Abstract. In this paper, we define Tribonacci and Tribonacci-Lucas matrix sequences and investigate their properties.

2010 Mathematics Subject Classification. 11B39, 11B83.

Keywords. Tribonacci numbers, Tribonacci matrix sequence, Tribonacci-Lucas matrix sequence.

1. Introduction and Preliminaries

Recently, there have been so many studies of the sequences of numbers in the literature that concern about subsequences of the Horadam numbers and generalized Tribonacci numbers such as Fibonacci, Lucas, Pell and Jacobsthal numbers; Tribonacci, Tribonacci-Lucas, Padovan, Perrin, Padovan-Perrin, Narayana, third order Jacobsthal and third order Jacobsthal-Lucas numbers.

The sequences of numbers were widely used in many research areas, such as physics, engineering, architecture, nature and art. For example, the ratio of two consecutive Fibonacci numbers converges to the Golden section (ratio), \( \alpha_F = \frac{1 + \sqrt{5}}{2} \); which appears in modern research, particularly physics of the high energy particles or theoretical physics. Another example, the ratio of two consecutive Padovan numbers converges to the Plastic ratio, \( \alpha_P = \sqrt[3]{\frac{1}{2} + \frac{1}{6} \sqrt[3]{23}} \); which have many applications to such as architecture, see [9]. One last example, the ratio of two consecutive Tribonacci numbers converges to the Tribonacci ratio, \( \alpha_T = \sqrt[3]{\frac{1}{2} + \frac{1}{5} \sqrt[3]{33} + \frac{1}{2} - \frac{1}{5} \sqrt[3]{33}} \). For a short introduction to these three constants, see [10].

On the other hand, the matrix sequences have taken so much interest for different type of numbers. For matrix sequences of generalized Horadam type numbers, see for example [4], [5], [7], [15], [16], [17], [19], and for matrix sequences of generalized Tribonacci type numbers, see for instance [2], [20], [21].

In this paper, the matrix sequences of Tribonacci and Tribonacci-Lucas numbers will be defined for the first time in the literature. Then, by giving the generating functions, the Binet formulas, and summation formulas over these new matrix sequences, we will obtain some fundamental properties on Tribonacci and Tribonacci-Lucas numbers. Also, we will present the relationship between these matrix sequences.
First, we give some background about Tribonacci and Tribonacci-Lucas numbers. Tribonacci sequence $\{T_n\}_{n \geq 0}$ (sequence A000073 in [13]) and Tribonacci-Lucas sequence $\{K_n\}_{n \geq 0}$ (sequence A001644 in [13]) are defined by the third-order recurrence relations

\begin{equation}
T_n = T_{n-1} + T_{n-2} + T_{n-3}, \quad T_0 = 0, T_1 = 1, T_2 = 1,
\end{equation}

and

\begin{equation}
K_n = K_{n-1} + K_{n-2} + K_{n-3}, \quad K_0 = 3, K_1 = 1, K_2 = 3
\end{equation}

respectively. Tribonacci concept was introduced by M. Feinberg [6] in 1963. Basic properties of it is given in [1], [11], [12], [18] and Binet formula for the $n$th number is given in [14].

The sequences $\{T_n\}_{n \geq 0}$ and $\{K_n\}_{n \geq 0}$ can be extended to negative subscripts by defining $T_{-n} = -T_{-(n-1)} - T_{-(n-2)} + T_{-(n-3)}$ and $K_{-n} = -K_{-(n-1)} - K_{-(n-2)} + K_{-(n-3)}$ for $n = 1, 2, 3, \ldots$ respectively. Therefore, recurrences (1.1) and (1.2) hold for all integer $n$.

By writing $T_{n-1} = T_{n-2} + T_{n-3} + T_{n-4}$ and eliminating $T_{n-2}$ and $T_{n-3}$ between this recurrence relation and recurrence relation (1.1), a useful alternative recurrence relation is obtained for $n \geq 4$:

\begin{equation}
T_n = 2T_{n-1} - T_{n-4}, \quad T_0 = 0, T_1 = T_2 = 1, T_3 = 2.
\end{equation}

Extension of the definition of $T_n$ to negative subscripts can be proved by writing the recurrence relation (1.3) as

$$T_{-n} = 2T_{-n+3} - T_{-n+4}.$$ \nonumber

Note that $T_{-n} = T_{n-1}^2 - T_{n-2}T_n$, (see [3]).

We can give some relations between $\{T_n\}$ and $\{K_n\}$ as

\begin{equation}
K_n = 3T_{n+1} - 2T_n - T_{n-1}
\end{equation}

and

\begin{equation}
K_n = T_n + 2T_{n-1} + 3T_{n-2}
\end{equation}

and also

\begin{equation}
K_n = 4T_{n+1} - T_n - T_{n+2}.
\end{equation}

Note that the last three identities hold for all integers $n$.

