Formality of function spaces

Micheline VIGUÉ-POIRRIER

Abstract

Let $X$ be a nilpotent space such that there exists $p \geq 1$ with $H^p(X, \mathbb{Q}) \neq 0$ and $H^n(X, \mathbb{Q}) = 0$ if $n > p$. Let $Y$ be a $m$-connected space with $m \geq p+1$ and $H^*(Y, \mathbb{Q})$ is finitely generated as algebra. We assume that $X$ is formal and there exists $p$ odd such that $H^p(X, \mathbb{Q}) \neq 0$. We prove that if the space $\mathcal{F}(X, Y)$ of continuous maps from $X$ to $Y$ is formal, then $Y$ has the rational homotopy type of a product of Eilenberg-Mac Lane spaces. At the opposite, we exhibit an example of a formal space $\mathcal{F}(S^2, Y)$ where $Y$ is not rationally equivalent to a product of Eilenberg Mac Lane spaces.

AMS classification: 55P62, 55P35

Key words: mapping spaces, formal space, Sullivan model, Lie model.

1 Introduction

All the spaces we consider have the rational homotopy type of CW complexes of finite type. Let $X$ be a nilpotent space such that there exists $p \geq 1$ with $H^p(X, \mathbb{Q}) \neq 0$ and $H^n(X, \mathbb{Q}) = 0$ if $n > p$. Let $Y$ a $m$-connected space with $m \geq p+1$.

Under these hypothesis, the space $\mathcal{F}(X, Y)$ of continuous maps from $X$ to $Y$ is simply connected. The rational homotopy types of this space has been determined in [1], [5], [8], [10] where Sullivan models or Lie models are computed.

In his paper *L'homologie des espaces fonctionnels*, [9], Thom studied the homotopy type of the space of continuous maps of $X$ to $Y$ homotopic to a given map $f$. He proved that if $Y$ is an Eilenberg-Mac Lane space then $\mathcal{F}(X, Y)$ has the homotopy type of a product of Eilenberg Mac Lane spaces. This implies that if $H^*(Y, \mathbb{Q})$ is a free commutative algebra, then $H^*(\mathcal{F}(X, Y))$ is a free commutative algebra for any $X$. Another proof is
given in [10]. Recall that a 1-connected space has the rational homotopy of a product of Eilenberg-Mac Lane space if and only if its cohomology algebra is free commutative.

In rational homotopy theory the notion of formality plays a crucial role (see below), since the rational homotopy type of a formal space is entirely determined by the data of the singular cohomology algebra. An open question is a converse to Thom’s result.

**Question:** What conditions on $X$ and $Y$ imply that $F(X, Y)$ is a formal space?

In [3] it is proved that for $X = S^1$ and $H^*(Y, \mathbb{Q})$ a finitely generated algebra, if $F(X, Y)$ is a formal space, then $H^*(Y, \mathbb{Q})$ is free commutative. The proof relies on the theory of Sullivan minimal models. With similar methods, Yamaguchi proves in [11] that if $Y$ satisfies $\dim H^*(Y, \mathbb{Q}) < +\infty$ and $\dim \pi_*(Y) \otimes \mathbb{Q} < +\infty$, then the formality of $F(X, Y)$ implies that the cohomology algebra of $Y$ is free commutative. In this paper we prove:

**Main Theorem:** Let $X$ be a nilpotent space such that there exists $p \geq 1$ with $H^p(X, \mathbb{Q}) \neq 0$ and $H^n(X, \mathbb{Q}) = 0$ if $n > p$. Let $Y$ be a $m$-connected space with $m \geq p + 1$ and $H^*(Y, \mathbb{Q})$ is finitely generated as algebra. We assume that $X$ has a minimal Sullivan model $(\bigwedge V, d)$ with $\text{Ker} d \cap V_{\text{odd}} \neq 0$.

Then the following assertions are equivalent:

1. $F(X, Y)$ is formal
2. $F(X, Y)$ has the rational homotopy type of a product of Eilenberg Mac Lane spaces
3. $Y$ has the rational homotopy type of a product of Eilenberg Mac Lane spaces

**Remark:** Suppose $X$ is formal and there exists $p$ odd such that $H^p(X, \mathbb{Q}) \neq 0$. Let $2d + 1 = \inf\{p, \text{ odd, } H^p(X, \mathbb{Q}) \neq 0\}$, then there exists a nonzero element $a \in H^{2d+1}(X)$ and $a$ does not belong to $H^+(X) \cdot H^+(X)$. So $X$ has a minimal bigraded model in the sense of [7], $\rho : (\bigwedge V, d) \to H^*(X)$ with a generator $t \in V_0, (dt = 0), | t | = 2d + 1$ and $\rho(t) = a$. Such a space satisfies the hypothesis of the theorem.

