ABSTRACT
A new sequence of new pyrazoline derivatives (5a-5h) was synthesized from 2-naphthylstyryl chalcone to react with hydrazine hydrate in the presence of n-butyric acid using the cyclization method. Synthesized compounds (5a-5h) chemical structure was elucidated by FT-IR, Proton and Carbon NMR Spectral data and CHN analysis. All the compounds (5a-5h) were subjected to in-vitro biological activity using disk diffusion method. The electron-withdrawing fluoro substituted compound 5b was better antibacterial activity against the bacterial strain of Pseudomonas aeruginosa and also the electron-withdrawing compound like bromo substitution 5d was excellent activity against bacterial strain of Escherichia coli and the fluoro substituted compound 5b was shown excellent activity against the gram-positive bacterial strain of Streptococcus pyogenes which was compared with the standard drug (Ciprofloxacin). The fluoro substituted compound 5b shown good antifungal activity against candida albicans. After that synthesized compounds (5a-5h) were subjected to molecular docking studies using bacterial protein and breast cancer protein. From this result, the synthesized compounds (5a-5h) have a high binding affinity score compared with the standard drug ciprofloxacin. Based on the high binding affinity score, compound 5b was subjected to in-vitro anticancer activity by MTT assay method against MDA MB-231 Cell line. From this result, the fluoro substituted compound 5b showed good activity at low concentration (6.25 µg/ml). The LC 50 value of this compound 5b is 27.76 ± 0.003 µg/ml. Compounds 5b and 5h are the most important compound and there is only needed to develop new antibacterial agents. The compounds (5a-5h) are also subjected to ADME (druglikness) property using Osiris program, a result that 5c has the best druglikness property and 0.51 drug score with 32.67Å total polar surface area.

Keywords: Conventional method, 2-Naphthylstyryl Ketone, n-Butyric acid, Hydrazine hydrate, Antimicrobial activity; Anticancer activity(MDA MB-231 Cell line).

INTRODUCTION
For centuries, Cancer has been prevailing as the most serious disease and its incidence is rising day-to-day in the world. The literature review is clearly explained more than 90% of cancer patients die due to chronic tumor metastases. Despite the presence of a large number of anticancer drugs, there is no currently available agents can destroy completely cancer cells without harming normal tissues The development of a new anticancer agent's future is very important in the major engrossment in many industrial research laboratories and academics across the world to develop more potent molecules with higher explicitness and minimized toxicity. Heterocyclic compounds particularly those with oxygen, nitrogen and sulphur atoms have been identified to have the most comprehensive spectrum of biological activities. In the synthesis of heterocyclic compounds, chalcones are used as an intermediate and it should have good biological activity as well as it plays an important role in medicinal chemistry and drug discovery. The pyrazoline derivatives are the most important classes of the heterocyclic compound and it is a versatile lead molecule in the agrochemical and pharmaceutical field. The pyrazoline derivatives have various biological activities such as antimicrobial, antitumor, antibacterial, anti-inflammatory, anticancer, antidiabetic, pharmacological, free radical scavenging activities. Among the reported activities, it is important to
note that pyrazoline is not only useful in the treatment of various cancer types, including brain, bone, mouth, esophagus, stomach, liver, bladder, pancreas, cervix, lung, breast, colon, rectum and prostate cancers, but some of them act as cancer chemopreventive agents. Most of the pyrazole compounds have a lot of industrial applications and anticorrosive inhibition property. On the other hand, pyrazoline derivatives were carried out of the focus of drug discovery; like the studies drug-ability and bioactivity of the compounds. The concept of drug-ability is defined as the prospect to find a compound with high potency, drug-like properties, as well as measured properties concerning undesirable side effects, metabolism, and intestinal absorption. It was observed that about 30% of oral drug fail in development due to poor pharmacokinetics studies. It is worth to note that lack of in vivo effectiveness of a drug candidate might be due to poor physicochemical properties of the drug candidate itself. Also biding activity can be predicted by studying whether the tested compounds are complementary with the binding sites on biological molecules in terms of topology, volume and physiochemical properties. That’s to say, it is useful to estimate the probability that a molecule can bind a given protein with sufficient affinity to modify its activity. So, Computation screening of new compounds, ie in-silico prediction of druglikness and bioactivity, has been proved to be very important in the early stage of drug discovery to subject the most suitable compounds to further optimization and to find drug candidate for further clinical development.

