**Norm-Resolvent Convergence in Perforated Domains**

K. Cherednichenko, P. Dondl, F. Röser

November 20, 2017

**Abstract**

For several different boundary conditions (Dirichlet, Neumann, Robin), we prove norm-resolvent convergence for the operator $-\Delta$ in the perforated domain $\Omega \setminus \bigcup_{i \in Z^d} B_{a_\varepsilon}(i)$, $a_\varepsilon \ll \varepsilon$, to the limit operator $-\Delta + \mu_i$ on $L^2(\Omega)$, where $\mu_i \in \mathbb{C}$ is a constant depending on the choice of boundary conditions.

This is an improvement of previous results [CM97], [Kaizu85], which show strong resolvent convergence. In particular, our result implies Hausdorff convergence of the spectrum of the resolvent for the perforated domain problem.

1 Introduction

In this article we study the following homogenisation problems labelled by $\iota \in \{D, N, \alpha\}$ (“D” for Dirichlet, “N” for Neumann, and “$\alpha$” for Robin). Let $\Omega \subset \mathbb{R}^d$, $d \geq 2$, be open (bounded or unbounded) and satisfy the strong local Lipschitz condition. Let $\alpha \in \mathbb{C} \setminus \{0\}$, $\mathrm{Re}(\alpha) \geq 0$ and denote $\Omega_\varepsilon := \Omega \setminus \bigcup_{i \in L^\iota_\varepsilon} B_{a_\varepsilon}(i)$ where $\varepsilon \in (0, 1)$, $B_{a_\varepsilon}(i)$ is the ball of radius $a_\varepsilon$ centered at the point $i \in L^\iota_\varepsilon$, and

$$
L^D_\varepsilon := 2\varepsilon \mathbb{Z}^d, \quad L^N_\varepsilon := \{ i \in 2\varepsilon \mathbb{Z}^d : \text{dist}(B_{a_\varepsilon}(i), \partial \Omega) > \varepsilon \}.
$$

Consider the boundary value problems

$$
\begin{cases}
(-\Delta + 1) u^\varepsilon &= f \text{ in } \Omega_\varepsilon, \\
u^\varepsilon &= 0 \text{ on } \partial \Omega_\varepsilon,
\end{cases}
$$

(Dir)

$$
\begin{cases}
(-\Delta + 1) u^\varepsilon &= f \text{ in } \Omega_\varepsilon, \\
\partial_\nu u^\varepsilon &= 0 \text{ on } \partial \Omega_\varepsilon,
\end{cases}
$$

( Neu)

$$
\begin{cases}
(-\Delta + 1) u^\varepsilon &= f \text{ in } \Omega_\varepsilon, \\
\partial_\nu u^\varepsilon + \alpha u &= 0 \text{ on } \partial \Omega_\varepsilon,
\end{cases}
$$

(Rob)

i.e. the resolvent problem for the Laplacian, subject to the Dirichlet, Neumann and Robin boundary conditions, respectively. It is easy to see, using the Lax-Milgram theorem, that for all $\varepsilon \in (0, 1)$ each of these problems has a unique weak solution $u^\varepsilon$. It is a classical question, which we refer to as the homogenisation problem, whether the family of solutions to (Dir), (Neu), (Rob), obtained by varying the parameter $\varepsilon$, converges in the sense of the $L^2$-norm to a function $u \in L^2(\Omega)$ as $\varepsilon \to 0$ and whether the limit function $u$ solves, in a reasonable sense, some PDE whose form is independent of the right-hand side datum $f$.

Homogenisation problems of this type have been studied extensively for a long time [CM97, RT75, MK64, Kaizu85]. For example, results by Cioranescu & Murat and Kaizu give a positive answer to the
previous question for all three choices of boundary conditions at least in the case of *bounded* domains. In fact, they showed that the solutions of \((\text{Dir}), (\text{Rob}), (\text{Neu})\) converge strongly in \(L^2(\Omega)\) to the solution 
\[ u \in H^1(\Omega) \text{ of } (-\Delta + 1 + \mu_\iota)u = f, \]
where
\[
\mu_\iota = \begin{cases} 
\frac{\pi}{2}, & \iota = D, \ d = 2, \\
\frac{(d-2)S_d}{2^d}, & \iota = D, \ d \geq 3, \\
0, & \iota = N, \\
\frac{\alpha S_d}{2^d}, & \iota = \alpha.
\end{cases}
\tag{1.3}
\]
where \(S_d\) denotes the surface area of the unit ball in \(\mathbb{R}^d\).

In this article we attempt to improve this result in two directions. First, we show the above convergence not only in the strong sense, but in the *norm-resolvent sense* (that is, the right-hand side \(f\) is allowed to depend on \(\varepsilon\)). Second, our result is then extended to the case of unbounded domains. As a corollary, we obtain a statement about the convergence of the spectra of the perforated domain problems (Dir), (Neu), (Rob) as \(\varepsilon \to 0\).

The paper is organised as follows. In Section 2 we will briefly give a more precise formulation of the problem and include previous results. In Section 3 we will state our main result and its implications. Sections 4, 5 and 6 contain the proof of the main theorem and in Section 7 we consider implications of our main theorem for the semigroup generated by the Robin Laplacian. Section 8 contains a brief conclusion and discusses open problems.

## 2 Geometric setting and previous results

As above, assume \(d \geq 2\), and let
\[
\begin{align*}
T_\varepsilon := \bigcup_{i \in \mathcal{L}_\iota^\varepsilon} T_\varepsilon^i, \\
T_1^\varepsilon := B_{a_\iota}(i), & i \in \mathcal{L}_1^\varepsilon,
\end{align*}
\]
where \(a_\iota, L_\iota^\varepsilon\) as in (1.1), (1.2). Denote \(\Omega_\varepsilon := \Omega \setminus T_\varepsilon\). We also denote \(B_i^\varepsilon := B_\iota(i)\) and \(P_i^\varepsilon := \varepsilon[-1,1]^d + i\) for \(i \in \mathcal{L}_\iota^\varepsilon\). Constants independent of \(\varepsilon\) will be denoted \(C\) and may change from line to line. Note that our assumptions on \(\Omega\) ensure that the set \(\{\phi|_\Omega : \phi \in C_0^\infty(\mathbb{R}^d)\}\) is dense in \(H^1(\Omega)\) (cf. [Bre11, Cor. 9.8]) in the cases \(\iota = N, \alpha\).

Moreover, since we are dealing with varying spaces \(L^2(\Omega_\varepsilon)\), it is convenient to define the identification operators
\[
\begin{align*}
J_\varepsilon : L^2(\Omega_\varepsilon) & \to L^2(\Omega), \\
J_\varepsilon f(x) = \begin{cases} f(x), & x \in \Omega_\varepsilon, \\
0, & x \in \Omega \setminus \Omega_\varepsilon.
\end{cases} \\
T_\varepsilon : H^1(\Omega_\varepsilon) & \to H^1(\Omega), \\
T_\varepsilon u = \begin{cases} u & \text{in } \Omega_\varepsilon, \\
v & \text{in } T_\varepsilon.
\end{cases}
\tag{2.1}
\end{align*}
\]
where \( v \) is the harmonic extension of \( u \) into the holes, i.e.

\[
\begin{align*}
\Delta v &= 0 \text{ in } T_\varepsilon, \\
v &= u \text{ on } \partial T_\varepsilon.
\end{align*}
\]  

\text{(2.2)}

\textbf{Lemma 2.1.} In the cases \( \iota \in \{N, \alpha\} \) the harmonic extension operator \( T_\varepsilon \) satisfies

\( \text{(i) } \limsup_{\varepsilon \to 0} \|T_\varepsilon\|_{H^1(\Omega_\varepsilon) \to H^1(\Omega)} < \infty. \)

\( \text{(ii) There exists } C > 0 \text{ such that } \|T_\varepsilon w\|_{H^1(\Omega_\varepsilon)} \leq C \|w\|_{H^1(\Omega)} \text{ for all } w \in H^1(\Omega_\varepsilon) \text{ and } i \in L^2_\varepsilon. \)

\( \text{(iii) For any sequence } w_\varepsilon \text{ such that } \limsup_{\varepsilon \to 0} \|w_\varepsilon\|_{H^1(\Omega_\varepsilon)} < \infty \text{ one has } \|T_\varepsilon w_\varepsilon - J_\varepsilon w_\varepsilon\|_{L^2(\Omega)} \to 0. \)

