Accepted 21 February, 2011

This research is based on the analysis of the waterway transport on Danube River and its aim is to point out the facts, based on which it will be possible to predict further directions of sustainable transport development on the most important waterway of Europe. The research indicates the basic rules of European politics of sustainable inland waterway development. The River Danube is considered to be the backbone of water transport in Europe. It connects, via Rhine – Main Canal, Western Europe and Rotterdam harbor with the Black Sea, that is with Russia and the East. The authors also analyse the data about the use of Danube waterway for transport of goods. This research covered a short description of Danube, the analysis of Danube fleet, the analysis of the amount of transported goods. Based on the result analysis the authors arrived at a conclusion that the use of River Danube for waterway transport purposes is unsatisfactory and that as such cannot be sustained in long term. Also, the research points to the basic European initiatives and investment projects in the field of river transport promotion. Considering the basic regulation documents and research results, the authors present an overview of measures and suggestions for efficient promotion of inland waterway.

Key words: Promotion, inland waterway, transport, Danube.

INTRODUCTION

Sustainable development, as a global development concept, represents a multi-dimensional phenomenon and it includes many different indicators of human activities. When trying to view such a large concept it is necessary to individualize, measure and follow the movement of those indicators that are considered the most important and the most influential from the point of view of sustainability of future development. In certain number of cases, big changes in values of some indicators do not have a significant influence. However, indicators that show the state of the field which is exploited and use of energy belong to the group of the most important indicators of sustainable development in general (Golusin et al., 2009).

In all fields of human activity, certain forms and amounts of energy are used in different ways and with a different efficiency degree, which depends on a big number of diverse factors. Anyhow, theory and practice show to the fact that transport in general is absolutely the biggest energy consumer and contributes to pollution in biggest amount (Munitlak et al., 2009). That being said, a lot more attention needs to be devoted to consideration and implementation of solutions that will lead us to the lower energy consumption and lower exploitation for transportation needs.

In traditional sense, we can talk about air, land and water transport. Water transport is considered ecologically most acceptable for several reasons. Above all, in order to carry out water transport, natural waterways (rivers, canals, seas and oceans) are used, with the use of some waterways whose purpose is to shorten the distance during a certain trip. Another point is that, while conducting a water transport, many modern high-capacity...
means of transport are used and they allow heavy load transport. Apart from all of this, these means of transport can use ecologically acceptable fuels, especially biodiesel and its blends. Water transport, if conducted properly, does not jeopardize environment too much, it does not create waste, it does not create much pollution and it does not harm the view of the landscape, which can entirely retain its characteristics. Lastly, it is important to say that the economists today completely agree on one thing—water transport is absolutely the cheapest way of transport nowadays.

Because of everything mentioned above, in all European countries, as well as inside the European Union, the possibilities to exploit and to use these existing waterways are seriously considered. Namely, the analyses show that there is an extremely well-developed network of waterways in Europe which are only partially used.

It has been estimated that around 30,000 km of rivers and canals are running through Europe. They are evenly distributed in all European countries. Besides, in Europe there are some canals which were build on purpose and which connect north and south, east and west, Europe, Asia and the rest of the world. European rivers provide homes to some of the biggest and most developed capitals and cities. These areas are also famous for being the most developed ones and the most inhabited ones. In spite of favorable natural conditions, in the EU countries, water transport covers only 5.6% of total land transport in those countries. In the most developed European countries (which belong to Rhine region) water transport is constantly decreasing. From 12% in 1970 to 7% in the year 2000. At the same time, the total transport increased for 18% in the period of 30 years (Mihić et al., 2010).

In order to promote the total transport, European Commission passed a so-called White Paper “European Transport Policy for 2010: Time to decide” by which Europe declares its willingness to intensify river transport as an economic, efficient, reliable and ecologically acceptable way of transport (EU Commission, 2009). Likewise, the Declaration of European Ministers of Transport signed in Rotterdam in September 2001 called upon Member and Accession States to implement Pan-European RIS by the year 2005.

