 15 min, the reaction mixture was dried under vacuum. The sodium was isolated as a black solid after washing with pentane (5 × 5 mL). The isolated sodium was titrated according to the literature procedure.11 After the isolated black powder was added to a solution of naphthalene (22 mg, 0.17 mmol) in 5 mL of THF, the color of the reaction mixture immediately turns to deep green. The sodium naphthalenide solution was added dropwise to 0.5 mL of 1,1-diphenylethylene in 100 mL of round-bottom flask, and the color of the reaction mixture immediately turned to intense red indicating the formation of dianion. The dianion solution was titrated against 0.50 M of t-butanol solution in toluene. Upon addition of 230 µL of t-butanol solution, the color of the reaction mixture changed to a pale-yellow end-point, and the yield of the sodium was calculated based on the following equation: (0.50 M*230 µL)/(0.0817 mmol*2) = 70.4%.

**Control experiments for detecting a naphthalenide radical from the reaction of NaH and PhLi with naphthalene.** To a solution of naphthalene (11 mg, 0.086 mmol) in 5 mL of THF the reagent (0.090~0.092 mmol) was added at room temperature. The reaction mixture was stirred for 3 hrs, and THF was added to the resulting solution to give a final volume of 20 mL. UV-vis spectrum (200 nm < λ < 1100 nm) was measured by diluting 1 mL of the stock solution into 10 mL of THF to give final concentration of 0.43 mM of naphthalene or naphthalenide solution. The distinctive broad absorption of naphthalenide radical at 830 nm (ε = ca. 2000) was not observed, confirming that sodium was generated from the reaction of 2 with benzene.

**Determination of the melting point of sodium(0).** After 2 (558 mg, 0.386 mmol) was dissolved in 20 mL of benzene, the reaction mixture was stirred at room temperature. After stirring for 15 min, the reaction mixture was dried under vacuum. The resulting solid was isolated as a black powder after washing with pentane (5 × 5 mL). A capillary was charged with an isolated powder, which melted at around 101 °C. The reversibility of the melting point of the black powder was not determined in this experiment. The same measurement was conducted with an authentic sample of Na(0), which gave the same melting point, see Figure shown below, (a) a black powder isolated from the reaction and (b) an authentic sample of Na(0).
Purification of NH\textsubscript{3}(g). Sodium metal in a Schlenk flask was taken out of the dry-box and connected to the Schlenk line. After the flask was connected to an oil bubbler and an ammonia gas cylinder, NH\textsubscript{3}(g) was transferred and liquified at -78 °C by using an acetone/dry-ice bath. The resulting liquid ammonia was dried over sodium metal revealing a dark blue color solution.

Detection of sodium in the black solid residue with liquid ammonia. After 2 (310 mg, 215 mmol) was dissolved in 10 mL of benzene, the reaction mixture was stirred at room temperature for 10 min. All volatiles were removed and the solid reaction mixture was dried under vacuum. The resulting solid was isolated as a black powder after washing with pentane (5 × 5 mL). The isolated black powder in a Schlenk cuvette was taken out of the dry-box and connected to the Schlenk line. To the cuvette at -80 °C, purified NH\textsubscript{3}(g) stored as a blue stock solution of NH\textsubscript{3}(l) was added, revealing the formation of a blue solution. The same procedure conducted with an authentic Na(0) showed the same blue solution (Figure S95).

Elemental analysis of the black solid residue. After 2 (384 mg, 0.266 mmol) was dissolved in 20 mL of benzene, the reaction mixture was stirred for 30 min at room temperature. All volatiles were removed and the solid reaction mixture was dried under vacuum. The resulting solid was isolated as a black powder after washing with pentane (5 × 5 mL). The procedure was repeated 5 times to collect the solid residue for EA analysis. Elemental analysis data reveals only a trace amount of C and H (C, 0.11; H, 0.05) and nitrogen was not detected.

