INTRODUCTION

The heterocyclic compounds have biological and pharmaceutical applications. So, they attract researchers to synthesize heterocyclic compounds for diverse applications. These heterocyclic compounds can also be synthesized from amino acids. The peptides are the important constituents of living organisms possessing diverse biological functions. But its applications were limited because of its poor metabolic stability in vivo, low oral bioavailability, and hydrolysis by proteases. These drawbacks can be overcome by its reaction with various amide-surrogates such as urea, thiourea, carbamates, and heterocycles and thus making them suitable for various applications [1, 2]. In particular, the insertion of heterocycles such as tetrazole, triazole, thiazole, and isoxazoline in the place of amide bond is of considerable interest in designing the peptidomimetics due to the added pharmacophoric values of those aromatic nuclei [3, 4]. The compounds possessing 1,3,4-oxadiazoles belong to a group of heterocycles. These heterocycles have potential applications in pharmaceutical applications and gained a special interest in drug discovery [5]. Many of them exhibit antibacterial, anticonvulsant, anticancer activities and are used to fight infections involving AIDS [6-8]. This heterocycle can also be used as a surrogate of amide and esters [9]. In agriculture, these compounds are used as herbicides, fungicides, and insecticides [10]. The 1,3,4-oxadiazoles possess photochemical, photophysical, electrochemical properties and also have thermal and electroluminescent properties [11-13]. The 1,3,4-oxadiazoles are used to produce organic light-emitting diodes (OLED), optical brighteners, and laser diodes in electronics [16, 17]. The 1,3,4-oxadiazoles derivatives exhibit the crystal structure [16-18]. Based on earlier studies, an attempt is made to prepare thio-1,2,3-oxadiazole derivatives. The prepared samples were characterized for their potential applications.

MATERIALS AND METHODS

Materials

The chemicals L-phenyl glycine, potassium carbonate, di-tert-butyl dicarbonate, hydrazine hydrate, carbon disulphide, potassium hydroxide, dimethylformamide (DMF), ethyl acetate, substituted halides were purchased from Sigma-Aldrich and used without purification. The dry ethyl acetate, hexane, and ethanol were obtained from Spectrochem for the crystallization process.

Instruments and methods

To obtain the information about the functional groups present the samples were undergone FTIR spectral studies using the Perkin-Elmer spectrum 100 series spectrophotometer. The 1HNMR spectra were recorded on a 400MHz Varian spectrometer to get the number of protons and their position. The 13CNMR spectra of these compounds were taken for the samples with the help of a 100MHz Brucker spectrometer with TMS as internal standard. The mass spectra are recorded on Shimadzu mass spectrometer. All the reactions were monitored by TLC plates and their spots were visualized by exposing them to a UV lamp, iodine chamber, or KMnO4, and it was performed with silica gel 60-120 mesh. To ensure the crystalline nature of the sample powder XRD was taken from the XPERT-PRO-Gonio scan-2 m instrument. The photoluminescence property of the samples was tested by Cary Eclipse-EL8083851 photometer. The elemental analysis was done by the Varian instrument (VARIO EL-3 series analyzer).

Synthesis and characterization

Synthesis of ethyl(S)-2-amino-2-phenylacetate (2)
About 100 ml of ethanol was taken in a round bottom flask. In this, 10 g (66 mmol) of phenyl glycine was added and stirred well. Then con. H₂SO₄, 7 ml (0.2 eq, 13 mmol) was added gradually. This solution is maintained at a temperature not exceeding 35 °C. Then, the reaction mixture was refluxed for 16 h. The mixture was monitored by TLC (mobile phase Ethyl acetate: hexane: 8:2). The reaction mixture was concentrated, washed with water, and dried with Na₂SO₄. It results in an oily residue. This ester is directly used for the second stage without carrying for any further purification.

