I. General Methods

All reagents were used as received from commercial sources unless otherwise noted. Tetrahydrofuran, acetonitrile and triethylamine were dried by passing through an alumina column under argon pressure on a push still solvent system. Toluene-\textit{d}_8 was dried over CaH\textsubscript{2}, degassed using three freeze-pump-thaw cycles, and vacuum transferred before use. Dioxane was degassed by sparging with nitrogen gas for 1 h. Manipulations were performed in a glovebox under nitrogen atmosphere unless otherwise noted. Analytical thin layer chromatography (TLC) was performed using Merck F\textsubscript{254} plates and visualized under UV irradiation at 254 nm, or using a basic aqueous solution of potassium permanganate. Flash chromatography was conducted using a Teledyne Isco Combiflash® Rf 200 Automatic Flash Chromatography System, and Teledyne Isco Redisep® 35–70 μm silica gel. All proton and carbon nuclear magnetic resonance (\textit{^1}H and \textit{^13}C NMR) spectra were recorded on a Bruker DRX-400 spectrometer, Bruker DRX-500 spectrometer outfitted with a cryoprobe, or a Bruker AVANCE-600 spectrometer. Boron nuclear magnetic resonance (\textit{^11}B NMR) spectra were recorded on a Bruker AVANCE-600 spectrometer. Fluorine nuclear magnetic resonance (\textit{^19}F NMR) spectra were recorded on a Bruker DRX-400 spectrometer. All coupling constants were measured in Hertz (Hz). Chemical shifts were reported in ppm and referenced to residual protonated solvent peak (δ\textsubscript{H} = 7.26 ppm for CDCl\textsubscript{3}, δ\textsubscript{H} = 2.08 ppm for d\textsubscript{8}-toluene, δ\textsubscript{H} = 2.05 ppm for d\textsubscript{6}-acetone in \textit{^1}H NMR spectroscopy experiments; δ\textsubscript{C} = 77.16 ppm for CDCl\textsubscript{3}, δ\textsubscript{C} = 20.43 ppm for d\textsubscript{8}-toluene, δ\textsubscript{C} = 29.84 ppm for d\textsubscript{6}-acetone in \textit{^13}C NMR spectroscopy experiments). \textit{^11}B and \textit{^19}F NMR spectroscopy experiments were referenced to the absolute frequency of 0 ppm in the \textit{^1}H dimension according to the Xi scale. High-resolution mass spectrometry data were obtained at the University of California, Irvine.

No precautions were taken to exclude air or water. The reaction was conducted in a fume hood with the light turned off. A solution of IPrAuCl SI-3 (124 mg, 200. μmol, 1.00 equiv) in DCM (2.0 mL) was added to a dram vial containing AgTFA SI-4 (48.6 mg, 220. μmol, 1.10 equiv) and a stirbar. A white precipitation was observed. The vial was capped and wrapped with aluminum foil to protect the reaction mixture from light. The reaction was stirred vigorously at 25 °C for 7 h. The resulting suspension was then filtered through a Celite plug (ca. 0.5 mL). The Celite was rinsed with additional DCM (3 × 0.5 mL), and the resulting solution was concentrated in vacuo to a a white solid. The solid was crushed to a fine powder, from which volatiles were removed at 25 °C and ca. 10 mTorr for 18 h to afford IPrAuTFA SI-5 as a white powder (135 mg, 97% isolated yield).

1H NMR (CDCl3, 500 MHz): δ 7.53 (t, J = 7.8 Hz, 2H), 7.31 (d, J = 7.8 Hz, 4H), 7.21 (s, 2H), 2.53 (sept, J = 7.0 Hz, 4H), 1.35 (d, J = 7.0 Hz, 12H), 1.23 (d, J = 7.0 Hz, 12H).

D. Optimization of oxyboration reaction conditions.

Boric ester 2a. The reaction was performed inside N2-filled glovebox. A 4-dram vial was charged with a solution of 1a (20.1 mg, 0.100 mmol, 1.00 equiv) in d8-toluene (0.30 mL). To this solution was added catecholborane (10.7 µL, 0.100 mmol, 1.00 equiv) at 25 °C. The reaction mixture was stirred for 30 min during which the evolution of H2 gas was observed, to afford 2a, which was used directly in the screen of reaction conditions without further purification.

