COEFFICIENT IDENTIFICATION IN PARABOLIC EQUATIONS WITH FINAL DATA

FAOUZI TRIKI

Abstract. In this work we determine the second-order coefficient in a parabolic equation from the knowledge of a single final data. Under assumptions on the concentration of eigenvalues of the associated elliptic operator, and the initial state, we show the uniqueness of solution, and we derive a Lipschitz stability estimate for the inversion when the final time is large enough. The Lipschitz stability constant grows exponentially with respect to the final time, which makes the inversion ill-posed. The proof of the stability estimate is based on a spectral decomposition of the solution to the parabolic equation in terms of the eigenfunctions of the associated elliptic operator, and an ad hoc method to solve a nonlinear stationary transport equation that is itself of interest.

1. Introduction and main results

Let $\Omega$ be a $C^3$ bounded domain of $\mathbb{R}^n$, $n = 2, 3$, with a boundary $\Gamma$. Let $\nu(x)$ be the outward unitary normal vector at $x \in \Gamma$. For $a_+ > 1$, a fixed constant, and $a_0 \in C^1(\Gamma)$, a given function, set

$$A = \left\{ a \in C^1(\Omega) : 1 \leq a(x); a|_\Gamma = a_0; \|a\|_{C^1(\Omega)} \leq a_+ \right\}.$$ 

Consider, for $u_0 \in L^2(\Omega)$ and $a \in A$, the following initial-boundary value problem

$$\begin{cases}
    u_t - \text{div}(a \nabla u) = 0 & \text{in } \Omega \times [0, +\infty[,
    \\
    u = 0 & \text{on } \Omega \times [0, +\infty[,
    \\
    u = u_0 & \text{in } \Omega \times \{0\}.
\end{cases}$$

(1)

The parabolic system (1) is used to describe a wide variety of time-dependent phenomena, including heat conduction, particle diffusion, and pricing of derivative investment instruments. It is well known that the system (1) has a unique solution $u(x,t) \in C^0([0, +\infty[; L^2(\Omega)) \cap C^0([0, +\infty[; H^2(\Omega) \cap H^1_0(\Omega))$ [11].

The goal of this work is to study the following inverse problem (P): Given $u(x,T) \in H^2(\Omega)$ for $T > 0$, to find $a \in A$ such that $u$ is a solution to the system (1).

This inverse problem finds applications in multi-wave imaging and geophysics [3, 5, 13, 21]. It can be seen as an extension to a non-stationary setting of a well known inverse elliptic problem with interior data, for which uniqueness and stability have been already derived [1, 4, 10]. In such an elliptic context, it can be seen that boundary information on the coefficient $a$ is needed, as well as a unique continuation property of the gradient of solutions. Notice that in dimension one a solution of an inverse problem similar to (P) was given under some special assumptions on the boundary data [14]. The inverse problem (P) was recently cited among few other open inverse problems in [2]. Reviews for results concerning inverse problems for parabolic equations can be found in the following books [6, 11, 15].

In this paper we show that the inverse problem (P) has a unique solution, and we derive stability estimates for the inversion under some assumptions on the point spectrum distribution of the associated elliptic
operator, the initial state $u_0$, and the observation time $T$.

It is well known that the unbounded operator $L_a : L^2(\Omega) \rightarrow L^2(\Omega)$, defined by
\[ L_a := -\text{div}(a \nabla \cdot) , \]
with a Dirichlet boundary condition on $\Gamma$, is self-adjoint, strictly positive operator with a compact resolvent [17]. Its domain is given by $D(L_a) = H^1_0(\Omega) \cap H^2(\Omega)$.

The uniqueness and stability estimate presented here depend in an intricate way on the distribution of the eigenvalues of $L_a$. We denote by $\lambda_k, k \in \mathbb{N}^*$, the eigenvalues of $L_a$ arranged in a non-decreasing order and repeated according to multiplicity. We also introduce the strictly ordered eigenvalues $\tilde{\lambda}_k, k \in \mathbb{N}^*$. Notice that the first two values of both sequences coincide.

**Definition 1.1.** We say that $L_a$ satisfies the property (G) with constants $\gamma \geq 0$ and $\delta > 0$ if its eigenvalues $\lambda_k, k \in \mathbb{N}^*$, verify the following gap condition:
\[ \tilde{\lambda}_{k+1} - \lambda_k \geq \delta \tilde{\lambda}_k^{-\gamma}, \quad k \in \mathbb{N}^*. \]

**Remark 1.1.** It is well known that under a non-trapping condition the operator $L_a$, subject to a Dirichlet boundary condition satisfies the property (G) with $\gamma = 0$, and $\delta > 0$ is a constant depending only on $a$ and $\Gamma$ [8,9]. The property (G) is also somehow related to the boundary observability problem for Schrödinger and wave equations in control theory [8,23].

The obtained stability estimate require that the property (G) be satisfied by the operator $L_a$. Therefore for $\gamma \geq 0$, and $\delta > 0$ some fixed constants, we introduce the set
\[ A_0 = \{ a \in A : L_a \text{ satisfies property (G) with fixed constants } \gamma \geq 0 \text{ and } \delta > 0 \}. \]

**Theorem 1.1.** Let $a, \tilde{a} \in A_0$, and $d_\Omega(x)$ be the distance of $x$ to the boundary $\Gamma$. Denote $u(x,t)$ and $\tilde{u}(x,t)$ the solutions to the system (1) with respectively diffusion coefficients $a$ and $\tilde{a}$. Assume that $\int_\Omega u_0(x) d_\Omega(x) dx \neq 0$. Then there exist $T_0 > 0$ and $C > 0$ depending on $A_0$, $u_0$, $n$, and $\Omega$, such that the following stability estimate holds
\[ \| a - \tilde{a} \|_{L^2(\Omega)} \leq C e^{^A_1 T} \| u(\cdot, T) - \tilde{u}(\cdot, T) \|_{H^2(\Omega)} , \]
for all $T > T_0$, where $\lambda^1_1$ is the first eigenvalue of the Dirichlet Laplacian on $\Omega$.

**Remark 1.2.** The stability estimate implies the uniqueness of the inverse problem (P). The exponential growth of the Lipschitz stability constant (3) shows that the inversion is in general ill-posed. The exponential growth constant $A_1, \lambda^1_1$ can actually be replaced by $\min(\lambda_1, \tilde{\lambda}_1)$, where $\lambda_1$ is the first eigenvalue of $L_a$. The required regularity on the right hand side of the stability estimate seems to be optimal, as for the inverse elliptic problem with interior data [1].