Example 6.5 in [7] provides a non formal space $X$ satisfying the hypothesis of the main theorem.

The proof uses simultaneously the theory of minimal Quillen models of a space in the category of Lie differential graded algebras and the theory
of minimal Sullivan models of a space in the category of commutative differential graded algebras. For that reason, we should ask the connectivity hypothesis on \( Y \) to ensure \( \mathcal{F}(X,Y) \) to be 1-connected. The idea of the proof is the following: we use Lie models to prove that, under the hypothesis of the theorem, the formality of \( \mathcal{F}(X,Y) \) implies the formality of some \( \mathcal{F}(Sp,Y) \) with \( p \) odd. Then we work with a Sullivan model for \( \mathcal{F}(Sp,Y) \) and we mimick the proof of [3].

In the last section, we give an explicit example where \( X = S^2 \), \( Y \) is not a product of Eilenberg Mac Lane spaces and however \( \mathcal{F}(S^2,Y) \) is formal.

2 Algebraic models in rational homotopy theory

All the graded vector spaces, algebras, coalgebras and Lie algebras \( V \) are defined over \( \mathbb{Q} \) and are supposed of finite type, i.e. \( \dim V_n < \infty \) for all \( n \).

If \( v \) has degree \( n \), we denote \(|v| = n\).

For precise definitions we refer to [4] or [6].

If \( V = \{V_i\}_{i\in\mathbb{Z}} \) is a (lower) graded \( \mathbb{Q} \)-vector space (when we need upper graded vector space we put \( V_i = V^{-i} \) as usual.)

We denote by \( sV \) the suspension of \( V \), we have: \((sV)_n = V_{n-1}, (sV)^n = V^{n+1} \).

A morphism between two differential graded vector spaces is called a quasi-isomorphism if it induces an isomorphism in homology.

2.1 Commutative differential graded algebras

In the following we consider only commutative differential algebras graded in positive degrees, \((A,d)\) with a differential of degree +1 and satisfying \( H^0(A,d) = \mathbb{Q} \). We denote by CDGA the category of commutative differential graded algebras. If \( V = \{V_i\}_{i\geq1} \) is a graded \( \mathbb{Q} \)-vector space we denote by \( \bigwedge V \) the free graded commutative algebra generated by \( V \). A commutative cochain algebra of the form \((\bigwedge V,d)\) where \( d \) satisfies some nilpotent conditions is called a Sullivan algebra,([4],12) . A Sullivan algebra is called minimal if \( dV \subset \bigwedge^+ V, \bigwedge^+ V \).

Definition 1 A Sullivan model for a commutative cochain algebra \((A,d)\) is a quasi-isomorphism:

\[(\bigwedge V,d) \rightarrow (A,d)\]

with \((\bigwedge V,d)\) a Sullivan algebra. If \( d \) is minimal, we say that \((\bigwedge V,d)\) is a minimal Sullivan model.
Any cochain algebra has a minimal Sullivan model. If $H^1(A,d) = 0$, then two minimal Sullivan models are isomorphic. Any path connected space $X$ admits a Sullivan model which is the Sullivan model of the cochain algebra $A_{PL}(X)$, where $A_{PL}$ denotes the contravariant functor of piecewise linear differential forms. Any simply connected space admits a minimal Sullivan model which contains all the informations on the rational homotopy type of the space, ([4], 12).

2.2 Differential graded Lie algebras

In the following we consider only differential graded Lie algebras: $L = (L_i)_{i\geq 1}$ and the differential has degree $-1$.

Recall that $TV$ denotes the tensor algebra on a graded vector space $V$, it is a graded Lie algebra if we endow it with the commutator bracket. The sub Lie algebra generated by $V$ is called the free graded Lie algebra on $V$ and it is denoted $L(V)$. A free differential Lie algebra $(L(V), \partial)$ is called minimal if $\partial(V) \subset [L(V), L(V)]$.

**Definition 2** A free Lie model of a chain Lie algebra $(L, d)$ is a quasi-isomorphism of differential Lie algebras of the form

$$m : (L(V), \partial) \to (L, d)$$

If $\partial$ is minimal, it is called a minimal free Lie model. Every chain Lie algebra $(L, \partial)$ admits a minimal free Lie model, unique up to isomorphism. Every simply connected space has a minimal free Lie model $(L(V), \partial)$ containing all the informations on the rational homotopy type of the space, ([4], 24) called the minimal Quillen model.

