INTRODUCTION

Medicinal plants are the richest bioresources for many types of medicinal practices such as modern medicines, Allopathy, Homeopathy, Naturopathy, Unani, Acupuncture, Ayurveda, nutraceuticals, and traditional medicines, synthetic drugs and pharmaceuticals, intermediate, food supplements [1].

Indian subcontinent is a vast repository of medicinal plants that are used in traditional medical treatments which also forms a rich source of knowledge [2]. India is one of the megadiversity centers in the planet having a diverse medicinal plant species which is unexplored most of them are endemic. India shares approximately 13% of world’s biodiversity, one among 17 megadiversity centers. Among the 34 hotspots in the world, India has 4 hotspots, namely, Eastern Himalaya, Indo-Burma, Western Ghats, Andaman and Nicobar Island. The various indigenous systems use several plant species to treat different ailments [3]. In India, around 20,000 medicinal plant species have been recorded recently, but more than 500 traditional communities use about 800 plant species for curing different diseases [4].

Western Ghats is a mountain range that runs parallel to the western coast of the Indian peninsula, located entirely in India. The range starts near the border of Gujarat and Maharashtra, runs approximately 1600 km through the states of Maharashtra, Goa, Karnataka, Kerala, and Tamil Nadu ending at Kanyakumari, at the southern tip of India [5].

Experimental medicinal plant and description:
Pavetta crassicaulis Bremek. Scientific classification:

Kingdom: Plantae
Division: Magnoliophyta
Class: Magnoliopsida
Subclass: Asteridae
Family: Rubiaceae
Order: Rubiales
Genus: Pavetta
Species: P. crassicaulis Bremek.

P. crassicaulis Bremek. is an important ethnomedicinal shrub or small tree belonging to the family Rubiaceae, grows up to 4 m tall, the plant is endemic to peninsular India. The leaves are often membranous with dark bacterial nodules, has small, white, tubular flowers, sometimes saiviform or funnel-shaped with 4 spreading petal lobes. The flowers are carried on terminal corymbs or cymes, the leaves are elliptical-oblong to elliptic-lanceolate, 6–15 cm long, and pointed at both ends. The flowers are white, rather fragrant, and borne in considerable number in hairy terminal panicle which is 6–10 cm long. The sepals are small and toothed. The flowers tube is slender and about 1.5 cm long, with obust pedals above half the length of the tube. The fruits are black when they dry, somewhat rounded and about 6 mm in diameter [6].

P. crassicaulis Bremek. endemic to peninsular India and distributed in many places such as Mizoram, Gujrat, Uttara Pradesh, Chhattisgarh, Orissa Maharashtra, and Karnataka [7-10].

P. crassicaulis Bremek. has medicinal properties which is used in many parts of India, Pavetta plant parts used in the treatment of arthritis, boils and itches, hemorrhoidal pains, visceral problems, dropsy [11], epilepsy, hemorrhoids [12], skin diseases [13], anticephalagic, fat burner, aphrodisiac [14], urinary complaints and fruits used as anthelmintic and flowers are eaten fried [15].

The preliminary qualitative phytochemical analysis of P. crassicaulis Bremek. methanolic crude extract revealed the presence of...
alkaloids, steroids, and terpenoid with moderate antimicrobial activity [16,17].

The present study focused on the anti-inflammatory properties of *P. crassicaulis* Bremek. plant parts.

**METHODS**

**Plant collection and authentication**

The bark and leaf materials of *P. crassicaulis* Bremek. were collected from Shringeri taluk, Karnataka in April 2014 (13.4198° N, 75.2567° E) (Fig. 1). The plant was identified by Prof. K G Bhat, Udupi, and a voucher specimen was conserved under the reference number KU/AB/RN/AS/001.

**Plant preparation and extraction**

The samples were dried in the shade for 20–25 days, mechanically powdered, and subjected to Soxhlet extraction using petroleum ether, chloroform, and ethanol [18]. The crude extracts were collected in air-tight plastic containers and stored in cool condition.