The proof is based on a particular decomposition of $-\partial_t u(x,T)$. The principal idea is to substitute $-\partial_t u(x,T)$ in the parabolic equation of the system (1) by $\tilde{\lambda}_1 u(x,T) + F(a;x,T)$, where $a \rightarrow F(a;x,T)$ is a Lipschitz non-linear function with Lipschitz constant that decays faster than $u(x,T)$ when $T$ tends towards infinity. Moreover the function $F(a;x,T)$ is independent of the data $u(x,T)$, and can be entirely recovered from the knowledge $a$, $u_0$, and $\Omega$. In this regard, the unknown coefficient $a$ satisfies a nonlinear stationary transport equation
\[ \text{div}(a \nabla u(x,T)) = -\tilde{\lambda}_1 u(x,T) + F(a;x,T), \quad x \in \Omega. \]
Since $F(a;x,T)$ decays faster than $u(x,T)$ in $L^2(\Omega)$ for large $T$, the system above can be considered as a nonlinear perturbation of a stationary linear transport equation
\[ \text{div}(a \nabla u(x,T)) = -\lambda_1 u(x,T), \quad x \in \Omega. \]
Consequently, by solving the simplified linear equation above, we shall be able to derive the global stability estimate for the nonlinear one using classical perturbation methods. The detailed proof is presented at the
The paper is organized as follows. The first section is dedicated to some useful properties of the solution $u$ of the system \((1)\) including its spectral decomposition. In section 2, we provide the proof of the main Theorem 1.1. In appendix A, we recall some known useful properties of the eigenvalues and eigenfunctions of elliptic operators in a divergence form.

2. Preliminaries results

We first derive some properties of the eigenelements of the unbounded operator $L_a$. Considering $\tilde{a}$ as a perturbation of the coefficient $a$, we derive an upper bound of the perturbation of eigenelements of $L_a$ in terms of $\|a - \tilde{a}\|_{L^2(\Omega)}$.

**Theorem 2.1.** Let $a, \tilde{a} \in A$, and $(\lambda_k)_{k \in \mathbb{N}^*} \subset \mathbb{R}^*$ (resp. $(\tilde{\lambda}_k)_{k \in \mathbb{N}^*} \subset \mathbb{R}^*$) be respectively the increasing sequence of eigenvalues of $L_a$ (resp. $L_{\tilde{a}}$). Then

\[
|\lambda_k - \tilde{\lambda}_k| \leq C \min(\lambda_k, \tilde{\lambda}_k) \|a - \tilde{a}\|_{L^2(\Omega)},
\]

where $C > 0$ is a constant that depends only on $n, A$ and $\Omega$.

*Proof.* Without loss of generality we assume that $\lambda_k \geq \tilde{\lambda}_k$.

Denote by $\phi_k, k \in \mathbb{N}^*$ (resp. $\tilde{\phi}_k, k \in \mathbb{N}^*$) the orthonormal sequence of eigenfunctions of $L_a$ (resp. $L_{\tilde{a}}$) associated to $\lambda_k, k \in \mathbb{N}^*$ (resp. $\lambda_k, k \in \mathbb{N}^*$).

Recall the Min-max characterization of the eigenvalues $(\tilde{\lambda}_k)_{k \in \mathbb{N}^*}$ [19]

\[
\tilde{\lambda}_k = \min_{\Phi_k \subset H_0^1(\Omega)} \max_{\dim(\Phi_k) = k} \frac{\int_{\Omega} \tilde{a} |\nabla \phi|^2 dx}{\int_{\Omega} |\phi|^2 dx}.
\]

In the expression above the minimum is achieved when $\Phi_k$ coincides with the finite dimension space generated by $\tilde{V}_k := \{\tilde{\phi}_l : l \leq k\}$. Therefore

\[
\lambda_k - \tilde{\lambda}_k \leq \max_{\phi \in \tilde{V}_k \setminus \{0\}} \frac{\int_{\Omega} a |\nabla \phi|^2 dx}{\int_{\Omega} |\phi|^2 dx} - \max_{\phi \in V_k \setminus \{0\}} \frac{\int_{\Omega} \tilde{a} |\nabla \phi|^2 dx}{\int_{\Omega} |\phi|^2 dx}.
\]

Since $\tilde{V}_k$ is a finite dimension space the first maximum is reached at some vector $\tilde{\psi}_k \in \tilde{V}_k \setminus \{0\}$, satisfying $\int_{\Omega} |\tilde{\psi}_k|^2 dx = 1$. Hence

\[
\lambda_k - \tilde{\lambda}_k \leq \int_{\Omega} a |\nabla \tilde{\psi}_k|^2 dx - \int_{\Omega} \tilde{a} |\nabla \tilde{\psi}_k|^2 dx \leq \|a - \tilde{a}\|_{L^2(\Omega)} \left( \int_{\Omega} |\nabla \tilde{\psi}_k|^4 dx \right)^{1/4}.
\]

Since $\tilde{\psi}_k \in \tilde{V}_k \setminus \{0\}$, there exists a real valued sequence $\alpha_l, l \leq k$, satisfying $\sum_{l=1}^k \alpha_l^2 = 1$, and $\tilde{\psi}_k = \sum_{l=1}^k \alpha_l \tilde{\phi}_l$. Therefore, $\tilde{\psi}_k$ verifies the following elliptic equation

\[
L_a \tilde{\psi}_k = \sum_{l=1}^k \alpha_l \lambda_l \tilde{\phi}_l.
\]

We then deduce from the classical elliptic regularity (Theorem 8.12 in [17])

\[
\|\tilde{\psi}_k\|_{H^2(\Omega)} \leq C_1 \left\| \sum_{l=1}^k \alpha_l \lambda_l \tilde{\phi}_l \right\|_{L^2(\Omega)} \leq C_1 \tilde{\lambda}_k,
\]

where $C_1 > 0$ depends only on $n, A$ and $\Omega$. 

end of section 2.
Classical Sobolev interpolation inequalities for \( n = 2, 3 \), give [17]

\[
\|\nabla \tilde{\psi}_k\|_{L^4(\Omega)} \leq C_2 \|\nabla \tilde{\psi}_k\|_{L^2(\Omega)}^{1-\frac{2}{n}} \|\tilde{\psi}_k\|_{H^2(\Omega)}^{\frac{2}{n}},
\]

where \( C_2 > 0 \) depends only on \( n \) and \( \Omega \).

By a simple calculation, and using the fact that \( \|\nabla \phi_l\|_{L^2(\Omega)}^2 \leq \lambda_l, \ l \in \mathbb{N}^* \), we obtain

\[
\|\nabla \tilde{\psi}_k\|_{L^2(\Omega)} \leq \tilde{\lambda}_k.
\]

Combining inequalities (7), (8) and (9), we get

\[
\|\nabla \tilde{\psi}_k\|_{L^4(\Omega)} \leq C_3 \tilde{\lambda}_k^{\frac{n+4}{4n}},
\]

where \( C_3 > 0 \) depends only on \( n, A \) and \( \Omega \). We then deduce from (6)

\[
\lambda_k - \tilde{\lambda}_k \leq C_3 \|a - \tilde{a}\|_{L^2(\Omega)} \lambda_k^{1 + \frac{1}{n}},
\]

which achieves the proof of the theorem.

\[\square\]

Remark 2.1. The estimate (4) may not be optimal. The objective here was to obtain an inequality with an uniform constant for all functions \( a, \tilde{a} \in A \).

Theorem 2.2. Let \( a, \tilde{a} \in A_0 \). Let \( P_k \) (resp. \( \tilde{P}_k \)) be the orthogonal projection onto the eigenspace of \( L_a \) (resp. \( L_{\tilde{a}} \)) corresponding to the eigenvalue \( \lambda_k \) (resp. \( \tilde{\lambda}_k \)). There exist constants \( \eta > 0 \) and \( C > 0 \) that depend only on \( n, A_0 \), and \( \Omega \), such that if

\[
\|a - \tilde{a}\|_{L^2(\Omega)} \leq \eta \max(\lambda_k, \tilde{\lambda}_k)^{-(1+\gamma+\frac{1}{n})},
\]

then, the following estimate

\[
\|P_k - \tilde{P}_k\|_{L^2(\Omega)} \leq C(\max(\lambda_k, \tilde{\lambda}_k)^{\gamma+1} + 1)^2 \|a - \tilde{a}\|_{L^2(\Omega)}.
\]

holds.

