Abstract

We consider a system of nonlinear spinor and scalar fields with minimal coupling in general relativity. The nonlinearity in the spinor field Lagrangian is given by an arbitrary function of the invariants generated from the bilinear spinor forms $S = \bar{\psi}\psi$ and $P = i\bar{\psi}\gamma^5\psi$; the scalar Lagrangian is chosen as an arbitrary function of the scalar invariant $\Upsilon = \varphi_\alpha\varphi^\alpha$, that becomes linear at $\Upsilon \rightarrow 0$. The spinor and the scalar fields in question interact with each other by means of a gravitational field which is given by a plane-symmetric metric. Exact plane-symmetric solutions to the gravitational, spinor and scalar field equations have been obtained. Role of gravitational field in the formation of the field configurations with limited total energy, spin and charge has been investigated. Influence of the change of the sign of energy density of the spinor and scalar fields on the properties of the configurations obtained has been examined. It has been established that under the change of the sign of the scalar field energy density the system in question can be realized physically iff the scalar charge does not exceed some critical value. In case of spinor field no such restriction on its parameter occurs. In general it has been shown that
the choice of spinor field nonlinearity can lead to the elimination of scalar field contribution to the metric functions, but leaving its contribution to the total energy unaltered.

**Key words:** Nonlinear spinor field (NLSF), nonlinear scalar field, plane-symmetric metric

**PACS:** 03.65.P, 04.20.H

1. **INTRODUCTION**

Nonlinear phenomena have been one of the most popular topics during last years. Nevertheless, it must be admitted that nonlinear classical fields have not received general consideration. This is probably due to the mathematical difficulties which arise because of the nonrenormalizability of the Fermi and other nonlinear couplings [1].

Nonlinear selfcouplings of the spinor fields may arise as a consequence of the geometrical structure of the space-time and, more precisely, because of the existence of torsion. As soon as 1938, Ivanenko [2-4] showed that a relativistic theory imposes in some cases a fourth order selfcoupling. In 1950 Weyl [5] proved that, if the affine and the metric properties of the space-time are taken as independent, the spinor field obeys either a linear equation in a space with torsion or a nonlinear one in a Riemannian space. As the self action is of spin-spin type, it allows the assignment of a dynamical role to the spin and offers a clue about the origin of the nonlinearities. This question was further clarified in some important papers by Utiyama, Kibble and Sciama [6-8] In the simplest scheme the selfaction is of pseudovector type, but it can be shown that one can also get a scalar coupling [9]. An excellent review of the problem may be found in [10].

Nonlinear quantum Dirac fields were used by Heisenberg [11,12] in his ambitious unified theory of elementary particles. They are presently the object of renewed interest since the widely known paper by Gross and Neveu [13].

Nonlinear spinor field (NLSF) in external cosmological gravitational field was first studied by G.N. Shikin in 1991 [14]. This study was extended by us for the more general case where we consider the nonlinear term as an arbitrary function of all possible invariants generated from spinor bilinear forms. In that paper we also studied the possibility of elimination of initial singularity especially for the Kasner Universe [15]. For few years we studied the behavior of self-consistent NLSF in a B-I Universe [16,17] both in presence of perfect fluid and without it that was followed by the Refs., [18-20] where we studied the self-consistent system of interacting spinor and scalar fields. In a series of paper we also thoroughly studied the interacting scalar and electromagnetic fields in spherically and cylindrically space-time [21,22]. The purpose of the paper is to study the role of nonlinear spinor and scalar field in the formation of configurations with localized energy density and limited total energy, spin and charge of the spinor field.

2. **FUNDAMENTAL EQUATIONS AND GENERAL SOLUTIONS**

The Lagrangian of the nonlinear spinor, scalar and gravitational fields can be written in the form

$$L = \frac{R}{2\kappa} + L_{sp} + L_{sc}$$  \hspace{1cm} (2.1)
with

\[ L_{sp} = \frac{i}{2} \left[ \bar{\psi} \gamma^\mu \nabla_\mu \psi - \nabla_\mu \bar{\psi} \gamma^\mu \psi \right] - m \bar{\psi} \psi + L_N, \quad (2.2) \]

and

\[ L_{sc} = \Psi(\Upsilon), \quad \Upsilon = \varphi_\alpha \varphi^\alpha. \quad (2.3) \]

Here \( R \) is the scalar curvature and \( \kappa \) is the Einstein’s gravitational constant. The nonlinear term \( L_N \) in spinor Lagrangian describes the self-interaction of a spinor field and can be presented as some arbitrary functions of invariants generated from the real bilinear forms of a spinor field having the form

\[ S = \bar{\psi} \psi, \quad P = i \bar{\psi} \gamma^5 \psi, \quad v^\mu = (\bar{\psi} \gamma^\mu \psi), \quad A^\mu = (\bar{\psi} \gamma^5 \gamma^\mu \psi), \quad T^{\mu\nu} = (\bar{\psi} \sigma^{\mu\nu} \psi), \]

where \( \sigma^{\mu\nu} = (i/2)[\gamma^\mu \gamma^\nu - \gamma^\nu \gamma^\mu] \). Invariants, corresponding to the bilinear forms, look like

\[ I = S^2, \quad J = P^2, \quad I_v = v_\mu v^\mu = (\bar{\psi} \gamma^\mu \psi) g^{\mu\nu} (\bar{\psi} \gamma^\nu \psi), \]

\[ I_A = A_\mu A^\mu = (\bar{\psi} \gamma^5 \gamma^\mu \psi) g^{\mu\nu} (\bar{\psi} \gamma^5 \gamma^\nu \psi), \quad I_T = T_{\mu\nu} T^{\mu\nu} = (\bar{\psi} \sigma^{\mu\nu} \psi) g_{\mu\alpha} g_{\nu\beta} (\bar{\psi} \sigma^{\alpha\beta} \psi). \]

According to the Pauli-Fierz theorem, among the five invariants only \( I \) and \( J \) are independent as all other can be expressed by them: \( I_v = -I_A = I + J \) and \( I_T = I - J \). Therefore we choose the nonlinear term \( L_N = F(I, J) \), thus claiming that it describes the nonlinearity in the most general of its form.

The scalar Lagrangian \( L_{sc} \) is an arbitrary function of invariant \( \Upsilon = \varphi_\alpha \varphi^\alpha \), satisfying the condition

\[ \lim_{\Upsilon \to 0} \Psi(\Upsilon) = \frac{1}{2} \Upsilon + \cdots \quad (2.4) \]

The static plane-symmetric metric we choose in the form

\[ ds^2 = e^{2\rho} dt^2 - e^{2\alpha} dx^2 - e^{2\beta} (dy^2 + dz^2), \quad (2.5) \]

where the metric functions \( \rho, \alpha, \beta \) depend on the spatial variable \( x \) only and obey the coordinate condition

\[ \alpha = 2\beta + \rho. \quad (2.6) \]