**Preliminary phytochemical screening**

Air-dried and powdered leaf materials and also all crude extracts were screened for the presence of tannins, alkaloids, saponin, glycosides, flavonoids, steroids/sterols, and phenols using standard methods [19-21].

**Gas chromatography and mass spectroscopy (GC-MS) analysis**

*Pavetta crassicaulis* Bremek leaf and flower ethanolic extracts were subjected to GC-MS analysis and obtained spectra was analysed. GC model: Thermo Trace GC Ultra, MS Model: Thermo DSQ II, Ionization: Electron impact ionization (EI), chemical ionization (CI), mass range: 1–1074 m/z.

**Isolation of pure compound**

The stationary phase in column chromatography is silica gel and the mobile phase or eluent is the mixture of different immiscible solvents [22]. 5 g of residue is dissolve in ethanol and it will adsorbed on to the silica gel powder and of 1.50 g is loaded to column. The column was eluted with n-hexane 100%, flowed by n-hexane and ethyl acetate in different ratios (99:1, 90:10, 80:20, 60:40, 50:50) and followed by ethyl acetate 100% and the with mixture of ethyl acetate:ethanol (99:1, 98:2, 95:5, 90:10, 80:20). Simultaneously, the same elution is monitored by thin-layer chromatography (TLC) (silica gel and for visualization, mixture of vanillin: Sulfuric acid heated at 110°C). Each time, 5 ml were collected and TLC monitored same elute was concentrate to 5 ml stored in the refrigerator.

**Rat maintenance**

Rats (120–170 g) of either sex kept at the laboratory Animal home of the Faculty of Pharmacy, SCS College of Pharmacy, Harapanahalli, Davanagere, were used. The animals were maintained under standard environmental conditions and had free access to standard diet and water. Plant extracts were administered orally by gavage in distilled water at different dose levels. All experiments were carried out according to the Institutional Animal Ethics Committee Guidelines (Re: SCSCP/IAEC/11/12/2016-17).

**Anti-inflammatory activity by carrageenin-induced rat hind paw edema method (in vivo model)**

Anti-inflammatory activity was measured using carrageenan-induced rat paw edema assay [23,24]. Groups of 5 rats of both sexes (pregnant females excluded) were given a dose of the extract. After 1 h, 0.1 ml 1% carrageenan suspension in 0.9% NaCl solution was injected into the subplantar tissue of the right hind paw. Paw volume was measured plethysmometrically at 0 h and 3 h after carrageenin injection [25]. Two groups of drug-treated rats and one control group were used each test day, the mean paw edema value for the test group being compared with its mean value for the control group for that day. The test compounds (50 mg/kg) were administered orally; standard group was treated with diclofenac (50 mg/kg) orally 1 h. before by injection and control group received only vehicle. Mean difference in paw volume was measured and percentage inhibition was calculated by following formula.

\[
\text{% inhibition of edema} = \left( \frac{V_c - V_t}{V_c} \right) \times 100
\]

Where Vt = mean paw volume of test group, Vc = mean paw volume of control group.

Anti-inflammatory activity [26] was measured as the percentage reduction in edema level when drug was present, relative to control.

**Statistical analysis**

All data were validated with the help of statistical software PRISM and MINITAB; the values were expressed as mean ± standard error of the mean and results were statistically analyzed by one-way analysis of variance (ANOVA) followed by Dunnet’s t-test. Symbols represent statistical significance:*p<0.05, **p<0.01, ***<0.0001 ns - not significant, as compared to control group.

**RESULTS**

**Extract yield and preliminary phytochemical analysis**

The Soxhlet extraction of *P. crassicaulis* Bremek. leaf (750 g) with petroleum ether gives 12.32 g, with chloroform gives 19.99 g and with ethanol gives 75.35 g yield. The results of preliminary qualitative phytochemical screening of different extracts of *P. crassicaulis* Bremek. leaf indicate the presence of saponins, tannins, flavonoids, steroids/sterols, glycosides, and phenols in ethanolic crude extract and chloroform extract confirms the presence of phenols and sterols and petroleum extracts negative results for all the phytochemical tests.