Proof. In the proof \( C > 0 \) denotes a generic constant depending \( n, A_0 \), and \( \Omega \). Without loss of generality we further assume that \( \lambda_k \geq \tilde{\lambda}_k \).

Since \( a, \tilde{a} \in A_0 \), the gap condition (2) implies

\[
B_{\rho_k}(\lambda_k) \cap \{\lambda_l, l \in \mathbb{N}^*\} = \{\lambda_k\}, \quad B_{\rho_k}(\tilde{\lambda}_k) \cap \{\tilde{\lambda}_l, l \in \mathbb{N}^*\} = \{\tilde{\lambda}_k\},
\]

where \( B_{\rho_k}(z) \) is the complex disc of center \( z \in \mathbb{C} \), and radius \( \rho_k = \frac{4}{4\lambda_k^\gamma} \).

On the other hand estimate (4) leads to

\[
|\lambda_k - \tilde{\lambda}_k| \leq C\lambda_k^{1+\frac{1}{n}} \|a - \tilde{a}\|_{L^2(\Omega)}.
\]

Now, combining inequalities (13) and (10), we have

\[
|\lambda_k - \tilde{\lambda}_k| \leq C\eta^{-\frac{1}{n}} \rho_k.
\]

Choosing \( \eta > 0 \) small enough such that \( C\eta < 1 \), we obtain

\[
\tilde{\lambda}_k \in B_{\rho_k}(\lambda_k).
\]

Therefore, we also have

\[
B_{\rho_k}(\lambda_k) \cap \{\tilde{\lambda}_l, l \in \mathbb{N}^*\} = \{\tilde{\lambda}_k\}.
\]
Consequently, the resolvents \((\lambda I - L_a)^{-1}\) and \((\lambda I - L_\hat{a})^{-1}\) are well defined as operators from \(L^2(\Omega)\) onto \(H_0^1(\Omega) \cap H^2(\Omega)\) for all \(\lambda \in \partial B_{\rho_k}(\hat{\lambda}_k)\). In addition, by the well-known Riesz formula, we get [16]

\[
P_k = -\frac{1}{2i\pi} \int_{|\lambda - \hat{\lambda}_k| = \rho_k} (\lambda I - L_a)^{-1}d\lambda, \quad \tilde{P}_k = -\frac{1}{2i\pi} \int_{|\lambda - \hat{\lambda}_k| = \rho_k} (\lambda I - L_\hat{a})^{-1}d\lambda,
\]

where \(t \in \mathbb{C}\) is the imaginary complex number, and \(I\) is the identity operator.

Hence

\[
P_k - \tilde{P}_k = \frac{1}{2i\pi} \int_{|\lambda - \hat{\lambda}_k| = \rho_k} (\lambda I - L_a)^{-1}(L_a - L_\hat{a})(\lambda I - L_\hat{a})^{-1}d\lambda.
\]

Since \(P_k\) and \(\tilde{P}_k\) are orthogonal projections, \(P_k - \tilde{P}_k\) is a self-adjoint bounded operator from \(L^2(\Omega)\) to itself.

Consequently

\[
\|P_k - \tilde{P}_k\|_{L^2(\Omega)} = (2\pi)^{-1} \sup_{\lambda \in \partial B_{\rho_k}(\hat{\lambda}_k), f \in W_k, \|f\|_{L^2(\Omega)} = 1} \left| \langle (L_a - L_\hat{a})\tilde{u}_f^\lambda, u_f^\lambda \rangle_{L^2(\Omega)} \right|,
\]

\[
= (2\pi)^{-1} \sup_{\lambda \in \partial B_{\rho_k}(\hat{\lambda}_k), f \in W_k, \|f\|_{L^2(\Omega)} = 1} \left| \int_{\Omega} (a - \tilde{a})\nabla u_f^\lambda \nabla \tilde{u}_f^\lambda dx \right|,
\]

\[
\leq (2\pi)^{-1}\|a - \tilde{a}\|_{L^2(\Omega)} \sup_{\lambda \in \partial B_{\rho_k}(\hat{\lambda}_k), f \in W_k, \|f\|_{L^2(\Omega)} = 1} \|\nabla u_f^\lambda\|_{L^4(\Omega)} \|\nabla \tilde{u}_f^\lambda\|_{L^4(\Omega)},
\]

(17)

where \(u_f^\lambda = (\lambda I - L_a)^{-1}f\), \(\tilde{u}_f^\lambda = (\lambda I - L_\hat{a})^{-1}f\), and \(W_k\) is the finite dimension vector space in \(L^2(\Omega)\), spanned by the eigenfunctions associated to \(\hat{\lambda}_k\), and \(\tilde{\lambda}_k\).

By construction, we have

\[
\|u_f^\lambda\|_{L^2(\Omega)}, \|\tilde{u}_f^\lambda\|_{L^2(\Omega)} \leq \frac{1}{\rho_k}
\]

(18)

Similar to the proof of Theorem 2.1, we deduce from the classical elliptic regularity

\[
\|u_f^\lambda\|_{H^2(\Omega)} \leq C(\lambda\|u_f^\lambda\|_{L^2(\Omega)} + 1), \quad \|\tilde{u}_f^\lambda\|_{H^2(\Omega)} \leq C(\lambda\|u_f^\lambda\|_{L^2(\Omega)} + 1),
\]

which associated to inequalities (18), provide

\[
\|u_f^\lambda\|_{H^2(\Omega)}, \|\tilde{u}_f^\lambda\|_{H^2(\Omega)} \leq C\left(\frac{\lambda}{\rho_k} + 1\right).
\]

(19)

Sobolev embedding Theorem gives [17]

\[
\|\nabla u_f^\lambda\|_{L^4(\Omega)} \leq C\|u_f^\lambda\|_{H^2(\Omega)}, \quad \|\nabla \tilde{u}_f^\lambda\|_{L^4(\Omega)} \leq C\|\tilde{u}_f^\lambda\|_{H^2(\Omega)}.
\]

(20)

Combining estimates (19) and (20), we finally obtain

\[
\|\nabla u_f^\lambda\|_{L^4(\Omega)}, \|\nabla \tilde{u}_f^\lambda\|_{L^4(\Omega)} \leq C\left(\frac{\lambda}{\rho_k} + 1\right).
\]

(21)

We infer from (17)

\[
\|P_k - \tilde{P}_k\|_{L^2(\Omega)} \leq C(\lambda_k^{\gamma+1} + 1)^2\|a - \tilde{a}\|_{L^2(\Omega)}.
\]

\(\square\)
3. Proof of Theorem 1.1

We first introduce the nonlinear function $F(a; x, T)$, and show that its Lipschitz continuous modulus with respect to $a$, decays faster than $u(x, T)$ for large $T$. Without loss of generality we further assume that $\int_{\Omega} u_0(x) d\Omega(x) dx > 0$.