1H NMR (d8-toluene, 600 MHz): δ 8.10–8.09 (m, 2H), 7.12–7.10 (m, 3H), 6.91–6.90 (m, 2H), 6.72 (dd, J = 5.3, 3.4 Hz, 2H), 2.12 (t, J = 6.8 Hz, 2H), 1.35–1.28 (m, 4H), 0.79 (t, J = 7.1 Hz, 3H).

11B NMR (d8-toluene, 600 MHz): δ 25.4 (s).

Boronic ester 3a. Catalyst was dissolved in d8-toluene (0.2 mL) and added to the dram vial containing 2a. After mixing thoroughly, the reaction mixture was transferred to a J. Young NMR tube, which was capped and removed from the glovebox. The tube was heated in a preheated oil bath at the temperature listed in Table SI-1. After heating for the indicated time, the progress of the reaction was monitored by 1H and 11B NMR spectroscopy.
**E. General procedure NMR conversions using ERECTIC.**

In a N₂-filled glovebox, an alkynylloxime (0.10 mmol, 1.0 equiv) was dissolved in 0.3 mL d₈-toluene in a 4-dram vial equipped with stir bar. Catecholborane (10.7 µL, 0.100 mmol, 1.00 equiv) was added via gastight syringe to the solution above. The resulting solution was allowed to stir at room temperature for 0.5 h. The catalyst IPrAuTFA (1.8 mg, 0.0025 mmol, 2.5 mol %) was dissolved in 0.2 mL d₈-toluene and transferred via syringe to the solution above. This mixture was then transferred into a J. Young NMR tube, which was sealed and removed from the glove box. Reaction progress was monitored by ¹H NMR spectroscopy (600 MHz, d₈-toluene) of 3 using the ERECTIC method relative to external mesitylene standard (252 mmol/L in d₈-toluene). This general procedure was used for R₁ = Ph, R₂ = n-Bu (3a, 90%, 6 h, 50 °C); R₁ = 3-furyl, R₂ = n-Bu (3b, 85%, 24 h, 50 °C); R₁ = 4-BrC₆H₄, R₂ = n-Bu (3c, 93%, 6 h, 50 °C); R₁ = t-Bu, R₂ = Ph (3d, 95%, 4 h, 110 °C); R₁ = 4-NO₂C₆H₄, R₂ = n-Bu (3e, 90%, 6 h, 50 °C); R₁ = Ph, R₂ = TMS (3f, 87%, 24 h, 90 °C); R₁ = 4-MeC₆H₄, R₂ = n-Bu (3g, 95%, 6 h, 50 °C); R₁ = 4-FC₆H₄, R₂ = n-Bu (3h, 92%, 6 h, 50 °C); R₁ = 4-MeOC₆H₄, R₂ = n-Bu (3i, 92%, 24 h, 60 °C); R₁ = 4-CF₃C₆H₄, R₂ = n-Bu (3j, 98%, 6 h, 50 °C); R₁ = Ph, R₂ = (CH₂)₃CO₂Me (3k, 94%, 8 h, 50 °C).

**F. Synthesis of pinacol boronates 4: General procedure.**

In a N₂-filled glovebox, oxime 1 (0.50 mmol, 1.0 equiv) was dissolved in 1.5 mL toluene in a 20-dram vial equipped with stir bar. Catecholborane (53.5 µL, 0.500 mmol, 1.00 equiv) was added via gastight syringe to the solution above. The resulting solution was allowed to stir at room temperature for 0.5 h. The catalyst IPrAuTFA (8.8 mg, 0.012 mmol, 2.5 mol %) was dissolved in 1.0 mL toluene and transferred via syringe to the solution above in a capped vial and the resulting suspension was stirred in a pre-heated copper shot heating bath at appropriate temperature and time. The reaction mixture was then cooled to room temperature and a solution of PPh₃ (6.6 mg, 0.025 mmol, 5.0 mol %) in toluene (3.0 mL) was added. The resulting suspension was stirred for 20 h at room temperature in order to quench IPrAuTFA before proceeding.
Pinacol (177 mg, 1.50 mmol, 3.0 equiv) was dissolved in anhydrous Et$_3$N (1.04 mL, 7.50 mmol, 15.0 equiv). The resulting solution was added to the quenched reaction mixture, and the resulting suspension was stirred at 25 °C for 1 h. The reaction mixture was then removed from the glovebox. Volatiles were removed in vacuo. The resulting light brown oil was purified by silica gel chromatography using an elution gradient from 100% hexanes to 100% CH$_2$Cl$_2$. Solvents were removed in vacuo to afford the desired pinacol boronate 4. All of the pinacol boronates 4a-4k are missing one carbon signal in the $^{13}$C NMR spectroscopy data. This carbon atom is assigned to the carbon in the newly formed C–B σ-bond. This is expected due to the quadrupolar relaxation of B.$^{11}$