It was obtained as colourless liquid. The yield was 66 %. (LCMS: 95.2 % purity). B.p t.104-106 °C, IR (KBBr, cm⁻¹): v_max 1740 (C=O), 1537-1493 (C=C), 3342 (amide-NH), 1681 (C=O), 1526-1493 (C=C), 3350 (amide-NH), 1682 (C=O), 1526-1493 (C=C), 3350 (amide-NH), 15H₂1NO₄, Calculated: C-64.62 %, H-7.42 %, N-5.22 %, O-22.74 %. Found: C-64.70 %, H-7.58 %, N-5.01 %, O-22.91 %. LCMS [M+1]+: m/z 180.6.

**Synthesis of ethyl(S)-2-((tert-butoxy carbonyl)amino)-2-phenylacetate(3)**

In 20 ml of ethanol, the compound N-protected phenylglycine ethyl ester (3) 6.4 g (24 mmol) was dissolved and then 3.6 ml of 98 % hydrazine solution was added. To a stirred solution of tert-butyl(2-hydrazineyl-2-oxo-1-phenyl)ethyl)carbamate (4) (5 g, 18.8 mmol), in ethanol (30 ml), KOH 2.1 g (37.6 mmol) was added. It was obtained as white solid with 67 % of yield (LCM S: 95.3 % purity), m. pt.104-106 °C, IR (KBr, cm⁻¹): vmax 1681(C=O), 1529-1518 (C=C), 3346 (amide-NH), 1599-1518 (C=C), 3340 (amide-NH), 1309-1024 (C-O, C-N), 1000-675 (C-H). 1HNMR (400 MHz, DMSO-d₆, ppm): 8 1.380 (s, 9H,-CH₃), 2.508-2.526 (d, 1H, J=7.2Hz,-CH₃), 5.123-5.145 (d, 1H, J=6.8Hz,-NH), 5.527-5.545 (d, 1H, J=7.2Hz,-CH), 7.227-7.330 (m, 5H, ArH), 12.908 (s, 1H, -SH). 13CNMR (100 MHz, DMSO-d₆, ppm): 8 28.62, 79.58, 170.36, 62.74, 129.45, 128.32, 129.78 , 128.63, 136.20, 176.40, 63.82 . For C₁₀H₁₃NO₂, Calculated: C-67.02 %, H -7.31 %, N-7.82 %, O-17.85 %. Found: C-67.14 %, H-7.58 %, N-7.64 %, O-17.96 %. LCMS [M+1]+: m/z 280.7.

**Synthesis of tert-butyl(2-hydrazineyl-2-oxo-1-phenyl)ethyl)carbamate(4)**

In 20 ml of ethanol, the compound N-protected phenylglycine ethyl ester (3) 6.4 g (24 mmol) was dissolved and then 3.6 ml of 98 % hydrazine solution was added. To a stirred solution of tert-butyl(2-hydrazineyl-2-oxo-1-phenyl)ethyl)carbamate (4) (5 g, 18.8 mmol), in ethanol (30 ml), KOH 2.1 g (37.6 mmol) was added. It was obtained as white solid with 67 % of yield (LCM S: 95.3 % purity), m. pt.104-106 °C, IR (KBr, cm⁻¹): vmax 1681(C=O), 1529-1518 (C=C), 3346 (amide-NH), 1599-1518 (C=C), 3340 (amide-NH), 1309-1024 (C-O, C-N), 1000-675 (C-H). 1HNMR (400 MHz, DMSO-d₆, ppm): 8 1.380 (s, 9H,-CH₃), 2.508-2.526 (d, 1H, J=7.2Hz,-CH₃), 5.123-5.145 (d, 1H, J=6.8Hz,-NH), 5.527-5.545 (d, 1H, J=7.2Hz,-CH), 7.227-7.330 (m, 5H, ArH), 12.908 (s, 1H, -SH). 13CNMR (100 MHz, DMSO-d₆, ppm): 8 28.62, 79.58, 170.36, 62.74, 129.45, 128.32, 129.78 , 128.63, 136.20, 176.40, 63.82 . For C₁₀H₁₃NO₂, Calculated: C-67.02 %, H -7.31 %, N-7.82 %, O-17.85 %. Found: C-67.14 %, H-7.58 %, N-7.64 %, O-17.96 %. LCMS [M+1]+: m/z 280.7.