Define for $a \in A_0$ and $T > 0$, the nonlinear function $F(a; x, T) \in L^2(\Omega)$, by

$$F(a; x, T) = \partial_t u(x, T) + \hat{\lambda}_1 u(x, T), \quad x \in \Omega,$$

where $u$ is the unique solution of the system (1).

**Theorem 3.1.** Let $a, \bar{a} \in A_0$. Then there exists a constant $C > 0$ that depends only on $\theta, \Omega, n, u_0$ and $A_0$, such that the inequality

$$\|F(a; x, T) - F(\bar{a}; x, T)\|_{L^2(\Omega)} \leq Ce^{-\min(\hat{\lambda}_k, \hat{\lambda}_2)T}\|a - \bar{a}\|_{L^2(\Omega)},$$

is valid for all $T \geq 1$.

**Proof.** In the proof $C > 0$ denotes a generic constant depending on $n, A_0, u_0$, and $\Omega$.

We start the proof by writing the decomposition of $F(a; x, T)$ (resp. $F(\bar{a}; x, T)$) in terms of the eigenfunctions of the elliptic operator $L_a$ (resp. $L_{\bar{a}}$). Recall $P_k$ (resp. $\bar{P}_k$) the orthogonal projection onto the eigenspace of $L_a$ (resp. $L_{\bar{a}}$) associated to the eigenvalue $\hat{\lambda}_k$ (resp. $\hat{\lambda}_{\bar{k}}$).

It is well known that $u$ and $\bar{u}$ have the following spectral decomposition [11]

$$u(x, t) = \sum_{k=1}^{\infty} e^{-\hat{\lambda}_k t} P_k u_0(x); \quad \bar{u}(x, t) = \sum_{k=1}^{\infty} e^{-\hat{\lambda}_{k} \bar{t}} \bar{P}_k u_0(x).$$

Forward calculations yield

$$F(a; x, T) = \sum_{k=2}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_1) e^{-\hat{\lambda}_k T} P_k u_0(x); \quad \bar{F}(a; x, T) = \sum_{k=2}^{\infty} (\hat{\lambda}_{\bar{k}} - \hat{\lambda}_1) e^{-\hat{\lambda}_{\bar{k}} \bar{T}} \bar{P}_k u_0(x).$$

Hence

$$F(a; x, T) - F(\bar{a}; x, T) = \sum_{k=2}^{\infty} \left( (\hat{\lambda}_k - \hat{\lambda}_1) e^{-\hat{\lambda}_k T} - (\hat{\lambda}_{\bar{k}} - \hat{\lambda}_1) e^{-\hat{\lambda}_{\bar{k}} T} \right) P_k u_0(x) + \sum_{k=2}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_{\bar{k}}) e^{-\hat{\lambda}_k T} \left[ P_k - \bar{P}_k \right] u_0(x) = F_1 + F_2.$$

Let $\beta_k, k \in \mathbb{N} \setminus \{0, 1\}$, defined by

$$\beta_k = \min(\hat{\lambda}_k, \hat{\lambda}_{\bar{k}}).$$

Then

$$\|F_1\|_{L^2(\Omega)}^2 \leq \sum_{k=2}^{\infty} \left[ |\hat{\lambda}_k - \hat{\lambda}_{\bar{k}}| (1 + \beta_k T) + |\hat{\lambda}_1 - \hat{\lambda} \bar{1} \bar{k} \bar{T} | \right] e^{-2\beta_k T} \|u_0\|_{L^2(\Omega)}^2.$$

Using results of Theorem 2.1 and Lemma A.2, we obtain

$$\|F_1\|_{L^2(\Omega)}^2 \leq C \sum_{k=2}^{\infty} \left[ \beta_k^2 e^{\beta_k T} \|u_0\|_{L^2(\Omega)}^2 \right] e^{-2\beta_k T} \|a - \bar{a}\|_{L^2(\Omega)}^2,$$

$$\leq C \sum_{k=2}^{\infty} \beta_k^2 e^{\beta_k T} \|u_0\|_{L^2(\Omega)}^2 \|a - \bar{a}\|_{L^2(\Omega)}^2 \leq C e^{-\beta_2 T} \sum_{k=2}^{\infty} \beta_k^2 e^{-(\beta_k - \beta_2) T} \|u_0\|_{L^2(\Omega)}^2 \|a - \bar{a}\|_{L^2(\Omega)}^2.$$
Note that by Weyl’s asymptotic formula, we have \( \lambda_k \sim C k^{\frac{1}{2}} \) for large \( k \), which guarantees the convergence of the series above [18, 19].

The results of Lemma A.3 imply
\begin{equation}
\|F_1\|_{L^2(\Omega)} \leq Ce^{-\beta_2 T}\|a - \tilde{a}\|_{L^2(\Omega)}.
\end{equation}

Since the orthogonality of the terms of the series \( F_2 \) is no longer true, and the fact that the perturbation does not affect uniformly the eigenfunctions, deriving an upper bound for \( \|F_2\|_{L^2(\Omega)} \) is more involved.

Recall that the sequences \( \hat{\lambda}_k \) and \( \tilde{\lambda}_k \) are strictly increasing. Let \( N \in \mathbb{N}^+ \) be the smallest integer satisfying
\begin{equation}
\|a - \tilde{a}\|_{L^2(\Omega)} > \eta \max(\hat{\lambda}_k, \tilde{\lambda}_k)^{-(1+\gamma+\frac{1}{2})} \geq \eta \beta_k^{-(1+\gamma+\frac{1}{2})}, \quad \forall k \geq N,
\end{equation}
where \( \eta > 0 \) is the constant introduced in Theorem 2.2.

Next, we split \( F_2 \) into two parts:
\begin{equation}
F_2 = \sum_{k=2}^{N-1} (\hat{\lambda}_k - \hat{\lambda}_1)e^{-\hat{\lambda}_k T} [P_k - \tilde{P}_k] u_0(x) + \sum_{k=N}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_1)e^{-\hat{\lambda}_k T} [P_k - \tilde{P}_k] u_0(x) = F_{21} + F_{22},
\end{equation}
with the convention that the first sum \( F_{21} = 0 \) when \( N = 2 \).