The first few Tribonacci numbers and Tribonacci Lucas numbers with positive subscript are given in the following table:
The first few Tribonacci numbers and Tribonacci Lucas numbers with negative subscript are given in the following table:

| n  | 0  | 1  | 2  | 3  | 4  | 5  | 6  | 7  | 8  | 9  | 10 | 11 | 12 | ... |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| $T_n$ | 0  | 1  | 1  | 2  | 4  | 7  | 13 | 24 | 44 | 81 | 149 | 274 | 504 | ... |
| $T_{-n}$ | 0  | 0  | 1  | -1 | 0  | 2  | -3 | 1  | 4  | -8 | 5  | 7  | -20 | ... |

It is well known that for all integers $n$, usual Tribonacci and Tribonacci-Lucas numbers can be expressed using Binet’s formulas

(1.7) \[ T_n = \frac{\alpha^{n+1}}{(\alpha - \beta)(\alpha - \gamma)} + \frac{\beta^{n+1}}{(\beta - \alpha)(\beta - \gamma)} + \frac{\gamma^{n+1}}{(\gamma - \alpha)(\gamma - \beta)} \]
and

(1.8) \[ K_n = \alpha^n + \beta^n + \gamma^n \]

respectively, where $\alpha, \beta$ and $\gamma$ are the roots of the cubic equation $x^3 - x^2 - x - 1 = 0$. Moreover,

\[
\begin{align*}
\alpha &= \frac{1 + \sqrt[3]{19 + 3\sqrt{33}} + \sqrt[3]{19 - 3\sqrt{33}}}{3}, \\
\beta &= \frac{1 + \omega \sqrt[3]{19 + 3\sqrt{33}} + \omega^2 \sqrt[3]{19 - 3\sqrt{33}}}{3}, \\
\gamma &= \frac{1 + \omega^2 \sqrt[3]{19 + 3\sqrt{33}} + \omega \sqrt[3]{19 - 3\sqrt{33}}}{3}
\end{align*}
\]

where

\[ \omega = \frac{-1 + i\sqrt{3}}{2} = \exp(2\pi i/3), \]

is a primitive cube root of unity. Note that we have the following identities

\[
\begin{align*}
\alpha + \beta + \gamma &= 1, \\
\alpha\beta + \alpha\gamma + \beta\gamma &= -1, \\
\alpha\beta\gamma &= 1.
\end{align*}
\]

The generating functions for the Tribonacci sequence \( \{T_n\}_{n \geq 0} \) and Tribonacci-Lucas sequence \( \{K_n\}_{n \geq 0} \) are

(1.9) \[ \sum_{n=0}^{\infty} T_n x^n = \frac{x}{1 - x - x^2 - x^3} \quad \text{and} \quad \sum_{n=0}^{\infty} K_n x^n = \frac{3 - 2x - x^2}{1 - x - x^2 - x^3}. \]

Note that the Binet form of a sequence satisfying (1.1) and (1.2) for non-negative integers is valid for all integers $n$. This result of Howard and Saidak [8] is even true in the case of higher-order recurrence relations as the following theorem shows.
Theorem 1.1. Let \( \{w_n\} \) be a sequence such that

\[
\{w_n\} = a_1w_{n-1} + a_2w_{n-2} + \ldots + a_kw_{n-k}
\]

for all integers \( n \), with arbitrary initial conditions \( w_0, w_1, \ldots, w_{k-1} \). Assume that each \( a_i \) and the initial conditions are complex numbers. Write

\[
f(x) = x^k - a_1x^{k-1} - a_2x^{k-2} - \ldots - a_{k-1}x - a_k
\]

with \( d_1 + d_2 + \ldots + d_h = k \), and \( \alpha_1, \alpha_2, \ldots, \alpha_k \) distinct. Then

(a): For all \( n \),

\[
w_n = \sum_{m=1}^{k} N(n, m)(\alpha_m)^n
\]

where

\[
N(n, m) = A_1^{(m)} + A_2^{(m)}n + \ldots + A_r^{(m)}n^{r_m-1} = \sum_{u=0}^{r_m-1} A_u^{(m)}n^u
\]

with each \( A_i^{(m)} \) a constant determined by the initial conditions for \( \{w_n\} \). Here, equation (1.11) is called the Binet form (or Binet formula) for \( \{w_n\} \). We assume that \( f(0) \neq 0 \) so that \( \{w_n\} \) can be extended to negative integers \( n \).

If the zeros of (1.10) are distinct, as they are in our examples, then

\[
w_n = A_1(\alpha_1)^n + A_2(\alpha_2)^n + \ldots + A_k(\alpha_k)^n.
\]

(b): The Binet form for \( \{w_n\} \) is valid for all integers \( n \).

2. The Matrix Sequences of Tribonacci and Tribonacci-Lucas Numbers

In this section we define Tribonacci and Tribonacci-Lucas matrix sequences and investigate their properties.

Definition 2.1. For any integer \( n \geq 0 \), the Tribonacci matrix \( (T_n) \) and Tribonacci-Lucas matrix \( (K_n) \) are defined by

\[
T_n = T_{n-1} + T_{n-2} + T_{n-3},
\]

\[
K_n = K_{n-1} + K_{n-2} + K_{n-3},
\]

respectively, with initial conditions

\[
T_0 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}, T_1 = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}, T_2 = \begin{pmatrix} 2 & 2 & 1 \\ 1 & 1 & 1 \\ 1 & 0 & 0 \end{pmatrix}
\]
and
\[ K_0 = \begin{pmatrix} 1 & 2 & 3 \\ 3 & -2 & -1 \\ -1 & 4 & -1 \end{pmatrix}, \quad K_1 = \begin{pmatrix} 3 & 4 & 1 \\ 1 & 2 & 3 \\ 3 & -2 & -1 \end{pmatrix}, \quad K_2 = \begin{pmatrix} 7 & 4 & 3 \\ 3 & 4 & 1 \\ 1 & 2 & 3 \end{pmatrix}. \]

The sequences \( \{T_n\}_{n \geq 0} \) and \( \{K_n\}_{n \geq 0} \) can be extended to negative subscripts by defining
\[ T_{-n} = -T_{-(n-1)} - T_{-(n-2)} + T_{-(n-3)} \]
and
\[ K_{-n} = -K_{-(n-1)} - K_{-(n-2)} + K_{-(n-3)} \]
for \( n = 1, 2, 3, \ldots \) respectively. Therefore, recurrences (2.1) and (2.2) hold for all integers \( n \).