Quantification of NaH with ethyl diethylphosphonoacetate. After 2 (209 mg, 0.144 mmol) was dissolved in 15 mL of benzene, the reaction mixture was stirred at room temperature. After stirring for 1 day, the reaction mixture was dried under vacuum. The NaH was isolated as a gray powder after washing with pentane (5 × 5 mL). The yield of the corresponding anion generated from the hydride content of the sample was determined by comparing the integration of a peak at 3.33 ppm (those associated with the methylene proton of remaining ethyl diethylphosphonoacetate, 1.00) vs. a peak at 2.81 ppm (those associated with the vinylic methine proton of ethyl sodiodiethylphosphonoacetate, 0.46) in \textsuperscript{1}H NMR spectrum, shown in Figure S41. The yield of the NaH was calculated based on the following equation: \{0.46*0.489 mmol/(1.0*0.5+0.46)\}/(0.144 mmol*2) = 81%.

Magic angle spinning (MAS) Solid state \textsuperscript{23}Na NMR spectrum of NaH. After 2 (237 mg, 0.164 mmol) was dissolved in 15 mL of benzene, the reaction mixture was stirred at room temperature. After stirring for 1 day, the reaction mixture was dried under vacuum. The NaH was isolated as a gray powder after washing with pentane (5 × 5 mL) (Figure S77).

Synthesis of \{([acriPNP]Ni-(N\textsubscript{2})–K(THF))\textsubscript{2} (2-K). After potassium (42 mg, 1.1 mmol) was added to a solution of naphthalene (29 mg, 0.23 mmol) in 5 mL of THF, the reaction mixture was stirred for 3 hrs at room temperature. The resulting potassium naphthalenide solution was filtered away from remaining potassium and added dropwise to a solution of ([acriPNP]Ni+C\textsubscript{10}H\textsubscript{8} (148 mg, 0.226 mmol) in 5 mL of THF at -35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from reddish brown to red. After stirring for additional 30 min, the reaction mixture was filter through Celite, and the volatiles were removed.
under vacuum. The resulting residue was dissolved in 15 mL of pentane/THF (5:1), and the solution was cooled to ~35°C. A red crystalline solid was precipitated out after two days. An analytically pure material \( \{^{(acri}PNP)Ni\text–}(N_2)\cdot K(THF)\}_2 \) (2-K, 112 mg, 0.0758 mmol, 67.1%) was obtained after washing with cold pentane and drying under vacuum. \(^1\)H NMR (400 MHz, THF-d6) δ 7.01 (s, 4H, Ar-H), 6.86 (t, \( J = 7.2 \) Hz, 4H, Ar-H), 2.39 – 2.32 (m, 8H, CH(CH3)2), 2.20 (s, 12H, Ar-CH3), 1.45 (s, 12H, Ar2C(CH3)2), 1.27 (q, \( J = 7.2 \) Hz, 24H, CH(CH3)2). \(^{13}\)C NMR (101 MHz, THF-d6) δ 156.58 (t, \( J = 14.1 \) Hz, Ar-C), 130.31 (t, \( J = 5.1 \) Hz, Ar-C), 129.61 (s, Ar-C), 124.78 (t, \( J = 3.0 \) Hz, Ar-C), 118.73 (t, \( J = 16.2 \) Hz, Ar-C), 36.84 (s, Ar2C(CH3)2), 32.94 (s, Ar2C(CH3)2), 26.37 (s, CH(CH3)2), 20.84 (s, Ar-CH3), 20.00 (t, \( J = 3.0 \) Hz, CH(CH3)2), 18.83 (s, CH(CH3)2). \(^{31}\)P NMR (162 MHz, THF-d6) δ 47.9 (s). Anal. Calcd. for C74H120K2N6Ni2O4P4: C, 60.17; H, 8.19; N, 5.69. Found: C, 60.22; H, 8.24; N, 5.57. IR (KBr Pellet, cm\(^{-1}\)): \( v_{NN} = 1946 \).