We deduce from (25) the following estimate
\begin{align*}
\|F_{22}\|_{L^2(\Omega)}^2 &\leq \eta^{-2} \sum_{k=2}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_1)^2 \beta_k^{2(1+\gamma+\frac{1}{2})} e^{-2\beta_k T} \|u_0\|_{L^2(\Omega)}^2 \|a - \tilde{a}\|_{L^2(\Omega)}^2,
&\leq \eta^{-2} e^{-2\beta_2 T} \sum_{k=2}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_1)^2 \beta_2^{2(1+\gamma+\frac{1}{2})} e^{-2(\beta_2 - \beta_2)} \|u_0\|_{L^2(\Omega)}^2 \|a - \tilde{a}\|_{L^2(\Omega)}^2.
\end{align*}

Again using the upper and lower bounds derived in Lemma A.3, we obtain
\begin{equation}
\|F_{22}\|_{L^2(\Omega)} \leq Ce^{-\beta_2 T}\|a - \tilde{a}\|_{L^2(\Omega)}.
\end{equation}

On the other hand, we have
\begin{equation}
\|F_{21}\|_{L^2(\Omega)}^2 \leq \left\| \sum_{k=2}^{N-1} (\hat{\lambda}_k - \hat{\lambda}_1)e^{-\hat{\lambda}_k T} \left[ P_k - \tilde{P}_k \right] u_0(x) \right\|_{L^2(\Omega)}^2.
\end{equation}
Cauchy-Shwartz inequality gives
\begin{equation}
\|F_{21}\|_{L^2(\Omega)}^2 \leq \left( \sum_{k=2}^{N-1} (\hat{\lambda}_k - \hat{\lambda}_1)^2 e^{-\hat{\lambda}_k T} \right)^{\frac{1}{2}} \left( \sum_{k=2}^{N-1} e^{-\hat{\lambda}_k T} \left\| P_k - \tilde{P}_k \right\|_{L^2(\Omega)}^2 \right)^{\frac{1}{2}} \|u_0\|_{L^2(\Omega)}^2.
\end{equation}
By construction, we have
\begin{equation}
\|a - \tilde{a}\|_{L^2(\Omega)} \leq \eta \max(\tilde{\lambda}_k, \hat{\lambda}_k)^{-(1+\gamma+\frac{1}{2})}, \quad \forall k \leq N - 1.
\end{equation}
Using the results of Theorem 2.2, leads to
\begin{align*}
\|F_{21}\|_{L^2(\Omega)}^2 &\leq C \left( \sum_{k=2}^{N-1} (\hat{\lambda}_k - \hat{\lambda}_1)^2 e^{-\hat{\lambda}_k T} \right)^{\frac{1}{2}} \left( \sum_{k=2}^{\infty} \left( \max(\tilde{\lambda}_k, \hat{\lambda}_k)^{\gamma+1} + 1 \right)^4 e^{-\hat{\lambda}_k T} \right)^{\frac{1}{2}} \|u_0\|_{L^2(\Omega)}^2 \|a - \tilde{a}\|_{L^2(\Omega)}^2.
&\leq Ce^{-2\beta_2 T} \left( \sum_{k=2}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_1)^2 e^{-(\hat{\lambda}_k - \hat{\lambda}_2)} \right)^{\frac{1}{2}} \left( \sum_{k=2}^{\infty} \left( \max(\tilde{\lambda}_k, \hat{\lambda}_k)^{\gamma+1} + 1 \right)^4 e^{-(\hat{\lambda}_k - \hat{\lambda}_2)} \right)^{\frac{1}{2}} \|u_0\|_{L^2(\Omega)}^2 \|a - \tilde{a}\|_{L^2(\Omega)}^2.
\end{align*}
Applying again the bounds in Lemma A.3, we get
\[ \| F_{21} \|_{L^2(\Omega)} \leq C e^{-\beta_2 T} \| a - \tilde{a} \|_{L^2(\Omega)}. \]

Finally, combining inequalities (24), (27), and (29), conducts to the desired estimate. \( \square \)

We next study the decay behavior of \( \partial_t u(x, T) \) and \( |\nabla u(x, T)|^2 \) as \( T \) tends towards infinity.

**Theorem 3.2.** Let \( a \in A_0 \), and \( u \) be the unique solution to the system (1). Then there exist \( T_1 > 0, \epsilon_0 > 0, \) and \( C > 0 \) depending only on \( A_0, \Omega, n \) and \( u_0 \) such that the following inequalities
\[ u(x, T) \geq C e^{-\lambda_1 T} \phi_1(x), \quad \forall x \in \Omega, \]
\[ -\partial_t u(x, T) \geq C e^{-\lambda_1 T} \phi_1(x), \quad \forall x \in \Omega, \]
\[ |\nabla u(x, T)|^2 \geq C e^{-2 \lambda_1 T} |\nabla \phi_1(x)|^2, \quad \forall x \in \Omega, \]
hold for all \( T \geq T_1 \), and \( 0 < \epsilon < \epsilon_0 \), with \( \Omega \epsilon = \{ x \in \Omega : d_0(x) < \epsilon \} \).

**Proof.** In the sequel \( C > 0 \) denotes a generic constant that depends only on \( A_0, \Omega, n \) and \( u_0 \). We further assume that \( T \geq 1 \).

The proof is based on the following decomposition of \( u \) in terms of the eigenfunctions of \( L_a \):
\[ u(x, t) = \sum_{k=1}^{\infty} e^{-\hat{\lambda}_k t} P_k u_0(x), \quad \forall t > 0, \ x \in \Omega. \]

For \( T \geq 1 \), we have
\[ \nabla u(x, T) = \sum_{k=1}^{\infty} e^{-\hat{\lambda}_k T} \nabla P_k u_0(x), \quad \forall x \in \Omega, \]
\[ -\partial_t u(x, T) = \sum_{k=1}^{\infty} \hat{\lambda}_k e^{-\hat{\lambda}_k T} \nabla P_k u_0(x), \quad \forall x \in \Omega. \]

Therefore
\[ -\partial_t u(x, T) \geq \hat{\lambda}_1 e^{-\hat{\lambda}_1 T} |P_1 u_0(x)| \geq \sum_{k=2}^{\infty} \hat{\lambda}_k e^{-\hat{\lambda}_k T} |P_k u_0(x)|, \]
\[ |\nabla u(x, T)|^2 \geq \frac{\hat{\lambda}_1^2}{2} e^{-2 \hat{\lambda}_1 T} \sum_{k=2}^{\infty} e^{-\hat{\lambda}_k T} |\nabla P_k u_0(x)|^2 \geq \left( \sum_{k=2}^{\infty} e^{-\hat{\lambda}_k T} |\nabla P_k u_0(x)|^2 \right)^{\frac{1}{2}} \left( \sum_{k=2}^{\infty} e^{-\hat{\lambda}_k T} \right)^{\frac{1}{2}}, \]
for all \( x \in \Omega. \)

Next, we derive the first inequality of the lemma. Using inequalities (57), we obtain
\[ -\partial_t u(x, T) \geq \left[ \hat{\lambda}_1 e^{-\hat{\lambda}_1 T} \sum_{k=2}^{\infty} e^{-\hat{\lambda}_k T} |u_0(x)|_{L^2(\Omega)} \right] \phi_1(x), \]
\[ \geq \left[ \hat{\lambda}_1 e^{-\hat{\lambda}_1 T} \sum_{k=2}^{\infty} e^{-\hat{\lambda}_k T} \| u_0(x) \|_{L^2(\Omega)} \right] \phi_1(x). \]

Since \( a \in A_0 \), the following gap condition (2), holds
\[ \hat{\lambda}_2 - \hat{\lambda}_1 \geq \frac{\delta}{\hat{\lambda}_1}. \]