Variation of \( (2.1) \) with respect to spinor field \( \psi (\bar{\psi}) \) gives nonlinear spinor field equations

\[ i \gamma^\mu \nabla_\mu \psi - \Phi \psi + i \mathcal{G} \gamma^5 \psi = 0, \quad (2.7a) \]

\[ i \nabla_\mu \bar{\psi} \gamma^\mu + \Phi \bar{\psi} - i \mathcal{G} \bar{\psi} \gamma^5 = 0, \quad (2.7b) \]

with

\[ \Phi = m - \mathcal{D} = m - 2S \frac{\partial F}{\partial I}, \quad \mathcal{G} = 2P \frac{\partial F}{\partial J}, \]

whereas, variation of \( (2.1) \) with respect to scalar field yields the following scalar field equation

\[ \frac{1}{\sqrt{-g}} \frac{\partial}{\partial x^\nu} \left( \sqrt{-g} g^{\nu\mu} \frac{d\Psi}{d\Upsilon} \varphi_\mu \right) = 0. \quad (2.8) \]
Varying (2.1) with respect to metric tensor $g_{\mu\nu}$ we obtain the Einstein’s field equation

$$R_\nu^\mu - \frac{1}{2} \delta_\nu^\mu R = -\kappa T^\mu_\nu$$

(2.9)

which in view of (2.5) and (2.6) is written as follows

$$G^0_0 = e^{-2\alpha}(2\beta'' - 2\rho'\beta' - \beta'^2) = -\kappa T^0_0$$

(2.10a)

$$G^1_1 = e^{-2\alpha}(2\rho'\beta' + \beta'^2) = -\kappa T^1_1$$

(2.10b)

$$G^2_2 = e^{-2\alpha}(\beta'' + \rho'' - 2\rho'\beta' - \beta'^2) = -\kappa T^2_2$$

(2.10c)

$$G^3_3 = G^2_2, \quad T^3_3 = T^2_3.$$  

(2.10d)

Here prime denotes differentiation with respect to $x$ and $T^\mu_\nu$ is the energy-momentum tensor of the spinor and scalar fields

$$T^\nu_\mu = T^\nu_{\text{sp}\mu} + T^\nu_{\text{sc}\mu}.$$  

(2.11)

The energy-momentum tensor of the spinor field is

$$T^\nu_{\text{sp}\mu} = \frac{i}{4} g^{\rho\sigma} \left( \bar{\psi}\gamma_\mu \nabla_\nu \psi + \bar{\psi}\gamma_\nu \nabla_\mu \psi - \nabla_\mu \bar{\psi}\gamma_\nu \psi - \nabla_\nu \bar{\psi}\gamma_\mu \psi \right) - \delta^\rho_\mu L_{\text{sp}}$$

(2.12)

where $L_{\text{sp}}$ with respect to (2.1) takes the form

$$L_{\text{sp}} = -\frac{1}{2} \left( \bar{\psi} \frac{\partial F}{\partial \psi} + \frac{\partial F}{\partial \bar{\psi}} \psi \right) - F,$$

(2.13)

and the energy-momentum tensor of the scalar one is

$$T^\nu_{\text{sc}\mu} = \frac{2}{\Upsilon} \frac{d\Psi}{d\Upsilon} \varphi^\nu \varphi^\mu \delta^\mu_\nu - \delta^\nu_\mu \psi, \quad \Upsilon = -\varphi'^2 e^{-2\alpha}, \quad \varphi' = \frac{d\varphi}{dx}.$$  

(2.14)

In (2.7) and (2.12) $\nabla_\mu$ denotes the covariant derivative of spinor, having the form [28,29]

$$\nabla_\mu \psi = \frac{\partial \psi}{\partial x^\mu} - \Gamma_\mu^\nu \psi,$$

(2.15)

where $\Gamma_\mu(x)$ are spinor affine connection matrices. $\gamma$ matrices in the above equations are connected with the flat space-time Dirac matrices $\bar{\gamma}$ in the following way

$$g_{\mu\nu}(x) = e^a_\mu(x) e^b_\nu(x) \eta_{ab}, \quad \gamma_\mu(x) = e^a_\mu(x) \bar{\gamma}^a, $$

(2.16)

where $\eta_{ab} = \text{diag}(1, -1, -1, -1)$ and $e^a_\mu$ is a set of tetrad 4-vectors. Using (2.16) we obtain

$$\gamma^0(x) = e^{-\rho}\gamma^0, \quad \gamma^1(x) = e^{-\alpha}\gamma^1, \quad \gamma^2(x) = e^{-\beta}\gamma^2, \quad \gamma^3(x) = e^{-\beta}\gamma^3.$$  

(2.17)

From

$$\Gamma_\mu(x) = \frac{1}{4} g_{\rho\sigma}(x) \left( \partial_\mu e^b_\delta e^a_\rho - \Gamma^a_{\mu\delta} \right) \gamma^a \gamma^b,$$

(2.18)

one finds
\( \Gamma_0 = -\frac{1}{2} \bar{\gamma}^0 \gamma^1 e^{-2 \beta'} \), \( \Gamma_1 = 0 \), \( \Gamma_2 = \frac{1}{2} \bar{\gamma}^2 \gamma^1 e^{-(\rho+\beta)} \beta' \), \( \Gamma_3 = \frac{1}{2} \bar{\gamma}^3 \gamma^1 e^{-(\rho+\beta)} \beta' \). \hspace{1cm} (2.19)

Flat space-time matrices \( \bar{\gamma} \) we will choose in the form, given in \([30]\):

\[
\bar{\gamma}^0 = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix}, \quad \bar{\gamma}^1 = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & -1 & 0 & 0 \\ -1 & 0 & 0 & 0 \end{pmatrix},
\]

\[
\bar{\gamma}^2 = \begin{pmatrix} 0 & 0 & 0 & -i \\ 0 & 0 & i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{pmatrix}, \quad \bar{\gamma}^3 = \begin{pmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -1 \\ -1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{pmatrix}.
\]

Defining \( \gamma^5 \) as follows,

\[
\gamma^5 = -\frac{i}{4} E_{\mu\nu\sigma\rho} \gamma^\mu \gamma^\nu \gamma^\sigma \gamma^\rho, \quad E_{\mu\nu\sigma\rho} = \sqrt{-g} \varepsilon_{\mu\nu\sigma\rho}, \quad \varepsilon_{0123} = 1,
\]

we obtain

\[
\bar{\gamma}^5 = \begin{pmatrix} 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \\ -1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \end{pmatrix}.
\]

The scalar field equation (2.8) has the solution

\[
\frac{d\Psi}{d\Upsilon} \varphi' = \varphi_0, \quad \varphi_0 = \text{const}.
\] \hspace{1cm} (2.20)

The equality (2.20) for a given \( \Psi(\Upsilon) \) is an algebraic equation for \( \varphi' \) that is to be defined through metric function \( e^{\alpha(x)} \).

We will consider the spinor field to be the function of the spatial coordinate \( x \) only \([\psi = \psi(x)]\). Using (2.15), (2.17) and (2.19) we find

\[
\gamma^\mu \Gamma_\mu = -\frac{1}{2} e^{-\alpha'} \gamma^1. \hspace{1cm} (2.21)
\]

Then taking into account (2.21) we rewrite the spinor field equation (2.7a) as
Further setting $V(x) = e^{\alpha/2}\psi(x)$ with
\[
V(x) = \begin{pmatrix} V_1(x) \\ V_2(x) \\ V_3(x) \\ V_4(x) \end{pmatrix}
\]
for the components of spinor field from (2.22) one deduces the following system of equations:
\[
\begin{align*}
V_1' + ie^0 \Phi V_1 - e^2 \mathcal{G} V_3 &= 0, \\
V_2' + ie^0 \Phi V_2 - e^2 \mathcal{G} V_4 &= 0, \\
V_2' - ie^0 \Phi V_3 + e^2 \mathcal{G} V_1 &= 0, \\
V_1' - ie^0 \Phi V_4 + e^2 \mathcal{G} V_2 &= 0.
\end{align*}
\] (2.23)

As one sees, the equation (2.23) gives following relations
\[V_1^2 - V_2^2 - V_3^2 + V_4^2 = \text{const.}\] (2.24)

Using the solutions obtained one can write the components of spinor current:
\[
j^\mu = \bar{\psi} \gamma^\mu \psi. \tag{2.25}
\]