**Reaction of 2-K with benzene.** In an NMR tube equipped with a J-Young valve, a red solution of 2-K (8.6 mg, 5.8 mmol) in 0.6 mL of benzene-d6 was taken out of the dry-box and shaken at room temperature for 12 hrs. As monitored by \(^{31}\)P NMR spectroscopy, no reaction occurs under ambient conditions, but new species appear when the reaction mixture was heated at 40°C for 12 hrs. The resulting mixture contains a starting material 2-K (64%) with 3-D (14%), 4-C6D5 (14%) and an unknown species (8%). The identity of the products was confirmed by a comparison of its \(^1\)H and \(^{31}\)P NMR data with those of an authentic sample of 3-D and 4-C6D5.

**Synthesis of \( \{^{(acri}PNP)Ni\text–}(N_2)\cdot Li(THF)\}_2 \) (2-Li).** After lithium (11 mg, 1.6 mmol) was added to a solution of naphthalene (210 mg, 1.64 mmol) in 10 mL of THF, the reaction mixture was stirred for 3 hrs at room temperature. The resulting lithium naphthalenide solution was filtered away and added dropwise to a solution of \( ^{(acri}PNP)Ni\text{•}C_{10}H_{18} \) (1056 mg, 1.611 mmol) in 20 mL of THF at ~35°C with stirring. The reaction mixture was gradually warmed to room temperature resulting in a color change from reddish brown to red. After stirring for additional 30 min, the reaction mixture was filter through Celite, and the volatiles were removed under vacuum. The resulting residue was dissolved in 50 mL of pentane/THF (5:1), and the solution was cooled to ~35°C. A red crystalline solid was precipitated out after two days. An analytically pure material \( \{^{(acri}PNP)Ni\text–}(N_2)\cdot Li(THF)\}_2 \) (2-Li, 808 mg, 0.572 mmol, 71.0%) was obtained after washing with cold pentane and drying under vacuum. \(^1\)H NMR (400 MHz, THF-d6) δ 7.01 (s, 4H, Ar-H), 6.86 (t, \( J = 7.2 \) Hz, 4H, Ar-H), 2.39 – 2.33 (m, 8H, CH(CH3)2), 2.20 (s, 12H, Ar-CH3), 1.45 (s, 12H, Ar2C(CH3)2), 1.26 (q, \( J = 7.2 \) Hz, 24H, CH(CH3)2), 1.10 (q, \( J = 7.2 \) Hz, 24H, CH(CH3)2). \(^{13}\)C NMR (101 MHz, THF-d6) δ 156.58 (t, \( J = 14.1 \) Hz, Ar-C), 130.31 (t, \( J = 5.1 \) Hz, Ar-C), 129.61 (s, Ar-C), 124.78 (t, \( J = 3.0 \) Hz, Ar-C), 118.73 (t, \( J = 16.2 \) Hz, Ar-C), 36.84 (s, Ar2C(CH3)2), 32.94 (s, Ar2C(CH3)2), 26.37 (s, CH(CH3)2), 20.84 (s, Ar-CH3), 20.00 (t, \( J = 3.0 \) Hz, CH(CH3)2), 18.83 (s, CH(CH3)2). \(^{31}\)P NMR (162 MHz, THF-d6) δ 47.6 (s). Anal. Calcd. for C74H120Li2N6Ni2O4P4: C, 62.90; H, 8.56; N, 5.95. Found: C, 62.95; H, 8.84; N, 5.83. IR (KBr Pellet, cm\(^{-1}\)): \( v_{NN} = 1944 \).