Notice that the gap condition between the two first eigenvalues is always fulfilled \([18] \).
We deduce from Lemma A.3
\begin{equation}
\hat{\lambda}_2 - \hat{\lambda}_1 \geq \frac{\delta}{a + \lambda_1^T}.
\end{equation}
Hence
\begin{equation}
\partial_t u(x, T) \geq e^{-\hat{\lambda}_1 T} \left[ \hat{\lambda}_1 \|P_1 u_0(x)\|_{L^2(\Omega)} - e^{-\frac{\delta}{a + \lambda_1^T} T} \sum_{k=2}^{\infty} \lambda_k^{\frac{1}{2}} + \frac{a}{2} \|u_0\|_{L^2(\Omega)} \right] \phi_1(x).
\end{equation}
Again using Lemma A.3 leads to
\begin{equation}
|\partial_t u(x, T)| \geq e^{-\hat{\lambda}_1 T} \left[ \lambda_1^T \|P_1 u_0(x)\|_{L^2(\Omega)} - Ce^{-\frac{\lambda_1^T}{a + \lambda_1^T} T} \|u_0\|_{L^2(\Omega)} \right] \phi_1(x).
\end{equation}
On the other hand, we deduce from Lemma A.2
\begin{equation}
\|P_1 u_0(x)\|_{L^2(\Omega)} = \left| \int_{\Omega} u_0(x) \phi_1(x) \, dx \right| \geq C \int_{\Omega} u_0(x) \, d\Omega(x) \, dx.
\end{equation}
Since \( \int_{\Omega} u_0(x) \, d\Omega(x) \, dx > 0 \), we have \( \|P_1 u_0(x)\|_{L^2(\Omega)} = \int_{\Omega} u_0(x) \, d\Omega(x) \, dx \). Hence there exists a unique \( T_{11} \in \mathbb{R} \) solution to the equation
\begin{equation}
\|P_1 u_0(x)\|_{L^2(\Omega)} - Ce^{-\frac{\lambda_1^T}{a + \lambda_1^T} T_{11}} \|u_0\|_{L^2(\Omega)} = 0.
\end{equation}
Obviously \( T_{11} \) depends only on \( A_0, \Omega, n \) and \( u_0 \).

Consequently
\begin{equation}
-\partial_t u(x, T) \geq Ce^{-\hat{\lambda}_1 T} \phi_1(x), \quad \forall x \in \Omega, \ t \in [T_{11}, +\infty[,
\end{equation}
Similar analysis on \( u(x, T) \), leads to
\begin{equation}
u(x, T) \geq Ce^{-\hat{\lambda}_1 T} \phi_1(x), \quad \forall x \in \Omega, \ t \in [T_{12}, +\infty[,
\end{equation}
where \( T_{12} \in \mathbb{R} \).

Now, we shall focus on the second inequality. To do so we need to estimate \( \|\nabla \phi_k\|_{L^\infty(\Omega)} \). There are many works dealing with optimal increasing rate of \( \|\phi_k\|_{L^\infty(\Omega)} \) and \( \|\nabla \phi_k\|_{L^\infty(\Omega)} \) in terms of \( \lambda_k \), when \( k \) tends to infinity (see for instance [20, 22] and references therein). Most existing results considered the Laplacian operator or did not pay attention to the regularity of the elliptic coefficients. Since the optimal increasing rate is out of the focus of this work, we prefer here deriving similar estimates using classical elliptic regularity combined with results of Lemma A.4.

We deduce from elliptic regularity (Theorem 9.12 in [17])
\begin{equation}
\|\phi_k\|_{W^{2,n+\frac{4}{n}}(\Omega)} \leq C(1 + \hat{\lambda}_k)\|\phi_k\|_{L^{n+\frac{4}{n}}(\Omega)}.
\end{equation}
By Sobolev embedding Theorem, we have
\begin{equation}
\|\nabla \phi_k\|_{C^{\frac{1}{n+1}}(\Omega)} \leq C(1 + \hat{\lambda}_k)\|\phi_k\|_{L^\infty(\Omega)}.
\end{equation}
Lemma A.4 yields
\begin{equation}
\|\nabla \phi_k\|_{C^{\frac{1}{n+1}}(\Omega)} \leq C(1 + \hat{\lambda}_k)\hat{\lambda}_k^{\frac{1}{2}} + \frac{\hat{\lambda}_k}{2^n}.
\end{equation}
Combining (36) with (34), we get
Recall that the constants $\varepsilon(x)$ for all $x \in \mathbb{R}^n$ is valid for all $\varepsilon > 0$ small enough, $\Omega$ becomes a tubular domain, and can be parametrized by $\Omega_{\varepsilon} = \{ x + s \nu(x) : x \in \Gamma, \ 0 < s < \varepsilon \}$. We deduce from (36), the following estimate

$$|\nabla \phi_1(x + s \nu(x))| \cdot \nu(x) + \partial_s \phi_1(x) | \leq C(1 + \hat{\lambda}_1) \hat{\lambda}_1^{\frac{1}{2} + \frac{n}{2}} e^{-\frac{1}{\varepsilon} \varepsilon^{-\frac{n}{2}}}$$

for all $s \in [0, \varepsilon]$, $x \in \Gamma$. Hence

$$|\nabla \phi_1(x + s \nu(x))| \geq -\nabla \phi_1(x + s \nu(x)) \cdot \nu(x) \geq -\partial_s \phi_1(x) - C(1 + \hat{\lambda}_1) \hat{\lambda}_1^{\frac{1}{2} + \frac{n}{2}} e^{-\frac{1}{\varepsilon} \varepsilon^{-\frac{n}{2}}}, \quad \forall s \in [0, \varepsilon[, \ x \in \Gamma.$$
Now, we are ready to prove the main Theorem 1.1. Without loss of generality, we assume that \( \hat{\lambda}_2 = \min(\hat{\lambda}_2, \overline{\lambda}_2) \). Further \( C > 0 \) denotes a generic constant that depending on \( A_0, \Omega, n \) and \( u_0 \).

Since \( u \) satisfies (1), \( a \) verifies the following nonlinear transport equation
\[
\text{div}\left( \frac{a}{\lambda_1} \nabla u(x, T) \right) = -u(x, T) + \frac{1}{\lambda_1} F(a; x, T), \quad x \in \Omega. \tag{40}
\]
Similarly, \( \tilde{a} \) satisfies the following nonlinear transport equation
\[
\text{div}\left( \frac{\tilde{a}}{\lambda_1} \nabla \tilde{u}(x, T) \right) = -\tilde{u}(x, T) + \frac{1}{\lambda_1} F(\tilde{a}; x, T), \quad x \in \Omega. \tag{41}
\]

Taking the difference between the two equations (40) and (41), we get
\[
\text{div}\left( \frac{\tilde{a} - a}{\lambda_1} \nabla u(x, T) \right) = \text{div}\left( \frac{\tilde{a}}{\lambda_1} \nabla \tilde{u}(x, T) \right) + \tilde{u}(x, T) - u(x, T) + \frac{1}{\lambda_1} F(a; x, T) - \frac{1}{\lambda_1} F(\tilde{a}; x, T), \quad x \in \Omega. \tag{42}
\]

**Proposition 3.2.** There exist constants \( T_2 > 0, C > 0 \) and \( \varepsilon > 0 \) that depend only on \( \Omega, n, A_0 \) and \( u_0 \) such that the following inequalities
\[
\left| \frac{1}{\lambda_1} - \frac{1}{\tilde{\lambda}_1} \right| \leq C \left[ e^{\tilde{\lambda}_1 T} \| u - \tilde{u} \|_{L^2(\Omega)} + e^{-(\hat{\lambda}_2 - \hat{\lambda}_1) T} \| a - \tilde{a} \|_{L^2(\Omega)} \right], \tag{43}
\]
and
\[
\int_{\Omega} \left| \frac{a}{\lambda_1} - \frac{\tilde{a}}{\lambda_1} \right|^2 |\nabla \phi_1|^2 dx + \int_{\Omega} \left| \frac{\tilde{a}}{\lambda_1} - \frac{\tilde{\alpha}}{\tilde{\lambda}_1} \right|^2 |\nabla \phi_1|^2 dx \leq C \left[ e^{\tilde{\lambda}_1 T} \| u - \tilde{u} \|_{H^2(\Omega)} + e^{-(\hat{\lambda}_2 - \hat{\lambda}_1) T} \left( \| a - \tilde{a} \|_{L^2(\Omega)} + \left| \frac{1}{\lambda_1} - \frac{1}{\tilde{\lambda}_1} \right| \right) \right] \left. \left| \frac{a}{\lambda_1} - \frac{\tilde{a}}{\lambda_1} \right| \right|_{L^2(\Omega)}, \tag{44}
\]
hold for all \( T \geq T_2, \) and \( \varepsilon \in ]0, \varepsilon_0[ \).