Prompted by the aforementioned findings and in the continuation of our ongoing research in the field of design, synthesis, and biological evaluation of pyrazoline derivatives, herein we described the synthesis and spectral characterization of a new series of substituted pyrazoline as potential anticancer agents against (3,4-methylenedioxymethamphetamine) MDA MB 231 Breast cancer cell line study by MTT (3-(4,5-dimethyl thiazol-2-yl)-2,5-diphenyltetrazolium bromide) assay method. Molecular docking studies
were carried out against bacterial proteins and breast cancer protein. Finally, the synthesized compounds were screened for antimicrobial activity against the disc diffusion method. New anticancer drugs are previously used in clinical research, some of the anticancer drugs are not efficiently and intolerable side effects. Based on the above study, we need to development of new drugs against anticancer and antimicrobial activities. Therefore, we were led to identifying new approaches of pyrazoline derivatives as well as test the antimicrobial and anticancer activity.

EXPERIMENTAL

Chemicals and Reagents
All the chemicals were purchased from variable sources, used without purification. The synthesized compounds were checked by TLC on Silica gel plates (E-Merk, Mumbai, India). The melting points of the synthesized compounds are carried out by an open capillary method and it was uncorrected. The FT-IR spectrum was recorded in KBr pellets on an FT-IR Shimadzu 8400s spectrometer in the range of 400-4000 cm\(^{-1}\). \(^1\)H NMR and \(^13\)C NMR spectra were recorded by Brucker 400 MHz and Brucker 100 MHz spectrometer (in δ ppm) using TMS as an internal standard. CHN analyses were recorded on the Perkin Elmer CHN analyzer. By adopting the literature precedent; chalcones (3a-3h) are prepared.

Synthesis of Pyrazoline Butanone Derivatives (5a-5h)
Naphthyl Chalcones (3a-3h) (0.01 mol), hydrazine hydrate (0.01 mol), anhydrous sodium acetate (0.01 mol) and Butyric acid (Propyl formic acid) (20 ml) are taken in a round bottom flask and reaction mixture was refluxed until the products are formed. The reaction is monitored by TLC. The time required for the formation of various pyrazole is 6-9 hrs. The reaction mixture is poured into crushed ice and left overnight. The precipitate is separated by filtration, washed well with water, dried and the obtained solids are purified by recrystallization using rectified sprit which affords the title compounds (5a-5h) in moderate yield. The experimental procedure was followed by the reference method.

Molecular Docking Study
The molecular docking studies have been carried out using the Auto dock Tools (ADT) version 1.5.6 and Auto dock version 4.2.5.1 docking program.

Preparation of the Protein
The bacterial protein and breast cancer protein were downloaded from Protein Data Bank with PDB id: 1UAG and 1OQA.

Ligand Preparation
2D structure of the target compounds is drawn using Chemdraw Ultra 8.0 (Chemoffice 2002). After Chem 3D Ultra 8.0 was used to convert the 2D structure into the 3D structure, and the energy is minimized using the semi-empirical AM1 method. All the structures are saved as pdb file format for input to ADT. Finally, all the ligand structures are saved as PDB file format to carry out molecular docking in Auto dock Vina.

Grid Formation
A grid box with a dimension of 40 X 40 X 40 Å\(^3\) in 0.375Å spacing and centered on 30.473, 47.997, 9.563 has created around the binding site of protein using ADT. The center of the box was set at ligand center and grid energy calculations have been carried out.