Taking into account that $\bar{\psi} = \psi^\dagger \gamma^0$, where $\psi^\dagger = (\psi_1^*, \psi_2^*, \psi_3^*, \psi_4^*)$ and $\psi_j = e^{-\alpha/2}V_j$, $j = 1, 2, 3, 4$ for the components of spinor current we write
\[
\begin{align*}
j^0 &= [V_1^* V_1 + V_2^* V_2 + V_3^* V_3 + V_4^* V_4]e^{-(\alpha+\rho)}, \\
j^1 &= [V_1^* V_4 + V_2^* V_3 + V_3^* V_2 + V_4^* V_1]e^{-2\alpha}, \\
j^2 &= -i[V_1^* V_4 - V_2^* V_3 + V_3^* V_2 - V_4^* V_1]e^{-(\alpha+\beta)}, \\
j^3 &= [V_1^* V_3 - V_2^* V_4 + V_3^* V_1 - V_4^* V_2]e^{-(\alpha+\beta)}.
\end{align*}
\] (2.26)

Since we consider the field configuration to be static one, the spatial components of spinor current vanishes, i.e.,
\[
j^1 = 0, \quad j^2 = 0, \quad j^3 = 0. \tag{2.27}
\]

This supposition gives additional relation between the constant of integration. The component $j^0$ defines the charge density of spinor field that has the following chronometric-invariant form
\[
\varrho = (j_0 \cdot j^0)^{1/2}. \tag{2.28}
\]

The total charge of spinor field is defined as
\[
Q = \int_{-\infty}^{\infty} \varrho \sqrt{-g} dx \tag{2.29}
\]
Let us consider the spin tensor $S_{\mu\nu,\epsilon} = \frac{1}{4} \bar{\psi} \{ \gamma^\epsilon \sigma^{\mu\nu} + \sigma^{\mu\nu} \gamma^\epsilon \} \psi$. (2.30)

We write the components $S_{ik,0} (i,k = 1,2,3)$, defining the spatial density of spin vector explicitly. From (2.30) we have

$$S_{ij,0} = \frac{1}{4} \bar{\psi} \{ \gamma^0 \sigma_{ij} + \sigma_{ij} \gamma^0 \} \psi = \frac{1}{2} \bar{\psi} \gamma^0 \sigma_{ij} \psi$$ (2.31)

that defines the projection of spin vector on $k$ axis. Here $i,j,k$ takes the value 1, 2, 3 and $i \neq j \neq k$. Thus, for the projection of spin vectors on the $X, Y$ and $Z$ axis we find

$$S_{23,0} = [V_1 V_2 + V_2^* V_1 + V_3^* V_4 + V_4^* V_3] e^{-\alpha - 2\beta - \rho},$$

$$S_{31,0} = [V_1^* V_2 - V_2^* V_1 + V_3^* V_4 - V_4^* V_3] e^{-2\alpha - \beta - \rho},$$

$$S_{12,0} = [V_1^* V_1 - V_2^* V_2 + V_3^* V_3 - V_4^* V_4] e^{-2\alpha - \beta - \rho}.\quad (2.32a, b, c)$$

The chronometric invariant spin tensor takes the form

$$S_{ij,0}^{ch} = (S_{ij,0} S_{ij,0})^{1/2},$$

and the projection of the spin vector on $k$ axis is defined by

$$S_k = \int_{-\infty}^{\infty} S_{ij,0}^{ch} \sqrt{-3} g dx.$$

(In (2.34), as well as in (2.29) integrations by $y$ and $z$ are performed in the limit $(0,1)$). From (2.7) one can write the equations for $S = \bar{\psi} \psi$, $P = i \bar{\psi} \gamma^5 \psi$ and $A = \bar{\psi} \gamma^5 \gamma^j \psi$

$$S' + \alpha' S + 2 e^\alpha G A = 0,$$

$$P' + \alpha' P + 2 e^\alpha \Phi A = 0,$$

$$A' + \alpha' A + 2 e^\alpha \Phi P + 2 e^\alpha G S = 0.$$

(2.35a, b, c)

Note that, $A$ in (2.35) is indeed the pseudo-vector $A^1$. Here for simplicity, we use the notation $A$. From (2.33) immediately follows

$$S^2 + P^2 - A^2 = C_0 e^{-2\alpha}, \quad C_0 = \text{const.}\quad (2.36)$$

Let us now solve the Einstein equations. To do it we first write the expression for the components of the energy-momentum tensor explicitly. Using the property of flat space-time Dirac matrices and the explicit form of covariant derivative $\nabla_\mu$, for the spinor field one finds

$$T_{sp}^1 = m S - F(I, J), \quad T_{sp}^0 = T_{sp}^2 = T_{sp}^3 = D S + G P - F(I, J).$$

(2.37)

On the other hand, taking into account that the scalar field $\varphi$ is also a function of $x$ only $[\varphi = \varphi(x)]$ for the scalar field one obtains

$$T_{sc}^1 = 2 \Upsilon \frac{d\Psi}{d\Upsilon} - \Psi(\Upsilon), \quad T_{sc}^0 = T_{sc}^2 = T_{sc}^3 = -\Psi(\Upsilon).$$

(2.38)
In view of $T_0^0 = T_2^2$, subtraction of Einstein equations (2.10a) and (2.10c) leads to the equation

$$\beta'' - \gamma'' = 0,$$

(2.39)

with the solution

$$\beta(x) = \gamma(x) + Bx,$$

(2.40)

where $B$ is the integration constant. The second constant has been chosen to be trivial, since it acts on the scale of $Y$ and $Z$ axes only. In account of (2.39) from (2.6) one obtains

$$\beta'' = \frac{1}{3} \alpha'', \quad \gamma'' = \frac{1}{3} \alpha''.$$  

(2.41)

Solutions to the equation (2.41) together with (2.6) and (2.40) lead to the following expression for $\beta(x)$ and $\gamma(x)$

$$\beta(x) = \frac{1}{3} (\alpha(x) + BX), \quad \gamma(x) = \frac{1}{3} (\alpha(x) - 2Bx).$$  

(2.42)

Equation (2.10b), being the first integral of (2.10a) and (2.10c), is a first order differential equation. Inserting $\beta$ and $\gamma$ from (2.42) and $T_1^1$ in account of (2.11), (2.37) and (2.38) into (2.10b) for $\alpha$ one gets

$$\alpha'^2 - B^2 = -3\kappa e^{2\alpha} \left[ mS - F(I, J) + 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi(\Upsilon) \right].$$  

(2.43)

As one sees from (2.35) and (2.36), the invariants are the functions of $\alpha$, so is the right hand side of (2.43), hence can be solved in quadrature. In the sections to follow, we analyze the equation (2.43) in details given the concrete form of nonlinear term in spinor Lagrangian.

3. ANALYSIS OF THE RESULTS

In this section we shall analyze the general results obtained in the previous section for concrete nonlinear term.

A. Case with linear spinor and scalar fields

Let us consider the self-consistent system of linear spinor and massless scalar field equations. By doing so we can compare the results obtained with those of the self-consistent system of nonlinear spinor and scalar field equations, hence clarify the role of nonlinearity of the fields in question in the formation of regular localized solutions such as static solitary wave or solitons [32,33].