**Proof.** Multiplying equation (42) by 1, and integrating over \( \Omega \), we obtain
\[
\left| \frac{1}{\lambda_1} - \frac{1}{\tilde{\lambda}_1} \right| \int_{\Gamma} a_0 \partial_{\nu} u(\cdot, T) ds(x) \leq C \left[ \| u - \tilde{u} \|_{L^2(\Omega)} + \left| \frac{1}{\lambda_1} - \frac{1}{\tilde{\lambda}_1} \right| \| F(a; \cdot, T) \|_{L^2(\Omega)} + \frac{1}{\tilde{\lambda}_1} \| F(\tilde{a}; \cdot, T) - F(\tilde{a}; \cdot, T) \|_{L^2(\Omega)} \right]. \tag{45}
\]
Recall
\[
\| F(a; T) \|_{L^2(\Omega)}^2 = \sum_{k=2}^{\infty} (\hat{\lambda}_k - \hat{\lambda}_1)^2 e^{-2\hat{\lambda}_k T} \| P_k u_0 \|_{L^2(\Omega)}^2,
\]
for all \( T \geq 1 \).

Consequently
\[
\| F(a; T) \|_{L^2(\Omega)} \leq C e^{-\hat{\lambda}_2 T}, \quad \forall T \geq 1. \tag{46}
\]
Applying inequalities (56), (23) and (46) to the relation (45), yields

\[
\frac{1}{\lambda_1} - \frac{1}{\lambda_1} \left| \frac{1}{\lambda_1} \right| ^{-1} \int_\Gamma a_0 \partial_t u(\cdot, T) ds(x) \leq C \left[ \| u - \bar{u} \|_{L^2(\Omega)} + e^{-\lambda_2 T} \left( \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \right) + \| a - \bar{a} \|_{L^2(\Omega)} \right].
\]

We deduce from inequalities (55), (32), and the fact that \( a_0 \geq 1 \), the following estimate

\[
e^{-\lambda_1 T} \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \leq C \left[ \| u - \bar{u} \|_{L^2(\Omega)} + e^{-\lambda_2 T} \left( \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \right) + \| a - \bar{a} \|_{L^2(\Omega)} \right].
\]

Inequality (35) gives

\[
(1 - C e^{-\theta T}) \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \leq C \left[ e^{\lambda_1 T} \| u - \bar{u} \|_{L^2(\Omega)} + e^{-(\lambda_2 - \lambda_1) T} \| a - \bar{a} \|_{L^2(\Omega)} \right],
\]

with \( \theta = \frac{\delta}{a + \lambda_1} \). Finally, taking \( T \geq \max(T_{21}, 1) \), where \( T_{21} \in \mathbb{R} \) verifies \( e^{-\theta T_{21}} = \frac{1}{2} \), provides the first inequality (43).

Now, we shall focus on the second inequality. Let

\[
\zeta = \frac{1}{a} \left( \frac{a}{\lambda_1} - \frac{\bar{a}}{\lambda_1} \right).
\]

Multiplying again the equation (42) by \( \zeta(x) u(x, T) \), and integrating over \( \Omega \), we obtain

\[
\frac{1}{2} \int_\Omega a u(\cdot, T) \nabla u(\cdot, T) \cdot \nabla \zeta^2 dx - \int_\Omega \zeta^2 a |\nabla u(\cdot, T)|^2 dx + \int_\Gamma a \zeta^2 u(\cdot, T) \partial_t u(\cdot, T) ds(x) = \int_\Omega \text{div} \left( \frac{\bar{a}}{\lambda_1} \nabla (u(\cdot, T) - \bar{u}(\cdot, T)) \right) \zeta u(\cdot, T) dx + \int_\Omega (\bar{u}(\cdot, T) - u(\cdot, T)) \zeta u(\cdot, T) dx + \int_\Omega (\frac{1}{\lambda_1} \mathbb{T}(a; \cdot, T) - \frac{1}{\lambda_1} \mathbb{T}(\bar{a}; \cdot, T)) \zeta u(\cdot, T) dx.
\]

Integrating by parts the first term on the left hand side, leads to

\[
\frac{1}{2} \int_\Omega \zeta^2 a |\nabla u(\cdot, T)|^2 dx + \frac{1}{2} \int_\Omega \zeta^2 a |\nabla u(\cdot, T)|^2 dx - \int_\Gamma a \zeta^2 u(\cdot, T) \partial_t u(\cdot, T) ds(x) \leq C \left[ \| u - \bar{u} \|_{H^2(\Omega)} + \frac{1}{\lambda_1} \left( \| \mathbb{T}(a; \cdot, T) \|_{L^2(\Omega)} + \| \mathbb{T}(\bar{a}; \cdot, T) \|_{L^2(\Omega)} \right) \| u(\cdot, T) \|_{L^2(\Omega)} \| \zeta \|_{L^2(\Omega)} \right].
\]

Since the third term on the right side is positive for \( T \geq T_1 \), we deduce from inequalities (46), (56), (23), the following estimate

\[
(47) \quad \frac{1}{2} \int_\Omega \zeta^2 a |\nabla u(\cdot, T)|^2 dx + \frac{1}{2} \int_\Omega \zeta^2 a |\nabla u(\cdot, T)|^2 dx \quad C \left[ \| u - \bar{u} \|_{H^2(\Omega)} + e^{-\lambda_2 T} \left( \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \right) + \| a - \bar{a} \|_{L^2(\Omega)} \right] \| u(\cdot, T) \|_{L^2(\Omega)} \| \zeta \|_{L^2(\Omega)}, \quad \forall T \geq T_1.
\]

On the other hand, we have

\[
\| u \|_{L^2(\Omega)}^2 = \sum_{k=1}^\infty \lambda_k^2 e^{-\lambda_k T} \| P_k u_0 \|_{L^2(\Omega)}^2 \leq e^{-2\lambda_k T} \sum_{k=1}^\infty \lambda_k^2 e^{-2(\lambda_k - 1)} \| u_0 \|_{L^2(\Omega)}^2.
\]