The European Parliament resolution following the White Paper sided the creation of high performance, geographically-comprehensive information systems of inland waterways to be extremely important in this connection and asked the Commission to submit a proposal for harmonized technical provisions towards the implementation of River Information Services (RIS). In the session of the Transport Council of 9th October 2003, The Netherlands, supported by other Member States, welcomed the Commission’s initiative to put forward a proposal for a Directive on River Information Services. Meanwhile, this resulted in a RIS Directive, which creates a European-wide harmonized framework for River Traffic Information Services in order to ensure compatibility and interoperability between current and new RIS systems and to achieve effective interaction between different information services on inland waterways of international importance.

The harmonized river information services (RIS) on inland waterways in the Community Directive was published in the official journal of the European Union on 30th of September 2005 and came into force on 20th of October 2005.

Relevance of Danube River – Regional, global, for EU

Danube is, together with River Volga, the longest European river. The length of the river from its spring in Germany, to its mouth in the Black Sea is 2,850 km. Danube connects 10 European countries. Taking into consideration the strategic concept of Europe as a region with long term sustainability strategy, European Commission has started considering the important potential, ecologic and economic relevance of unexploited waterway transport, by which the biggest attention is paid to the most important European river-Danube. River Danube is a waterway which makes an integral part of Trans European Transport Network (TEN-T). Via canal network, Danube connects Rotterdam harbor in the Netherlands with the Black Sea, that is, with Russia on the east. Because of all of this, Danube is thought to be the most important river in Europe, if not in the world.

Via Danube-Rhine-Main Canal, the length of waterway has been extended to 3,500 km, and in that way western and south-eastern Europe have been completely connected. Danube has a navigable length of 2,411 km out of which 1,156 km (or 48%) are border sections. The countries which belong to Danube waterway are: Germany, Austria, Slovakia, Hungary, Croatia, Serbia, Romania, Bulgaria, Moldavia and Russia (via Black Sea). Given the position of Europe as a continent and considering the Danube’s flow direction, this river can be seen as the “gate of Europe”, that is, it can be its water connection to Russia, Asia, Africa and via Mediterranean Sea it can be connected to the rest of the world.

Apart from its global relevance, Danube’s water flow is of vital importance for entire Europe and especially for the region and the countries through which it flows. Danube has multiple significance for the development of the region. Above all, Danube represents the cheapest and ecologically the most acceptable way of transport. This fact is especially important if taken into account that Danube flows through and connects some of the highly developed world countries which constantly increase their level of export and import services, which, of course, requires quality and efficient transport.

Besides, Danube embodies a sort of ecosystem with its
own characteristics and regions and cities which it flows through have great historical and cultural importance and hence act as a backbone for sustainable tourism in this part of the world. Danube region and its countries are in part the most developed European countries and in part there are countries which are on the road to economic development. The prognoses point to the fact that the other Eastern European countries will grow economically and more intensely in the following decade. Therefore, contemporary Europe thinks of Danube as of the basis for development of this region, it sees it as a connection between European Union, Balkan countries in south and Russia, which is considered a region with special development potential.

All countries that are on Danube flow have marked a significant degree in economic development. Ninety million inhabitants live in the Danube region and they produce a Gross Domestic Product (GDP) of around 450 billion euro. Based on the predictions made by BMVIT and European Commission, the average growth rate degree in some countries of this region could happen in the period between 2010 and 2015 and it could be considered extremely favorable. Namely, all Danube region countries will show growth of GDP. This growth is predicted to be of 2.2% per inhabitant in Germany and even 4.9% per inhabitant which is expected in Croatia. This positive trend will impose the need for more intense and for a better organized river transport on Danube (Mihić et al., 2010).

The European Union believes that Danube should represent the point of integration in this region and hence help and accelerate the progress of less developed countries, especially in Croatia, Serbia and Turkey, which are the only countries out of the EU at the moment. The countries through which Danube does not flow could also profit from the upgrading of water transport, in an indirect way at least. The entire Danube region is expected to show an extremely encouraging period of economic growth, and as a consequence it will have higher needs for transport.