Docking Protocol
The Auto dock calculation, are such as default parameters have been used and 10 docked conformations are generated for each compound. The energy calculation is done using genetic algorithms. The outputs are exported to Chimera 1.10 and discovery studio 4.5 for visual inspection of the binding modes and interaction of the compounds with amino acid residues in the active site. The procedure was followed by the literature method.
Pharmacological Activity

Antibacterial Screening
The antibacterial screening for synthesized pyrazoline compounds was determined by the agar disk diffusion method against gram-positive bacterial strains of *Staphylococcus aureus*, *Streptococcus pyogenes* and gram-negative bacterial strains of *Escherichia coli*, *Pseudomonasaeruginosa*. The zone of inhibition was measured after 24h incubation at 37 °C. The biological screening experimental procedure was adopted by the literature survey method.\textsuperscript{35-37}

Antifungal Screening
The antifungal screening for synthesized pyrazoline compounds was determined by the agar disk diffusion method against *Candida albicans* strain. The zone of inhibition was measured after 24 h incubation at 37 °C.

In-silico Druglikness Property
ADME property is done by Osiris online software program. All synthesized compounds (5a-5h) subjected to druglikness property to predict the solubility, absorption, Lipinski rule violation, and surface area of the compounds. The compound which has molecular weight ≤500, n-HA ≤10, n-HD ≤5, logP≤5 and Molar refractivity ≤140 obey the Lipinski rule of five. Also, compounds have a polar surface area (7 to 200), solubility value and drug score (above 0.5). All the above properties are predicted with the help of the Osiris program.

Anticancer Activity

MTT Assay
MDA MB-231 (Human Breast Adenocarcinoma) cell was initially procured from National Centre for Cell Sciences (NCCS), Pune, India and maintained Dulbecco’s modified eagle’s medium, DMEM (Sigma Aldrich, USA).
The cell line was cultured in 25cm\(^2\) tissue culture flask with DMEM supplemented with 10% FBS, L-glutamine, sodium bicarbonate (Merck, Germany) and an antibiotic solution containing: penicillin (100 U/ml), Streptomycin (100 µg/ml), Streptomycin (100 µg/ml), and Amphotericin B (2.5 µg/ml). Cultured cell lines were kept at 37 ºC in a humidified 5% CO\(_2\) incubator (NBS Eppendorf, Germany).
The viability of cells was evaluated by direct observation of cells by an inverted phase-contrast microscope and followed by MTT assay method.

Cells Seeding in 96 Well Plate
Two days old confluent monolayer of cells trypsinzed and the cells were suspended in 10% growth medium, 100 µl cell suspension (5X10\(^4\) cells/well) was seeded in 96 well tissue culture plate and incubated at 37 °C in a humidified 5% CO\(_2\) incubator.

Preparation of Compound Stock
1mg of the sample was weighed and dissolved in 1 ml DMEM using a cyclomixer. The sample solution was filtered through 0.22 µm Millipore syringe filter to ensure sterility.

Anticancer evaluation
After 24 h the growth medium was removed, freshly prepared each compound in 5% DMEM was five times serially diluted by two-fold dilution (100, 50, 25, 12.5, 6.25 µg in 500 µl) of 5% DMEM and each concentration of 100 µl was added in triplicates to the respective wells and incubated at 37 °C in a humidified 5% CO\(_2\) incubator. Non treated control cells were also maintained\textsuperscript{5}.

Anticancer Assay by MTT Method
15 mg of MTT (Sigma, M-5655) was reconstituted in 3 ml PBS until completely dissolved and sterilized by filter sterilization. After 24 h of the incubation period, the sample content in wells was removed and 30 µl of reconstituted MTT solution was added to all test and cell control wells, the plate was gently shaken
well, then incubated at 37 °C in a humidified 5% CO₂ incubator for 4 h. After the incubation period, the supernatant was removed and 100 µl of MTT solubilization solution (DMSO, Sigma Aldrich, USA) was added and the cells were mixed gently by pipetting up and down to solubilize the formazan crystals. The absorbance values were measured by using a microplate reader at a wavelength of 540 nm. The percentage of growth incubation was calculated using the following formula:

\[
\% \text{ of Viability} = \left[ \frac{\text{Mean OD Samples} \times 100}{\text{Mean OD of Control Group}} \right]
\]

RESULTS AND DISCUSSION

Synthesis and Characterization of Pyrazoline Analogs

The pyrazoline derivatives (5a-5h) were synthesized from 2-naphthylstyril chalcone react with Hydrazine hydrate in the presence of propyl formic acid using the cyclization process via the conventional method. Before that, the 2-naphthyl styryl chalcone derivatives (3a-3h) were synthesized from 2-naphthylstyril ketone react with different substituted aromatic aldehydes in the presence of a strong base. The synthetic route of pyrazoline derivatives represented in Scheme-1.