The Soxhlet extraction of *P. crassicaulis* Bremek. flower (750 g) with petroleum ether gives 20.34 g, with chloroform gives 18.64 g and with ethanol gives 45.38 g yield. The results of phytochemical screening of *P. crassicaulis* Bremek. flower extracts indicate the presence of alkaloids, saponins, flavonoids, steroids/sterols, glycosides, and phenols in...
ethanol crude extract, the chloroform crude extracts shows positive results for flavonoids. However, the petroleum ether crude extract gave negative results for all these compounds (Table 1).

**GC-MS analysis of ethanolic crude extract**

**Leaf ethanolic extract**

In GC-MS analysis of medicinal *P. crassicaulis* Bremek, ethanolic leaf extract revealed the presence 34 compounds, in that major percentage of compounds present was 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol (38.84%), cyclo{tetra[(5-t-butyl-2-hydroxy-1,3-phenylene)methylene]} (15.72%), 4H-pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl- (9.34%), bicyclo[3.3.1]nona-3,7-diene-2,9-dione (6.25%), and methyl ester of bicyclo[4.3.0]non-1(6)-en-4,7-dione-8-carboxylic acid (5.6%). The major compound 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol (37.44%) have antioxidant properties and also used as ultraviolet stabilizer. Cyclo{tetra[(5-t-butyl-2-hydroxy-1,3-phenylene)methylene]} (15.72%), 4H-pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl- (9.34%) has antioxidant properties (Table 2 and Figs. 2-4).

**Flower ethanolic extract**

The GC-MS analysis of *P. crassicaulis* Bremek. flower ethanolic extract revealed the presence of 39 compounds, in that, 4H-pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl- (13.82%), benzaldehyde, 2-methyl- (7.25%), benzaldehyde, 2-hydroxy-6-methyl- (6.52%), 2-furancarboxaldehyde, and 5-(hydroxymethyl)-(6.30%) in major percentage. and campesterol also (0.80%), stigmasterol (0.62%), β-Sitosterol (3.10%) in meagre percentage (Figs. 5-7 and Table 3).

**Column chromatography of ethanolic leaf and flower extract**

**Leaf ethanolic extract**

Elution carried out with n-hexane in 100% concentration eluted compound 1 in small quantity and with n-hexane:ethyl acetate at the ratio 80:20 gives compound 2, but its yield is too less. Ethyl acetate was eluted mixture of many compounds and ethyl acetate: ethanol at 80:20 yielded large quantity of compound 3. The gradient of other residues was yielded mixture of compound which is confirmed by TLC therefore not subjected to further process.

Compound 3L was yielded more so, we took only compound 3L for further structural analysis.

The pure compound 3L was crystaline transparent grayish color. Further, the pure compound subjected to cNMR, hNMR, infrared (IR), mass spectral analysis, and the molecular formula was C_{40}H_{58}O_{3}, molecular weight 586.887 g/mol. From all these details, the compound name was found to be tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol (Figs. 8-11).

---

### Table 1: Preliminary phytochemical analysis of different extract of *P. crassicaulis* Bremek. leaf and flower

| Secondary metabolites | Type of tests | Petroleum ether crude extract | Chloroform crude extract | Ethanol crude extract |
|-----------------------|--------------|-------------------------------|--------------------------|---------------------|
|                       |              | Leaf | Flower | Leaf | Flower | Leaf | Flower |

Flower ethanolic extract

Elution carried out with n-hexane in 100% concentration eluted nil compound and with n-hexane:ethyl acetate at the ratio 90:10 gives compound 1, but its yield is too less. Ethyl acetate was eluted compound 2 and ethyl acetate:ethanol at 90:10 yielded large quantity of compound 3. The gradient of other residues was yielded mixture of compound which is confirmed by TLC therefore not subjected to further process.