There is a wide range of speeds that Danube’s flow can take. Near the spring of the river the average speed is 6.5 km/h. Near Vienna the speed is 6 km/h. Afterwards the speed slightly decreases so that when entering Romania it is 4.6 km/h and on its way to the Black Sea the speed is 2.2 km/h. There are 78 bridges in total, whereas the biggest number of bridges is in bigger cities like Vienna and Budapest (Golusin et al., 2009).

Regardless the fact that Danube does not flow through Russia, this country is extremely interested in Danube’s waterway, especially given the fact that Russia borders with the Black Sea which represents the mouth of Danube River. Danube can be used for transport of natural resources and of products from Russia to the rest of the Europe and world, as well as vice versa. This fact shows how important is the need for a more precise long-term sustainable transport on this waterway.

EXPLOITATION OF DANUBE’S WATERWAY

Danube has been used for transport for a long time, but the precise data about transport on this river can be followed starting only from the year 1950, which was taken as the first year of the research figure 1. The final year of the research is 2005 or 2009 depending on the availability of the data. The data for the last year have been given in the form of an assumption, based on the movement on Danube in the last period, with a goal to get a clear and unique picture about character of transport on Danube in this period of 60 years, which was also the period of a strong economic development of Europe. The research covered the analysis of the following parameters (Bloesch, 2009):

(i) Description and analysis of the existing fleet.
(ii) The amount and analysis of heavy load transport.
(iii) The amount and analysis of passenger transport.
(iv) The influence these characteristics had on ecology.

The analysis of the data was made based on the research results, and suggestions have been given on how to improve the quality and quantity of traffic on Danube, to make its sustainable use possible by giving a significant contribution to sustainable economic and ecological development of entire west, central and south-east region of Europe.

Fleet and heavy load transport

The development of Danube fleet has been monitored statistically since 1962. For the needs of this research the authors had at their disposal the data for the period since 1965, taking into account that some data are registered every 5 years, so that the data for year 2010 were not yet available. The research shows that the number and the power of the fleet have been increasing year after year. The basic changes in the characteristics of the fleet used on Danube in the period from 1962 to 2005 are as follows:

(i) The number of the entire fleet grew from 3,142 vessels in 1962 to 4,529 vessels in 2005 which represents growth of 144%.
(ii) The total heavy load which was transferred by the Danube fleet increased from 1,807,219 tons in 1962 to 4,385,986 tons in 2005 which represents growth of 242%.
(iii) The biggest number of Danube fleet is used in Germany, Austria, Romania and Ukraine. The number of vessels in Serbia, Croatia and Moldavia is for 5% lower than the total number of vessels on Danube. These mentioned growths point to the fact that Danube fleet transports more and more heavy load but not due to the bigger amount of vessels but because their capacity and operational power grow. From the point of view of
sustainable transport on Danube this tendency can be considered extremely favorable, being that energetic efficiency could be one of the key solutions to problems of energy consumption today.

The volume of heavy load transport on Danube has been monitored since 1965 and it includes the analysis of the amount of transported goods and the analysis of traffic in harbors on Danube River.

The analysis in this field gave extremely precious data when talking about the possibility of realization of water transport on this waterway.

Namely, the objective of this research is promotion and stimulation of efficient and ecologically acceptable transport of bigger heavy loads by waterway.

The amount of load has been monitored on three different bases: the load which entered the river’s flow from the Black Sea, the load which used Danube to get to the Black Sea as well as the load transported between Danube harbors without reaching the Black Sea. By analyzing these data the authors concluded that the transport on Danube in the last 40 years recorded 3 characteristic periods, as shown in Figure 2.

First and foremost, this diagram shows that the total amount of heavy load transported on Danube increased 4.8 times in comparison to the initial year, that is, 1950. During this period, the economic growth of some countries in this region directly affected the increase in transport as well.