To a flame-dried 100 mL round bottom flask equipped with stir bar under N₂ atmosphere was added FeCl₃ (162 mg, 1.00 mmol, 1.0 equiv). The flask was evacuated and purged with N₂ in three cycles. The reaction flask was cooled to 0 °C in an ice-water bath. Acid chloride SI-1a (1.16 mL, 10.0 mmol, 1.0 equiv), trimethylsilylpropyne (2.22 mL, 15.0 mmol, 1.5 equiv), and CH₂NO₂ (20.0 mL) were added to the reaction flask at 0 °C under N₂ atmosphere. The reaction mixture was stirred at 0 °C for 6 h. The reaction mixture was then allowed to warm to 25 °C. The suspension was filtered through a Celite plug (ca. 0.5 mL), and rinsed with dichloromethane (3 × 5 mL). The crude reaction mixture was concentrated in vacuo, purified by silica gel flash column chromatography (5% EtOAc in hexanes) to afford SI-6 as a yellow oil (0.867 g, 60% isolated yield). Pinacol boronate (6). In a N₂-filled glovebox, alkynyloxime 5 (31.8 mg, 0.200 mmol, 1.00 equiv) was dissolved in 0.6 mL toluene in a 4-dram vial equipped with stir bar. Catecholborane (21.4 µL, 0.200 mmol, 1.00 equiv) was added via gastight syringe to the solution above. The resulting solution was allowed to stir at room temperature for 0.5 h. The catalyst IPrAuTFA (3.5 mg, 0.0050 mmol, 2.5 mol %) was dissolved in 0.4 mL toluene and transferred via syringe to the solution above in a capped vial and the resulting suspension was stirred in a pre-heated 50 °C copper shot heating bath for 6 h. The reaction mixture was then cooled to room temperature and a solution of PPh₃ (2.6 mg, 0.010 mmol, 5.0 mol %) in toluene (1.2 mL) was added. The resulting suspension was stirred for 20 h at room temperature in order to quench IPrAuTFA before proceeding.

Pinacol (70.8 mg, 0.600 mmol, 3.00 equiv) was dissolved in anhydrous Et₃N (0.42 mL, 3.0 mmol, 15.0 equiv). The resulting solution was added to the quenched reaction mixture, and the resulting suspension was stirred at 25 °C for 1 h. The reaction mixture was then removed from the glovebox. Volatiles were removed in vacuo. The resulting light brown oil was purified by silica gel chromatography using an elution gradient from 100% hexanes to 100% CH₂Cl₂. Solvents were removed in vacuo to afford the desired pinacol boronate 6 as white solid (40.5 mg, 71% isolated yield). TLC (40% CH₂Cl₂/hexanes): R₁ = 0.08, visualized by UV absorbance. ¹H NMR (CDCl₃, 600 MHz): δ 7.83–7.81 (m, 2H), 7.43–7.39 (m, 3H), 2.61 (s, 3H), 1.30 (s, 12H). This spectrum is in agreement with previously reported spectral data.

Valdecoxib (8) was prepared according to a literature procedure, but with using building block 6 from our method. To a flame-dried 10 mL round bottom flask equipped with stir bar under N₂ atmosphere was added pinacol boronate 6 (54.4 mg, 0.191 mmol, 1.00 equiv), PdCl₂(dppf)-DCM (15.5 mg, 0.0190 mmol, 0.100 equiv), K₃PO₄ (122 mg, 0.574 mmol, 3.00 equiv), sulfonamide 7 (90.2 mg, 0.382 mmol, 2.00 equiv), and degassed dioxane (1.2 mL). The reaction mixture was stirred at 85 °C for 21 h. The reaction mixture was allowed to cool to 25 °C, quenched by DI water (10 mL). The aqueous layer was extracted with dichloromethane (3 × 20 mL). The combined organic layer was washed with brine (20 mL), dried over MgSO₄, filtered, and concentrated in vacuo. The crude was purified by silica gel flash column chromatography using an elution gradient from 30% to 40% EtOAc in hexanes to afford 8 as a light yellow solid (37.4 mg, 62% isolated yield). TLC (40% EtOAc/hexanes): R₁ = 0.14, visualized by UV absorbance. ¹H NMR (CD₃OD, 600 MHz): δ 7.83–7.81 (m, 2H), 7.43–7.39 (m, 3H), 2.61 (s, 3H), 1.30 (s, 12H). This spectrum is in agreement with previously reported spectral data.
600 MHz) δ: 7.91 (d, J = 8.4 Hz, 2H), 7.44–7.35 (m, 7H), 4.84 (s, 2H), 2.49 (s, 3H). This spectrum is in agreement with previously reported spectral data.\(^1\)