\textbf{Proof.} See [Kaizu85, RT75, p. 40]. \( \square \)

In the above geometric setting, we will study the linear operators \( A_\varepsilon^\iota, \iota = D, N, \alpha \) in \( L^2(\Omega_\varepsilon) \), defined by the differential expression \( -\Delta + 1 \), with (dense) domains

\[
\begin{align*}
\mathcal{D}(A_\varepsilon^D) &= H^1_0(\Omega_\varepsilon) \cap H^2(\Omega_\varepsilon), \\
\mathcal{D}(A_\varepsilon^N) &= \{ u \in H^2(\Omega_\varepsilon) : \partial_\nu u = 0 \text{ on } \partial \Omega_\varepsilon \}, \\
\mathcal{D}(A_\varepsilon^\alpha) &= \{ u \in H^2(\Omega_\varepsilon) : \partial_\nu u + \alpha u = 0 \text{ on } \partial \Omega_\varepsilon \},
\end{align*}
\]

respectively, and the linear operators \( A^\iota \) in \( L^2(\Omega_\varepsilon) \) defined by the expression \( -\Delta + 1 + \mu_\iota \), with domains

\[
\begin{align*}
\mathcal{D}(A^D) &= H^1_0(\Omega) \cap H^2(\Omega), \\
\mathcal{D}(A^N) &= \{ u \in H^2(\Omega) : \partial_\nu u = 0 \text{ on } \partial \Omega \}, \\
\mathcal{D}(A^\alpha) &= \{ u \in H^2(\Omega) : \partial_\nu u + \alpha u = 0 \text{ on } \partial \Omega \},
\end{align*}
\]

respectively, where \( \mu_\iota, \iota = D, N, \alpha \), are defined in (1.3).

\textbf{Remark 2.2.} In the case when \( d \geq 3 \) one has the characterisation

\[
\mu_D = \frac{1}{2^d} \min \left\{ \int_{\mathbb{R}^d \setminus B_1(0)} |\nabla u|^2, \quad u \in H^1(\mathbb{R}^d), \quad u = 1 \text{ on } B_1(0) \right\}. 
\]  

\text{(2.3)}

Note that the factor \( 1/2^d \) arises from the fact that the unit cell is of size \( 2\varepsilon \).

Using the notation above, we recall the following classical results.

\textbf{Theorem 2.3 ([CM97]).} Let \( \Omega \subset \mathbb{R}^d \) be open (bounded or unbounded). Suppose that \( f \in L^2(\Omega) \), and let \( u^\varepsilon \) and \( \bar{u} \) be the solutions to

\[
(-\Delta + 1)u^\varepsilon = f, \quad u^\varepsilon \in H^1_0(\Omega_\varepsilon),
\]

\[
(-\Delta + 1 + \mu_D)\bar{u} = f, \quad \bar{u} \in H^1_0(\Omega).
\]

Then \( J_\varepsilon u^\varepsilon \overset{\varepsilon \to 0}{\longrightarrow} \bar{u} \) in \( H^1_0(\Omega) \).

\textbf{Theorem 2.4 ([Kaizu85]).} Let \( \Omega \subset \mathbb{R}^d \) be open (bounded or unbounded), and suppose that \( \partial \Omega \) is smooth. Suppose also that \( f \in L^2(\Omega) \), and let \( u^\varepsilon \) and \( \bar{u} \) be the solutions to

\[
(-\Delta + 1)u^\varepsilon = f, \quad u^\varepsilon \in \mathcal{D}(A^\varepsilon^N),
\]

\[
(-\Delta + 1 + \mu_\alpha)\bar{u} = f, \quad \bar{u} \in \mathcal{D}(A^{\alpha,N}).
\]

Then one has

\[
J_\varepsilon u^\varepsilon \overset{\varepsilon \to 0}{\longrightarrow} \bar{u} \quad \text{in } H^1(\Omega).
\]

\textbf{Proof of Theorems 2.3 and 2.4.} The results are obtained by following the proofs of [CM97, Thm 2.2], [Kaizu85, Thm 2]. Note that the weak convergence in \( H^1(\Omega) \) is immediately obtained also for unbounded domains (and complex \( \alpha \)). \( \square \)
An important ingredient in the proofs are auxiliary functions \( w_\varepsilon \in W^{1,\infty}(\mathbb{R}^d) \) defined, for each \( \varepsilon \in (0, 1) \), as the solution to the problems

\[
\begin{align*}
\begin{cases}
w_\varepsilon^D = 0 & \text{in } T^\varepsilon_i, \\ \Delta w_\varepsilon^D = 0 & \text{in } B^\varepsilon_i \setminus T^\varepsilon_i, \\ w_\varepsilon^D = 1 & \text{in } P^\varepsilon_i \setminus B^\varepsilon_i, \\ w_\varepsilon^D & \text{continuous},
\end{cases} & \quad \begin{cases}
\partial_\nu w_\varepsilon^\alpha + \alpha w_\varepsilon^\alpha = 0 & \text{on } \partial T^\varepsilon_i, \\ \Delta w_\varepsilon^\alpha = 0 & \text{in } B^\varepsilon_i \setminus T^\varepsilon_i, \\ w_\varepsilon^\alpha = 1 & \text{in } P^\varepsilon_i \setminus B^\varepsilon_i, \\ w_\varepsilon^\alpha & \text{continuous},
\end{cases}
\end{align*}
\]

(2.4)

used as a test function in the weak formulation of the problems (Dir), (Neu), (Rob).

### 3 Main results

In what follows we prove the following claim.

**Theorem 3.1.** Let \( J_\varepsilon, A^\varepsilon, A^\prime \) be defined as in the previous section. Then for \( \varepsilon \in \{D, N, \alpha\} \) one has

\[
\|J_\varepsilon(A^\varepsilon)^{-1} - (A^\prime)^{-1}J_\varepsilon\|_{\mathcal{L}(L^2(\Omega), L^2(\Omega))} \to 0 \quad (\varepsilon \to 0),
\]

that is, the operator sequence \( A^\varepsilon \) converges to \( A^\prime \) in the norm-resolvent sense.

We note an important consequence of the above theorem.

**Corollary 3.2.** For all compact \( K \subset C \), one has \( \sigma(A^\varepsilon) \cap K \xrightarrow{\varepsilon \to 0} \sigma(A^\prime) \cap K \) in the Hausdorff sense.

**Proof.** First, note that the spectra of \( A^\varepsilon \) converge to that of \( A^\prime \), in the sense that for each compact \( K \subset \rho(A^\prime) \) there exists \( \varepsilon_0 > 0 \) such that \( K \subset \rho(A^\varepsilon) \) for all \( \varepsilon \in (0, \varepsilon_0) \). The proof of this is obtained by combining the proofs of Lemma 3.11, Theorem 3.12 and Corollary 3.14 in [MNP13].

On the other hand, due to strong resolvent convergence, we also have that for every \( \lambda \in \sigma(A^\varepsilon) \) there exists a sequence \( \lambda_\varepsilon \in \sigma(A^\varepsilon) \) such that \( \lambda_\varepsilon \to \lambda \) (cf. [RS80, Theorem VIII.24]). Together these two facts imply Hausdorff convergence.

In particular, this corollary shows that (if \( \text{Re}(\mu_\varepsilon) > 0 \)) a spectral gap opens for \( A^\varepsilon \) between 0 and \( \text{Re}(\mu_\varepsilon) \).

**Remark 3.3.** We note that our assumption on the spherical shape of the holes was made for the sake of definiteness, however, our results easily generalise to more general geometries as detailed in [CM97, Th. 2.7]. Moreover, our results are also valid for more general elliptic operators \( \text{div}(A\nabla) \) with continuous coefficients \( A \) (cf. [CM97]).

### 4 Uniformity with respect to the right-hand side

In this section we prove that the result of Theorems 2.3, 2.4 hold in a strengthened form, namely, uniformly with respect to the right-hand side \( f \). More precisely, the following holds.