The growth registered each year reached its maximum in 1980 when a heavy load transport of 8 million tons was recorded. Such a high level of transported goods has been maintained until 1990.

After that, there was a long period characterized by sudden decrease in the volume of transported goods, which is explained by the fact that transporters mostly used land transport.

What brought to this decrease was also the worsening of economic and political situation and changes in countries of this region which belong to Eastern Europe and in most cases they have accessed the process of political and economic transition.

After the sudden decrease, the transport on Danube started recording some growth which was, however much slower so that in the last available year regarding the data (2005), the traffic equal to the traffic of 1970 was recorded. Because of these reasons, the promotion of
The total of heavy load transported via Danube in the period from 1965 to 2005.

Danube and sustainable transport development on it are of extreme importance.

The biggest volume of goods was recorded with the load entering the Danube through the Black sea. Somewhat less amount of goods refers to the goods transported between Danube harbors. The least amount of transported goods is represented by the goods which were imported from the countries of this region towards the Black Sea and further on. All this shows that in the past Danube, as well as now, has been used as a river by which different goods is imported in Danube region countries, and it is mostly referred to raw materials and unfinished products meant to be further processed. The least amount of goods is represented by raw materials or finished goods produced in the countries of this region and which are addressed to markets outside Europe. It is very encouraging to see that transport among Danube harbors is well developed. The sustainable development of Danube traffic and this region as a whole insists on maximizing the use of Danube as means of road which can, whenever that is possible, substitute traditional land and railway traffic which represent much bigger a threat to the quality of the environment of this densely populated part of the world.

The biggest growth in the amount of transported goods was recorded in Romania, where transport increased 6.8 times respect to 1950. In the same period, the transport in Austria also increased, 5.7 times. The lowest growth was noted in Slovakia, 1.7 times (Mihic et al., 2009).

Besides the general overview of transported goods in this monitored period, the traffic in harbors situated on Danube was also analyzed. The results of transport carried out in Danube harbors from 1965 to 2005 are given in Figure 3.

The traffic of goods in Danube harbors completely follows the tendency of transport on Danube in the monitored period. With the increase of transport of goods, the traffic in Danube harbors grew as well and it reached its maximum in 1980. After that the traffic in harbors suddenly decreases so that in 2000 it starts recording a new growth, with the expected positive tendency.

The biggest traffic was noted in harbors in Germany, Austria, Slovakia and Hungary, whereas the lowest values were recorded in Romania and Ukraine. Taking into account that Romania and Ukraine are as well the countries that have at their disposal 40% of entire Danube fleet, these results point to the fact that heavy load only travels through these countries but does not stop in their harbors. This situation opens the possibility for additional engagement of Ukrainian and Romanian harbors as a place for loading the goods produced in these countries. For the moment Danube in Romania and
Ukraine has only a transition character. It is encouraging to know that traffic in Danube harbors in Serbia is increasing, even though it is a country with the least developed fleet in comparison to the other countries from this monitored sample. The goods transported via Danube is very diverse. Mostly there are iron ore (25.6%), then processed and unprocessed metals (22.7%), coal (9.1%), oil and oil derivatives (8.5%), cement (7.5%), grain goods (6%), processed metals of metal industry (5.4%), natural resources: wood (4.3%), colored metals ores (3%), finished metal products (2.7%) and the least transported goods is agricultural goods like fodder (1.6%). These data show that, for no reason at all, Danube is not sufficiently used for transport of agricultural products, especially given the fact that Danube flows through almost exclusively agricultural regions and where the production of food represents the basis for export of food from the countries of Danube region, above all for Hungary, Serbia, Croatia, Bulgaria and Romania.

**IMPROVEMENT IN USE OF DANUBE RIVER WATERWAY**

**Promotion of inland waterway transport**

In accordance with regulations conducted so far regarding the development of Europe, which is supported by the results obtained after the analysis of 60 years of Danube waterway, it is clear why all European countries support the development to intensify transport on Danube, certainly by respecting the concept of sustainability of transport and development in general. Considering the fact that Danube’s potential has not been used enough, the new concept was defined as an all-embracing basis for the promotion of inland waterway transport. The name of the project is PLATINA.