The following theorem gives the \( n \)-th general terms of the Tribonacci and Tribonacci-Lucas matrix sequences.

**Theorem 2.2.** For any integer \( n \geq 0 \), we have the following formulas of the matrix sequences:

\begin{align*}
T_n &= \begin{pmatrix} T_{n+1} & T_n + T_{n-1} & T_n \\ T_n & T_{n-1} + T_{n-2} & T_{n-1} \\ T_{n-1} & T_{n-2} + T_{n-3} & T_{n-2} \end{pmatrix}, \\
K_n &= \begin{pmatrix} K_{n+1} & K_n + K_{n-1} & K_n \\ K_n & K_{n-1} + K_{n-2} & K_{n-1} \\ K_{n-1} & K_{n-2} + K_{n-3} & K_{n-2} \end{pmatrix}.
\end{align*}

Proof. We prove (2.3) by strong mathematical induction on \( n \). (2.4) can be proved similarly.

If \( n = 0 \) then, since \( T_1 = 1, T_2 = 1, T_0 = T_{-1} = 0, T_{-2} = 1, T_{-3} = -1 \), we have
\[ T_0 = \begin{pmatrix} T_1 & T_0 + T_{-1} & T_0 \\ T_0 & T_{-1} + T_{-2} & T_{-1} \\ T_{-1} & T_{-2} + T_{-3} & T_{-2} \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \]
which is true and
\[ T_1 = \begin{pmatrix} T_2 & T_1 + T_0 & T_1 \\ T_1 & T_0 + T_{-1} & T_0 \\ T_0 & T_{-1} + T_{-2} & T_{-1} \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}\]
Thus, by strong induction on $n$, we have

\[
T_{k+1} = T_k + T_{k-1} + T_{k-2}
\]

Using the matrices given by (2.5) and initial condition which is given in Definition 2.1, and also applying linear algebra operations, we obtain

\[
\alpha \beta \gamma
\]

Similarly we have the formula (2.6).

We now give the Binet formulas for the Tribonacci and Tribonacci-Lucas matrix sequences.

**Theorem 2.3.** For every integer $n$, the Binet formulas of the Tribonacci and Tribonacci-Lucas matrix sequences are given by

\[
T_n = A_1 \alpha^n + B_1 \beta^n + C_1 \gamma^n,
\]

\[
K_n = A_2 \alpha^n + B_2 \beta^n + C_2 \gamma^n.
\]

where

\[
A_1 = \frac{\alpha T_2 + \alpha (\alpha - 1) T_1 + \gamma}{\alpha (\alpha - \gamma) (\alpha - \beta)}, B_1 = \frac{\beta T_2 + \beta (\beta - 1) T_1 + \gamma}{\beta (\beta - \gamma) (\beta - \alpha)}, C_1 = \frac{\gamma T_2 + \gamma (\gamma - 1) T_1 + \gamma}{\gamma (\gamma - \beta) (\gamma - \alpha)}
\]

\[
A_2 = \frac{\alpha K_2 + \alpha (\alpha - 1) K_1 + \gamma}{\alpha (\alpha - \gamma) (\alpha - \beta)}, B_2 = \frac{\beta K_2 + \beta (\beta - 1) K_1 + \gamma}{\beta (\beta - \gamma) (\beta - \alpha)}, C_2 = \frac{\gamma K_2 + \gamma (\gamma - 1) K_1 + \gamma}{\gamma (\gamma - \beta) (\gamma - \alpha)}
\]

Proof. We prove the theorem only for $n \geq 0$ because of Theorem 1.1. We prove (2.5). By the assumption, the characteristic equation of (2.1) is $x^3 - x^2 - x - 1 = 0$ and the roots of it are $\alpha, \beta$ and $\gamma$. So its general solution is given by

\[
T_n = A_1 \alpha^n + B_1 \beta^n + C_1 \gamma^n.
\]

Using initial condition which is given in Definition 2.1 and also applying linear algebra operations, we obtain the matrices $A_1, B_1, C_1$ as desired. This gives the formula for $T_n$.

Similarly we have the formula (2.6).
The well known Binet formulas for Tribonacci and Tribonacci-Lucas numbers are given in (1.7) and (1.8) respectively. But, we will obtain these functions in terms of Tribonacci and Tribonacci-Lucas matrix sequences as a consequence of Theorems 2.2 and 2.3. To do this, we will give the formulas for these numbers by means of the related matrix sequences. In fact, in the proof of next corollary, we will just compare the linear combination of the 2nd row and 1st column entries of the matrices.