Compound 3F was yielded higher quantity so we took only compound 3F for further structural analysis.

The pure compound 3F was crystalline light brown colored and shiny surface. Further, it was subjected to cNMR, hNMR, IR, and mass spectral analysis and the molecular formula was found to be C_{6}H_{8}O_{4}, molecular weight 144.1253 g/mol, from all these details the compound name was found to be 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- (Fig. 3).

Ant-inflammatory activity of different extract of P. crassicaulis

The extracts were tested at three different dose levels to know if they were dose-dependent. From the results obtained, it is revealed

![Flower ethanolic extract](image)

![Anti-inflammatory activity of different extract of P. crassicaulis](image)
that petroleum ether and chloroform extract did not showed any anti-inflammatory activity against carrageenin-induced rat hind paw edema in all concentrations compared with the control. Leaf ethanolic extract showed appreciable anti-inflammatory in all the concentrations (100, 150, 200, 250, and 500 mg/kg concentration) by ANOVA statistical analysis obtained values were validated, which revealed that the leaf ethanolic extract of *P. crassicaulis* Bremek. was highly significant against carrageenin-induced rat hind paw edema in all concentrations in all the interval time. The leaf ethanolic extract of *P. crassicaulis* Bremek. excellent in reducing edema induced by carrageenan in all the phases. Therefore, leaf ethanolic extract of *P. crassicaulis* Bremek. crude extract definitely possess anti-

| 27     | 9,12-octadecadienoic acid, methyl ester | 1.29 | Anti-inflammatory, nematicide, insecticide, hypocholesterolemic, cancer preventive, hepatoprotective, antihistaminic, anti-acne, anti-arithmetic, anti-eczemic, 5-alpha reductase inhibitor, antiantiandrogenic, anticonvulsant [68,69] |

(Contd...)
inflammatory secondary metabolites which was reducing the paw edema significantly (Table 4, Figs. 16 and 17).

**Anti-inflammatory activity of flower crude extracts**

Like leaf ethanolic extract, the flower ethanolic extract also showed appreciated effect in suppressing inflammation. Here, also petroleum ether and chloroform showed nil effect on the tested animals in suppressing inflammation. The activity is dose dependent and in all the concentrations (100, 150, 200, 250, and 500 mg/kg concentration), the ethanolic flower extract showed excellent activity which is revealed statistically through one-way ANOVA. By this, it is proved that ethanolic leaves extract having some metabolite responsible for its anti-inflammatory activity (Table 5, Figs. 18 and 19).

**Percentage of inflammation inhibition of all leaf extracts**

The percentage of inflammation inhibition of the petroleum ether and chloroform leaf crude extracts were initially showed negative values (0–1 h) after the initial hours (2–4 h), these extracts also showed positive results with little inflammation inhibition at final hour (6 h).

The ethanolic crude extract showed excellent results in all the time intervals, in all the concentrations (100, 150, 200, 250, and 500 mg/kg). In all the crude extracts, ethanolic extract has excellent inflammation inhibition activity, much higher than other extracts.