Realization of Danube waterway promotion is connected to a lot of different problems which, above all, refer to the different levels of economic and institutional development of the countries through which Danube flows. The need for sustainable use of one river is possible only if all the activities, whose primary objective is equalization in position of some countries, are performed. Only in this way will it be possible to see Danube as unique, undivided and safe waterway, from source to mouth of river. For that reason, PLATINA projects points out the following primary activities:

(i) Establish a knowledge network bringing together all relevant actors concerned to assist in the implementation of NAIADES in Europe (EC, Member States and third countries).

(ii) Provision of technical expertise and support.
(iii) Provision of organizational, infrastructural and financial support.
(iv) Platform deals with areas that require non-legislative coordinative actions at the European level.

These activities will be adjusted to the needs of each country. In order to proceed with efficient implementation of Danube promotion project, it is first necessary that every country makes its own personal action plan, which has to cover the following parts:

**Improvement and maintenance of waterway infrastructure:** Each country that uses Danube waterway shows different quality of river and transport infrastructure. That being said, it is necessary that all the countries be put in the state which will suit the requirements of contemporary river transport (ICPDR, 2009).

**Exploitation of Danube’s waterway potential:** The results of this and similar researches confirm the fact that Danube’s waterway is not being sufficiently used. Besides, the economic predictions of intensity regarding the economic development of Danube region in the following decades shows that there will be higher growth in industrial development and that imposes the need for more intense transport. Because of this, every country needs to think of Danube’s waterway as of one of the most dominant existing waterways in the future.

**Building capacity for waterway and navigation authorities as well as for related administrations:** The development of administrative and institutional systems which provide support and which intensify transport on Danube.

**Implementation of river information (RIS) services on Danube:** To create and implement the unique RIS system in all the Danube region countries represents one of the most important conditions for integration of the region. In this way, Danube’s waterway will surpass international borders and it will represent the unique waterway whose users will be able to use independent information and logistic support, which is something that will contribute to upgrading of the quality of sustainable transport.

**Implementation of transport management:** The implementation of contemporary transport management primarily refers to providing the project with monitoring, control and navigation systems by which it is possible to control the traffic, to prevent delays, to reduce the cost of fuel and to reduce the cost of fleet maintenance. Besides fleet control, contemporary or modern transport management provides some solutions to the synchronization of harbors, load and unload equipment, container services and it provides the solution for bridges on Danube’s waterway.

**Modernization of the fleet:** The results of the research show that there are unfavorable characteristics when it comes to vessels used for transport on Danube. Especially worrying indicators of quality of the fleet are noted in the lowest developed countries (Serbia, Moldavia). It is necessary to proceed with adequate adjustments of existing vessels and with the purchase of new vessels which according to their characteristics fit with modern day economic, transport and ecological requirements. At this point it needs to be said that all the countries in the region have good conditions for production of biodiesel which is considered excellent when used in naval engines (Ostojic et al., 2010).

**Development and integration of ecological strategies and concepts for Danube River:** Danube represents a unique ecosystem with lower characteristics in some of its parts. Besides, some parts of Danube river bank represent protected natural, cultural and historical places. Sustainable development of transport on Danube needs to provide preservation and improvement of ecological maintenance of these regions.

**Creation of an international traffic model for the Danube region:** It is necessary to analyze the existing infrastructure that is directly or indirectly related to Danube’s waterway. All forms of land transport that are connected to Danube (roads, railways) have to be considered a priority in terms of investments for maintenance and for extending capacities. Also, it is necessary to decide future transport corridors which will connect industrial and agricultural capacities to Danube. Special attention needs to be given to modernization of international transport corridors, borders and customs free zones.