**Corollary 2.4.** For every integers \(n\), the Binet’s formulas for Tribonacci and Tribonacci-Lucas numbers are given as

\[
T_n = \frac{\alpha^{n+1}}{(\alpha - \gamma) (\alpha - \beta)} + \frac{\beta^{n+1}}{(\beta - \gamma) (\beta - \alpha)} + \frac{\gamma^{n+1}}{(\gamma - \beta) (\gamma - \alpha)},
\]

\[
K_n = \alpha^n + \beta^n + \gamma^n.
\]

**Proof.** From Theorem 2.3 we have

\[
T_n = \frac{\alpha T_n + \alpha (\alpha - 1) T_{n-1} + \alpha}{(\alpha - \gamma) (\alpha - \beta)} \alpha^n + \frac{\beta T_n + \beta (\beta - 1) T_{n-1} + \beta}{(\beta - \gamma) (\beta - \alpha)} \beta^n
\]

\[
+ \frac{\gamma T_n + \gamma (\gamma - 1) T_{n-1} + \gamma}{(\gamma - \beta) (\gamma - \alpha)} \gamma^n
\]

\[
= \frac{\alpha^{n-1}}{(\alpha - \gamma) (\alpha - \beta)} \begin{pmatrix}
\alpha^3 & \alpha (\alpha + 1) & \alpha^2 \\
\alpha^2 & \alpha + 1 & \alpha \\
\alpha & \alpha (\alpha - 1) & 1
\end{pmatrix} + \frac{\beta^{n-1}}{(\beta - \gamma) (\beta - \alpha)} \begin{pmatrix}
\beta^3 & \beta (\beta + 1) & \beta^2 \\
\beta^2 & \beta + 1 & \beta \\
\beta & \beta (\beta - 1) & 1
\end{pmatrix}
\]

\[
+ \frac{\gamma^{n-1}}{(\gamma - \beta) (\gamma - \alpha)} \begin{pmatrix}
\gamma^3 & \gamma (\gamma + 1) & \gamma^2 \\
\gamma^2 & \gamma + 1 & \gamma \\
\gamma & \gamma (\gamma - 1) & 1
\end{pmatrix}
\]

By Theorem 2.2 we know that

\[
T_n = \begin{pmatrix}
T_{n+1} & T_n + T_{n-1} & T_n \\
T_n & T_{n-1} + T_{n-2} & T_{n-1} \\
T_{n-1} & T_{n-2} + T_{n-3} & T_{n-2}
\end{pmatrix}.
\]

Now, if we compare the 2nd row and 1st column entries with the matrices in the above two equations, then we obtain

\[
T_n = \frac{\alpha^{n-1} \alpha^2}{(\alpha - \gamma) (\alpha - \beta)} + \frac{\beta^{n-1} \beta^2}{(\beta - \gamma) (\beta - \alpha)} + \frac{\gamma^{n-1} \gamma^2}{(\gamma - \beta) (\gamma - \alpha)}
\]

\[
= \frac{\alpha^{n+1}}{(\alpha - \gamma) (\alpha - \beta)} + \frac{\beta^{n+1}}{(\beta - \gamma) (\beta - \alpha)} + \frac{\gamma^{n+1}}{(\gamma - \beta) (\gamma - \alpha)}.
\]
From Theorem \(2.3\) we obtain

\[
K_n = A_2\alpha^n + B_2\beta^n + C_2\gamma^n
\]

\[
= \frac{aK_2 + a(\alpha - 1)K_1 + K_0}{\alpha (\alpha - \gamma) (\alpha - \beta)} \alpha^n + \frac{\beta K_2 + \beta(\beta - 1)K_1 + K_0}{\beta (\beta - \gamma) (\beta - \alpha)} \beta^n + \frac{\gamma K_2 + \gamma(\gamma - 1)K_1 + K_0}{\gamma (\gamma - \beta) (\gamma - \alpha)} \gamma^n
\]

\[
= \frac{\alpha^{n-1}}{(\alpha - \gamma) (\alpha - \beta)} \begin{pmatrix}
3\alpha^2 + 4\alpha + 1 & 4\alpha^2 + 2 & \alpha^2 + 2\alpha + 3 \\
\alpha^2 + 2\alpha + 3 & 2\alpha^2 + 2\alpha - 2 & 3\alpha^2 - 2\alpha - 1 \\
3\alpha^2 - 2\alpha - 1 & -2\alpha^2 + 4\alpha + 4 & -\alpha^2 + 4\alpha - 1 \\
\end{pmatrix}
\]

\[
+ \frac{\beta^{n-1}}{(\beta - \gamma) (\beta - \alpha)} \begin{pmatrix}
3\beta^2 + 4\beta + 1 & 4\beta^2 + 2 & \beta^2 + 2\beta + 3 \\
\beta^2 + 2\beta + 3 & 2\beta^2 + 2\beta + 2 & 3\beta^2 - 2\beta - 1 \\
3\beta^2 - 2\beta - 1 & -2\beta^2 + 4\beta + 4 & -\beta^2 + 4\beta - 1 \\
\end{pmatrix}
\]

\[
+ \frac{\gamma^{n-1}}{(\gamma - \beta) (\gamma - \alpha)} \begin{pmatrix}
3\gamma^2 + 4\gamma + 1 & 4\gamma^2 + 2 & \gamma^2 + 2\gamma + 3 \\
\gamma^2 + 2\gamma + 3 & 2\gamma^2 + 2\gamma - 2 & 3\gamma^2 - 2\gamma - 1 \\
3\gamma^2 - 2\gamma - 1 & -2\gamma^2 + 4\gamma + 4 & -\gamma^2 + 4\gamma - 1 \\
\end{pmatrix}
\].