In this case for the scalar field we have $\Psi(\Upsilon) = \frac{1}{2} \Upsilon$. Inserting this into (2.24) we obtain

$$\varphi'(x) = \varphi_0.$$  

(3.1)

From (2.38) in account of (3.1) we get

$$\varphi(x) = \varphi_0 x.$$  

(3.2)
\[-T^{1}_{sc1} = T^{0}_{sc0} = T^{2}_{sc2} = T^{3}_{sc3} = -\frac{1}{2} \Upsilon = \frac{1}{2} \varphi_0^2 e^{-2\alpha}.\] (3.2)

On the other hand for the linear spinor field we have
\[T^{1}_{sp1} = mS, \quad T^{0}_{sp0} = T^{2}_{sp2} = T^{3}_{sp3} = 0.\] (3.3)

As one can easily verify, for the linear spinor field the equation (2.35a) results
\[S = C_0 e^{-\alpha}.\] (3.4)

Taking this relation into account and the fact that \(\alpha'(x) = -\frac{1}{S} \frac{dS}{dx}\) from (2.43) we write
\[\int \frac{dS}{\sqrt{(1 + \kappa/2)B^2 S^2 - 3\kappa C_0^2 S}} = x, \quad \tilde{\kappa} = 3\kappa \varphi_0^2 / B^2,\] (3.5)

with the solution
\[S(x) = \frac{M^2}{H^2} \cosh^2(\tilde{H}x), \quad M^2 = 3\kappa C_0^2, \quad H^2 = B^2(1 + \kappa/2), \quad \tilde{H} = H/2.\] (3.6)

Further we define the functions \(\psi_j\). Taking into account that in this case
\[F(S) = mC_0/S \sqrt{H^2 S^2 - M^2 S},\]
for \(N_{1,2}\) in view of (3.6) we find
\[N_{1,2}(x) = \pm (2H/3\kappa C_0) \tanh(\tilde{H}x) + R_{1,2}.\]

We can then finally write
\[\psi_{1,2}(x) = ia_{1,2}E(x) \cosh[f(x) + R_{1,2}],\] (3.7)
\[\psi_{3,4}(x) = a_{2,1}E(x) \sinh[f(x) + R_{2,1}],\]

where \(E(x) = \sqrt{3\kappa m C_0 / H^2} \cosh(\tilde{H}x)\) and \(f(x) = (2H/3\kappa C_0) \tanh(\tilde{H}x)\). For the scalar field energy density we find
\[T^{0}_{sc0}(x) = \frac{1}{2} \varphi_0^2 e^{-2\alpha} = \frac{M^4 \varphi_0^2}{2 C_0^2 H^4} \cosh^4(\tilde{H}x).\] (3.8)

It is clear from (3.8) that the scalar field energy density is not localized.

Let us consider the case when the scalar field possesses negative energy density. Then we have \(\Psi(\Upsilon) = -(1/2) \Upsilon\) and
\[-T^{1}_{sc1} = T^{0}_{sc0} = T^{2}_{sc2} = T^{3}_{sc3} = \frac{1}{2} \Upsilon = -\frac{1}{2} \varphi_0^2 e^{-2\alpha}.\] (3.9)

Then for \(S\) we get
\[\int \frac{dS}{\sqrt{(1 - \tilde{\kappa}/2)B^2 S^2 - 3\kappa C_0^2 S}} = x.\] (3.10)
As one sees, the field system considered here is physically realizable iff \(1 - \bar{\kappa}/2 > 0\), i.e., the scalar charge \(|\varphi_0| < \sqrt{2/3} B\). Moreover, in the specific case with \(B = 0\), independent to the quantity of scalar charge \(\varphi_0\), the existence of scalar field with negative energy density in general relativity is impossible (even in absence of linear spinor field).

For the total charge \(Q\) of the system in this case we have

\[
Q = 2a^2 \int_{-\infty}^{\infty} \cosh \left[ \frac{4H}{3\kappa C_0} \tanh(\tilde{H}x) + 2R \right] \left( \frac{C_0 H^2}{M^2 \cosh^2(\tilde{H}x)} \right)^{3/2} e^{2Bx/3} \, dx < \infty. \tag{3.11}
\]

It can be shown that, in case of linear spinor and scalar fields with minimal coupling both charge and spin of spinor field are limited. The energy density of the system, in view of (3.3) is defined by the contribution of scalar field only:

\[
T_{00}(x) = T_{00}^{sc}(x) = \frac{1}{2} \phi_0^2 M^4 C_0^2 H^4 \cosh^4(\tilde{H}x). \tag{3.12}
\]

From (3.12) follows that, the energy density of the system is not localized and the total energy of the system \(E = \int_{-\infty}^{\infty} T_{00}^{sc} \sqrt{-g} \, dx\) is not finite.

**B. Nonlinear spinor and linear scalar fields**

**Case I: \(F = F(I)\).** Let us consider the case when the nonlinear term in spinor field Lagrangian is a function of \(I(S)\) only, that leads to \(G = 0\). From (2.35) as in case of linear spinor field we find \(S = C_0 e^{-\alpha(x)}\). Proceeding as in foregoing subsection, for \(S\) from (2.43) we write

\[
\frac{dS}{dx} = \pm \mathcal{L}(S), \quad \mathcal{L}(S) = \sqrt{B^2 S^2 - 3\kappa C_0^2 \left[ mS - F(S) + 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi(\Upsilon) \right]} \tag{3.13}
\]

with the solution

\[
\int \frac{dS}{\mathcal{L}(S)} = \pm(x + x_0). \tag{3.14}
\]

Given the concrete form of the functions \(F(S)\) and \(\Psi(\Upsilon)\), from (3.14) yields \(S\), hence \(\alpha, \beta, \rho\).

Let us now go back to spinor field equations (2.23). Setting \(V_j(x) = U_j(S), j = 1, 2, 3, 4\) and taking into account that in this case \(G = 0\), for \(U_j(S)\) we obtain

\[
\begin{align*}
\frac{dU_4}{dS} + i\mathcal{F}(S)U_1 &= 0, \tag{3.15a} \\
\frac{dU_3}{dS} + i\mathcal{F}(S)U_2 &= 0, \tag{3.15b} \\
\frac{dU_2}{dS} - i\mathcal{F}(S)U_3 &= 0, \tag{3.15c} \\
\frac{dU_1}{dS} - i\mathcal{F}(S)U_4 &= 0. \tag{3.15d}
\end{align*}
\]

with \(\mathcal{F}(S) = \Phi \mathcal{L}(S) C_0 / S\). Differentiating (3.15a) with respect to \(S\) and inserting (3.15d) into it for \(U_4\) we find
\[
\frac{d^2 U_4}{ds^2} - \frac{1}{\mathcal{F}} \frac{d\mathcal{F}}{ds} \frac{dU_4}{ds} - \mathcal{F}^2 U_4 = 0
\]  

(3.16)

that transforms to

\[
\frac{1}{\mathcal{F}} \frac{d}{ds} \left( \frac{1}{\mathcal{F}} \frac{dU_4}{ds} \right) - U_4 = 0,
\]  

(3.17)

with the first integral

\[
\frac{dU_4}{ds} = \pm \sqrt{U_4^2 + C_1 \cdot \mathcal{F}(S)}, \quad C_1 = \text{const}.
\]  

(3.18)

For \( C_1 = a_1^2 > 0 \) from (3.18) we obtain

\[
U_4(S) = a_1 \sinh N_1(S), \quad N_1 = \pm \int \mathcal{F}(S) dS + R_1, \quad R_1 = \text{const}.
\]  

(3.19)

whereas, for \( C_1 = -b_1^2 < 0 \) from (3.18) we obtain

\[
U_4(S) = a_1 \cosh N_1(S)
\]  

(3.20)

Inserting (3.19) and (3.20) into (3.15d) one finds

\[
U_1(S) = ia_1 \cosh N_1(S), \quad U_1(S) = ib_1 \sinh N_1(S).
\]  

(3.21)

Analogically, for \( U_2 \) and \( U_3 \) we obtain

\[
U_3(S) = a_2 \sinh N_2(S), \quad U_3(S) = b_2 \cosh N_2(S).
\]  

(3.22)

and

\[
U_2(S) = ia_2 \cosh N_2(S), \quad U_2(S) = ib_2 \sinh N_2(S).
\]  

(3.23)

where \( N_2 = \pm \int \mathcal{F}(S) dS + R_2 \) and \( a_2, b_2 \) and \( R_2 \) are the integration constants. Thus we find the general solutions to the spinor field equations (3.15) containing four arbitrary constants.