A differential graded Lie algebra is called a model for a space $Y$ if its minimal free Lie model is the minimal Quillen of the space.

2.3 Dictionary between Sullivan models and Lie models

A way of constructing Sullivan algebras from differential graded Lie algebras is given by the functor $C^*$ which is obtained by dualizing the Cartan-Chevalley construction that associates a cocommutative differential coalgebra to a differential Lie algebra, ([4], 23). In fact $C^*(L, d_L)$ is a Sullivan algebra $(\wedge V, d)$ with differential $d = d_0 + d_1$, $d_0(V) \subset V$ and $d_1(V) \subset \wedge^2(V)$. More precisely $V$ and $sL$ are dual graded vector spaces, $d_0$ is dual of $d_L$, $d_1$ corresponds by duality to the Lie bracket on $L$. 

4
2.4 Formal commutative differential algebras and formal spaces

Definition 3 A commutative cochain algebra \((A,d)\) is formal if its minimal model is quasi-isomorphic to \((H = H^*(A,d),0)\). A space \(M\) whose Sullivan minimal model \((\bigwedge V,d)\) is quasi-isomorphic to \((H^*(M),0)\) is called formal.

Examples of formal spaces are given by Eilenberg-Mac Lane spaces, spheres, complex projective spaces. Connected compact Kähler manifolds (2) and quotients of compact connected Lie groups by closed subgroups of the same rank are formal. Symplectic manifolds need not be formal. Product and wedge of formal spaces are formal.

We give now a property for the conservation of formality between two cochain algebras, it will be a key point in the proof of the main theorem. A variant of this result is proved in (3).

Proposition 2.1 Let \((A,d_A)\) and \((B,d_B)\) two commutative differential graded algebras satisfying \(H^1(A) = 0\). We assume that there exist two CDGA morphisms \(f : (A,d_A) \rightarrow (B,d_B)\) and \(g : (B,d_B) \rightarrow (A,d_A)\) satisfying: \(g \circ f = Id\). If \((B,d_B)\) is formal, then \((A,d_A)\) is formal.

Proof: From (6,9), on (4,14), the morphism \(f\) has a Sullivan minimal model, ie, there exists a commutative diagram of CDGA algebras:

\[
\begin{array}{ccc}
(A,d_A) & \xrightarrow{f} & (B,d_B) \\
\downarrow m_A & & \uparrow m_B \\
(\bigwedge U,d) & \xrightarrow{i} & (\bigwedge U \otimes \bigwedge V,d')
\end{array}
\]

where \((\bigwedge U,d)\) is a Sullivan minimal algebra, \((\bigwedge U,d) \rightarrow (\bigwedge U \otimes \bigwedge V,d')\) is a minimal relative Sullivan algebra and the vertical maps are quasi-isomorphisms. The existence of \(g\) satisfying \(g \circ f = Id\) implies that there exists a retraction \(q : (\bigwedge U \otimes \bigwedge V,d') \rightarrow (\bigwedge U,d)\) satisfying \(q \circ i\) homotopic to the identity map. A classical argument implies that \(d'\) is minimal. Now we use the fact that \((B,d_B)\) is formal, so there exists a CDGA map \(\rho : (\bigwedge U \otimes \bigwedge V,d') \rightarrow (H^*(B),0)\) such that \(\rho^* = m_B^*\). Consider

\[\theta = g^* \circ \rho \circ i : (\bigwedge U,d) \rightarrow (H^*(A),0)\]

Then we have: \(\theta^* = g^* \circ \rho^* \circ i^* = g^* \circ m_B^* \circ i^* = g^* \circ f^* \circ m_A^* = m_A^*\). This proves that \((A,d_A)\) is formal.
3 Proof of the main theorem

It relies on the results of [8] and [10] and does not use the computations of [5] or [1]. We begin by working with a Lie model for the space $\mathcal{F}(X,Y)$.

Recall that if $X$ is a nilpotent space with finite dimensional cohomology, it has a finite dimensional model in the category of commutative differential graded algebras.