**Synthesis of tert-butyl(2-hydrazineyl-2-oxo-1-phenyl)ethyl)carbamate(5)**

In 20 ml of ethanol, the compound N-protected phenylglycine ethyl ester (3) 6.4 g (24 mmol) was dissolved and then 3.6 ml of 98 % hydrazine solution was added. To a stirred solution of tert-butyl(2-hydrazineyl-2-oxo-1-phenyl)ethyl)carbamate (4) (5 g, 18.8 mmol), in ethanol (30 ml), KOH 2.1 g (37.6 mmol) was added and stirred for 30 min. Then Cs₂: 1.75 g (22.56 mmol) was added and stirred and filtered for 1 h. After completion of the reaction, concentrated to the residue, acidify with 1.5N HCl, solid was thrown out, filtered, and dried.

It was obtained as white solid with 67 % of yield (LCMS: 95.3 % purity), m. pt.104-106 °C, IR (KBBr, cm⁻¹): v max 1681(C=O), 1599-1518 (C=C), 3340 (amide-NH), 1016-1245 (C-O, C-N), 79.23, 155.82, 19.88. For C₁₃H₁₉N₃O₃S, Calculated: C-58.85 %, H-7.22 %, N-15.84 %, S-10.33 %. LCMS [M+1]+: m/z 266.30.

**Preparation of 1,3,4-oxadiazol derivatives (6a-d)**

The one equivalent (100 mg) weighed compound-(5) was dissolved in DMF (2 ml). KCO₃ (2 eq) was added and the reaction mixture was stirred for 15 min. Then alkyl/aryl halide (1 eq) solution was added dropwise and stirred for 16 h at room temperature. After the completion of the reaction (monitored by TLC), ice water was added and extracted with ethyl acetate. The organic layer was filtered to remove potassium carbonate. The filtrate was concentrated and diluted with Ethyl acetate (2x 2 ml) washed with water and brine solution, dried, and concentrated. The crude was purified by column chromatography (gradient elution of 30-40 % of ethyl acetate in hexane) to get desired product (6a-d).

**Fig. 1: The scheme of reaction**
Table 1: List of alkyl halides used in the reaction

| Compound | Alkyl halides | Product | Yield % | m.pt. °C |
|----------|---------------|---------|---------|----------|
| 6a       | 4-fluorobenzyl chloride |         | 95      | 96-97    |
| 5b       | Benzyl bromide |         |         | 109-111 (b.pt) |
| 6c       | Propyl iodide |         | 95      | 68-70    |
| 5d       | 3-fluoro-5-((trifluoromethyl)benzyl bromide |         | 95      | 98-100   |

**Synthesis of tert-butyl((5-((4-fluorobenzyl)thio)-1,3,4-oxadiazol-2-yl)(phenyl)methyl) carbamate (6a)**

The aryl halide 4-fluorobenzyl chloride was added in this reaction. It gives the compound 6(a) which was also a white solid with 95 % yield. (LCMS: 95.2 % purity), m. pt. 96-97 °C, IR (KBr, cm⁻¹): υmax 1694 (C=O), 1577-1476 (C=C), 3396 (amide-NH), 1240-1007 (C-O, C-N), 626(C-S), 1007-1055 (C-F), 969-692 (C-H). 1HNMR (400 MHz, DMSO-d6, ppm): δ 1.478 (s, 9H, -CH₃), 8.252 -8.259 (d, 1H, J=2.8Hz, -NH), 5.754 -5.772 (d, 1H, J=7.2Hz, -CH), 7.080-7.121 (m, 5H, ArH), 4.451 (s, 2H, -CH₂), 7.373-7.420 (m, 4H, ArH). 13CNMR (100 MHz, DMSO-d6, ppm): δ 28.5, 79.53, 155.36, 51.00, 128.77, 129.08, 127.97, 137.22, 163.24, 35.45, 131.59, 129.08, 115.67, 160.81. For C₂₁H₂₂FN₃O₃S, Calculated: C-60.92 %, H-5.47 %, F-4.76 %, N-10.04 %, O-11.29 %, S-7.52 %. Found: C-60.71 %, H-5.34 %, F-4.57 %, N-10.11 %, O-11.55 %, S-7.72 %. LCMS [M+1]+: m/z 416.7.