**Theorem 4.1.** Suppose that \( \varepsilon_n \nearrow 0 \), \( f_n \in L^2(\Omega_{\varepsilon_n}) \), \( n \in \mathbb{N} \), with \( \|f_n\|_{L^2(\Omega_{\varepsilon_n})} \leq 1 \), and let \( u_n^\varepsilon \) and \( \tilde{u}_n^\varepsilon \) be the solutions to the problems (\( \iota \in \{D, N, \alpha\} \))

\[
\begin{align*}
(-\Delta + 1)u_n^\varepsilon &= f_n, & u_n^\varepsilon &\in \mathcal{D}(A_{\varepsilon_n}^\varepsilon), \\
(-\Delta + 1 + \mu_\varepsilon)\tilde{u}_n^\varepsilon &= J_{\varepsilon_n}f_n, & \tilde{u}_n^\varepsilon &\in \mathcal{D}(A^\varepsilon).
\end{align*}
\]

(4.1) (4.2)

Then for every bounded, open \( K \subset \Omega \) one has

\[
\begin{align*}
J_{\varepsilon_n}u_n^\varepsilon - \tilde{u}_n^\varepsilon &\to 0 \quad \text{strongly in } L^2(K), \\
J_{\varepsilon_n}\nabla u_n^\varepsilon &\to \nabla u^\varepsilon \quad \text{weakly in } L^2(K),
\end{align*}
\]

for \( \iota \in \{D, N, \alpha\} \).

---

*For the definition of Hausdorff convergence, see e.g. [EG15].*
Proof. We have the following a priori estimates (note Lemma 2.1):

\[
\|T_n u_n^\alpha\|_{H^1(\Omega)} \leq C \|J_n f_n\|_{L^2(\Omega)},
\]
\[
\|J_n u_n^\alpha\|_{H^1(\Omega)} \leq C \|J_n f_n\|_{L^2(\Omega)},
\]
\[
\|\tilde{u}_n\|_{H^1(\Omega)} \leq C \|J_n f_n\|_{L^2(\Omega)} \quad \forall \iota \in \{D, N, \alpha\}.
\]

Thus, there exists a subsequence (still indexed by \(n\)) and \(u', \tilde{u}' \in H^1(\Omega)\) such that

\[
\begin{align*}
J_n u_n^\alpha &\xrightarrow{n \to \infty} u^\alpha, \\
T_n u_n^\alpha &\xrightarrow{n \to \infty} u^\alpha, \\
\tilde{u}_n &\xrightarrow{k \to \infty} \tilde{u}', \quad \iota \in \{D, N, \alpha\}
\end{align*}
\]

weakly in \(H^1(\Omega)\). (4.3)

Note that that for every bounded \(K \subset \Omega\) the convergence statements (4.3) are strong in \(L^2(K)\). In particular, employing Lemma 2.1 (i), (iii) we immediately obtain

\[
\begin{align*}
J_n u_n' &\to u' \quad \text{strongly in } L^2(K), \\
J_n \nabla u_n' &\to \nabla u' \quad \text{weakly in } L^2(K).
\end{align*}
\]

(4.4) (4.5)

for all \(\iota \in \{D, N, \alpha\}\). Next, choose a further subsequence (still indexed by \(n\)) such that also \(J_n f_n \xrightarrow{n \to \infty} f\) weakly in \(L^2(\Omega)\), where the limit \(f\) may depend on the choice of subsequence. Now, consider the weak formulations of the problem (4.2), i.e.

\[
\int \nabla u_n' \nabla \phi + (1 + \mu_\iota) \int \tilde{u}_n' \phi = \int T_n \phi,
\]

where \(\phi \in C_0^\infty(\Omega)\) for \(\iota = D\) and \(\phi \in C_0^\infty(\mathbb{R}^d)\) for \(\iota = \alpha, N\). Letting \(n \to \infty\) and using the convergencies (4.4),(4.5) (with \(K = \Omega \cap \text{supp } \phi\)) we obtain

\[
\int \nabla u' \nabla \phi + (1 + \mu_\iota) \int u' \phi = \int T \phi.
\]

Next consider the weak formulation of (4.1), where we choose the test function \(w_c' \phi\):

\[
\int \nabla u_n' \nabla (w_c' \phi) = \int \nabla w_c' \phi,
\]

where again \(\phi \in C_0^\infty(\Omega)\) for \(\iota = D\) and \(\phi \in C_0^\infty(\mathbb{R}^d)\) for \(\iota = \alpha, N\). It follows from the results of [CM97, Kaizu85] that the left and right-hand side of this equation converge to

\[
\int (\nabla u' \nabla \phi + (1 + \mu_\iota) u' \phi) \quad \text{and} \quad \int T \phi,
\]

respectively. Thus, we obtain

\[
\int (\nabla u' \nabla \phi + (1 + \mu_\iota) u' \phi) = \int T \phi,
\]

and hence \(u'\) and \(\tilde{u}'\) are weak solutions to the same equation. Uniqueness of solutions (for all \(\iota \in \{D, N, \alpha\}\)) implies \(\tilde{u}' = u'\), which shows the assertion for the chosen subsequence.

Finally, applying the above reasoning to every subsequence of \((J_n u_n' - \tilde{u}_n')\) yields the result for the whole sequence. \(\square\)

**Corollary 4.2.** If the domain \(\Omega\) is bounded, one has

\[
\|J_\varepsilon(A_\varepsilon)^{-1} - (A_\varepsilon)^{-1} J_\varepsilon\|_{L^2(\Omega), L^2(\Omega)} \to 0 \quad (\varepsilon \to 0)
\]

for \(\iota \in \{D, N, \alpha\}\), i.e., Theorem 3.1 holds in that case of bounded \(\Omega\).
Proof. Since $\Omega$ is bounded, the embedding of $H^1(\Omega)$ in $L^2(\Omega)$ is compact, thus the sequence $J_\varepsilon u_n^\varepsilon - \tilde{u}_n^\varepsilon$ from the previous proof has a subsequence converging to 0 strongly in $L^2(\Omega)$. Since this can be done for every subsequence of $(J_\varepsilon u_n^\varepsilon - \tilde{u}_n^\varepsilon)$, the whole sequence converges to 0.

Now, choose a sequence $f_n \in L^2(\Omega_{\varepsilon n})$, $\|f_n\|_{L^2(\Omega_{\varepsilon n})} \leq 1$, such that

$$\sup_{\|f\|_{L^2(\Omega_{\varepsilon n})} \leq 1} \| (J_\varepsilon u_n^\varepsilon (A^\varepsilon_n)^{-1} - (A^\varepsilon_n)^{-1} J_\varepsilon) f \|_{L^2(\Omega_{\varepsilon n})} = \frac{1}{n} < \| (J_\varepsilon u_n^\varepsilon (A^\varepsilon_n)^{-1} - (A^\varepsilon_n)^{-1} J_\varepsilon) f_n \|_{L^2(\Omega_{\varepsilon n})}.$$  

By the above, the right-hand side of this inequality converges to zero, which implies the claim.  

Treating unbounded domains requires further effort. Since we lack compact embeddings in this case, we will have to take advantage of the sufficiently rapid decay of solutions to $(-\Delta + 1)u = f$ and a decomposition of the right hand side with a bound on the interactions.

5 Exponential decay of solutions

We begin with a general result which we assume is classical, but include for the sake of completeness. Let $U \subset \mathbb{R}^d$ open satisfying the strong local Lipschitz condition, $\lambda > \frac{1}{2}$ and consider the problems (cf. (Dir), (Neu), (Rob))

$$\begin{cases}
(-\Delta + \lambda) u^\alpha &= f & \text{in } U, \\
\partial_n u^\alpha + \alpha u^\alpha &= 0 & \text{on } \partial U;
\end{cases} \quad (5.1)$$

$$\begin{cases}
(-\Delta + \lambda) u^N &= f & \text{in } U, \\
\partial_n u^N &= 0 & \text{on } \partial U;
\end{cases} \quad (5.2)$$

$$\begin{cases}
(-\Delta + \lambda) u^D &= f & \text{in } U, \\
u^D &= 0 & \text{on } \partial U.
\end{cases} \quad (5.3)$$

Let $x_0 \in \mathbb{R}^d$, and define the function $\omega(x) = \cosh(|x - x_0|)$. Then the following statement holds.

**Proposition 5.1.** Let $f \in L^2(U)$, supp($f$) compact. Then each of the problems (5.1)–(5.3) has a unique weak solution $u^\varepsilon \in H^1(U)$ satisfying

$$\int_U |u^\varepsilon|^2 \omega \, dx \leq M \int_U |f|^2 \omega \, dx \quad (5.4)$$

$$\int_U |
abla u^\varepsilon|^2 \omega \, dx \leq M \int_U |f|^2 \omega \, dx \quad (5.5)$$

where $M := \max \{2, (\lambda - \frac{1}{2})^{-1}\}$.