**Reaction of 2-Li with benzene.** In an NMR tube equipped with a J-Young valve, a red solution of 2-Li (8.0 mg, 5.7 mmol) in 0.6 mL of benzene-d6 was taken out of the dry-box and shaken at room temperature for 12 hrs. As monitored by \(^{31}\)P NMR spectroscopy, no reaction occurs under ambient conditions, but new species appear when the reaction mixture was heated at 40°C for 12 hrs. The resulting mixture contains 3-D (11%), 4-C6D5 (56%) and \( ^{(acri}PNP)Li(THF) \) (29%). The
Identity of the products was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 3-D and 4-C$_6$D$_5$ and ($^{31}$PNP)Li(THF).$^1$

**Reaction of ($^{31}$PNP)Ni–L (L = H, Cl or empty) with excess sodium in benzene.** After sodium (85–90 mg, 3.7–3.9 mmol) was added to a solution of ($^{31}$PNP)Ni–L (L = H, Cl or empty) (0.187–0.189 mmol) in 15 mL of benzene, the reaction mixture was stirred at room temperature. Aliquots were taken at 1.0, 1.5 and 2.0 hrs to monitor the reaction with $^{31}$P NMR spectroscopy (Figure S57). After stirring for 2 hrs, the reaction mixture was filtered through Celite. The filtrate was dried under vacuum to remove the volatiles. The product 4-Ph ($107–111$ mg, 0.178–0.184 mmol, 95.2–97.3%) was isolated as a yellow powder after drying under vacuum. The identity of the product was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 4-Ph.

**Reaction of ($^{31}$PNP)Ni–L (L = H, Cl or empty) with excess sodium in toluene.** After sodium (83–90 mg, 3.6–3.9 mmol) was added to a solution of ($^{31}$PNP)Ni–L (L = H, Cl or empty) (0.176–0.189 mmol) in 15 mL of toluene, the reaction mixture was stirred at room temperature. After stirring for 2 hrs, the reaction mixture was filtered through Celite. The filtrate was dried under vacuum to remove the volatiles. The mixture of 4-mTol and 4-pTol (101–112 mg, 0.164–0.181 mmol, 93.2–95.8%) was isolated as a yellow powder after drying under vacuum. The identity of the products was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 4-mTol and 4-pTol.

**Reaction of ($^{31}$PNP)Ni–L (L = H or Cl) with sodium and excess naphthalene.** After sodium (11–12 mg, 0.48–0.52 mmol) was added to a solution of ($^{31}$PNP)Ni–L (L = H or Cl) (0.217–0.237 mmol) in 25 mL of pentane/THF (20:1), the reaction mixture was stirred at room temperature resulting in a color change to red brown. After stirring for 6 hrs naphthalene (557–609 mg, 4.35–4.75 mmol) was added, and the reaction mixture was further stirred for 2 days. After the volatiles were removed under vacuum, the remaining solid was dissolved in benzene. The solution was filtered through Celite, and the filtrate was dried under vacuum. The product 4-Naph (101–103 mg, 0.154–0.157 mmol, 66.2–71.4%) was isolated as a yellow powder after washing with pentane and drying under vacuum. The identity of the product was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 4-Naph.

**Reaction of ($^{31}$PNP)Ni–L (L = H or Cl) with sodium and excess anthracene.** After sodium (11–13 mg, 0.48–0.57 mmol) was added to a solution of ($^{31}$PNP)Ni–L (L = H or Cl) (0.214–0.259 mmol) in 25 mL of pentane/THF (20:1), the reaction mixture was stirred at room temperature resulting in a color change to red brown. After stirring for 6 hrs anthracene (763–916 mg, 4.28–5.14 mmol) was added, and the reaction mixture was further stirred for 2 days. After the volatiles were removed under vacuum, the remaining solid was dissolved in benzene. The solution was filtered through Celite, and the filtrate was dried under vacuum. The product 4-Anth (71~87 mg, 0.10–0.12 mmol, 47–48%) was isolated as a yellow powder after washing with pentane and drying under vacuum. The identity of the product was confirmed by a comparison of its $^1$H and $^{31}$P NMR data with those of an authentic sample of 4-Anth.