Using the solutions obtained, from (2.26) we find the components of spinor current

\[
j^0 = \left[ a_1^2 \cosh(2N_1(S)) + a_2^2 \cosh(2N_2(S)) \right] e^{-(\alpha + \rho)},
\]  

(3.24a)

\[
j^1 = 0,
\]  

(3.24b)

\[
j^2 = -\left[ a_1^2 \sinh(2N_1(S)) - a_2^2 \sinh(2N_2(S)) \right] e^{-(\alpha + \beta)},
\]  

(3.24c)

\[
j^3 = 0.
\]  

(3.24d)

The supposition (2.27) leads to the following relations between the constants: \( a_1 = a_2 = a \) and \( R_1 = R_2 = R \), since \( N_1(S) = N_2(S) = N(S) \). The chronometric-invariant form of the charge density and the total charge of spinor field are

\[
\varrho = 2a^2 \cosh(2N(S)) e^{-\alpha},
\]  

(3.25)

\[
Q = 2a^2 \int_{-\infty}^{\infty} \cosh(2N(S)) e^{\alpha - \rho} dx.
\]  

(3.26)
From (2.31) we find
\[ S_{12,0} = 0, \quad S_{13,0} = 0, \quad S_{23,0} = a^2 \cosh(2N(S)) e^{-2\alpha}. \]  
(3.27)

Thus, the only nontrivial component of the spin tensor is \( S_{23,0} \) that defines the projection of spin vector on \( X \) axis. From (2.33) we write the chronometric invariant spin tensor
\[ S_{23,0}^{\text{ch}} = a^2 \cosh(2N(S)) e^{-\alpha}, \]  
(3.28)

and the projection of the spin vector on \( X \) axis
\[ S_1 = a^2 \int_{-\infty}^{\infty} \cosh(2N(S)) e^{\alpha - \rho} dx. \]  
(3.29)

(in (2.34), as well as in (2.29) integrations by \( y \) and \( z \) are performed in the limit \((0, 1))

Note that the integrants both in (3.26) and (3.29) coincide.

Let us now analyze the result obtained choosing the nonlinear term in the form
\[ F(I) = \lambda S^n = \lambda I^{n/2} \]  
with \( n \geq 2 \) and \( \lambda \) is the parameter of nonlinearity. For \( n = 2 \) we have

Heisenberg-Ivanenko type nonlinear spinor field equation
\[ i e^{-\alpha} \gamma^1 (\partial_x + \frac{1}{2} \alpha') \psi - m \psi + 2\lambda (\bar{\psi} \psi) \psi = 0. \]  
(3.30)

Setting \( F = S^2 \) into (3.14) we come to the expression for \( S \) that is similar to that for linear case with
\[ H^2 \to H_1^2 = B^2 + 3\kappa \lambda C_0 + 3\kappa \varphi_0^2/2. \]  
(3.31)

Let us write the functions \( \psi_j \) explicitly. In this case we have
\[ F(S) = m(C_0 - 2\lambda S)/S \sqrt{H_1^2 S^2 - M^2 S}, \]
and
\[ N_{1,2}(x) = (2H_1/3\kappa C_0) \tanh(\bar{H}_1 x) - 2\lambda C_0 x + R_{1,2}, \quad \bar{H}_1 = H_1/2. \]

We can then finally write
\[ \psi_{1,2}(x) = i a_{1,2} \frac{\sqrt{3\kappa m C_0}}{H_1} \cosh(\bar{H}_1 x) \cosh N_{1,2}(x), \]  
(3.32)

\[ \psi_{3,4}(x) = i a_{2,1} \frac{\sqrt{3\kappa m C_0}}{H_1} \cosh(\bar{H}_1 x) \cosh N_{2,1}(x). \]

Let us consider the energy-density distribution of the field system:
\[ T_{00}^\alpha = (\lambda + \frac{1}{2} \varphi_0^2 \frac{M^4}{C_0^2}) \frac{M^4}{H_1^4} \cosh^4(\bar{H}_1 x). \]  
(3.33)

From (3.33) follows that, the energy density of the system is not localized and the total energy of the system \( E = \int_{-\infty}^{\infty} T_{00}^\alpha \sqrt{-g} dx \) is not finite. Note that, the energy density of the system can be trivial, if
$$\lambda + \frac{1}{2} \frac{\varphi_0^2}{C_0^2} = 0.$$  \hspace{1cm} (3.34)

It is possible, iff the sign of energy density of spinor and scalar fields are different. Let us write the total charge of the system.

$$Q = 2a^2 \int_{-\infty}^{\infty} \cosh \left[ \frac{4H_1}{3\kappa C_0} \tanh(\bar{H}x) - 4\lambda C_0 x + 2R \right] \left( \frac{C_0 H_1^2}{M^2 \cosh^2(\bar{H}x)} \right)^{3/2} e^{2Bx/3} \, dx.$$  \hspace{1cm} (3.35)

If $12\lambda^2 C_0^2 + \lambda C_0 (4B - \kappa C_0) - \kappa \varphi_0^2 / 2 < 0$, the integral (3.33) converges, that means the possibility of existence of finite charge and spin of the system.

In case of $n > 2$, the energy density of the system in question is

$$T_0^0 = \lambda (n - 1) S^n + \frac{1}{2} \frac{\varphi_0^2}{C_0^2} S^2,$$  \hspace{1cm} (3.36)

which shows that the regular solutions with localized energy density exists iff $S = \bar{\psi}\psi$ is a continuous and limited function and $\lim_{x \to \pm \infty} S(x) \to 0$. The condition, when $S$ possesses the properties mentioned above is

$$\int \frac{dS}{\sqrt{(1 + \kappa/2)B^2 S^2 - 3\kappa C_0^2 (mS - \lambda S^n)}} = x.$$  \hspace{1cm} (3.37)

As one sees from (3.37), for $m \neq 0$ at no value of $x$ $S$ becomes trivial, since as $S \to 0$, the denominator of the integrant beginning from some finite value of $S$ becomes imaginary.

It means that for $S(x)$ to be trivial at spatial infinity ($x \to \infty$), it is necessary to choose massless spinor field setting $m = 0$ in (3.37). Note that, in the unified nonlinear spinor theory of Heisenberg, the massive term is absent, and according to Heisenberg, the particle mass should be obtained as a result of quantization of spinor prematter [35]. It should be emphasized that in the nonlinear generalization of classical field equations, the massive term does not possess the significance that it possesses in the linear one, as it by no means defines total energy (or mass) of the nonlinear field system [36]. Thus without losing the generality we can consider massless spinor field putting $m = 0$. Note that in the sections to follow where we consider the nonlinear spinor term as $F = P^n$, or $F = (K_\pm)^n$ with $K_\pm = (I \pm J)$, we will study the massless spinor field only.