We postpone the proof, in order to introduce some notation and prove auxiliary results. First, let us denote $d\mu := \omega dx$ and introduce the weighted Sobolev spaces $H := W^{1,2}(U; \omega)$, $H_0 := W^{1,2}_0(U; \omega)$ with scalar product

$$\langle u, v \rangle_H = \int_U uv \, d\mu + \int_U \nabla u \cdot \nabla v \, d\mu.$$

Moreover, let $\lambda > \frac{1}{2}$ and define the sesquilinear forms

$$a^\alpha(u, v) := \int_U (\nabla u \cdot \nabla v + \lambda uv) \, d\mu + \int_U v \nabla u \cdot \nabla \omega \, d\mu + \alpha \int_{\partial U} v \omega dS \quad \text{on } H, \quad (5.6)$$

$$a^N(u, v) := \int_U (\nabla u \cdot \nabla v + \lambda uv) \, d\mu + \int_U v \nabla u \cdot \nabla \omega \, d\mu \quad \text{on } H, \quad (5.7)$$

$$a^D(u, v) := \int_U (\nabla u \cdot \nabla v + \lambda uv) \, d\mu + \int_U v \nabla u \cdot \nabla \omega \, d\mu \quad \text{on } H_0. \quad (5.8)$$
Lemma 5.2. For \( \lambda > \frac{1}{2} \) and \( \iota \in \{D, N, \alpha\} \), the form \( a^\iota \) is continuous and coercive on \( \mathcal{H} \) (on \( H_0 \) in the case \( \iota = D \)).

Proof. We will only treat the Robin case here, the other cases being analogous. Denote by \( I \) the second term in (5.6) and note that \( \omega \) was chosen so that \( |\nabla \omega| \leq \omega \). By Hölder’s inequality with respect to \( \mu \) one has

\[
|I| \leq \left\| \frac{\nabla \omega}{\omega} \right\|_\infty \left\| \nabla u \right\|_{L^2(\mu)} \left\| v \right\|_{L^2(\mu)} \leq \frac{1}{2} \left\| \nabla u \right\|_{L^2(\mu)}^2 + \frac{1}{2} \left\| v \right\|_{L^2(\mu)}^2,
\]

and thus

\[
a(u, u) \geq \left\| \nabla u \right\|_{L^2(\mu)}^2 + \lambda \left\| u \right\|_{L^2(\mu)}^2 + |\alpha| \left\| \omega^{1/2} u \right\|_{L^2(\partial U)}^2 + I \geq \left\| \nabla u \right\|_{L^2(\mu)}^2 + \frac{1}{2} \left\| \nabla u \right\|_{L^2(\mu)}^2 - \frac{1}{2} \left\| u \right\|_{L^2(\mu)}^2 + \left( \lambda - \frac{1}{2} \right) \left\| u \right\|_{L^2(\mu)}^2,
\]

which shows coercivity in \( \mathcal{H} \). Continuity follows by estimating the boundary term. By the trace theorem [DiB02, Prop. IX.18.1] we have, for each \( \delta > 0 \),

\[
\int_{\partial U} |u|^2 \omega \, dx \leq 2\delta \left\| \nabla (\omega^{1/2} u) \right\|_{L^2(U)}^2 + \frac{C}{\delta} \left\| \omega^{1/2} u \right\|_{L^2(\partial U)}^2.
\]

(5.9)

The first term can be estimated using the special choice of \( \omega \):

\[
\left\| \nabla (\omega^{1/2} u) \right\|_{L^2(U)}^2 = \int_U \omega^{1/2} \nabla u + \frac{1}{2} \left\| \frac{\nabla \omega}{\omega} \right\|_{L^2(U)}^2 \, dx \\
\leq 2 \int_U \omega |\nabla u|^2 \, dx + \frac{1}{2} \int_U |u|^2 \left\| \frac{\nabla \omega}{\omega} \right\|_{L^2(U)}^2 \, dx \\
\leq 2 \left\| \nabla u \right\|_{L^2(\mu)}^2 + 2 \left\| \frac{\nabla \omega}{\omega} \right\|_{L^2(\mu)}^2 \int_U |u|^2 \omega \, dx \\
\leq 2 \left\| \nabla u \right\|_{H^1(\mu)}^2.
\]

(5.10)

The desired continuity now follows immediately by combining (5.9) and (5.10).

Lemma 5.3. Let \( f \in L^2(U) \), \( \iota \in \{D, N, \alpha\} \), and suppose that \( \text{supp}(f) \) compact. Then the problem

\[
a^\iota(u, v) = \int_U \bar{f} v \, d\mu \quad \forall v \in \mathcal{H}
\]

has a solution in \( \mathcal{H} \).

Proof. By Hölder inequality, one has

\[
\left| \int_U \bar{f} v \, d\mu \right| \leq \|f\|_{L^2(\mu)} \|v\|_{L^2(\mu)} \leq \|\omega\|_{L^\infty(\text{supp } f)} \|f\|_{L^2(U)} \|v\|_{L^2(\mu)},
\]

so \( f \in \mathcal{H}' \). The assertion now follows from Lemma 5.2 and the Lax-Milgram theorem for complex, non-symmetric sesquilinear forms [TL80, Thm. VI.1.4].

Proof of Proposition 5.1. Again we focus on the Robin case, the other cases being analogous. Denote by \( u \) the solution obtained from Prop. 5.3. Then \( u \in H^1(U) \), since \( \mathcal{H} \subset H^1(U) \). Moreover, let \( \phi \in C_0^\infty(\mathbb{R}^d) \) be arbitrary and decompose it as \( \phi = \omega \psi \). Then \( \psi \in C_0^\infty(\mathbb{R}^d) \subset \mathcal{H} \) and one has

\[
\int_U \nabla u \cdot \nabla \phi \, dx + \lambda \int_U \nabla \phi \, dx + \alpha \int_{\partial U} \nabla \phi \, dS
\]
Thus, the function $u$ solves the problem
\begin{equation}
\int_U \nabla u \cdot \nabla \phi \, dx + \lambda \int_U \nabla \psi \cdot \nabla \phi \, dx + \alpha \int_{\partial U} \nabla \psi \cdot \nu \phi \, dS = \int_U \phi \, dx \quad \forall \phi \in C_0^\infty(\mathbb{R}^d).
\end{equation}

Uniqueness of solutions and density of $C_0^\infty(\mathbb{R}^d)$ in $H^1(U)$ implies that $u$ is the weak solution in $H^1(U)$ to the Robin problem (5.1).

The estimates (5.4), (5.5) follow from the coercivity of $a^\varepsilon$.

6 Decomposition of the right-hand side

In this section we consider the case of unbounded $\Omega$. We conclude the proof of Theorem 3.1 by decomposing the domain into cubes $Q_i$, writing $f = \sum_i f_{\chi_Q}$, and then applying the above results to each term $f_{\chi_Q}$. The following lemma shows uniform convergence with respect to the position of the cubes.

**Lemma 6.1.** Let $\varepsilon_n \downarrow 0$ and $f_n \in L^2(\Omega)$, $n \in \mathbb{N}$, be such that $\|f_n\|_{L^2(\Omega)} \leq 1$ and supp$(f_n) \subset Q_{i_n}$, where $Q_{i_n} = [0,1]^d + i_n$ with $i_n \in \mathbb{Z}^d$. Let $u_n, \tilde{u}_n$ be the solutions to the problems
\begin{equation}
A_{\varepsilon_n}^\delta u_n = f_n|_{\Omega_{i_n}}, \quad A^\delta \tilde{u}_n = f_n, \quad n \in \mathbb{N}, \quad \varepsilon \in \{D,N,\alpha\}.
\end{equation}

Then $\|J_{\varepsilon_n} u_n - \tilde{u}_n\|_{L^2(\Omega)} \to 0$ for all $\varepsilon \in \{D,N,\alpha\}$.