---

| 34     | cis, cis, cis-7,10,13-hexadecatrienal | 1.34 | Bactericde, antifungal, cytotoxic, antibacterial, antioxidant, antitumor, cancer preventive, immunostimulant, chemopreventive, lipoxygenase inhibitor, perfumery, pesticide, and sunscreen [53] |
| 35     | 2,6,10,14,18,22-tetracosahexaene, 2,6,10,15,19,23-hexamethyl- | 0.56 | Drug delivery mediums for topical and oral pharmaceuticals, organic application mediums for cosmetics, cleaning materials for art conservation, as delivery mediums and/or nutrients in nutraceuticals (vitamins and supplements), particles in personal care products (shampoo, conditioner, soap, toothpaste, etc., as a crystalline fat alternative in food processing [71] |
| 36     | Hexatriacontane | 0.80 | Campesterol is also sometimes used to treat some specific prostate conditions, used in nutrient medicines such as nutrients, body building supplements, and food additive [72] |
| 37     | Campesterol | 0.80 | Drug delivery mediums for topical and oral pharmaceuticals, organic application mediums for cosmetics, cleaning materials for art conservation, as delivery mediums and/or nutrients in nutraceuticals (vitamins and supplements), particles in personal care products (shampoo, conditioner, soap, toothpaste, etc., as a crystalline fat alternative in food processing [71] |
| 38     | Stignasterol | 0.62 | Drug delivery mediums for topical and oral pharmaceuticals, organic application mediums for cosmetics, cleaning materials for art conservation, as delivery mediums and/or nutrients in nutraceuticals (vitamins and supplements), particles in personal care products (shampoo, conditioner, soap, toothpaste, etc., as a crystalline fat alternative in food processing [71] |
| 39     | Beta-Sitosterol | 3.10 | Drug delivery mediums for topical and oral pharmaceuticals, organic application mediums for cosmetics, cleaning materials for art conservation, as delivery mediums and/or nutrients in nutraceuticals (vitamins and supplements), particles in personal care products (shampoo, conditioner, soap, toothpaste, etc., as a crystalline fat alternative in food processing [71] |
suppression activity and rest of the extracts has negligible inflammation suppression (Table 6, Figs. 20 and 21).

**Percentage of inflammation inhibition of all flower extracts**

For initial hours, petroleum ether and chloroform flower extracts were showed negative values (0–1 h) after that (2–4 h) petroleum ether and chloroform extracts also showed positive results with little inflammation inhibition. The flower ethanolic extract showed appreciable inflammation suppression activity in all the time intervals, in all the concentrations (100, 150, 200, 250, and 500 mg/kg) (Table 7, Figs. 22 and 23).

**Anti-inflammatory activity of pure compound 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol**

The pure compound “2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol” (10 mg/kg) which is extracted from ethanolic leaf crude extract of *P. crassicaulis* Bremek. has excellent anti-inflammatory activity which is almost equal to the standard diclofenac (10 mg/kg) used in all the intervals of time. By statistical tool ANOVA, it is revealed that the activity showed by the pure compound which is equivalent to the standard used (Table 4 and Figs. 17, 20, 21).

Fig. 20: Inflammation suppression in rats after treating leaf ethanolic extracts and its pure compound at different time intervals at different concentrations.
The pure compound 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol (10 mg/kg) has showed excellent percentage of inflammation inhibition almost equal to the standard diclofenac (10 mg/kg) used in all the intervals of time (Table 6 and Figs. 17, 20, 21).

The pure compound 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- (10 mg/kg) which is extracted from ethanolic flower crude extract of *P. crassicaulis* Bremek. has excellent anti-inflammatory activity equal to the standard diclofenac (10 mg/kg) used in all the intervals of time. By statistical tool ANOVA, it is revealed that the activity showed by the pure compound which is equivalent to the standard used. The results obtained once again withstand the positive activity of the pure compound which was previously tested for its anti-inflammatory activity [27-29] (Table 5 and Figs. 19, 22, 23).

### DISCUSSION

Preliminary quantitative phytochemical analysis of *P. crassicaulis* Bremek. leaf petroleum ether, chloroform crude extracts showed negative results for all the tested phytochemicals aqueous extract gives positive results for saponins and glycosides, but the ethanolic crude extract gives positive confirmation test for saponins, tannins, flavanoids, steroids/sterols, glycosides, and phenols.

Preliminary quantitative phytochemical analysis of *P. crassicaulis* Bremek. flower petroleum ether, chloroform crude extracts showed negative results for all the tested phytochemicals aqueous extract.

Percentage of inhibition was calculated [25] with the formula % inhibition of edema = (Vc–Vt)/Vc×100. Vt=mean paw volume of test group. Vc=mean paw volume of control group.