Scheme-1: Synthetic Route of the Isolated Compounds (5a-5h)

Spectral Characterization

The isolated compound's chemical structures were elucidated using FT-IR, \(^1\)H NMR, \(^13\)C NMR and elemental analysis. The compound 3a was confirmed by FT-IR spectral data showing the sharp band at 1660.70 cm\(^{-1}\) which is indicate the presence of carbonyl group (C=O). The aromatic CH stretching frequency was observed sharp peak at 3059.10 cm\(^{-1}\). The aromatic C=C stretching frequency was observed at 1593.20 cm\(^{-1}\). Other chalcone derivative's physical and chemical properties are shown in Table-1. The pyrazoline derivatives (5a-5h) chemical structures were confirmed using FT-IR spectral data. From this result, compound 5a shows the strong absorption frequency at 1658.78 cm\(^{-1}\), which indicates the presence of a carbonyl group of butane moiety. The C=N stretching frequency was observed
The aromatic CH stretching frequency was observed at 3140.11 cm\(^{-1}\). Other compounds IR results were shown in Table-2.

The Proton NMR spectrum of compound 5a shows the three doublets of doublet 3.25, 3.85 and 5.59 ppm respectively, the doublet of a doublet at in the downfield region of the 5.59 ppm and it has the coupling constant value J\(_{5a, 4a}\) = 11.6 Hz and J\(_{5a, 4b}\) = 4.4 Hz, which indicates the presence of H-5a proton of pyrazole moiety. The H-4a proton of the pyrazole moiety exhibited the downfield shift that appeared at the doublet of a doublet at 3.25 ppm and the coupling constant value J\(_{4a, 4b}\) = 17.4 Hz and J\(_{4a, 5a}\) = 4.2 Hz. The H-4b proton of pyrazole moiety in appeared the doublet of a doublet at 3.85 ppm and the coupling constant value J\(_{4b, 4a}\) = 17.2 Hz and J\(_{4b, 5a}\) = 12 Hz. The aromatic protons have appeared at the range between 7.19 – 8.09 ppm. The methyl group of butane moiety in pyrazoline compound appears triplet at the range is 1.008-1.026 ppm. The methylene proton of butane moiety in the pyrazoline compound exhibited a multiplet at in the range of 2.75 ppm – 2.90 ppm is due to the presence of neighboring protons of butane moiety. Another CH\(_{2}\) proton of butane moiety in pyrazoline compound exhibits the multiplet at in the range of 1. 725 ppm – 1.780 ppm. The compounds (5a-5h) Proton-NMR spectral values are shown in Table-3. From the proton NMR spectral studies of the synthesized compound; the structure has been unambiguously confirmed.
The $^{13}$C NMR spectrum of compound 5a shows that the $^{13}$C resonance observed at 171.61 ppm is attributed to C=O group of butane moiety in the pyrazoline compound. The $^{13}$C resonance observed at 153.52 ppm which indicates the presence of C=N group of pyrazole ring in the pyrazoline compound. The $^{13}$C resonance observed at 59.63 ppm is due to the presence of C-5 carbon of pyrazole ring in pyrazoline.
compound. The $^{13}$C resonance observed at 41.95 ppm which is attributed to the presence of C-4 carbon of pyrazole ring in pyrazoline compound. The $^{13}$C resonance observed at 36.17 ppm which indicates the presence of C-2' carbon of pyrazole ring in pyrazoline compound. The $^{13}$C resonance observed at 18.39 ppm which is unambiguously assigned the presence of C-3' carbon of butane moiety in pyrazoline compound. The $^{13}$C resonance observed at 14.04 ppm which is due to the presence of CH$_3$ group of butane moiety in pyrazoline compound. The aromatic carbons are appeared at in the range of 123.39 – 129.10 ppm. The other $^{13}$C signals 133.02, 133.40, 134.28 and 140.40ppm are the presence of ipso carbons From the Carbon-NMR spectral results, the structures of the synthesized compounds were confirmed. The other compounds (5a-5h) $^{13}$C NMR spectral data values are shown in Table-4.