**Kinetic Isotope Effect Experiments**

**Determination of kinetic isotope effect from the parallel reactions.** 2 (19 mg, 0.013 mmol) was treated with benzene or benzene-$d_6$ to bring the final volume of 2 mL (0.0065 M of 2). Around 0.6
mL of the resulted solution was placed into the NMR tube with a J-Young valve. The solution was stored frozen in acetone/dry ice bath until retrieved to perform $^{31}$P NMR kinetic studies at 298 K. After the reaction mixture was warmed to room temperature, the spectra were collected with 3 min intervals over the course of 12 min with benzene and 18 min with benzene-$d_6$. Integration of the peak of the starting 2 was used for plotting the ln[2] vs. time graph (Figure S58). According to the kinetic study, the KIE was calculated as follows: $k_{H}/k_D = 0.00354 \text{s}^{-1}/0.00101 \text{s}^{-1} = 3.5$.

**Determination of kinetic isotope effect from an intermolecular competition.** After 2 (26 mg, 0.018 mmol) was dissolved in 4 mL of benzene/benzene-$d_6$ (1:1), the reaction mixture was stirred at room temperature. After stirring for 15 min, the resulting products were confirmed by their $^1$H and $^3$P NMR spectra (Figure S49 and S50). The intermolecular KIE was derived from the relative integration of a peak at 7.70 ppm (those associated with the Ar-$H$ proton of phenyl ligand in 4-Ph, 2.00) vs. a peak at 6.90 ppm (those associated with the Ar-$H$ proton of acrPnP ligand in 4-Ph and 4-C$_6$D$_5$, 2.60) in $^1$H NMR spectrum. The KIE was calculated as follows: [P$_H$]/[P$_D$] = 2.00/(2.60-2.00) = 3.3.

**Synthesis of (acrPnP)Ni(CH=CH$_2$) (5) from 4-Ph and 15-crown-5.** Sodium metal (28.8 mg, 1.25 mmol) was added to a solution of naphthalene (28.5 mg, 0.222 mmol, 2.78 equiv) in THF (3 mL), the reaction mixture was stirred for 3 hrs at room temperature. The resulting dark green sodium naphthalenide solution was cooled to $-35$ °C for 10 minutes. In a separate vial, a solution of 4-Ph (22.7 mg, 0.0799 mmol) and 15-crown-5 (32.6 mg, 0.148 mmol, 1.85 equiv) in THF (3 mL) was also cooled to $-35$ °C for 30 minutes. Next the sodium naphthalenide solution was filtered away from the remaining sodium and added dropwise over one minute to the 4-Ph solution while stirring. The solution immediately darkened to give a dark brown solution. After 20 hrs, the solution color changed to a light yellow brown. The crude $^{31}$P NMR spectrum indicated the presence of 61% 5, 37% 3 and 2% unknown species (Figure S51). The volatiles were then removed under vacuum.

**Isolation of tetraethylene glycol disodium salt.** Pentane (2 mL) was added to the crude residue and removed under vacuum. This procedure was repeated and then pentane (10 mL) was added to the residue again. A Celite column ($1 \times 0.6$ cm) was prepared with pentane and the reaction mixture was added. A yellow fraction was collected and the Celite was washed with pentane (5 mL). The resulting yellow fraction was set aside (see below for isolation of 5). Next, the column was then washed with THF (2 mL) to give a brown fraction, which was reduced to a brown residue under vacuum. The brown residue was dissolved in a 4:1 mixture of pentane:benzene (5 mL) and stored a $-35$ °C for 16 hrs. The pale yellow solution was decanted from the resulting solid, washed three times with cold pentane (1 mL, $-35$ °C) and dried under vacuum to give tetraethylene glycol disodium salt as an off-white residue Na$_{4}$O(C$_2$H$_4$O)$_4$Na (9.1 mg, 0.0382 mmol, 47.9% based on Ni). See Figure S71 for comparison of NMR spectra to independently prepared sample.