By Theorem \(2.2\) we know that

\[
K_n = \begin{pmatrix}
K_{n+1} & K_n + K_{n-1} & K_n \\
K_n & K_{n-1} + K_{n-2} & K_{n-1} \\
K_{n-1} & K_{n-2} + K_{n-3} & K_{n-2} \\
\end{pmatrix}.
\]

Now, if we compare the 2nd row and 1st column entries with the matrices in the above last two equations, then we obtain

\[
K_n = \frac{\alpha^{n-1}(\alpha^2 + 2\alpha + 3)}{(\alpha - \gamma) (\alpha - \beta)} + \frac{\beta^{n-1}(\beta^2 + 2\beta + 3)}{(\beta - \gamma) (\beta - \alpha)} + \frac{\gamma^{n-1}(\gamma^2 + 2\gamma + 3)}{(\gamma - \beta) (\gamma - \alpha)}.
\]

Using the relations, \(\alpha + \beta + \gamma = 1\), \(\alpha\beta\gamma = 1\) and considering \(\alpha, \beta\) and \(\gamma\) are the roots the equation \(x^3 - x^2 - x - 1 = 0\), we obtain

\[
\frac{\alpha^2 + 2\alpha + 3}{(\alpha - \gamma) (\alpha - \beta)} = \frac{\alpha^2 + 2\alpha + 3}{\alpha^2 - \alpha\beta - \alpha\gamma + \beta\gamma} = \alpha, \\
\frac{\beta^2 + 2\beta + 3}{(\beta - \gamma) (\beta - \alpha)} = \frac{\beta^2 + 2\beta + 3}{\beta^2 - \alpha\beta + \alpha\gamma - \beta\gamma} = \beta, \\
\frac{\gamma^2 + 2\gamma + 3}{(\gamma - \beta) (\gamma - \alpha)} = \frac{\gamma^2 + 2\gamma + 3}{\gamma^2 + \alpha\beta - \alpha\gamma - \beta\gamma} = \gamma.
\]
So finally we conclude that

\[ K_n = \alpha^n + \beta^n + \gamma^n \]

as required.

Now, we present summation formulas for Tribonacci and Tribonacci-Lucas matrix sequences.

**Theorem 2.5.** For \( m > j \geq 0 \), we have

\[
\sum_{i=0}^{n-1} T_{mi+j} = \frac{T_{mn+m+j} + T_{mn-m+j} + (1 - K_m)T_{mn+j}}{K_m - K_{-m}} - \frac{T_{m+j} + T_{j-m} + (1 - K_m)T_j}{K_m - K_{-m}}
\]

and

\[
\sum_{i=0}^{n-1} K_{mi+j} = \frac{K_{mn+m+j} + K_{mn-m+j} + (1 - K_m)K_{mn+j}}{K_m - K_{-m}} - \frac{K_{m+j} + K_{j-m} + (1 - K_m)K_j}{K_m - K_{-m}}
\]

**Proof.** Note that

\[
\sum_{i=0}^{n-1} T_{mi+j} = \sum_{i=0}^{n-1} (A_1 \alpha^{mi+j} + B_1 \beta^{mi+j} + C_1 \gamma^{mi+j})
\]

\[
= A_1 \alpha^j \left( \frac{\alpha^m - 1}{\alpha^m - 1} \right) + B_1 \beta^j \left( \frac{\beta^m - 1}{\beta^m - 1} \right) + C_1 \gamma^j \left( \frac{\gamma^m - 1}{\gamma^m - 1} \right)
\]

and

\[
\sum_{i=0}^{n-1} K_{mi+j} = \sum_{i=0}^{n-1} (A_2 \alpha^{mi+j} + B_2 \beta^{mi+j} + C_2 \gamma^{mi+j})
\]

\[
= A_2 \alpha^j \left( \frac{\alpha^m - 1}{\alpha^m - 1} \right) + B_2 \beta^j \left( \frac{\beta^m - 1}{\beta^m - 1} \right) + C_2 \gamma^j \left( \frac{\gamma^m - 1}{\gamma^m - 1} \right)
\]

Simplifying and rearranging the last equalities in the last two expression imply (2.7) and (2.8) as required.

As in Corollary 2.4 in the proof of next Corollary, we just compare the linear combination of the 2nd row and 1st column entries of the relevant matrices.