Leaf ethanolic crude extract was subjected to GC-MS revealed the presence of 33 compounds (Table 2 and Fig. 2) Among all the confirmed phytochemicals, 21 compounds reported for many medicinal and pharmacological properties and 12 compounds activity was not reported. All the other phyto compounds such as Bicyclo[3.3.1]nona-3,7-diene-2,9-dione (6.22%), Methyl Ester Of Bicyclo[4.3.0]Non-1(6)-En-4,7-Diene-6-[trichloromethyl]-2-pyrimidine (1.14%), 2-Methoxy-4-vinylphenol (1.14%), 2-(3H)-Naphthalenone, 4,4a,5,6-tetrahydro- [0.77%], 2,4-Dimethyl-3-nitrobicyclo[3.2.1]octan-8-one (0.96%), Stigmast-5-en-3-ol, (3.beta.,24S)- (0.95%), 2-Hexadecanol, 2-hydroxy-1-(hydroxymethyl)ethyl ester (0.62%), 2,5-dimethyl-
4-hydroxy-3(2H)-furanone (0.52%), 2,6,10,15,19,23-hexamethyl-2,6,10,15,19,23-hexamethylen-1,5-dinitro- (0.4%), Phenol, 2-methoxy-4-(2-propenyl)- (0.39%), Octanal, 7-methoxy-3,7-dimethyl- (0.37%), 9,12-Octadecadienoic acid (ZZ)-, 2-hydroxy-1-(0.3%), Hexadecanoic acid, methyl ester (0.29%), 9,12,15-Octadecatrienoic acid, methyl ester, (Z,Z,Z)- (0.28%) were present in a meager percentage have reported for many medical as well as pharmacological properties (Table 2 and Fig. 2).

Flower ethanolic crude extract was subjected to GC-MS revealed the presence of 39 compounds (Table 3 and Fig. 5). Among all the confirmed phytochemicals, 31 compounds reported for many medicinal and pharmacological properties and 8 compounds activity was not reported.

Among the phytochemicals present in the flower ethanolic extract, 4H-Pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl- (13.82%), Benzaldehyde, 2-methyl- (7.25%), Benzaldehyde, 2-methyl-6 hydroxy (6.52%), 2-Furancarboxaldehyde, 5-(hydroxymethyl)- (6.3%) were the major compounds. The major compound 4H-Pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl-was previously report for its antioxidant and other pharmacological properties [27-29]. Benzaldehyde, 2-methyl-, Benzaldehyde, 2-methyl- 6 hydroxy, 2-Furancarboxaldehyde, 5-(hydroxymethyl)- were commonly used in food and perfume industry as a flavoring agent [44,45,62].

The rest of the compound present in the GC-MS analysis of flower ethanolic extract was Methyl Ester Of Bicyclo[4.3.0]Non-1(6)-En-4,7-Dione-8- (4.77%), 1,2-Benzenedioli (4.33%), Alpha-D-Glucopyranose, 4-O-beta-D-galactopyranosyl (3.95%), Benzofuran, 2,3-dihydro- (3.5%), N-Hexadecanoic Acid (3.11%), Beta-Sitosterol (3.1%), 1,2,3-Propanetriol, diacetate (3%), 9,12-Octadecadienoic acid (ZZ)-, 2-hydroxy-1- (2.75%), 2,6-Dimethyl-4-hydroxybenzaldehyde (2.73%), 2-Methoxy-4-vinylphenol (2.58%), Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester (2.57%), 4-((1E)-3-Hydroxy-1-propenyl)-2-methoxyphenol (2.57%), 9,12,15-Octadecatrienoic acid, methyl ester, (Z,Z,Z)- (2.38%), Benzaldehyde, 4-hydroxy- (2.3%), Acetic acid, 1-(2-methylytetrazol-5-yl)ethyl ester (2.15%), Benzoyl beta-D-glucoside (2.13%), 2,5-Dimethyl-4-Hydroxy-3(2H)-furanone (1.99%), Benzoic acid, ammonium salt (1.62%), 2,4-Dihydroxy-2,5-dimethyl-3(2H)-furan-3-one (1.4%), cis,cis,cis-7,10,13-Hexadecatrienal (1.34%), 9,12-Octadecadienoic acid, methyl ester (1.29%), Hexadecanoic acid, methyl ester (1.11%), 2,2-Dimethyl-3-[3-methyl-5-(phenylthio)pent-3-yl]oxirane (1.06%), Butanedioic acid, monomethyl ester (0.9%), Tricyclo[7.1.0.0[1,3]]decane-2-carboxaldehyde...
The pure compounds showed excellent inflammation suppression activity in that, 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol showed 75.88% average edema suppression and 4H-Pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- showed excellent anti-inflammation activity which is almost equal to the 75.94% average edema suppression.