We deduce from inequalities (56)

\[
(48) \quad \| u \|_{L^2(\Omega)} \leq C e^{-\lambda_1 T}, \quad \forall T \geq 1.
\]
Since $\frac{1}{2} \geq \frac{1}{\lambda_1}$, we have

\begin{equation}
(49) \quad \|\zeta\|_{L^2(\Omega)} \leq C \left\| \frac{a}{\lambda_1} - \frac{\tilde{a}}{\lambda_1} \right\|_{L^2(\Omega)}.
\end{equation}

Combining inequalities (30), (31), (32), (47), (48), and (49), we finally obtain the second inequality (44) for $T \geq T_2 = \max(T_1, T_{21})$.

\[ \square \]

**Proposition 3.3.** Let $a \in A$, and $\phi_1$ be the first eigenfunction of $L_2$. Then for $\varepsilon \in ]0, \varepsilon_0[$, there exists a constant $C > 0$ depending only on $\varepsilon, A, n,$ and $\Omega$ such that

\begin{equation}
(50) \quad \phi_1^2(x) + \mathbb{1}_{\Omega}(x)|\nabla \phi_1(x)|^2 \geq C, \quad \forall x \in \Omega.
\end{equation}

**Proof.** Since $\varepsilon \in ]0, \varepsilon_0[$, inequality (38) in Proposition 3.1 implies

\begin{equation}
(51) \quad |\nabla \phi_1(x)| \geq C_0, \quad \forall x \in \Omega_\varepsilon.
\end{equation}

Combining (51) with inequality (55) provides the wanted estimate. \[ \square \]

Back to the proof of Theorem 1.1. Fixing $\varepsilon = \frac{\varepsilon_0}{2}$, we deduce from Propositions 3.2 and 3.3 the following estimate

\begin{equation}
(52) \quad \left\| \frac{a}{\lambda_1} - \frac{\tilde{a}}{\lambda_1} \right\|_{L^2(\Omega)} \leq C \left[ e^{\lambda_1 T} \|u - \tilde{u}\|_{H^2(\Omega)} + e^{-(\lambda_2 - \lambda_1) T} \left( \|a - \tilde{a}\|_{L^2(\Omega)} + \left| \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \right| \right) \right],
\end{equation}

for all $T \geq T_2$.

We further assume that $T \geq T_2$. By a simple calculation, we get

\begin{equation}
\left( \frac{1}{\lambda_1} \int_{\Omega} |a - \tilde{a}|^2 \, dx \right)^{\frac{1}{2}} \leq \left\| \frac{a}{\lambda_1} - \frac{\tilde{a}}{\lambda_1} \right\|_{L^2(\Omega)} + \left| \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \right| \|\tilde{a}\|_{L^2(\Omega)}.
\end{equation}

We deduce from inequalities (56), the following estimate

\begin{equation}
(53) \quad \|a - \tilde{a}\|_{L^2(\Omega)} \leq C \left[ \left\| \frac{a}{\lambda_1} - \frac{\tilde{a}}{\lambda_1} \right\|_{L^2(\Omega)} + \left| \frac{1}{\lambda_1} - \frac{1}{\lambda_1} \right| \right].
\end{equation}

Combining estimates (53), (52), and (43), yields

\begin{equation}
(54) \quad \|a - \tilde{a}\|_{L^2(\Omega)} \leq C \left[ e^{\lambda_1 T} \|u - \tilde{u}\|_{H^2(\Omega)} + e^{-(\lambda_2 - \lambda_1) T} \|a - \tilde{a}\|_{L^2(\Omega)} \right].
\end{equation}

The gap condition (35) gives

\[ (1 - C e^{-\theta T}) \|a - \tilde{a}\|_{L^2(\Omega)} \leq C e^{\lambda_1 T} \|u - \tilde{u}\|_{L^2(\Omega)} \]

with $\theta = \frac{\delta}{\lambda_1 \lambda_1}$. Finally, taking $T \geq \max(T_2, T_3)$, where $T_3 \in \mathbb{R}$ verifies $e^{-\theta T_3} = \frac{1}{2C}$, provides the main estimate (3) of Theorem 1.1.
APPENDIX A.

We recall some known properties of the eigenelements of the unbounded operator $L_a$.

Lemma A.1. The eigenvalue $\lambda_1$ is simple, and has a strictly positive eigenfunction $\phi_1 \in C^1(\Omega)$.

Proof. The proof can be found in many references [17,18]. Since it is too short and for the sake of completeness we give it here.

We can recover the second result by using the Min-max principle. It is well known that the smallest eigenvalue $\lambda_1$ is the minimizer of the Rayleigh quotient [18]

$$\lambda_1 = \min_{\phi \in H^1_0(\Omega) \setminus \{0\}} \frac{\int_{\Omega} a |\nabla \phi|^2 dx}{\int_{\Omega} |\phi|^2 dx}.$$ 

Since $\phi_1 \in H^1_0(\Omega)$ we also have $|\phi_1| \in H^1(\Omega)$ and $\nabla |\phi_1| = \text{sign}(\phi_1)\nabla \phi_1$, we see that $|\phi_1|$ and $\phi_1$ has the similar Rayleigh quotient. Therefore, $|\phi_1|$ is also a minimizer of the Rayleigh quotient and, therefore, an eigenfunction associated to $\lambda_1$. By Harnack inequality for elliptic operators, $|\phi_1|$ does not vanish in $\Omega$. Since two functions having contant signs can not be orthogonal in $L^2(\Omega)$, $\lambda_1$ is simple. We also deduce from elliptic regularity that $\phi_1$ is $C^1(\Omega)$. \hfill $\square$

The proof of the following results can be found in Proposition 2.1 and Lemma 2.1 in [7] or Lemma 4.6.1 in [12].

Lemma A.2. Let $a \in A$, and $\phi_1$ be the first eigenfunction of $L_a$. Then there exists a constant $C > 0$ that depends only on $A$ and $\Omega$ such that

$$(55) \quad \phi_1(x) \geq Cd_\Omega(x) \quad \forall x \in \Omega; \quad -\partial_a \phi_1(x) > C \quad \forall x \in \partial \Omega.$$ 

The proof of the following lemma based on the Min-max principle is forward.

Lemma A.3. Let $a \in A$, and let $\lambda_k$, $k \in \mathbb{N}^*$, be the increasing eigenvalues of $L_a$. Then

$$(56) \quad \lambda_k^\Omega \leq \lambda_k \leq a_+ \lambda_k^\Omega, \quad \forall k \in \mathbb{N}^*,$$

where $\lambda_k^\Omega, k \in \mathbb{N}^*$, are the increasing Dirichlet eigenvalues of the Laplacian $-\Delta$ in $\Omega$.

The proof of the following lemma is based on the analysis of the rate of decay of the heat kernel, and can be found in (Corollary 4.6.3 of [12]).

Lemma A.4. Let $a \in A$, and let $\lambda_k$, $k \in \mathbb{N}^*$, be the increasing eigenvalues of $L_a$, and $\phi_k$, $k \in \mathbb{N}^*$, be corresponding orthonormal sequence of eigenfunctions. Then there exists a constant $C > 0$ depending on $A, n$ and $\Omega$ such that

$$(57) \quad |\phi_k(x)| \leq C \lambda_k^{\frac{2}{n} + \frac{4}{n}} \phi_1(x), \quad \forall x \in \Omega, \ k \in \mathbb{N}^*.$$