Valdecoxib ester analog (9) was prepared according to a literature procedure,\(^1\) using building block 4k from our method. To a flame-dried 10 mL round bottom flask equipped with stir bar under \(\text{N}_2\) atmosphere was added pinacol boronate 4k (59.0 mg, 0.159 mmol, 1.00 equiv), \(\text{PdCl}_2(\text{dpff})\cdot\text{DCM}\) (13.0 mg, 0.0159 mmol, 0.100 equiv), \(\text{K}_3\text{PO}_4\) (101 mg, 0.477 mmol, 3.00 equiv), sulfonamide 7 (75.0 mg, 0.318 mmol, 2.00 equiv), and degassed dioxane (1.20 mL). The reaction mixture was stirred at 90 °C for 46 h. The reaction mixture was allowed to cool to 25 °C, quenched by DI water (10 mL). The aqueous layer was extracted with dichloromethane (3 × 20 mL). The combined organic layer was washed with brine (20 mL), dried over \(\text{MgSO}_4\), filtered, and concentrated in vacuo. The crude was purified by silica gel flash column chromatography using an elution gradient from 30% to 40% EtOAc in hexanes to afford 9 as a white solid (47.1 mg, 74% isolated yield). TLC (40% EtOAc/hexanes): \(R_f = 0.14\), visualized by UV absorbance. \(^1\)H NMR (\(\text{d}_6\)-acetone, 500 MHz) δ: 7.93–7.91 (m, 2H), 7.45–7.36 (m, 7H), 6.70 (bs, 1H), 3.81 (bs, 1H), 3.57 (s, 3H), 2.94–2.91 (m, 4H), 2.40 (t, \(J = 7.0\) Hz, 2H). \(^1\)C NMR (\(\text{d}_6\)-acetone, 125 MHz): δ 173.3, 170.8, 161.6, 144.3, 134.8, 131.2, 130.3, 129.8, 129.4, 129.1, 127.2, 115.5, 51.6, 33.2, 25.4, 23.5. HRMS (ESI+) \(m/z\) calcld for \(\text{C}_{20}\text{H}_{20}\text{N}_2\text{O}_5\text{S} ([M+Na]^+)\) 423.0991, found 423.0987.

**L. Gram-scale preparation of 4a**

The gram-scale uncatalyzed oxyboration reaction was conducted in a 100 mL Schlenk bomb equipped with stir bar under \(\text{N}_2\) atmosphere. A flame-dried 100-mL Schlenk bomb with a stir bar was charged with oxime 1a (1.47 g, 7.31 mmol, 1.00 equiv). Anhydrous toluene (7.3 mL) was added. To the resulting rapidly stirring suspension was added catecholborane (0.78 mL, 7.31 mmol, 1.00 equiv) via syringe, and allowed to stir at room temperature for 30 min. The Schlenk bomb was removed from the glovebox and heated in a preheated oil bath at 110 °C until full consumption of starting materials was achieved (24 h).

Pinacol (2.59 g, 21.9 mmol, 3.00 equiv) was dissolved in anhydrous \(\text{Et}_3\text{N}\) (3.05 mL, 21.9 mmol, 3.00 equiv). The resulting solution was added to the above reaction mixture, and the resulting suspension was stirred at 25 °C for 1 h. Volatiles were removed in vacuo. The resulting light brown oil was purified by silica gel chromatography using an elution gradient from 100% hexanes to...
100% CH2Cl2. Solvents were removed in vacuo to afford the desired pinacol boronate 4a as a light yellow oil (1.72 g, 72% isolated yield). Spectral data were identical to those previously obtained for this compound (see page S11).