Antibacterial Activity

Antibacterial screening of synthesized derivatives (5a-5h) against Gram-positive bacterial species: *Staphylococcus aureus*, *Streptococcus pyogenes* and gram-negative species *Escherichia coli*, *Pseudomonas aeruginosa*. Antibacterial activity results (Table-6) particularly; compound 5b (Fluoro substitution) exhibited good zone of inhibition (20 mm) against *Staphylococcus aureus* and Compound 5d (Bromo substitution ) exhibited excellent zone of inhibition (24 mm) as compared with standard drug ciprofloxacin against *Streptococcus pyogenes*. Compound 5b (Fluoro substitution) exhibited an excellent zone of inhibition (24 mm) as compared with standard drug ciprofloxacin against *E.coli*. Compound 5b has an excellent zone of inhibition (25 mm) compared with the standard drug against *Pseudomonas aeruginosa*. Finally, the antibacterial result, the electronegativity group (F and Br) has excellent activity. The reason is due to the presence of the electronegativity group directly attached to the pyrazole ring moiety of compound 5b and 5d. The electron-withdrawing group attached to the pyrazoline ring portion increased the antibacterial potential against *S.pyogenes*.

Antifungal Activity
Antifungal screening of synthesized derivatives (5a-5h) against *candida albicans* species was done by agar disk diffusion method. Antifungal results indicated (Table-7) particularly compound 5b shown more promising antifungal activity (14 mm) as compared with standard drug Clotrimazole (24 mm) while other derivatives are moderately active. The electron-withdrawing group directly attached with pyrazole ring portion of compound 5b increased the antifungal potential against *C. albicans*.

In-silico Molecular Docking Study
Pyrazoline Compounds (5a-5h), Docked with Bacterial Protein
Molecular modeling studies were accomplished to investigate the possible bind mode of the synthesized eight pyrazoline derivatives targeting the crystal structure of the bacterial protein 1UAG using Auto dock docking program. From this Table-8, the docking score, conventional hydrogen bond, and hydrophobic contacts such as alkyl and pi-alkyl stacking were provided. Most of the synthesized pyrazoline compounds showed very good interaction with the studied protein. Our synthesized compounds (5a-5h) all are exhibited good binding affinity scores compared with standard drugs. Among the 8 pyrazoline compounds studied with the protein 1UAG, compound 5b showed a high binding affinity score -9.4 kcal/mol compared with standard drug ciprofloxacin -7.9 kcal/mol. Compound 5b has three conventional
hydrogen bond contact with the residue such as SER A: 415, PHE A: 422, LYS A: 115. The C=O group of compound 5b interacted with the active pockets of the enzyme forming hydrogen bonds with SER A: 415 and PHE A: 422 at different distances (2.06 Å, 2.70 Å). Also, 4-f substitution benzene ring of compound 5b interacted with the active pockets of the enzyme forming a hydrogen bond with LYS A: 115 at 2.95 Å distance. The pyrazole ring and benzene ring of compound 5b interacted with the active pockets of the enzyme forming hydrophobic contact with ALA A: 414 and LEU A: 416 at different distances of 4.70 Å, 4.67 Å respectively. Docking score, hydrophobic contact of the derivatives are shown in Table-8. 2D and 3D image of compound 5b is shown in Fig.-8.