From (3.37) for $m = 0$, $\lambda > 0$ and $n > 2$ for $S(x)$ we obtain

$$S(x) = \left[ -H_1/\sqrt{3\kappa \lambda C_0^2 (\zeta^2 - 1)} \right]^{2/(n-2)}, \quad \zeta = \cosh[(n-2)\bar{H}x]$$  \hspace{1cm} (3.38)

from which follows that $\lim_{x \to 0} |S(x)| \to \infty$. It means that $T_0^0(x)$ is not bounded at $x = 0$ and the initial system of equations does not possess solutions with localized energy density.

If we set in (3.37) $m = 0$, $\lambda = -\Lambda^2 < 0$ and $n > 2$, then for $S$ we obtain

$$S(x) = \left[ H_1/\sqrt{3\kappa \lambda C_0^2 \zeta} \right]^{2/(n-2)}$$  \hspace{1cm} (3.39)

It is seen from (3.39) that $S(x)$ has maximum at $x = 0$ and $\lim_{x \to \pm \infty} S(x) \to 0$. For energy density we have

$$T_0^0 = -\Lambda^2(n-1) S^n + \frac{1}{2} \frac{\varphi_0^2}{C_0^2} S^2,$$  \hspace{1cm} (3.40)
where $S$ is defined by (3.39). In view of $S$ it follows that $T_0^0(x)$ is an alternating function.
Let us find the condition when the total energy of the system is bound

$$E = \int_{-\infty}^{\infty} T_0^0 \sqrt{-3g} \, dx < \infty. \quad (3.41)$$

For this we write the integrant of (3.41)

$$\varepsilon(x) = T_0^0 \sqrt{-3g} = C_0^{5/3} \left[ \frac{\varphi_0^2}{2C_0^2} - \frac{(n - 1)H_1^2 \zeta^2}{3kC_0^2} \right] \left[ \frac{H_1^2 \zeta}{3kC_0^2} \right]^{1/3(n-2)} e^{2Bx/3}. \quad (3.42)$$

From (3.42) follows that $\lim_{x \to -\infty} \varepsilon(x) \to 0$ for any value of the parameters, while $\lim_{x \to +\infty} \varepsilon(x) \to 0$ iff $H > 2B$ or $k\varphi_0^2 > 2B^2$. Note that in this case the contribution of scalar field to the total energy is not finite: $T_{sc0}^0 = \varphi_0^2 / 2C_0^2 S^2$, $E_{sc} = \int_{-\infty}^{\infty} T_{sc0}^0 \sqrt{-3g} \, dx < \infty$. \quad (3.43)

Note that in the case considered the scalar field is linear and massless. As far as in absence of spinor field energy density of the linear scalar field is not localized and the total energy in not finite, in the case considered the properties of the field configurations are defined by those of nonlinear spinor field. The contribution of nonlinear spinor field to the total energy is negative. Moreover, it remains finite even in absence of scalar field for $n > 2$. \[37\]

The components of spinor field in this case have the form

$$\psi_{1,2}(x) = ia_{1,2}E(x) \cosh N_{1,2}(x),$$

$$\psi_{3,4}(x) = a_{2,1}E(x) \sinh N_{2,1}(x),$$

where

$$E(x) = (1/\sqrt{C_0}) \left[ H_1 / \sqrt{3kC_0^2 \zeta} \right]^{1/(n-2)}$$

and

$$N_{1,2}(x) = -\frac{2nH_1 \sqrt{\zeta^2 - 1}}{3kC_0(n - 2)\zeta} + R_{1,2}.$$ 

For the solutions obtained we write the chronometric-invariant charge density of the spinor field $\varrho$:

$$\varrho(x) = \frac{2a^2}{C_0} \cosh \left\{ -\frac{4nH_1 \sqrt{\zeta^2 - 1}}{3kC_0(n - 2)\zeta} + 2R \right\} \left[ \frac{H_1^2 \zeta}{3kC_0^2 \zeta^2} \right]^{1/(n-2)}.$$ \quad (3.45)

As one sees from (3.45), the charge density is localized, since $\lim_{x \to \pm \infty} \varrho(x) \to 0$. Nevertheless, the charge density of the spinor field, coming to unit invariant volume $\varrho \sqrt{-3g}$, is not localized:

$$\varrho \sqrt{-3g} = 2a^2 \cosh[2N(x)] e^{\alpha - \gamma} = 2a^2 \cosh[2N(x)] (C_0 / S)^{2/3} e^{2Bx/3}. \quad (3.46)$$
It leads to the fact that the total charge of the spinor field is not bounded as well. As far as the expression for chronometric-invariant tensor of spin $(3.28)$ coincides with that of $\varrho(x)/2$, the conclusions made for $\varrho(x)$ and $Q$ will be valid for the spin tensor $S_{\text{ch}}^{23,0}$ and projection of spin vector on $X$ axis $S_1$, i.e., $S_{\text{ch}}^{23,0}$ is localized and $S_1$ is unlimited.

The solution obtained describes the configuration of nonlinear spinor and linear scalar fields with localized energy density but with the metric that is singular at spatial infinity, as in this case

$$e^{2\alpha} = \left(\frac{C_0}{S}\right)^2 = C_0^2 \left\{ \frac{3\kappa \Lambda C_0^2 \zeta}{H_1^2} \right\}^{2/(n-2)} \bigg|_{x\to\pm\infty} \to \infty \quad (3.47)$$

Let us consider the massless spinor field with

$$F = -\Lambda^2 S^{-\nu}, \quad \nu = \text{constant} > 0. \quad (3.48)$$

In this case the energy density of the system of nonlinear spinor and linear scalar fields with minimal coupling takes the form

$$T_0^0 = \Lambda^2(\nu + 1)S^{-\nu} + \frac{\varphi_0^2}{2C_0^2}S^2 \quad (3.49)$$

For $S$ in this case we get

$$\int \frac{dS}{\sqrt{(1 + \kappa/2)B^2S^2 - 3\kappa C_0^2 \Lambda^2 S^{-\nu}}} = x \quad (3.50)$$

with the solution

$$S(x) = \left[ \frac{3\kappa \Lambda^2 C_0^2 \zeta^2}{H_1^2} \right]^{1/(\nu+2)}, \quad \zeta_1 = \cosh[(\nu + 2)\bar{H}_1 x]. \quad (3.51)$$

For energy density in this case we have

$$T_0^0(x) = \Lambda^2(\nu + 1) \left[ \frac{H_1^2}{3\kappa C_0^2 \Lambda^2 \zeta_1^2} \right]^{\nu/(\nu+2)} + \frac{\varphi_0^2}{2C_0^2} \left[ \frac{3\kappa C_0^2 \Lambda^2 \zeta_1^2}{H_1^2} \right]^{2/(\nu+2)}. \quad (3.52)$$

It follows from $(3.52)$ that the contribution of the spinor field in the energy density is localized while for the scalar field it is not the case.

The energy density distribution of the field system, coming to unit invariant volume is

$$\varepsilon(x) = T_0^0 \sqrt{-g} = \left[ \Lambda^2(\nu + 1)S^{-\nu} + \frac{\varphi_0^2}{2C_0^2}S^2 \right] e^{2\alpha-\gamma}$$

$$= \left\{ \frac{H_1^2(\nu + 1)}{3\kappa \zeta_1^2} + \frac{\varphi_0^2}{2} \right\} \left\{ \frac{H_1^2}{3\kappa C_0^2 \Lambda^2 \zeta_1^2} \right\}^{1/3(\nu+2)} e^{2Bx/3}. \quad (3.53)$$

As one sees from $(3.53)$ $\varepsilon(x)$ is a localized function, i.e., $\lim_{x\to\pm\infty} \varepsilon(x) \to 0$, if $H > 2B$ or $\kappa \varphi_0^2 > 2B^2$. In this case the total energy is also finite.