Some of the researchers used different methods of anti-inflammatory activity such as croton oil-induced ear edema in rats [80,81], protein denaturation bioassay [82-86], membrane stabilization assay using human red blood cell [87,88], but most of the researchers followed carrageenan-induced rat paw edema [89-93] to evaluated anti-inflammatory activity.

The results obtained from the above experiments, the ethanolic leaf and flower extracts of *P. crassicaulis* Bremek. showed excellent inflammation suppression activity, in that leaf ethanolic extract showed good inflammation suppression compared with the flower ethanolic extract. GC-MS analysis of both ethanolic crude extracts revealed the presence of 33 compounds, respectively, in that major compounds were 2-Tert-Butyl-4,6-Bis(3,5-Di-Tert-Butyl-4-Hydroxybenzyl)Phenol (38.84%) and 4H-Pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- (13.82%) respectively.

The pure compound 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol and 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- showed excellent anti-inflammation activity almost comparable to the standard diclofenac employed.

The pure compound extracted from flower ethanolic extract 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- was previously confirmed for its positive inflammation suppression activity and the pure compound extracted from leaf ethanolic extract 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol is the new report in anti-inflammatory activity.

2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol isolated from leaf is excellent inflammation suppressor in compared with the 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- extracted from flower ethanolic extract and the crude extracts were also showed the same activity which was also influence by the quantity of compound present in both ethanolic extracts (2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol - 38.84%) and 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- (13.82%) in GC-MS analysis.

In the crude extracts minor compound in little quantity may also influence the activity. If major compound confirms the positive effect, then its influence is more in the activity. In our experiments, both the extracted pure compound showed positive effect in suppressing inflammation.

After administration of crude extracts in tested animals were showed effective in suppressing the inflammation from 0 h and in next successive hours, these extracts maintain its effectiveness till the last testing hour (6 h).

**CONCLUSION**

The present study shows that the leaf and flower ethanolic crude extracts have remarkable anti-inflammatory activity compared to both petroleum ether and chloroform extracts. The pure compound 2-tert-butyl-4,6-bis(3,5-di-tert-butyl-4-hydroxybenzyl)phenol extracted from leaf ethanolic crude extract and 4H-pyran-4-one,2,3-dihydro-3,5-dihydroxy-6-methyl- extracted from flower ethanolic extract has excellent anti-inflammatory activity which is almost equal to the standards diclofenac sodium used. These results confirm positive activity of the plant as therapeutic agent in tribal medicine. Thus, *P. crassicaulis* Bremek. leaf and flower parts could be exploited as a valuable source of anti-inflammatory agent for the pharmaceutical industry.

**ACKNOWLEDGMENT**

The authors would like to thank Prof. Shannmukh I, HOD, Department of Pharmacy, SCS College of Pharmacy, Harapanahalli, Davanagere, Karnataka, for providing facilities to conduct our experimental work.

**AUTHOR’S CONTRIBUTIONS**

Ashwathanarayana R has collected the data, conducted the experiment, and drafted the article. Dr. Raja Naika, professor, has supervised the experiment and reviewed the article.

**CONFLICT OF INTEREST**

None.