**Corollary 2.6.** For \( m > j \geq 0 \), we have

\[
\sum_{i=0}^{n-1} T_{mi+j} = \frac{T_{mn+m+j} + T_{mn-m+j} + (1 - K_m)T_{mn+j}}{K_m - K_{-m}} - \frac{T_{m+j} + T_{j-m} + (1 - K_m)T_j}{K_m - K_{-m}}
\]

and

\[
\sum_{i=0}^{n-1} K_{mi+j} = \frac{K_{mn+m+j} + K_{mn-m+j} + (1 - K_m)K_{mn+j}}{K_m - K_{-m}} - \frac{K_{m+j} + K_{j-m} + (1 - K_m)K_j}{K_m - K_{-m}}
\]

Note that using the above Corollary we obtain the following well known formulas (taking \( m = 1, j = 0 \)):

\[
\sum_{i=0}^{n-1} T_i = \frac{T_{n+2} - T_n - 1}{2} \quad \text{and} \quad \sum_{i=0}^{n-1} K_i = \frac{K_{n+2} - K_n}{2}
\]

We now give generating functions of \( T \) and \( K \).
Theorem 2.7. The generating function for the Tribonacci and Tribonacci-Lucas matrix sequences are given as
\[ \sum_{n=0}^{\infty} T_n x^n = \frac{1}{1 - x - x^2 - x^3} \begin{pmatrix} 1 & x + x^2 & x \\ x & 1 - x & x^2 \\ x^2 & x - x^2 & 1 - x - x^2 \end{pmatrix} \]
and
\[ \sum_{n=0}^{\infty} K_n x^n = \frac{1}{1 - x - x^2 - x^3} \begin{pmatrix} 1 + 2x + 3x^2 & 2 + 2x - 2x^2 & 3 - 2x - x^2 \\ 3 - 2x - x^2 & -2 + 4x + 4x^2 & -1 + 4x - x^2 \\ -1 + 4x - x^2 & 4 - 6x & -1 + 5x^2 \end{pmatrix} \]
respectively.

Proof. We prove the Tribonacci case. Suppose that \( g(x) = \sum_{n=0}^{\infty} T_n x^n \) is the generating function for the sequence \( \{T_n\}_{n \geq 0} \). Then, using Definition 2.1, we obtain
\[ g(x) = \sum_{n=0}^{\infty} T_n x^n = T_0 + T_1 x + T_2 x^2 + \sum_{n=3}^{\infty} T_n x^n \]
\[ = T_0 + T_1 x + T_2 x^2 + \sum_{n=3}^{\infty} (T_{n-1} + T_{n-2} + T_{n-3}) x^n \]
\[ = T_0 + T_1 x + T_2 x^2 + \sum_{n=3}^{\infty} T_{n-1} x^n + \sum_{n=3}^{\infty} T_{n-2} x^n + \sum_{n=3}^{\infty} T_{n-3} x^n \]
\[ = T_0 + T_1 x + T_2 x^2 - T_0 x - T_1 x^2 - T_0 x^3 + \sum_{n=0}^{\infty} T_n x^n + x^2 \sum_{n=0}^{\infty} T_n x^n + x^3 \sum_{n=0}^{\infty} T_n x^n \]
\[ = T_0 + T_1 x + T_2 x^2 - T_0 x - T_1 x^2 - T_0 x^3 + xg(x) + x^2 g(x) + x^3 g(x). \]
Rearranging above equation, we get
\[ g(x) = \frac{T_0 + (T_1 - T_0)x + (T_2 - T_1 - T_0)x^2}{1 - x - x^2 - x^3}, \]
which equals the \( \sum_{n=0}^{\infty} T_n x^n \) in the Theorem. This completes the proof.

Tribonacci-Lucas case can be proved similarly.

The well known generating functions for Tribonacci and Tribonacci-Lucas numbers are as in (1.9). However, we will obtain these functions in terms of Tribonacci and Tribonacci-Lucas matrix sequences as a consequence of Theorem 2.7. To do this, we will again compare the the 2nd row and 1st column entries with the matrices in Theorem 2.1. Thus we have the following corollary.

Corollary 2.8. The generating functions for the Tribonacci sequence \( \{T_n\}_{n \geq 0} \) and Tribonacci-Lucas sequence \( \{K_n\}_{n \geq 0} \) are given as
\[ \sum_{n=0}^{\infty} T_n x^n = \frac{x}{1 - x - x^2 - x^3} \quad \text{and} \quad \sum_{n=0}^{\infty} K_n x^n = \frac{3 - 2x - x^2}{1 - x - x^2 - x^3}, \]
respectively.
3. Relation Between Tribonacci and Tribonacci-Lucas Matrix Sequences

The following theorem shows that there always exist interrelation between Tribonacci and Tribonacci-Lucas matrix sequences.

**Theorem 3.1.** For the matrix sequences \( \{T_n\} \) and \( \{K_n\} \), we have the following identities.

(a): \( K_n = 3T_{n+1} - 2T_n - T_{n-1} \),

(b): \( K_n = T_n + 2T_{n-1} + 3T_{n-2} \),

(c): \( K_n = 4T_{n+1} - T_n - T_{n+2} \),

(d): \( K_n = -T_{n+2} + 4T_{n+1} - T_n \),

(e): \( T_n = \frac{1}{22}(5K_{n+2} - 3K_{n+1} - 4K_n) \)

**Proof.** From (1.4), (1.5) and (1.6), (a), (b) and (c) follow. It is easy to show that \( K_n = -T_{n+2} + 4T_{n+1} - T_n \) and \( 22T_n = 5K_{n+2} - 3K_{n+1} - 4K_n \) using Binet formulas of the numbers \( T_n \) and \( K_n \), so now (d) and (e) follow.

**Lemma 3.2.** For all non-negative integers \( m \) and \( n \), we have the following identities.

(a): \( K_0T_n = T_nK_0 = K_n \),

(b): \( T_0K_n = K_nT_0 = K_n \).

**Proof.** Identities can be established easily. Note that to show (a) we need to use all the relations (1.4), (1.5) and (1.6).