**Applications and projects at work across Europe**

The realization of PLATINA project proceeds via wide range of special projects whose goal is to promote certain aspects of inland waterway transport. All the mentioned projects are ongoing and each of them affects the creation of sustainable transport on Danube, as well as on other waterways in Europe. Due to the canal connection of rivers Danube, Rhine and Main, these projects cover almost entire territory of central, northern and southern Europe. The developments of national stand-alone telematics services, which vary in functions, standards and architecture, brought challenges to the current service regime. Some of the existing applications are:

**ARGO (Advanced river navigation):** A German navigation system for inland waterway skippers. It provides data on the fairway conditions and actual water levels in real time.

**BICS (Barge information and communication system):** Is
a voyage and cargo (especially dangerous cargo) reporting system used in The Netherlands, Germany and other countries. The main aim of BICS is to support the reporting duties of the skipper/fleet operator towards the authorities.

**BIVAS** (Inland navigation intelligent demand and supply system): Is an internet-based interactive freight transport virtual marketplace.

**DoRIS** (Donau River information services): Is an Austrian system that can automatically generate traffic information by means of AIS transponders. The tactical traffic image is currently being tested for use by waterway authorities and skippers. In 2005, the roll-out of the DoRIS systems was performed on the Austrian section of the Danube and the operational test started in the beginning of 2006. Furthermore a subsidy program for RIS equipment is being provided for accelerating the penetration of RIS on the user-side.

**ELWIS**: A German electronic waterway information system, which provides a series of (fairway) information services.

**IBIS** (Informatisering Binnenscheepvaart): A Flanders centralized database system, allows administrations to deliver navigation licenses, locate ships within their territory and collect data on inland navigation.

**GINA** (Gestion informatisée de la navigation): A reporting application for Wallonia dedicated to the invoicing of navigation fees and the generation of statistics.

**IVS90**: A ship reporting system used by Dutch waterway authorities supporting lock planning, vessel traffic services, calamity abatement and statistics.

**NIF** (Nautischer informations-funk): A German service to transmit messages related to water levels, high-water notifications, water level predictions, ice and mist messages, and police messages.

**VNF2000**: A French information network used to invoice navigation tolls and to produce traffic statistics.

**VTS’s Rhine**: Vessel traffic management services are installed on the Rhine in two difficult stretches: in the gorge section reach around the Lorelei in Germany with narrow bends and strong currents, and on the meandering Lower Rhine in The Netherlands with heavy traffic. These differing operational practices and facilities in Member States reflect the current incompatibility of information systems, standards, and installations. Legislative and technical support for harmonized information services at a pan-European level become more and more necessary to guarantee the efficiency and safety for cross-border navigation and logistics. This was one of the principal motivating factors in the development.

Planned infrastructure projects:

(i) Germany: Straubing – Vilshofen (Danube, 2321 to 2249 km).
(ii) Austria: Vienna – cross border section with Slovakia (Danube, 1921 to 1873 km).
(iii) Hungary: Palkovicovo – Mohacs (Danube 1810 to 1433 km).
(iv) Bulgaria - Romania: Iron Gate II – Calarasi (Danube, 863 to 375 km)
(v) Romania: Calarasi – Braila (Danube, 375 to 175 km)

The number and volume of mentioned investment projects show that modernization of Danube waterway represents one of the most important initiatives which lead towards economic and ecological improvement of the region, which is based on sustainability and long-term stability.

**IMPORTANCE OF PROMOTION DANUBE WATERWAY**

The whole EU strategy is based on promotion and realization of conditions necessary for development of countries in this part of the world as well as all the activities conducted in them. Because of this, the special attention needs to be given to changes in traffic field which at the moment represents the biggest pollution threat for the environment. Based on the dimension of the problem and complexity of traffic in Europe, an all-inclusive sustainable development strategy, which concerns, apart from the other things, intensifying of water traffic in European waterways. These objectives are directed towards sustainable development of traffic and they include complex activities which have been going on for more than 20 years and therefore require special intensive and efficient promotion.