**Isolation of 5.** A silica column ($3 \times 4$ cm) was prepared in a 30 mL fritted Buchner funnel with pentane and the yellow pentane soluble fraction was added. A colorless fraction was eluted with pentane. The residue was identified as naphthalene by $^1$H NMR and was discarded. Next a yellow fraction eluted with 10:1 pentane:benzene which was dried under vacuum to give 5 (12.3 mg, 0.0222 mmol, 59.0%) as a yellow-orange powder. $^1$H NMR (400 MHz, C$_6$D$_6$) δ 7.15 (2 m overlap C$_6$D$_5$H, 3H, acrPnP Ar-$H$ + Ni-CH=CH$_2$) 6.90 (t, $J = 4.0$ Hz, 2H, acrPnP Ar-$H$), 5.89 (ddt, $J = 11.8$, 4.5, 2.5 Hz, 1H, Ni-CH=CH$_2$), 5.49 (m, $J = 19.0$, 3.0 Hz, 1H, Ni-CH=CH$_2$), 2.36 (sextet, $J = 2.8$ Hz, 4H, CH(CH$_3$)$_2$), 2.28 (s, 6H, acrPnP Ar-CH$_3$), 1.60 (s, 6H, acrPnP Ar$_2$C(CH$_3$)$_2$), 1.30 (q, $J = 7.4$ Hz).
H2, 12H, CH(CH3)2), 1.16 (q, J = 7.1 Hz, 12H, CH(CH3)2). 13C NMR (126 MHz, CD6) δ 156.3 (t, J = 14.1 Hz, acriPNP Ar-C-N), 151.8 (t, J = 32.2 Hz, Ni=CH=CH2), 130.7 (t, J = 5.4 Hz, acriPNP Ar-C), 130.2 (acriPNP Ar-C), 129.8 (acriPNP Ar-C), 124.8 (t, J = 3.4 Hz, acriPNP Ar-C), 122.0 (t, J = 6.0 Hz, CH=CH2), 117.3 (t, J = 16.9 Hz, acriPNP Ar-C-P), 36.42 (Ar2C(CH3)2), 34.00 (Ar3C(CH3)2), 23.4 (t, J = 13.0 Hz, CH(CH3)2), 21.0 (Ar=CH3), 18.6 (CH(CH3)2), 18.0 (CH(CH3)2). 31P NMR (162 MHz, CD6) δ 40.8. UV-vis [THF, nm (L mol⁻¹ cm⁻¹)]: 348, 353, 395 (sh), 465 (sh). ESI-MS {(acriPNP)Ni(CH=CH2)}⁺: calcd: 553.25 (100.0%), 554.26 (33.5%), 555.25 (38.5%), 556.25 (12.9%), 557.25 (5.3%), 558.25 (1.8%), 559.25 (1.4%); found: 553.25 (100.0%), 554.25 (33.76%), 555.17 (42.13%), 556.17 (15.00 %), 557.17 (7.18%), 558.17 (1.94%), 559.17 (1.63%). Anal. Calcd. for C31H47NNiP2: C, 67.17; H, 8.55; N, 2.53. 1H NMR spectrum was taken (0.1 mL of THF/D6) [Ni=CH=CH2] = 1604, 1593, 1546. X-ray quality crystals were grown by vapor diffusion of acetonitrile into a saturated toluene solution of 5 at –35 °C.

Synthesis of (acriPNP)Ni(CH=CH2) (5) from 4-C6D5 and 15-crown-5. The reaction above was repeated under analogous reaction and workup conditions using sodium metal (64.5 mg, 2.80 mmol) and naphthalene (30.6 mg, 0.239 mmol, 2.25 equiv) in THF (3 mL), and 4-C6D5 (64.4 mg, 0.106 mmol) and 15-crown-5 (58.8 mg, 0.267 mmol, 2.52 equiv) in THF (3 mL) to give 5 (27.3 mg, 0.0492 mmol, 46.5%). The identity of the product was confirmed by a comparison of its 1H and 31P NMR data with those of an authentic sample of 5.