Next Corollary gives another relation between the numbers \( T_n \) and \( K_n \) and also the matrices \( T_n \) and \( K_n \).

**Corollary 3.3.** We have the following identities.

(a): \( T_n = \frac{1}{22}(K_n + 5K_{n-1} + 2K_{n+1}) \),

(b): \( T_n = \frac{1}{22}(K_n + 5K_{n-1} + 2K_{n+1}) \).

**Proof.** From Lemma 3.2 (a), we know that \( K_0T_n = K_n \). To show (a), use Theorem 2.2 for the matrix \( T_n \) and calculate the matrix operation \( K^{-1}_n \) and then compare the 2nd row and 1st column entries with the matrices \( T_n \) and \( K^{-1}_n \). Now (b) follows from (a).

To prove the following Theorem we need the next Lemma.

**Lemma 3.4.** Let \( A_1, B_1, C_1; A_2, B_2, C_2 \) as in Theorem 2.3. Then the following relations hold:

\[
A_1^2 = A_1, \quad B_1^2 = B_1, \quad C_1^2 = C_1, \\
A_1B_1 = B_1A_1 = A_1C_1 = C_1A_1 = C_1B_1 = B_1C_1 = (0), \\
A_2B_2 = B_2A_2 = A_2C_2 = C_2A_2 = C_2B_2 = B_2C_2 = (0).
\]
Proof. Using $\alpha + \beta + \gamma = 1$, $\alpha \beta + \alpha \gamma + \beta \gamma = -1$ and $\alpha \beta \gamma = 1$, required equalities can be established by matrix calculations.

**Theorem 3.5.** For all non-negative integers $m$ and $n$, we have the following identities.

(a): $T_m T_n = T_{m+n}$.

(b): $T_m K_n = K_n T_m = K_{m+n}$.

(c): $K_m K_n = K_n K_m = 9T_{m+n+2} - 12T_{m+n+1} - 2T_{m+n} + 4T_{m+n-1} + T_{m+n-2}$.

(d): $K_m K_n = K_n K_m = T_{m+n} + 4T_{m+n-1} + 10T_{m+n-2} + 12T_{m+n-3} + 9T_{m+n-4}$.

(e): $K_m K_n = K_n K_m = T_{m+n} - 8T_{m+n+1} + 18T_{m+n+2} - 8T_{m+n+3} + T_{m+n+4}$.

Proof.

(a): Using Lemma 3.4 we obtain

$$T_m T_n = (A_1 \alpha^m + B_1 \beta^m + C_1 \gamma^m)(A_1 \alpha^n + B_1 \beta^n + C_1 \gamma^n)$$

$$= A_1^2 \alpha^{m+n} + B_1^2 \beta^{m+n} + C_1^2 \gamma^{m+n} + A_1 B_1 \alpha^m \beta^n + B_1 A_1 \alpha^n \beta^m$$

$$+ A_1 C_1 \alpha^m \gamma^n + C_1 A_1 \alpha^n \gamma^m + B_1 C_1 \beta^m \gamma^n + C_1 B_1 \beta^n \gamma^m$$

$$= A_1 \alpha^{m+n} + B_1 \beta^{m+n} + C_1 \gamma^{m+n}$$

$$= T_{m+n}.$$

(b): By Lemma 3.2 we have

$$T_m K_n = T_n T_k 0.$$ 

Now from (a) and again by Lemma 3.2 we obtain $T_m K_n = T_{m+n}K_0 = K_{m+n}$.

It can be shown similarly that $K_n T_m = K_{m+n}$.

(c): Using (a) and Theorem 3.1 (a) we obtain

$$K_m K_n = (3T_{m+1} - 2T_m - T_{m-1})(3T_{n+1} - 2T_n - T_{n-1})$$

$$= 2T_m T_{m-1} + 6T_n T_{m+1} + 2T_m T_{n-1} + 6T_n T_{n+1}$$

$$+ 4T_m T_n + T_{m-1} T_{n-1} - 3T_m T_{n+1} - 3T_{m-1} T_{n+1} + 9T_{m+1} T_{n+1}$$

$$= 2T_{m+n-1} - 6T_{m+n+1} + 2T_{m+n-1} - 6T_{m+n+1} + 4T_{m+n} + T_{m+n-2} - 3T_{m+n}$$

$$- 3T_{m+n} + 9T_{m+n+2}$$

$$= 9T_{m+n+2} - 12T_{m+n+1} - 2T_{m+n} + 4T_{m+n-1} + T_{m+n-2}$$

It can be shown similarly that $K_n K_m = 9T_{m+n+2} - 12T_{m+n+1} - 2T_{m+n} + 4T_{m+n-1} + T_{m+n-2}$.

The remaining of identities can be proved by considering again (a) and Theorem 3.1.