**Proposition 3.1** ([8], section 6), ([10] theorem 1). Let $X$ be a nilpotent space such that there exists $p \geq 1$ with $H^p(X, \mathbb{Q}) \neq 0$ and $H^n(X, \mathbb{Q}) = 0$ if $n > p$. Let $Y$ be a $m$-connected space with $m \geq p + 1$. If $(A, d_A)$ is a finite dimensional model of $X$ satisfying $A^n = 0$ if $n > p$. If $(L, d_L)$ is a Lie model of $Y$, then $(A \otimes L, D)$ is a Lie model for the space $\mathcal{F}(X,Y)$ where the structure of differential graded Lie algebra on $A \otimes L$ is the following:

1. $| a \otimes l | = - | a | + | l |$ if $a \in A$, $l \in L$
2. $[a \otimes l, a' \otimes l'] = (-1)^{|a'| |l|}aa' \otimes [l, l']$
3. $D(a \otimes l) = d_A a \otimes l + (-1)^{|a|}a \otimes d_L(l)$

Furthermore the projection: $(A, d_A) \mapsto A^0 = \mathbb{Q}$ extends to a morphism of differential Lie algebras: $(A \otimes L, D) \rightarrow (L, d_L)$ which is a model of the fibration $p : \mathcal{F}(X,Y) \rightarrow Y$, defined by $p(f) = f(x_0)$ if $x_0$ is a fixed point in $X$ and the inclusion $\mathbb{Q} \hookrightarrow A$ extends to a morphism of differential Lie algebras which is a model of the section of the fibration $p$.

**Proposition 3.2** Let $X$ be a space satisfying the hypothesis of the main theorem. Let $(A, d_A)$ be a finite dimensional model of $X$. Then there exists an exterior algebra $\bigwedge t$ with $| t | = 2d + 1 \geq 1$ and morphisms $i : (\bigwedge t, 0) \rightarrow (A, d_A)$, $q : (A, d_A) \rightarrow (\bigwedge t, 0)$ in the CDGA category satisfying: $q \circ i = Id$.

**Proof of proposition 3.2.** If $X$ has a minimal Sullivan model $(\bigwedge V, d)$ with $\text{Ker} d \cap V_{\text{odd}} \neq 0$. Let $t$ be an odd generator of $V$ with $dt = 0$ and $| t | = 2d + 1$. We denote by $i_0$ the inclusion $(\bigwedge t, 0) \rightarrow (\bigwedge V, d)$, the linear projection $V \hookrightarrow \bigwedge t$ extends to a morphism of differential algebras $q_0 : (\bigwedge V, d) \rightarrow (\bigwedge t, 0)$ since $d$ is minimal. Let $m : (\bigwedge V, d) \rightarrow (A, d_A)$ be the finite dimensional model of $X$ described in ([10] page 146), from the construction of $(A, d_A)$, it is easy to check that $q_0$ factors through $(A, d_A)$, ie, there exists $q : (A, d_A) \rightarrow (\bigwedge t, 0)$ such that $q \circ m = q_0$. Put $i = m \circ i_0$ then we have: $q \circ i = Id$. 

Corollary 3.3  Let X be a space satisfying the hypothesis of the main theorem. If \( \mathcal{F}(X, Y) \) is formal then there exists an integer \( 2d + 1 \geq 1 \) such that \( \mathcal{F}(S^{2d+1}, Y) \) is formal.

Proof of the corollary. Using propositions 3.1 and 3.2, we define differential Lie morphisms \( I = i \otimes \text{Id} : (\bigwedge t, 0) \otimes (L, d_L) \rightarrow (A, d_A) \otimes (L, d_L) \) and \( Q = q \otimes \text{Id} : (A, d_A) \otimes (L, d_L) \rightarrow (\bigwedge t, 0) \otimes (L, d_L) \) satisfying \( Q \circ I = \text{Id} \). Here \( (A, d_A) \) is a finite dimensional model of \( X \) in the category CDGA, \( (L, d_L) \) is a Lie model of \( Y \) and \( (\bigwedge t, 0) \) is a finite model of \( S^{2d+1} \). Let \( \mathcal{C}^* \) be the functor defined in section 2 from the category of differential Lie algebras to the category of commutative differential algebras. Denote \( g = \mathcal{C}^*(I) : \mathcal{C}^*(A \otimes L) \rightarrow \mathcal{C}(\bigwedge t \otimes L) \) and \( f = \mathcal{C}^*(Q) : \mathcal{C}(\bigwedge t \otimes L) \rightarrow \mathcal{C}^*(A \otimes L) \). Since \( f \) and \( g \) are two morphisms in the category CDGA, we use Proposition 2.1 to conclude.

Using Proposition 2.1, Proposition 3.1 and the methods developed in the proof of the corollary above, we can deduce the following proposition which is also proved in \([3]\) and \([11]\).