Synthesis of (acriPNP)Ni(CH=CH2) (5) from 4-Ph and glyme. The reaction above was repeated under analogous reaction and workup conditions using sodium metal (60.9 mg, 2.54 mmol) and naphthalene (9.1 mg, 0.071 mmol, 2.1 equiv) in glyme (3 mL), and 4-Ph (19.8 mg, 0.0328 mmol) in THF (3 mL) to give 5 (9.6 mg, 0.017 mmol, 53%). NaOMe (2.0 mg, 0.037 mmol, 1.1 eq) was also isolated from the pentane insoluble fraction.

Synthesis of (acriPNP)Ni(CH=CH2) (5) from 4-C6D5 and glyme. The reaction above was repeated under analogous reaction conditions using sodium metal (39.0 mg, 1.70 mmol) and naphthalene (27.7 mg, 0.216 mmol, 2.70 equiv) in glyme (3 mL) and 4-C6D5 (60.2 mg, 0.0799 mmol) in THF (4 mL). The crude residue (before chromatography) was taken in CD6 and a 31P NMR spectrum indicated the presence of 78% 5, 17% 3, and 5% unknown species. The workup above conditions gave 5 (32.6 mg, 0.0588 mmol, 59.5%).

Synthesis of (acriPNP)Ni(CH=CH2) (5) from 2, glyme, and PhLi. PhLi (1.8 mg, 0.021 mmol) was dissolved in glyme (1 mL), which produced in situ methyl vinyl ether. The resulting solution was added to crystalline 2 (14.0 mg, 0.00969 mmol) at room temperature and the reaction mixture was stirred for 18 hrs. The workup conditions above were repeated to give 5 (7.9 mg, 0.014 mmol, 73%).

Synthesis of (acriPNP)Ni(CH=CH2) (5) from 2, 15-crown-5, and PhLi. After PhLi (2.4 mg, 0.029 mmol) was added to the solution of 15-crown-5 (17.7 mg, 0.0804 mmol) in THF (1 mL), the reaction mixture turned a pale violet color, resulting in the formation of in situ vinyl ether. The reaction mixture was added to crystalline 2 (15.0 mg, 0.0104 mmol) at room temperature and the reaction was stirred for 5 hrs. A crude 31P NMR spectrum was taken (0.1 mL of THF-d8 was added to facilitate locking) and indicated the presence of 73% 5, 15% 3 and 12% 2 unknown species (Figure S72). The workup conditions above were repeated to give 5 (6.3 mg, 0.011 mmol, 55%).
Reaction of 2 and glyme. Glyme (0.1 mL) was added to 2 (26.4 mg, 0.0183 mmol) in THF (4 mL) at room temperature and the reaction was stirred for 18 hrs. The solvent was removed under vacuum and the reaction mixture was taken in C\textsubscript{6}D\textsubscript{6}. The crude \textsuperscript{31}P NMR spectrum of the reaction mixture showed a br singlet at -3.4 ppm (75\%, likely (acrPNP)Na), doublet at 61.3 ppm (14\%, 3), singlet at 40.8 ppm (4\%, (acrPNP)Ni(CH=CH\textsubscript{2})), 5, 48.3 ppm (3\%), 30.2 ppm (2\%), 48.8 ppm (2\%). The workup conditions described above did not result in a measurable yield of 5.

Synthesis of (acrPNP)Ni(CH=CH\textsubscript{2}) (5) from 2 and ethyl vinyl ether. Ethyl vinyl ether (12.0 mg, 0.166 mmol, 11.8 eq) in THF (1 mL) was added to 2 (20.3 mg, 0.0141 mmol) in THF (4 mL) at room temperature and the reaction was stirred for 18 hrs. The workup conditions above were repeated to give 5 (7.8 mg, 0.014 mmol, 50\%).