**Proof.** The idea of the proof is to use translation invariance, in order to shift supp$(f_n)$ back near zero for every $n$, and then use the Fréchet-Kolmogorov compactness criterion to obtain a convergent subsequence of $(J_{\varepsilon_n} u_n - \tilde{u}_n)$; Theorem 4.1 will identify its limit as zero. Since the following analysis is independent of the choice of boundary conditions, henceforth we omit $\varepsilon$ to simplify notation.

We now carry out the outlined strategy. We set, for $i \in \mathbb{N}$,
\begin{align*}
u_n(x) & := u_n(x - i_n), \\
\tilde{u}_n(x) & := \tilde{u}_n(x - i_n), \\
f_n(x) & := f_n(x - i_n).
\end{align*}

These functions still solve the problems (6.1) with $f_n$ replaced by $f_n^* \equiv f_n$ and $\Omega$ replaced by $\Omega + i_n$. The new sequence $f_n^*$ has the nice property that supp$(f_n^*) \subset [0,1]^d$ for all $n$. In the following we consider $J_{\varepsilon_n} u_n^*, \tilde{u}_n^*, f_n^*$ as elements of $L^2(\mathbb{R}^d)$ that are zero outside $\Omega + i_n$. We will now show that $\tilde{u}_n^* - J_{\varepsilon_n} u_n^*$ converges to zero in $L^2(\mathbb{R}^d)$. To this end, consider the bounded set
\begin{equation}
\mathcal{F} := \{\tilde{u}_n^* - J_{\varepsilon_n} u_n^* : n \in \mathbb{N}\} \subset L^2(\mathbb{R}^d).
\end{equation}

**Claim:** $\mathcal{F}$ is precompact in $L^2(\mathbb{R}^d)$.

We postpone the proof of this claim to Lemma 6.2. Since the shift $u \mapsto u(\cdot - i_n)$ is an isometry in $L^2(\mathbb{R}^d)$ we immediately obtain that $\langle \tilde{u}_n^* - J_{\varepsilon_n} u_n^* \rangle$ has a convergent subsequence in $L^2(\Omega)$. Furthermore, Theorem 4.1 shows that $\|\tilde{u}_n^* - J_{\varepsilon_n} u_n^*\|_{L^2(K)} \to 0$ for every bounded $K \subset \Omega$ which identifies the limit of the subsequence as zero.

Arguing as above for all subsequences of $\langle \tilde{u}_n^* - J_{\varepsilon_n} u_n^* \rangle$, we conclude that $\tilde{u}_n^* - J_{\varepsilon_n} u_n^* \to 0$ in $L^2(\Omega)$. \qed

**Lemma 6.2.** The set $\mathcal{F}$ defined in (6.2) is precompact in $L^2(\mathbb{R}^d)$.

**Proof.** We will use the notation and conventions from the previous proof and distinguish between the Dirichlet case and the Robin/Neumann cases.
Dirichlet case. Step 1: We have
\[ \sup_n \| \tau_h (\bar{u}_n^* - J_{\varepsilon_n} u_n^*) - (\bar{u}_n^* - J_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d)} \to 0 \quad \text{as } h \to 0 \quad \forall n \in \mathbb{N}, \]
where \( \tau_h \) denotes the operator of translation by \( h \). Indeed, the standard regularity theory implies
\[ \| \tau_h (\bar{u}_n^* - J_{\varepsilon_n} u_n^*) - (\bar{u}_n^* - J_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d)} \leq \| \nabla (\bar{u}_n^* - J_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d)} |h| \leq C \| f_n \|_{L^2(\Omega)} |h|. \]
Step 2: Notice that
\[ \sup_n \| \bar{u}_n^* - J_{\varepsilon_n} u_n^* \|_{L^2(\mathbb{R}^d \setminus B_R(0))} \to 0 \quad \text{as } R \to \infty, \]
due to the following estimate in which we set \( \omega_0(x) := \cosh(|x|) \).
\[
\| \bar{u}_n^* - J_{\varepsilon_n} u_n^* \|_{L^2(\mathbb{R}^d \setminus B_R(0))}^2 \leq 2 \| \bar{u}_n^* \omega_0 \|_{L^2(\Omega \setminus B_R(0))}^2 + 2 \| J_{\varepsilon_n} u_n^* \omega_0 \|_{L^2(\Omega \setminus B_R(0))}^2 \leq 4M \| f_n \|_{L^2(\Omega)} \| \omega_0 \|_{L^\infty(\Omega)} ^2 \exp(-R).
\]
Prop. 5.1
which completes Step 2. Applying the Fréchet-Kolmogorov theorem yields the precompactness of \( \mathcal{F} \).

Neumann and Robin case. Here the strategy is the same, but matters are complicated by the fact that \( J_{\varepsilon_n} u_n^* \) is not in \( H^1(\mathbb{R}^d) \). To show that \( \mathcal{F} \) is precompact, we decompose elements in \( \mathcal{F} \) as
\[ \bar{u}_n^* - J_{\varepsilon_n} u_n^* = (\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) + (\mathcal{T}_{\varepsilon_n} - J_{\varepsilon_n}) u_n^*, \]
define \( \mathcal{F}_1 := \{ \bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^* : n \in \mathbb{N} \} \), \( \mathcal{F}_2 := \{ (\mathcal{T}_{\varepsilon_n} - J_{\varepsilon_n}) u_n^* : n \in \mathbb{N} \} \) and show that \( \mathcal{F}_1 \) and \( \mathcal{F}_2 \) are precompact in \( L^2(\mathbb{R}^d) \). We will begin by showing that \( \mathcal{F}_1 \) is precompact. To this end, denote by \( \mathcal{E} : H^1(\Omega) \to H^1(\mathbb{R}^d) \) an extension operator satisfying \( \mathcal{E}u|_{\Omega} = u \) and \( \| \mathcal{E}u \|_{H^1(\mathbb{R}^d)} \leq C \| u \|_{H^1(\Omega)} \) for all \( u \in H^1(\Omega) \) (cf. Prop. VII.19.1 and Remark VII.19.2 in [DiB02]). Note that by translation invariance one has \( \mathcal{E} \tau_h = \tau_h \mathcal{E} \) and \( (\mathcal{E} u_n^*)^* = \mathcal{E}(u_n^*) \). We start by proving that
\[ \sup_n \| \tau_h \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) - \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) \| \to 0 \quad \text{as } h \to 0 \]
This readily follows from the estimate
\[ \| \tau_h \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) - \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d)} \leq \| \nabla \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d)} |h| \leq C \| \bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^* \|_{H^1(\Omega + \varepsilon_n)} |h| \leq C \| f_n \|_{L^2(\Omega + \varepsilon_n)} |h| \leq C |h|. \]
Next we prove that
\[ \sup_n \| \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d \setminus B_R(0))} \to 0 \quad \text{as } R \to \infty. \]
Indeed, notice first that
\[ \| \mathcal{E}(\bar{u}_n^* - \mathcal{T}_{\varepsilon_n} u_n^*) \|_{L^2(\mathbb{R}^d \setminus B_R(0))} \leq C \left( \| \bar{u}_n^* \|_{L^2(\Omega + \varepsilon_n \setminus B_R(0))} + \| \mathcal{T}_{\varepsilon_n} u_n^* \|_{L^2(\Omega + \varepsilon_n \setminus B_R(0))} \right) \]
\[ = C \left( \| \bar{u}_n \|_{L^2(\Omega \setminus B_r(0))} + \| \mathcal{T}_{\varepsilon_n} u_n \|_{L^2(\Omega \setminus B_r(0))} \right) , \quad (6.3) \]
To treat the two terms on the right-hand side we apply Lemma 2.1 (ii) and Proposition 5.1 with \( \omega_n(x) = \cosh(|x - i_n|) \) as follows. For the second term in (6.3), we obtain

\[
\left\| \mathcal{T}_{c_{n}}^* u_n \right\|_{L^2(\Omega)} \leq C \left( \left\| u_n \right\|_{L^2(\Omega)} + \left\| \nabla u_n \right\|_{L^2(\Omega)} \right)
\]

\[
\leq \left\| \omega_{c_{n}} u_n \right\|_{L^2(\Omega)} + \left\| \nabla \omega_{c_{n}} u_n \right\|_{L^2(\Omega)}
\]

\[
\leq C \left( \left\| \omega_{c_{n}}^2 u_n \right\|_{L^2(\Omega)} + \left\| \nabla \omega_{c_{n}}^2 u_n \right\|_{L^2(\Omega)} \right)
\]