Proposition 3.4  Let \( X \) be a nilpotent space such that there exists \( p \geq 1 \) with \( H^p(X, \mathbb{Q}) \neq 0 \) and \( H^n(X, \mathbb{Q}) = 0 \) if \( n > p \). Let \( Y \) be a \( m \)-connected space with \( m \geq p + 1 \). If \( \mathcal{F}(X, Y) \) is formal, then \( Y \) is formal.

Now we will finish the proof of the main theorem using similar arguments to those developed in \([3]\), so we come back to the category CDGA. We have proved that \( \mathcal{F}(X, Y) \) is formal. We will work with its bigraded minimal model \( (\bigwedge Z, d) \) in the sense of Halperin-Stasheff. \([7]\). Let \( \tilde{Z}^n = Z^{n+p} \) and \( \tilde{Z} = \oplus \tilde{Z}^n \), the identity map \( S \) defined by \( S(z) = \tilde{z} \) is extended to an algebra derivation of degree \(-p\), and it is clear that \( (\bigwedge (Z \oplus \tilde{Z}), d) \) is a minimal Sullivan model of \( \mathcal{F}(S^p, Y) \) where \( d(\tilde{z}) = -S(dz) \).

A slight generalization of lemme 3 in \([3]\) can be formulated as follows.
Lemma 3.5 Let $X = S^p$ and $Y$ be spaces satisfying the hypothesis of the main theorem. If $\mathcal{F}(S^p,Y)$ is formal and $(\wedge Z, d)$ is the bigraded minimal model of $Y$, then the minimal Sullivan algebra $(\wedge (Z \oplus \bar{Z}), d)$ bigraded by $(\bar{Z})_n = (Z_n)$ is the bigraded model of $\mathcal{F}(S^p,Y)$ in the sense of Halperin-Stasheff.

Recall a key lemma (lemme 1) in [3].

Lemma 3.6 Let $(\wedge (W_0 \oplus W_+), d)$ be the bigraded minimal model of a formal space such that $\dim W_0 < \infty$. Then for any nonzero element in $W_+^{even}$, there exist an element $w' \in W_+^{odd}$, an integer $n \geq 2$, and a decomposable element $\Omega$ without nonzero component in $w^n$ such that $dw' = w^n + \Omega$.

Consider the bigraded model of $\mathcal{F}(S^p,Y)$ defined by lemma 3.5. Suppose that $Z_+^{even} \neq 0$ and consider a nonzero element $\bar{z} \in \bar{Z}^{even}$. Since $d(\bar{Z}) \subset \bar{Z} \cdot \wedge Z$, there does not exist element $w' \in Z \oplus \bar{Z}$ such that $dw' = \bar{z}^n + \Omega$ for some $n \geq 2$. Since $p$ is odd, we get that $Z_+^{odd} = 0$. If we apply lemma 3.6 to $(\wedge Z, d)$ we get $Z_+^{even} = 0$. Finally we have $Z = Z_0$ and $d = 0$.

This completes the proof of the main theorem. We note that if $p$ was even we could not conclude.

4 A counterexample to the non-formality of $\mathcal{F}(S^p,Y)$ when $p$ is even.

Let $Y = K(\mathbb{Q}, 4) \vee K(\mathbb{Q}, 4)$, it is a 3-connected space whose minimal Sullivan model is $(\wedge (x_1, x_2, y), d)$ with $dx_1 = 0$, $dx_2 = 0$, $dy = x_1 x_2$, $| x_1 | = | x_2 | = 4$ and $| y | = 7$. We have $H^*(Y, \mathbb{Q}) = \mathbb{Q}[x_1, x_2]/(x_1 x_2)$ and $Y$ is formal. The propositions proved in section 3 show that a minimal model of $\mathcal{F}(S^2, Y)$ is the following:

$$(\wedge, d) = (\wedge (x_1, x_2, y, \bar{x}_1, \bar{x}_2, \bar{y}), d)$$

with $| \bar{x}_1 | = | \bar{x}_2 | = 2$ and $| \bar{y} | = 5$. We have $d\bar{x}_1 = d\bar{x}_2 = 0$ and $d\bar{y} = \bar{x}_1 x_2 + x_1 \bar{x}_2$. It is easy to check that the polynomials $(dy, d\bar{y})$ form a regular sequence in $\mathbb{Q}[x_1, x_2]$ so $(\wedge, d)$ is a Koszul complex, hence it is formal.