Control experiments related to the synthesis of 5:

Reduction of 4-Ph in THF. The reaction above was repeated under analogous reaction conditions using sodium metal (18.5 mg, 0.804 mmol) and naphthalene (5.3 mg, 0.041 mmol, 4.0 equiv) in THF (3 mL) and (acrPNP)NiPh (6.2 mg, 0.010 mmol) in THF (2 mL). The reaction mixture retained the dark green color of the naphthalide solution for 4 hrs but faded to a brown solution after 18 hrs. The solvent was removed under vacuum and the reaction mixture was taken in C\textsubscript{6}D\textsubscript{6}. No vinyl complex (5) was observed in the crude \textsuperscript{31}P NMR spectrum. The crude \textsuperscript{31}P NMR spectrum of the reaction mixture showed a broad peak at 48.4 ppm (80\% by integration, likely a Ni(0) species, 2) was detected along with a peak at 39.3 ppm (20\%, 4-Ph).

Reaction of 1•C\textsubscript{10}H\textsubscript{8} with glyme. To the solution of 1•C\textsubscript{10}H\textsubscript{8} (4.5 mg, 0.0085 mmol) dissolved in THF (1 mL), glyme (0.1 mL) was added. After 20 hrs, volatiles were removed under vacuum and the reaction mixture was taken in C\textsubscript{6}D\textsubscript{6}. No vinyl complex (5) was detected in the crude \textsuperscript{31}P NMR spectrum.

Reaction of 1•C\textsubscript{10}H\textsubscript{8} with ethyl vinyl ether. To the solution of 1•C\textsubscript{10}H\textsubscript{8} (7.0 mg, 0.013 mmol) dissolved in THF (1 mL), ethyl vinyl ether (4.0 mg, 0.055 mmol, 4.3 equiv) was added. After 20 hrs, all volatiles were removed under vacuum and the reaction mixture was taken in C\textsubscript{6}D\textsubscript{6}. No vinyl complex (5) was detected in the crude \textsuperscript{31}P NMR spectrum.

Reaction of 1•C\textsubscript{10}H\textsubscript{8} with glyme and PhLi. To the solution of 1•C\textsubscript{10}H\textsubscript{8} (8.5 mg, 0.016 mmol) dissolved in THF (1 mL), the mixture of PhLi (1.4 mg, 0.017 mmol, 1.0 equiv) and glyme (0.5 mL) was added. After 20 hrs, all volatiles were removed under vacuum and the reaction mixture was taken in C\textsubscript{6}D\textsubscript{6}. No vinyl complex (5) was detected in the crude \textsuperscript{31}P NMR spectrum.

Synthesis of (acrPNP)Ni(CH=CH\textsubscript{2}) (5) from (acrPNP)NiCl and ethyl vinyl ether with magnesium powder. Ethyl vinyl ether (50.0 mg, 0.693 mmol, 3.90 equiv) was added to (acrPNP)NiCl (100.4 mg, 0.178 mmol) in THF (5 mL). Magnesium powder (112.9 mg, 4.65 mmol, 26.1 equiv) was added to reaction, which was stirred for 24 hrs at room temperature. The workup conditions above were repeated to give 5 (92.3 mg, 0.166 mmol, 93.5\%). The identity of the product was confirmed by a comparison of its \textsuperscript{1}H and \textsuperscript{31}P NMR data with those of an authentic sample of 5.

Stability test of 1•C\textsubscript{10}H\textsubscript{8} in the presence of NaBAr\textsubscript{4}F. To a solution of 1•C\textsubscript{10}H\textsubscript{8} (18 mg, 0.027 mmol) in C\textsubscript{6}D\textsubscript{6}, a solution of NaBAr\textsubscript{4}F (23 mg, 0.027 mmol) in THF-d\textsubscript{8} was added and the reaction
mixture was monitored by $^1$H NMR spectroscopy resulting that 1 is stable in the C$_6$D$_6$ at room temperature as well as elevated temperature at 60 °C for over 24 hrs.