**Synthesis of tert-butyl((5-(benzylthio)-1,3,4-oxadiazol-2-yl)(phenyl)methyl) carbamate (6b)**

To get the compound 6(b), benzyl bromide (aryl halide) was added and results colour less liquid with 92 % yield. (LCMS: 95.5 % purity), b. pt.109-111 °C, IR (KBr, cm⁻¹): υmax 1703 (C=O), 1579 -1454 (C=C), 3311 (amide -NH), 1276 -1016 (C -O, C-N), 605 (C -S) 977 -696 (C-H). 1HNMR (400 MHz, DMSO-d₆, ppm): δ 1.393 (s, 9H, -CH₃), 8.254-8.274 (d, 1H, J=8Hz, -NH), 6.054-6.075 (d, 1H, J=8.4Hz, -CH), 7.326-7.401 (m, 5H, ArH), 4.573 (s, 2H, -CH₂), 7.543-7.707 (m, 5H, ArH). 13CNMR (100 MHz, DMSO-d₆, ppm): δ 28.56, 79.50, 155.37, 51.01, 128.75, 129.04, 127.93, 137.26, 163.98, 35.01, 137.26, 128.75, 129.04, 127.93. For C₂₁H₂₃N₃O₃S, Calculated: C-63.46 %, H-5.83 %, N-10.57 %, O-12.07 %, S-8.07 %. Found: C-63.21 %, H-5.95 %, N-10.39 %, O-12.02 %, S-8.43 %. LCMS [M+1]+: m/z 398.9.

**Synthesis of tert-butyl((5-(propylthio)-1,3,4-oxadiazol-2-yl)(phenyl)methyl)carbamate (6c)**

The reaction of propyl iodide (alkyl halide) and the compound -5 results the compound 6(c) in the form of white solid. Its yield percentage is 95 %. (LCMS: 94.4 % purity), m. pt.68-70 °C, IR (KBr, cm⁻¹): υmax 1685 (C=O), 1577-1475 (C=C), 3361 (amide-NH), 11286 -1020 (C-O, C-N), 633(C-S) 969-702 (C-H). 1HNMR (400 MHz, DMSO-d₆, ppm): δ 1.400 (s, 9H, -CH₃), 8.250-8.257 (d, 1H, J=2Hz, -CH), 7.352-7.441 (m, 5H, ArH), 3.320- 3.339 (t, 2H, J=7.6Hz, -CH₂), 1.650-1.688 (m, 2H, -CH₂), 0.860 -0.887 (t, 3H, J=10.8Hz, -CH₃). 13CNMR (100 MHz, DMSO-d₆, ppm): δ 28.50, 79.42, 155.30, 51.10, 128.70, 129.01, 128.30, 128.64, 164.50, 31.98, 21.24, 13.96. For C₁₈H₂₅N₃O₃S, Calculated: C-58.43 %, H -6.63  %, N -12.02 %, O -13.74 %, S -9.18 %. Found: C-58.54  %, H -6.52 %, N -12.14  %, O -13.68  %, S -9.12 %. LCMS [M+1]+: m/z 351.0.