Comparing matrix entries and using Theorem 2.3 we have next result.
Corollary 3.6. For Tribonacci and Tribonacci-Lucas numbers, we have the following identities:

(a): \( T_{m+n} = T_mT_{n+1} + T_n(T_{m-1} + T_{m-2}) + T_{m-1}T_n \)

(b): \( K_{m+n} = T_mK_{n+1} + K_n(T_{m-1} + T_{m-2}) + K_{n-1}T_m \)

(c): \( K_mK_{n+1} + K_n(K_{m-1} + K_{m-2}) + K_{m-1}K_{n-1} = 9T_{m+n+2} - 12T_{m+n+1} - 2T_{m+n} + 4T_{m+n-1} + T_{m+n-2} \)

(d): \( K_mK_{n+1} + K_n(K_{m-1} + K_{m-2}) + K_{m-1}K_{n-1} = T_{m+n} + 4T_{m+n-1} + 10T_{m+n-2} + 12T_{m+n-3} + 9T_{m+n-4} \)

(e): \( K_mK_{n+1} + K_n(K_{m-1} + K_{m-2}) + K_{m-1}K_{n-1} = T_{m+n} - 8T_{m+n+1} + 18T_{m+n+2} - 8T_{m+n+3} + T_{m+n+4} \)

Proof.

(a): From Theorem 3.5 we know that \( T_mT_n = T_{m+n} \). Using Theorem 2.2, we can write this result as

\[
\begin{pmatrix}
T_{m+1} & T_m + T_{m-1} & T_m \\
T_m & T_{m-1} + T_{m-2} & T_{m-1} \\
T_{m-1} & T_{m-2} + T_{m-3} & T_{m-2}
\end{pmatrix}
= 
\begin{pmatrix}
T_{n+1} & T_n + T_{n-1} & T_n \\
T_n & T_{n-1} + T_{n-2} & T_{n-1} \\
T_{n-1} & T_{n-2} + T_{n-3} & T_{n-2}
\end{pmatrix}
\]

Now, by multiplying the left-side matrices and then by comparing the 2nd rows and 1st columns entries, we get the required identity in (a).

The remaining of identities can be proved by considering again Theorems 3.5 and 2.2.

The next two theorems provide us the convenience to obtain the powers of Tribonacci and Tribonacci-Lucas matrix sequences.

Theorem 3.7. For non-negative integers \( m, n \) and \( r \) with \( n \geq r \), the following identities hold:

(a): \( T_n^m = T_{mn} \)

(b): \( T_{n+1}^m = T_1^nT_{mn} \)

(c): \( T_{n-r}T_{n+r} = T_n^2 = T_2^n \)

Proof.

(a): We can write \( T_n^m \) as

\[
T_n^m = T_nT_n...T_n \ (m \ times)
\]
Using Theorem 3.5 (a) iteratively, we obtain the required result:

\[ T_m^n = \underbrace{T_n T_n \cdots T_n}_{m \text{ times}} \]

\[ = T_{2n} T_n T_n \cdots T_n \]

\[ = T_{3n} T_n T_n \cdots T_n \]

\[ \vdots \]

\[ = T_{(m-1)n} T_n \]

\[ = T_{mn} \]

(b): As a similar approach in (a) we have

\[ T_{m+1}^n = T_{n+1} T_{n+1} \cdots T_{n+1} = T_{m(n+1)} = T_m T_{mn} = T_1 T_{m-1} T_{mn} \]

Using Theorem 3.5 (a), we can write iteratively \( T_m = T_1 T_{m-1}, T_{m-1} = T_1 T_{m-2}, \ldots, T_2 = T_1 T_1 \).

Now it follows that

\[ T_{m+1}^n = \underbrace{T_n T_1 \cdots T_1}_{m \text{ times}} T_{mn} = T_1^n T_{mn} \]

(c): Theorem 3.5 (a) gives

\[ T_{n-r} T_{n+r} = T_{2n} = T_n T_n = T_n^2 \]

and also

\[ T_{n-r} T_{n+r} = T_{2n} = \underbrace{T_2 T_2 \cdots T_2}_{n \text{ times}} = T_2^n \]

We have analogues results for the matrix sequence \( K_n \).

**Theorem 3.8.** For non-negative integers \( m, n \) and \( r \) with \( n \geq r \), the following identities hold:

(a): \( K_{n-r} K_{n+r} = K_n^2 \)

(b): \( K_n^m = K_0^n T_{mn} \)

**Proof.**

(a): We use Binet’s formula of Tribonacci-Lucas matrix sequence which is given in Theorem 2.2. So

\[ K_{n-r} K_{n+r} - K_n^2 \]

\[ = (A_2 \alpha^{n-r} + B_2 \beta^{n-r} + C_2 \gamma^{n-r}) (A_2 \alpha^{n+r} + B_2 \beta^{n+r} + C_2 \gamma^{n+r}) \]

\[ - (A_2 \alpha^n + B_2 \beta^n + C_2 \gamma^n)^2 \]

\[ = A_2 B_2 \alpha^{n-r} \beta^{n-r} (\alpha^n - \beta^n)^2 + A_2 C_2 \alpha^{n-r} \gamma^{n-r} (\alpha^n - \gamma^n)^2 \]

\[ + B_2 C_2 \beta^{n-r} \gamma^{n-r} (\beta^n - \gamma^n)^2 \]

\[ = 0 \]
since $A_2B_2 = A_2C_2 = C_2B_2$ (see Lemma 3.4). Now we get the result as required.

(b): By Theorem 3.7 we have

$$K_0^m T_{mn} = K_0 K_0 \ldots K_0 T_n T_n \ldots T_n.$$

When we apply Lemma 3.2 (a) iteratively, it follows that

$$K_0^m T_{mn} = (K_0 T_n)(K_0 T_n) \ldots (K_0 T_n)$$

$$= K_n K_n \ldots K_n = K_m^n.$$

This completes the proof.