\[
\leq CM \left\| f_n \omega_{c_{n}}^2 \right\|_{L^2(\Omega)} \exp(-R/3)
\]

\[
\leq 2CM \exp(-R/3),
\]

where we use the fact that \( \omega_{c_{n}} \) is bounded by 2 on \( \text{supp} f_n \). With an analogous calculation for the first term in (6.3), we finally find

\[
\left\| \mathcal{E}(\tilde{u}_{c_{n}}^* - \mathcal{T}_{c_{n}} u_{n}^*) \right\|_{L^2(\mathbb{R}^d)} \leq C \exp(-R/3),
\]

with \( C \) independent of \( n \). Applying the Fréchet-Kolmogorov theorem yields the precompactness of the set \( \{ \mathcal{E}(\tilde{u}_{c_{n}}^* - \mathcal{T}_{c_{n}} u_{n}^*): n \in \mathbb{N} \} \). Finally, noting that \( \mathcal{F}_1 = \{ \mathcal{E}(\tilde{u}_{c_{n}}^* - \mathcal{T}_{c_{n}} u_{n}^*): n \in \mathbb{N} \} \chi_{\Omega} \) and that multiplication by \( \chi_{\Omega} \) is a bounded operator on \( L^2(\mathbb{R}^d) \) we obtain precompactness of \( \mathcal{F}_1 \).

To prove precompactness of \( \mathcal{F}_2 \), first note that by Lemma 2.1 (iii) for any \( \delta > 0 \) there exists a \( n_0 \) such that

\[
\| (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{2} < \delta \quad \forall n > n_0.
\]

Let us fix arbitrary \( \delta > 0 \) and \( n_0 \) as above. It remains to estimate the terms

\[
\| \tau_{\delta} (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* - (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{L^2(\mathbb{R}^d)}, \quad n \leq n_0,
\]

but these are only finitely many, which clearly converge to zero individually, and hence

\[
\sup_{n \leq n_0} \| \tau_{\delta} (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* - (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{2} \to 0 \quad \text{as } h \to 0
\]

Altogether we have shown that

\[
\sup_{n} \| \tau_{\delta} (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* - (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{L^2(\mathbb{R}^d)} = \max \left\{ \sup_{n \leq n_0} \| \tau_{\delta} (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* - (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{2}, 2\delta \right\}
\]

\[
\to 0 \quad \text{as } h \to 0
\]

Since \( \delta > 0 \) was arbitrary we finally get

\[
\lim_{h \to 0} \sup_{n \in \mathbb{N}} \| \tau_{\delta} (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* - (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{L^2(\mathbb{R}^d)} = 0.
\]

This completes the first Fréchet-Kolmogorov-condition. The proof of the second condition

\[
\sup_{n} \| (J_{c_{n}} - \mathcal{T}_{c_{n}}) u_{n}^* \|_{L^2(\mathbb{R}^d \setminus B_R(0))} \to 0 \quad \text{as } R \to \infty
\]

is analogous to the case of \( \mathcal{F}_1 \). Applying the Fréchet-Kolmogorov theorem yields precompactness of \( \mathcal{F}_1 \) and completes the proof.

**Corollary 6.3.** There exists \( \delta_{\varepsilon} \) with \( \varepsilon \xrightarrow{\varepsilon \to 0} 0 \) such that

\[
\left\| (J_{c}(A^*)^{-1} - (A^*)^{-1} J_{c})(f \chi_{\Omega}, \varepsilon \Omega_{\varepsilon}) \right\|_{L^2(\Omega)} \leq \delta_{\varepsilon} \| f \chi_{\Omega} \|_{L^2(\Omega)}
\]

for all \( f \in L^2(\Omega) \) and \( i \in \mathbb{Z}^d \).
Proof. We argue by contradiction. Suppose that there is no such function \( \delta \). Then there exist sequences \( \varepsilon_n, f_n, i_n \) with \( \|f_n\|_{L^2(\Omega)} = 1 \) such that \( \|(J_\varepsilon(A^*)^{-1} - (A^*)^{-1}J_\varepsilon)(f \chi_{Q_n \cap \Omega_n})\|_{L^2(\Omega)} \) does not converge to zero, which is a contradiction to Lemma 6.1.

In order to finalise the decomposition, we require the following two lemmas.

**Lemma 6.4.** Suppose that \( f \in L^2(\Omega) \), and denote

\[
\varphi_i := (J_\varepsilon(A^*)^{-1} - (A^*)^{-1}J_\varepsilon)(f \chi_{Q_i \cap \Omega_i}), \quad i \in \mathbb{Z}^d.
\]

Then one has

\[
\langle \varphi_i, \varphi_j \rangle_{L^2(\Omega)} \leq C\|f \chi_{Q_i}\|_{L^2(\Omega)}\|f \chi_{Q_j}\|_{L^2(\Omega)} \exp(-|i - j|/2)
\] (6.5)

for all \( i, j \in \mathbb{Z}^d \) with \( i \neq j \), where \( \langle \cdot, \cdot \rangle_{L^2(\Omega)} \) denotes the standard inner product in \( L^2(\Omega) \).

**Proof.** For convenience we write \( f_i := f \chi_{Q_i}, i \in \mathbb{Z}^d \). Denote \( \omega_i(x) = \cosh(|x - i|) \) and note that by Proposition 5.1 we have \( \|\omega_i^{1/2} \varphi_i\|_{L^2(\Omega)} \leq C\|f_i \omega_i^{1/2}\|_{L^2(\Omega)} \). The statement of the lemma is a consequence of the following estimate:

\[
\langle \varphi_i, \varphi_j \rangle_{L^2(\Omega)} \leq \int_{\Omega} |\varphi_i(x)||\varphi_j(x)| \, dx
\]

\[
= \int_{\Omega} (|\varphi_i(x)|\omega_i^{1/2}) (|\varphi_j(x)|\omega_j^{1/2}) \omega_i^{-1/2} \omega_j^{-1/2} \, dx
\]

\[
\leq \|\varphi_i\omega_i^{1/2}\|_{L^2(\Omega)} \|\varphi_j\omega_j^{1/2}\|_{L^2(\Omega)} \omega_i^{-1/2} \omega_j^{-1/2} \|\varphi_i\|_{L^\infty(\Omega)} \omega_i^{-1/2} \omega_j^{-1/2} \|\varphi_j\|_{L^\infty(\Omega)}
\]

\[
\leq C\|f_i \omega_i^{1/2}\|_{L^2(\Omega)} \|f_j \omega_j^{1/2}\|_{L^2(\Omega)} \omega_i^{-1/2} \omega_j^{-1/2} \|\varphi_i\|_{L^\infty(\Omega)} \omega_i^{-1/2} \omega_j^{-1/2} \|\varphi_j\|_{L^\infty(\Omega)}
\]

\[
\leq C\|f_i\|_{L^2(\Omega)} \|f_j\|_{L^2(\Omega)} \exp(-|i - j|/2),
\]

where we use the fact that \( \text{supp}(f_i) \subset Q_i \) and \( \omega_i|_{Q_i} \leq 2 \).

**Lemma 6.5.** Suppose that \( f \in C_{0}^\infty(\Omega_\varepsilon) \) and define \( \varphi_i := (J_\varepsilon(A^*)^{-1} - (A^*)^{-1}J_\varepsilon)(f \chi_{Q_i}), i \in \mathbb{Z}^d \). Then for every \( n > 1 \) one has the inequality

\[
\left\| \sum_{m=1}^{N} \varphi_{i_m} \right\|_{L^2(\Omega)}^2 \leq C \left( n^3 \sum_{m=1}^{N} \|\varphi_{i_m}\|_{L^2(\Omega)}^2 + \|f\|_{L^2(\Omega)} \exp(-n/3) \right),
\] (6.6)

where \( N \) is the number of cubes such that \( Q_{i_k} \cap \text{supp}(f) \neq \emptyset \), and \( C, n \) do not depend on \( N \).