![Fig.-8: 2D and 3D Images of Compound 5b](image)

**In-vitro Anticancer Activity**

The anticancer activity of synthesized pyrazoline derivatives (5a-5h) was carried out for docking studies using breast cancer protein 1OQA and the results are presented in Table-9. From this result, synthesized compounds (5a-5h) all have a good binding affinity score. Especially, Compound 5b has a higher binding affinity score when compared with the other derivatives. The benzene ring of compound 5b interacted with the active pockets of the enzyme forming hydrophobic contact with the residues PRO A: 59 and PRO A: 103 at different distances (4.62 Å, 5.28 Å). The other compounds docking score, H-bond, and hydrophobic contacts are given in Table-9. The 2D and 3D images of compound 5b shown in Fig.-9.

**In-silico Druglikness Study**

The target molecules (5a-5h) subjected to druglikness property with the help of Osris program. The values from the program said that the solubility, MW, TPSA, log P o/w and drug score. All the compounds, the target 5c which have positive value 1.21 in the druglikness property, 0.51 as a drug score with 32.67Å TPSA and zero violation in Lipinski’s rule. All the pyrazoline derivatives have zero violations in Lipinski’s rule, have good TPSA and have solubility value between -7 to -5. The values are predicted from the software program, it was tabulated and given below in Table-10.

**In-vitro Anticancer Activity**

MTT Assay

According to the docking results. The compound 5b was performed in-vitro anticancer activity against the human breast cancer cell line (MDA MB-231) using MTT assay method at various concentrations (100, 50, 25, 12.5, 6.25 µg/ml) and the results are presented in Fig.-10 and 11. Anticancer screening results revealed that in general pyrazoline derivatives exhibited good anticancer potential against human breast cancer cell line, especially, compound 5b act as a moderate activity in all concentrations except 6.25 µg/ml showed good activity and the LC50 value of this compound is 27.76 ±0.003 µg/ml. Triplicate experimental method was followed and then the mean value was calculated.

| Compound | Log P | MW     | n-HA | n-HD | n-violation in rule of five | TPSA  | Solubility logS | Druglikness | Drug Score |
|----------|-------|--------|------|------|-----------------------------|-------|-----------------|-------------|------------|
| 5a       | 5.33  | 342.4  | 3    | 0    | 0                           | 32.67 | -5.76           | -0.60       | 0.45       |

Fig.-10: *In-vitro* Anticancer Activity Screening for Compound 5b at Low Concentration
Summarizing, eight novel proponone pyrazole compounds were synthesized and characterized by phiochemical and spectral data was found in good agreement with the assigned molecular structures. The in-vitro antimicrobial screening of synthesized compounds indicated 5b and 5d exhibited appreciable antimicrobial potential. The anticancer screening results demonstrated that compound 5b (LC50 = 27.76±0.003 μg/ml) is the most active one against MDA-MB-231 cancer cell line. Molecular docking studies indicated the compound 5b being the most active molecule has the maximum hydrogen bond interaction(three) and pi-pi stacking network among pyrazoline derivatives. The synthesized compounds may exhibit their antimicrobial and anticancer activity by the inhibition of enzymes 1OQA and MDA-MB-231.

**CONCLUSION**

Fig.-11: *In-vitro* Anticancer Activity of Compound 5i. MDA-MB-231 Cells were incubated for 48 hours in presence of (i) 5i at 6.25 μg/ml (ii) 5i at 12.5 μg/ml (iii) 5i at 25 μg/ml (iv) 5i at 50 μg/ml (v) 5i at 100 μg/ml

| Compound | LogP | MW | Lipinski's Rule | Activity | Binding | Inhibition |

MB-231 respectively. Finally, the obtained antimicrobial and anticancer data makes such type of compounds a fruitful matrix for further development of more potent and selective anticancer and/or antimicrobial agents. In particular the compound 5b could be considered as a possible dual antimicrobial-anticancer candidate that deserves further investigation and derivatization to explore the scope and limitation of its biological activities.

ACKNOWLEDGMENT

We thank the Biogenix Research Center for conducting the MDA MB-231 Cell line anticancer MTT assay for our compound 5b.