In Europe, there are many organizations which deal with promotion of Danube waterway and they have the same objective to make Danube an intensive and ecologically more acceptable waterway in the future. If this balance of sustainability is reached, the stability in quality of Danube and river bank area, as well as improvement of quality of life of this area’s inhabitants is provided. Given the importance of this problem and considering the number and diversity of Danube region countries, many governmental and non-governmental organizations follow and support the promotion of Danube waterway. Some of the most important are:

(i) Danube Commission with headquarters in Budapest,
capital of Hungary, is at the moment the most important international organization which deals with regulation, promotion and implementation of sustainable transport on Danube. This organization consists of all the countries that can be found on Danube's waterway, including Russia, which is connected to Danube via Black Sea. The main source of finances of this commission is the fund of all country members.

(ii) UN Economic Commission for Europe, Inland Transport Committee, the organization with headquarters in Geneva, Switzerland. The main goal of this organization is the technical development on inland transport as well as the development of laws and regulations in this area. This organization is financed by the UN.

(iii) European Conference of Ministers of Transport gathers all the transport ministers of all European countries whose objective is the implementation of all sustainable and ecologically acceptable forms of transport on the territory of entire Europe. The sustainable development of traffic on Danube is one of the priorities of this organization whose headquarters are in Paris and is financed by European countries.

(iv) Transport Infrastructure Needs Assessment: Corridor 7 is the association dealing with the development of transport infrastructure in inland waterways and it is financed by the EU Commission for the development of traffic. The headquarters of this organization are in Vienna, capital of Austria.

(v) Southeast European Cooperative Initiative: Danube Transport Working Group is the organization of Danube region countries with headquarters in Vienna. This organization deals with the development of traffic on Danube and it is financed by the EU member countries and by the USA.

(vi) Stability pact for South Eastern Europe is a special organization in the EU, founded with the objective to support and provide stable development of countries in this region which were over the past years exposed to a number of negative influences. The headquarters of this organization are in Brussels, Belgium.

(vii) Joint Austrian/Romanian initiative; Danube Cooperation Process is an association which stimulates the cooperation among all the countries which are situated on Danube waterway and its goal is to decrease border issues and limitations. It is financed by Riparian states, Stability Pact and European Commission.

(viii) Via Donau is founded and financed by Austria, with headquarters in Vienna. The main goal of this association is improvement in quality and long-term sustainability of river traffic and implementation of RIS system on entire Danube waterway.

This is an overview of the most important organizations which deal with promotion of Danube waterway from different aspects. Their number, importance and financial sources speak about the relevance that sustainable development of Danube waterway has in all the countries of Danube region and in Europe in general.

CONCLUSION

The development of inland waterway transport is one of the long-term priorities of sustainable development of EU. Danube and Rhine- Main Canal as well as Danube’s tributaries represent the most important waterway in Europe, therefore the biggest efforts of EU are put in analysis and improvement of sustainable water transport on Danube waterway.

By analyzing the available data which refer to the use of Danube waterway in period starting from 1950, it was stated that Danube waterway was used for the needs of traffic with different intensity.

By analyzing the amount of freight transport, the number of passengers and heavy load in Danube harbors it is confirmed that Danube was intensely used as a waterway up till 1990 and after that its popularity decreased. After the year 2000, with the beginning of all-inclusive initiative of EU on promotion of inland water transport, some growth in use of Danube was noticed but that growth cannot be considered sufficient neither acceptable.

Therefore in Danube region countries, as well as in EU as a whole, many projects have been developed and there are many ongoing activities which were explained in this research. The objective of all these things is to promote and improve sustainable water transport on Danube.

These activities mostly refer to modernization of Danube fleet (with emphasis on use of biodiesel as a power generating fuel), construction of adequate infrastructure, development and implementation of a unique information system on Danube as well as many promotional activities.

EU predicts that the first phase of the activities, which deals with improvement of sustainable water transport on Danube, will be over in 2027.