**Proof.**

\[
\left\| \sum_{m=1}^{N} \varphi_{i_m} \right\|_{L^2(\Omega)}^2 \leq \sum_{m,p=1}^{N} \langle \varphi_{i_m}, \varphi_{i_p} \rangle_{L^2(\Omega)}
\]

\[
= \sum_{k=0}^{\infty} \left( \sum_{|i - j| \in [k,k+1]} \langle \varphi_{i}, \varphi_{j} \rangle_{L^2(\Omega)} \right)
\]

\[
\leq \sum_{k=0}^{n} \left( \sum_{|i - j| \in [k,k+1]} \|\varphi_{i}\|_{L^2(\Omega)} \|\varphi_{j}\|_{L^2(\Omega)} \right) + \sum_{k=n}^{\infty} \left( \sum_{|i - j| \in [k,k+1]} \langle \varphi_{i}, \varphi_{j} \rangle_{L^2(\Omega)} \right)
\]

\[
\leq \sum_{k=0}^{n} \sum_{|i - j| \in [k,k+1]} \left( \frac{\|\varphi_{i}\|_{L^2(\Omega)}^2}{2} + \frac{\|\varphi_{j}\|_{L^2(\Omega)}^2}{2} \right) + \sum_{k=n}^{\infty} \left( \sum_{|i - j| \in [k,k+1]} \langle \varphi_{i}, \varphi_{j} \rangle_{L^2(\Omega)} \right)
\]

\[
\leq \sum_{k=0}^{n} \sum_{m=1}^{N} \left( \sum_{|j:|i_m-j|\in [k,k+1]} \|\varphi_{i_m}\|_{L^2(\Omega)} \right) + \sum_{k=n}^{\infty} \left( \sum_{|i - j| \in [k,k+1]} \langle \varphi_{i}, \varphi_{j} \rangle_{L^2(\Omega)} \right)
\]
\begin{equation}
\leq C \sum_{k=1}^{n} k^2 \sum_{m=1}^{N} \|u_{i,m}\|_{L^2(\Omega)}^2 + \sum_{k=n}^{\infty} \left( \sum_{|i-j|\leq|k,k+1|} \langle u_i, u_j \rangle_{L^2(\Omega)} \right) \\
\leq C n^3 \sum_{m=1}^{N} \|u_{i,m}\|_{L^2(\Omega)}^2 + \sum_{k=n}^{\infty} \left( \sum_{|i-j|\leq|k,k+1|} \langle u_i, u_j \rangle_{L^2(\Omega)} \right). \tag{6.7}
\end{equation}

We now study the last term of (6.7). It follows from Lemma 6.4 that
\[ \| \langle u_i, u_j \rangle_{L^2(\Omega)} \| \leq C \| f_i \|_{L^2(\Omega)} \| f_j \|_{L^2(\Omega)} e^{-\frac{\delta}{2}|i-j|}. \]

Using this fact and fixing \( k \) for the moment, we obtain
\[
\left| \sum_{|i-j|\leq|k,k+1|} \langle u_i, u_j \rangle_{L^2(\Omega)} \right| \leq C \sum_{|i-j|\leq|k,k+1|} \| f_i \|_{L^2(\Omega)} \| f_j \|_{L^2(\Omega)} \exp(-|i-j|/2) \\
\leq C \sum_{|i-j|\leq|k,k+1|} \left( \frac{\| f_i \|_{L^2(\Omega)}^2}{2} + \frac{\| f_j \|_{L^2(\Omega)}^2}{2} \right) \exp(-|i-j|/2) \\
\leq C \sum_{m=1}^{N} \| f_{i,m} \|_{L^2(\Omega)}^2 \exp(-k/2) \\
= C \| f \|_{L^2(\Omega)}^2 \exp(-k/2) \\
\leq C \| f \|_{L^2(\Omega)}^2 \exp(-k/2).
\]

Summing this inequality from \( k = n \) to infinity concludes the proof. \( \square \)

Combining the above lemmas, we have the following quantitative statement.

**Proposition 6.6.** Suppose that \( f \in C_0^\infty(\Omega) \). Then for every \( n \in \mathbb{N} \),
\[ \|(J_\varepsilon(A_\varepsilon) - 1) - (A^\varepsilon)^{-1}J_\varepsilon f\|_{L^2(\Omega)}^2 \leq C (n^3 \delta_\varepsilon^2 + \exp(-n/3)) \| f \|_{L^2(\Omega)}^2 \]
for some \( C > 0 \), where \( \delta_\varepsilon \) was defined in Corollary 6.3.

**Proof.** We denote \( u_i^\varepsilon := (J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon)(f \chi_{Q_i}) \), \( i \in \mathbb{R}^d \), and estimate
\[
\|(J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon) f\|_{L^2(\Omega)}^2 \leq \sum_{m=1}^{N} \| u_{i,m} \|_{L^2(\Omega)}^2 \\
\leq C \left( n^3 \sum_{m=1}^{N} \| u_{i,m} \|_{L^2(\Omega)}^2 + \exp(-n/3) \| f \|_{L^2(\Omega)}^2 \right) \\
\leq C \left( n^3 \delta_\varepsilon^2 \sum_{m=1}^{N} \| f_{i,m} \|_{L^2(\Omega)}^2 + \exp(-n/3) \| f \|_{L^2(\Omega)}^2 \right) \\
= C (n^3 \delta_\varepsilon^2 + \exp(-n/3)) \| f \|_{L^2(\Omega)}^2.
\]

**Proof of Theorem 3.1.** Let \( g \in L^2(\Omega) \) with \( \|g\|_{L^2(\Omega)} \leq 1 \). Fix \( \delta > 0 \) and choose \( f \in C_0^\infty(\Omega) \) such that \( \|g - f\|_{L^2(\Omega)} < \delta \) and choose \( n \in \mathbb{N} \) such that \( \exp(-n/3) \leq \delta \). Now compute
\[
\|(J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon) g\|_{L^2(\Omega)}^2 \leq 2\|(J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon) f\|_{L^2(\Omega)}^2 + 2\|(J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon)(g - f)\|_{L^2(\Omega)}^2
\]
\[ = \frac{1}{2} \|(J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon) f\|^2_{L^2(\Omega)} + \frac{1}{2} \|(J_\varepsilon(A_\varepsilon)^{i-1} - (A^\varepsilon)^{-1}J_\varepsilon)(g - f)\|^2_{L^2(\Omega)}.
\]
hence
\[ \sup_{\|g\|_{L^2(\Omega)}} \left\| (J_\varepsilon(A_\varepsilon')^{-1} - (A_\varepsilon')^{-1} J_\varepsilon)g \right\|_{L^2(\Omega)}^2 \leq C n^3 \delta^2 + C \delta + C \delta, \]
and therefore
\[ \limsup_{\varepsilon \to 0} \left\| (J_\varepsilon(A_\varepsilon')^{-1} - (A_\varepsilon')^{-1} J_\varepsilon) \right\|_{L^2(L^2(\Omega), L^2(\Omega))}^2 \leq C \delta. \]
Since \( \delta > 0 \) is arbitrary, the result follows. \( \square \)

### 7 Behaviour of the Semigroup

In this section we want to give an application of Theorem 3.1. In particular, we focus on the non-selfadjoint operator \( A_\alpha \) and study the large-time behaviour of its semigroup. In order to do this, we shall first study the numerical range of the Robin Laplacians more closely. In the remainder of this section, unless otherwise stated, the symbols \( \| \cdot \| \) and \( \langle \cdot, \cdot \rangle \) will denote the \( L^2 \) (operator-) norm and scalar product, respectively, and the symbol \( \Sigma_\theta \) denotes a sector of half-angle \( \theta \) in the complex plane.

#### 7.1 Decay of \( e^{-t(A^\alpha-\text{Id})} \)

Let \( \alpha \in \mathbb{C} \) and assume \( \text{Re} \alpha > 0 \). We want to study the decay properties of the heat semigroup \( e^{t(\Delta - \mu_\alpha)} \).