The components of spinor field in this case have the form

$$\psi_{1,2}(x) = ia_{1,2}E(x)\cosh N_{1,2}(x), \quad (3.54)$$

$$\psi_{3,4}(x) = a_{2,1}E(x)\sinh N_{2,1}(x),$$
where
\[ E(x) = \frac{1}{\sqrt{C_0}} \left[ \sqrt{\frac{3\kappa\Lambda^2 C_0^2}{H_1^2}} \zeta_1 \right]^{1/(\nu+2)} \]

and
\[ N_{1,2}(x) = -\frac{2H\nu}{3\kappa C_0(\nu+2)\zeta_1} + R_{1,2}. \]

The chronometric-invariant charge density of the spinor field coming to unit invariant volume with \( a_1 = a_2 = a \) and \( N_1 = N_2 \) reads
\[ \varrho \sqrt{-g} = 2a^2\cosh[2N(x)]e^{\alpha-\gamma} = \]
\[ = 2a^2(C_0)^{2/3}\cosh\left\{ 2R - \frac{4H_1\nu}{3\kappa C_0(\nu+2)\zeta_1} \right\} \left\{ \frac{H_1^2}{3\kappa C_0^2\Lambda^2\zeta_1^2} \right\}^{2/(\nu+2)} e^{2Br/3}. \]

It follows from (3.55) that \( \varrho \sqrt{-g} \) is a localized function and the total charge \( Q \) is finite.

**Case II: \( F = F(J) \).** Here we consider the massless spinor field with the nonlinearity \( F = F(J) \). In this case from (2.35b) immediately follows
\[ P = D_0 e^{-\alpha(x)}, \quad D_0 = \text{const}. \]

From (2.23) we now have
\[ V_1' - e^\alpha G V_3 = 0, \quad (3.57a) \]
\[ V_3' - e^\alpha G V_4 = 0, \quad (3.57b) \]
\[ V_2' + e^\alpha G V_1 = 0, \quad (3.57c) \]
\[ V_1' + e^\alpha G V_2 = 0, \quad (3.57d) \]

with the solutions
\[ V_1 = C_1 \sinh[-A + C_2], \quad (3.58a) \]
\[ V_2 = C_1 \cosh[-A + C_2], \quad (3.58b) \]
\[ V_3 = C_3 \sinh[A + C_4], \quad (3.58c) \]
\[ V_4 = C_3 \cosh[A + C_4], \quad (3.58d) \]

with \( C_1, C_2, C_3 \) and \( C_3 \) being the constant of integration and \( A = \int e^\alpha G dx \).

Using the solutions obtained, from (2.26) we now find the components of spinor current
\[ j^0 = [C_1^2 \cosh[2(-A + C_2)] + C_3^2 \cosh[2(A + C_4)]] e^{-(\alpha+\rho)}, \quad (3.59a) \]
\[ j^1 = [2C_1 C_3 \sinh(C_2 + C_4)] e^{-2\alpha}, \quad (3.59b) \]
\[ j^2 = 0, \quad (3.59c) \]
\[ j^3 = -[2C_1 C_3 \cosh[2(A - C_2 + C_4)] e^{-(\alpha+\beta)}]. \quad (3.59d) \]

The supposition (2.27) that the spatial components of the spinor current are trivial leads at least one of the constants \( (C_1, C_3) \) to be zero. Let us set \( C_1 = 0 \). The chronometric-invariant form of the charge density and the total charge of spinor field are
\[ \varrho = C_3^2 \cosh[2(A + C_4)] e^{-\alpha}, \quad (3.60) \]
\[ Q = C_3^2 \int_{-\infty}^{\infty} \cosh[2(A + C_4)]e^{\alpha - \rho} \, dx. \]  

(3.61)

From (2.31) we find
\[
S_{12,0} = -C_3^2 e^{-(2\alpha + \beta + \rho)}, \quad S_{31,0} = 0, \quad S_{23,0} = C_3^2 \sinh[2(A + C_4)]e^{-2\alpha}.
\]  

(3.62)

Thus, in this case we have two nontrivial components of the spin tensor \( S_{23,0} \) and \( S_{12,0} \), those define the projections of spin vector on \( \hat{X} \) and \( \hat{Z} \) axis, respectively. From (2.33) we write the chronometric invariant spin tensor
\[
S_{23,0} = C_3^2 \sinh[2(A + C_4)]e^{-\alpha},
\]  

(3.63a)

\[
S_{23,0} = C_3^2 e^{-\alpha}
\]  

(3.63b)

and the projections of the spin vector on \( \hat{X} \) and \( \hat{Z} \) axes are
\[
S_1 = C_3^2 \int_{-\infty}^{\infty} \sinh[2(A + C_4)]e^{\alpha - \rho} \, dx,
\]  

(3.64a)

\[
S_3 = C_3^2 \int_{-\infty}^{\infty} e^{\alpha - \rho} \, dx.
\]  

(3.64b)

Note that the equation for \( \alpha \), therefore for \( P \) will be the same as in previous case (i.e., for \( S \) with \( m = 0 \)) with all the conclusions made there. So we will not proceed further with this. We also note that for \( F = K_\pm \) with \( K_\pm = I \pm J \) for massless spinor field we obtain \( K_\pm = K_0 e^{-2\alpha} \) and the conclusions made above will be remain valid.

**C. Nonlinear scalar field in absence of spinor one**

Let us consider the system of gravitational and nonlinear scalar fields. As a nonlinear scalar field equation we choose Born-Infeld one, given by the Lagrangian \[33\]
\[ \Psi(\Upsilon) = -\frac{1}{\sigma} \left( 1 - \sqrt{1 + \sigma \Upsilon} \right), \]  

(3.65)

with \( \Upsilon = \varphi_0 \varphi_0 \) and \( \sigma \) is the parameter of nonlinearity. From (3.63) we also have
\[
\lim_{\sigma \to 0} \Psi(\Upsilon) = \frac{1}{2} \Upsilon \cdots
\]  

(3.66)

Inserting (3.65) into (2.24) for the scalar field we obtain the equation
\[ \varphi'(x) = \frac{\varphi_0}{\sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}}}, \]  

(3.67)

that gives
\[ \Upsilon = - (\varphi')^2 e^{-2\alpha} = -\frac{\varphi_0^2 e^{-2\alpha(x)}}{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}}. \]  

(3.68)
From (3.67) follows that \( \varphi'_{|_{\sigma=0}} = \varphi_0 \).

For the case considered in this section we have

\[
T_{sc0}^0 = T_{sc2}^3 = T_{sc3}^3 = -\Psi(\Upsilon) = \frac{1}{\sigma}(1 - 1/\sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}}),
\]

and

\[
T_{sc1}^1 = 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi = \frac{1}{\sigma}(1 - \sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}}).
\]

Putting (3.70) into (2.43), in account of \( m = 0 \) and \( F(I, J) \equiv 0 \) for \( \alpha \) we find

\[
\alpha' = \pm \sqrt{B^2 - \frac{3\kappa}{\sigma} e^{2\alpha(1 - \sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}})}}.
\]

From (3.71) one finds

\[
\int \frac{d\alpha}{\sqrt{B^2 - \frac{3\kappa}{\sigma} e^{2\alpha(1 - \sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}})}}} = -\frac{2}{B} \ln |\xi + \sqrt{\kappa + \xi^2}| + \frac{1}{B\sqrt{1 + \kappa/2}} \left[ \ln \sqrt{2B \sqrt{\kappa + \xi^2 + \sqrt{2B \sqrt{1 + \kappa \xi/2}}} - \ln \sqrt{3\kappa \varphi_0^2(\xi^2 - 2)}} \right] = x,
\]

with \( \xi^2 = 1 + \sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}} \). As one sees from (3.72)

\[
e^{2\alpha(x)} \bigg|_{x \to +\infty} \approx \frac{\sigma \varphi_0^2}{2} e^{2\sqrt{1 + \kappa/2}Bx} \to \infty,
\]

\[
e^{2\alpha(x)} \bigg|_{x \to -\infty} \approx \frac{\sigma \varphi_0^2}{2} e^{2Bx} \to 0.
\]