**Synthesis of tert-butyl((5-((3-fluoro5-(trifluoromethyl)benzyl)(thio)-1,3,4-oxadiazol-2-yl) (phenyl) methyl) carbamate(6d)**

The aryl halide 3-fluoro-5-(trifluoromethyl) benzyl bromide was added and reacted to produce the compound 6(d). It was obtained as white crystalline solid with 95 % yield. (LCMS: 95.6 % purity), m. pt.98-100 °C, IR (KBr, cm⁻¹): υmax 1681 (C=O), 1573-1473 (C=C), 3350 (amide-NH), 1292-1022 (C-O, C-N), 615(C-S) 974-694 (C-H), 1022-1049 (C-F), 1049-1165 (C-F, CF₃). 1HNMR (400 MHz, DMSO-d₆, ppm): δ 28.50, 79.50, 155.37, 51.01, 128.20, 128.75, 127.99, 137.26, 163.98, 35.01, 121.36, 119.24, 124-48. For C₂₂H₂₁F₄N₃O₃S, Calculated: C-54.65 %, H-6.63 %, N-12.02 %, O-13.74 %, S-9.18 %. Found: C-54.58 %, H-6.52 %, N-12.14 %, O-13.68 %, S-9.12 %. LCMS [M+1]+: m/z 484.4.

All the reaction schemes were shown in fig. 1. The yield and melting point of these samples are presented in table 1.

**RESULTS AND DISCUSSION**

**Powder XRD studies**

The powder XRD pattern is shown in fig. 2. From the graph, it is observed that the peaks are sharp and intense. This shows that the sample is pure and in crystalline nature.
The crystalline size is calculated from the Debye-scherrer formula

\[ D = \frac{0.9 \lambda}{\beta \cos \theta} \]

\( \lambda \rightarrow \) wavelength 1.546 Å

\( \beta \rightarrow \) Full width half (0.1476 deg = 0.002576 rad)

\( \theta \rightarrow \) Angle of diffraction (14.6486/2 = 7.3243 deg = 0.127833 rad)

\[ D = 0.9 \times 0.154/0.002576 \times \cos(0.1278) \]

\[ D = 54.2658 \text{ nm}. \]

The powder XRD pattern is shown in fig. 3. From the graph, it is observed that the peaks are sharp and intense. This shows that the sample is pure and in crystalline nature.
The crystalline size of the samples are calculated and presented in table 2

| S. No. | Compound name | Size (nm)   |
|-------|---------------|-------------|
| 1     | 4             | 54.2658     |
| 2     | 6d            | 54.3108     |

Generally, the crystalline size value will increase or decrease depending on the ordering inside the material. So when materials are added it will disturb the order of the parent compound also the additional compound produces strain inside the crystal. These strains restrict the growth of the crystal and hence result in smaller size crystals. The incorporation of additional compounds is evident from the decrease in the crystalline size as indicated in the table.

Photoluminescence

The photoluminescence (PL) spectrum examines material for its wide applications in the field of medical, biochemical, and chemical research. In PL spectroscopy, generally, a beam of light excites the electrons in the molecule of given materials and causes them to emit light in a longer wavelength than the observed radiation. The fig. Fig. 4-5 show the PL spectra of the samples. These spectra give the absorption wavelength at 358 nm which means the emission of blue radiation. The absorption peak is due to the band-to-band electronic transition in a material. When the PL spectrum of compound 6d is compared with compound 4, it is observed that the intensity of the peaks is high and also few less intense peaks were seen. These additional peaks are due to the electronic transition between the new electronic levels caused by the addition compound. The result predicts the use of the materials as a color filter.

**CONCLUSION**

The synthesis of derivatives of thiol-1,2,3-oxadiazole (6a-d) was carried out. The functional groups present in the samples were studied from the FTIR spectra and thus it confirms the synthesis of the compounds. The proton and carbon positions of these were obtained through 1HNMR and 13CNMR spectra respectively. The LCMS study indicates the good yield of all the compounds. The melting point of the samples was studied and
shows that almost all the compounds except 6(c) have high melting points. It means that the aliphatic compounds have lower melting point compared with aromatic compounds. The crystalline nature of these samples 6 (d) was confirmed by the powder X-ray diffraction studies. These samples show less optical nature as studied from PL study.