To this end, let us denote by \( B^\alpha := A^\alpha - \text{Id} \) the Robin Laplacian on \( \Omega \). It is our goal to derive estimates on the numerical range of \( B^\alpha \). Let \( u \in \mathcal{D}(B^\alpha) = \mathcal{D}(A^\alpha) \) and assume that \( \|u\|_{L^2(\Omega)} = 1 \). Notice that

\[
\langle B^\alpha u, u \rangle = \int_\Omega |\nabla u|^2 \, dx + \mu_\alpha \int_\Omega |u|^2 \, dx + \alpha \int_{\partial \Omega} |u|^2 \, dS
\]

\[ = \|\nabla u\|^2 + \mu_\alpha + \alpha \|u\|^2_{L^2(\partial \Omega)}, \]

and therefore

\[
\text{Re} \langle B^\alpha u, u \rangle \geq \text{Re} \mu_\alpha + \text{Re} \alpha \|u\|^2_{L^2(\partial \Omega)},
\]

\[
|\text{Im} \langle B^\alpha u, u \rangle| \leq |\text{Im} \mu_\alpha| + |\text{Im} \alpha| \|u\|^2_{L^2(\partial \Omega)}.
\]

Now, let \( \lambda \in (0, \text{Re} \mu_\alpha) \) and compute

\[
|\text{Im} \langle (B^\alpha - \lambda) u, u \rangle| \leq |\text{Im} \mu_\alpha| + |\text{Im} \alpha| \|u\|^2_{L^2(\partial \Omega)}
\]

\[ = \frac{|\text{Im} \mu_\alpha|}{\text{Re} \mu_\alpha} \text{Re} \mu_\alpha + \frac{|\text{Im} \alpha|}{\text{Re} \alpha} \text{Re} \alpha \|u\|^2_{L^2(\partial \Omega)}. \quad (7.1)\]

Recall from Section 1 that \( \mu_\alpha = \alpha S_d/2^d \) and hence \( |\text{Im} \mu_\alpha|/\text{Re} \mu_\alpha = |\text{Im} \alpha|/\text{Re} \alpha \). Combining this with (7.1), we obtain

\[
|\text{Im} \langle (B^\alpha - \lambda) u, u \rangle| \leq \frac{|\text{Im} \alpha|}{\text{Re} \alpha} \left( \text{Re} \mu_\alpha + \text{Re} \alpha \|u\|^2_{L^2(\partial \Omega)} \right)
\]

\[ \leq \frac{|\text{Im} \alpha|}{\text{Re} \alpha} \left( \text{Re} \langle (B^\alpha - \lambda) u, u \rangle + \lambda \right)
\]

\[ \leq \frac{|\text{Im} \alpha|}{\text{Re} \alpha} \frac{\lambda}{2^{-d} S_d}. \]

Using standard generation theorems about analytic semigroups, the next statement follows.
Proposition 7.1. The operator \(-B^\alpha - \lambda\) generates a bounded analytic semigroup in the sector \(\Sigma_{\frac{\pi}{2} - \theta_\lambda}\), where
\[
\theta_\lambda = \arctan \left( \frac{|\text{Im} \alpha|}{\text{Re} \alpha - \frac{\lambda}{2 - \delta S_d}} \right).
\]
Equivalently, \(-B^\alpha\) generates an analytic semigroup with
\[
\|\exp(-zB^\alpha)\| \leq \exp(-\lambda z) \quad \forall z \in \Sigma_{\frac{\pi}{2} - \theta_\lambda}.
\]

Proof. See [Kat95, Ch. IX.1.6].

7.2 Decay of \(e^{-t(A^\alpha - \text{Id})}\)

In this section we denote \(B^\alpha_\varepsilon := A^\alpha_\varepsilon - \text{Id}\). By calculations analogous to the above, we have
\[
|\text{Im}(B^\alpha_{\varepsilon} u, u)| \leq \frac{|\text{Im} \alpha|}{\text{Re} \alpha} \text{Re}(B^\alpha_{\varepsilon} u, u),
\]
that is, \(B^\alpha_{\varepsilon}\) is sectorial with sector \(\Sigma_{\theta_0}\), where \(\theta_0 = \arctan(|\text{Im} \alpha|/\text{Re} \alpha)\), and hence generates a bounded analytic semigroup in the sector \(\Sigma_{\frac{\pi}{2} - \theta_\alpha}\). In this subsection we improve this \(a\ priori\) result using spectral convergence. To this end, let \(\delta > 0\) and define the compact set
\[
K_\delta := \{ x + iy : x \in [0, \text{Re} \mu_\alpha], y \in [-|\text{Im} \mu_\alpha|, |\text{Im} \mu_\alpha|] \}.
\]
Note that then \(\Sigma_{\theta_\varepsilon} \cap \{ \text{Re} z \leq \text{Re} \mu_\alpha - \delta \} \subset K_\delta\). By [EE87, Th. III.2.3] one has \(K_\delta \subset \rho(B^\alpha_{\varepsilon})\) for every \(\delta > 0\). Applying Corollary 3.2 we see that for every \(\delta > 0\) there exists a \(\varepsilon_0 > 0\) such that \(K_\delta \subset \rho(B^\alpha_{\varepsilon_0})\) for all \(\varepsilon < \varepsilon_0\).

In particular we have shown that the resolvent norm \(\|(B^\alpha_{\varepsilon} - z)^{-1}\|\) is bounded on \(\Sigma_{\theta_0} \cap \{ \text{Re} z \leq \text{Re} \mu_\alpha - \delta \}\). By a trivial calculation analogous to the previous subsection this leads to the following statement.

Lemma 7.2. For every \(\lambda \in (0, \text{Re} \mu_\alpha - \delta)\) one has
\[
\sigma(B^\alpha_{\varepsilon} - \lambda) \subset \Sigma_{\theta_\lambda}, \quad \theta_\lambda = \arctan \left( \frac{|\text{Im} \mu_\alpha|}{\text{Re} \mu_\alpha - \lambda - \delta} \right).
\]
Furthermore, we obtain the following lemma.

Lemma 7.3. For every \(\lambda \in (0, \text{Re} \mu_\alpha - \delta)\) one has \(\mathbb{C} \setminus \Sigma_{\theta_\lambda} \subset \rho(B^\alpha_{\varepsilon} - \lambda)\) and there exists a \(M = M(\lambda, \delta) > 0\) such that
\[
\|(B^\alpha_{\varepsilon} - \lambda - z)^{-1}\| \leq \frac{M}{|z|} \quad \forall z \in \mathbb{C} \setminus \Sigma_{\theta_\lambda}.
\]
Proof. This is obtained by combining Lemma 7.2 with the following two facts:

\[ |\text{Im}(B^\alpha u, u)| \leq \frac{|\text{Im} \alpha|}{\text{Re} \alpha} |\text{Re}(B^\alpha u, u)|, \quad \| (B^\alpha - z)^{-1} \| \leq C \quad \text{on} \quad K_\delta. \]

By the theory of analytic semigroups (cf. [Kat95, Ch. IX.1.6]), we immediately obtain the following corollary.

**Corollary 7.4.** For all \( \lambda \in (0, \text{Re} \mu - \delta) \), the operator \( B^\alpha - \lambda \) generates a bounded analytic semigroup in the sector \( \Sigma_{\frac{\pi}{2} - \theta_0} \).

This yields the main result of this section, as follows.

**Theorem 7.5.** For every \( \delta > 0 \) there exists \( \varepsilon_0 > 0 \) such that for every \( \lambda \in (0, \text{Re} \mu - \delta) \) there exists \( M > 0 \) such that

\[ \| \exp(-t B^\alpha) \| \leq M \exp(-\lambda \text{Re} z) \quad \forall z \in \Sigma_{\theta_0}, \quad \varepsilon \in (0, \varepsilon_0). \]

**Remark 7.6.** It is straightforward to repeat the above proof for the case of Dirichlet boundary conditions to obtain an analogous result for \( \| \exp(-t(A^0 - \text{Id})) \| \). Here, the selfadjointness of \( A^0 \) allows us to choose the half-angle \( \theta \) arbitrarily close to \( \pi/2 \).

8 Conclusion

We have shown norm-resolvent convergence in the classical perforated domain problem with Dirichlet boundary conditions which has the interesting implication of spectral convergence (Cor. 3.2). Some questions remain open and will be addressed in the future. While the norm \( \| J_\varepsilon A^\varepsilon - A^{-1} A^{-1} J_\varepsilon \|_{\text{L}^2(\Omega_\varepsilon), \text{L}^2(\Omega)} \) converges to 0, it is not clear from our method of proof how fast this happens. It would be desirable to obtain a precise convergence rate. In the case of Dirichlet boundary conditions a explicit convergence rate has been found by [KP17]. Another interesting question is whether in the case \( \Omega = \mathbb{R}^d \) there exist gaps in the spectrum of \( A_\varepsilon \) and how these depend on \( \varepsilon \). The existence of spectral gaps has been confirmed in two dimensions [NRT12], but to the authors’ knowledge the higher-dimensional case is still open.