Let us study the energy density distribution of nonlinear scalar field. From (3.69) we find

\[
T_{sc0}^0(x) \bigg|_{x = -\infty} = \frac{1}{\sigma}, \quad T_{sc0}^0(x) \bigg|_{x = \infty} = 0,
\]

which shows that the energy density of the scalar field is not localized. Nevertheless, the energy density on unit invariant volume is localized if \( \kappa \varphi_0^2 > 2B^2 \):

\[
\varepsilon(x) = T_{sc0}^0 \sqrt{-3g} = \frac{1}{\sigma} \left( 1 - \frac{1}{1 + \sigma \varphi_0^2 e^{-2\alpha(1 - \sqrt{1 + \sigma \varphi_0^2 e^{-2\alpha(x)}})}} \right)^{e^{5\alpha/3 + 2Bx/3}} \bigg|_{x \to \pm \infty} \to 0.
\]

In this case the total energy of the scalar field is also bound. From (3.68) in account of (3.73) and (3.74) we also have

\[
\Upsilon(x) \bigg|_{x = -\infty} = \frac{1}{\sigma}, \quad \Upsilon(x) \bigg|_{x = +\infty} = 0,
\]

showing that \( \Upsilon(x) \) is kink-like.
Finally we consider the self-consistent system of nonlinear spinor and scalar fields. We choose the self-action of the spinor field as \( F = \lambda S^n, \ n > 2, \) where as the scalar field is taken in the form (3.65). Using the line of reasoning mentioned earlier, we conclude that the spinor field considered here should be massless. Taking into account that \( e^{-2\alpha} = S^2/C_0^2 \) for \( S \) we write

\[
\int \frac{dS}{\sqrt{B^2 + 3\kappa C_0^2 [\lambda S^n + (\sqrt{1 + \sigma \varphi_0^2 S^2}/C_0^2 - 1)/\sigma]}} = x. \tag{3.78}
\]

From (3.78) one estimates

\[
S(x) \bigg|_{x \to 0} \sim \frac{1}{x^{2/(n-2)}} \to \infty. \tag{3.79}
\]

On the other hand for the energy density we have

\[
T_0^0 = \lambda (n - 1) S^n + \frac{1}{\sigma} \left( 1 - \frac{1}{\sqrt{1 + \sigma \varphi_0^2 S^2}/C_0^2} \right) \tag{3.80}
\]

that states that for \( T_0^0 \) to be localized \( S \) should be localized too and \( \lim_{x \to \pm \infty} S(x) \to 0. \) Hence from (3.79) we conclude that \( S(x) \) is singular and energy density in unlimited at \( x = 0. \)

For \( \lambda = -\Lambda^2 \) and \( n > 2 \) we have

\[
\int \frac{dS}{\sqrt{B^2 + 3\kappa C_0^2 [-\Lambda^2 S^n + (\sqrt{1 + \sigma \varphi_0^2 S^2}/C_0^2 - 1)/\sigma]}} = x. \tag{3.81}
\]

In this case \( S(x) \) is finite and its maximum value is defined from

\[
S^n(x) = \frac{1}{3\kappa C_0^2 \Lambda^2} [B^2 S^2 + 3\kappa C_0^2 (\sqrt{1 + \sigma \varphi_0^2 S^2}/C_0^2 - 1)/\sigma]. \tag{3.82}
\]

Noticing that at spatial infinity effects of nonlinearity vanish, from (3.81) we find

\[
S(x) \bigg|_{x \to -\infty} \sim e^{Hx} \to 0, \quad S(x) \bigg|_{x \to +\infty} \sim e^{-Hx} \to 0, \tag{3.83}
\]

with \( H = \sqrt{B^2 + 3\kappa \varphi_0^2}/2 = B \sqrt{1 + \bar{\kappa}/2}. \) In this case the energy density \( T_0^0 \) defined by (3.81) is localized and the total energy of the system is bound. Nevertheless, spin and charge of the system unlimited.

Let us go back to the general case. For \( F = F(S) \) we now have

\[
T_1^1 = mS - F(S) + 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi. \tag{3.84}
\]

It follows that for the arbitrary choice of \( \Psi(\Upsilon) \), obeying (2.4), we can always choose nonlinear spinor term that will eliminate the scalar field contribution in \( T_1^1 \), i.e., by virtue of total freedom we have here to choose \( F(S) \), we can write

\[
F(S) = F_1(S) + F_2(S), \quad F_2(S) = 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi, \tag{3.85}
\]
since $\Upsilon = \Upsilon(S^2)$. To prove this we go back to (2.20) that gives

$$\Upsilon\left(\frac{d\Psi}{d\Upsilon}\right)^2 = -\frac{\varphi_0^2 S^2}{C_0^2}. \quad (3.86)$$

Since $\Psi$ is the function of $\Upsilon$ only, (3.86) comprises an algebraic equation for defining $\Upsilon$ as a function of $S^2$. For (3.87) takes place, we find

$$(\alpha')^2 - B^2 = -\frac{3\kappa C_0^2}{S^2}[mS - F_1(S)]. \quad (3.87)$$

As we see, the scalar field has no effect on space-time, but it contributes to energy density and total energy of the system as in this case

$$T_0^0 = SF_1'(S) - F_1(S) + S\frac{d}{d\Upsilon}(-2\Upsilon \frac{d\Psi}{d\Upsilon} + \Psi) \frac{d\Upsilon}{dS} + 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi. \quad (3.88)$$

Note that in (3.84) with $F(S)$ arbitrary, we cannot choose $\Psi(\Upsilon)$ such that

$$2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi = F(S), \quad (3.89)$$

due to the fact that $\Psi(\Upsilon)$ is not totally arbitrary, since it has to obey

$$\lim_{\Upsilon \to 0} \Psi(\Upsilon) \to \frac{1}{2} \Upsilon, \quad \lim_{\Upsilon \to 0} 2\Upsilon \frac{d\Psi}{d\Upsilon} - \Psi = 1 = \frac{\varphi_0^2}{2C_0^2} S^2 \quad (3.90)$$

whereas at $S \to 0$, $F(S)$ behaves arbitrarily.

4. CONCLUSION

The system of nonlinear spinor and nonlinear scalar fields with minimal coupling has been thoroughly studied within the scope of general relativity given by a plane-symmetric space-time. Contrary to the scalar field, the spinor field nonlinearity has direct effect on space-time. Energy density and the total energy of the linear spinor and scalar field system are not bounded and the system does not possess real physical infinity, hence the configuration is not observable for an infinitely remote observer, since in this case

$$R = \int_{-\infty}^{\infty} \sqrt{g_{11}} dx = \int_{-\infty}^{\infty} e^\alpha dx = \frac{4C_0 H}{M^2} < \infty. \quad (4.1)$$

But introduction of nonlinear spinor term into the system eliminates these shortcomings and we have the configuration with finite energy density and limited total energy which is also observable as in this case the system possesses real physical infinity. Thus we see, spinor field nonlinearity is crucial for the regular solutions with localized energy density. We also conclude that the properties of nonlinear spinor and scalar field system with minimal coupling are defined by that part of gravitational field which is generated by nonlinear spinor one.
