Abstract The Fibonacci number is famous for possessing wonderful and amazing properties. In this study, we introduce the $k$-Fibonacci-Like number and related identities. We establish some of the interesting properties of $k$-Fibonacci-Like number. We shall use the Induction method and Binet’s formula for derivation.

Keywords: $k$-Fibonacci numbers, $k$-Fibonacci-Like numbers, Binet’s formula

1. Introduction

Many authors have generalized second order recurrence sequences by preserving the recurrence relation and alternating the first two terms of the sequence and some authors have generalized these sequences by preserving the first two terms of the sequence but altering the recurrence relation slightly.

Kalman and Mena [7] generalize the Fibonacci sequence by

\begin{equation}
F_n = aF_{n-1} + bF_{n-2}, n \geq 2 \\
\text{with } F_0 = 0, F_1 = 1.
\end{equation}

Horadam [2] defined generalized Fibonacci sequence \{H_n\} by

\begin{equation}
H_n = H_{n-1} + H_{n-2}, n \geq 3 \\
\text{with } H_1 = p, H_2 = p + q
\end{equation}

where $p$ and $q$ are arbitrary integers.

Singh, Sikhwal, and Bhatnagar [5], defined Fibonacci-Like sequence by recurrence relation

\begin{equation}
S_k = S_{k-1} + S_{k-2}, k \geq 2 \\
\text{with } S_0 = 2, S_1 = 1.
\end{equation}

The associated initial conditions $S_0$ and $S_1$ are the sum of the Fibonacci and Lucas sequences respectively, i.e.

$S_0 = F_0 + L_0$ and $S_1 = F_1 + L_1$.

Natividad [9], Deriving a Formula in solving Fibonacci-Like sequence. He found missing terms in Fibonacci-Like sequence and solved by standard formula.

Gupta, Panwar and Sikhwal [19], defined generalized Fibonacci sequences and derived its identities connection formulae and other results. Gupta, Panwar and N. Gupta [18], stated and derived identities for Fibonacci-Like sequence. Also described and derived connection

\begin{equation}
S_{k,n} = kS_{k,n-1} + S_{k,n-2} \text{ for } n \geq 2 \\
\text{with } S_{k,0} = 2, S_{k,1} = 1.
\end{equation}

2. The $k$-Fibonacci-Like Sequence

Definition: For any positive real number $k$, the $k$-Fibonacci-Like sequence \{S_{k,n}\} is defined by for $n \geq 2$,

\begin{equation}
S_{k,n} = kS_{k,n-1} + S_{k,n-2} \text{ for } n \geq 2 \\
\text{with } S_{k,0} = 2, S_{k,1} = 2.
\end{equation}
The first few $k$-Fibonacci-Like numbers are

\[ S_{k,2} = 2k + 2 \]
\[ S_{k,3} = 2k^2 + 2k + 2 \]
\[ S_{k,4} = 2k^3 + 2k^2 + 4k + 2 \]
\[ S_{k,5} = 2k^4 + 2k^3 + 6k^2 + 4k + 2 \]

Particular case of $k$-generalized Fibonacci number is

If $k = 1$, generalized Fibonacci sequence is obtained

\[ S_0 = 2, \quad S_1 = 2 \]
and
\[ S_n = S_{n-1} + S_{n-2} \quad \text{for } n \geq 2; \]
\[ \{S_n\}_{n \in \mathbb{N}} = \{2, 1, 4, 6, 10, 16, \ldots\} \]

3. Properties of $k$-Fibonacci-Like Numbers

3.1. First Explicit Formula for $k$-Fibonacci-Like Numbers

In the 19th century, the French mathematician Binet devised two remarkable analytical formulas for the Fibonacci and Lucas numbers. In our case, Binet’s formula allows us to express the $k$-Fibonacci-Like numbers in function of the roots \( R_1, R_2 \) of the following characteristic equation, associated to the recurrence relation (2.1)

\[ x^2 - kx - 1 = 0 \]  (3.1)

**Theorem 1:** (Binet’s formula). The $n$th $k$-Fibonacci-Like number \( S_{k,n} \) is given by

\[ S_{k,n} = \frac{R_1^{n+1} - R_2^{n+1}}{R_1 - R_2} \]  (3.2)

where \( R_1 \) & \( R_2 \) are the roots of the characteristic equation (3.1) and \( R_1 > R_2 \).

**Proof:** We use the Principle of Mathematical Induction (PMI) on $n$. It is clear the result is true for \( n = 0 \) and \( n = 1 \) by hypothesis. Assume that it is true for $r$ such that \( 0 \leq r \leq i+1 \), then

\[ S_{k,r} = \frac{R_1^{r+1} - R_2^{r+1}}{R_1 - R_2} \]

It follows from definition of $k$-generalized Fibonacci numbers (2.1) and equation (3.2)

\[ S_{k,r+2} = kS_{k,r+1} + S_{k,r} = 2 \frac{R_1^{r+3} - R_2^{r+3}}{R_1 - R_2} \]

Thus, the formula is true for any positive integer $n$. where \( R_1 = \frac{k+\sqrt{k^2+4}}{2} \) and \( R_2 = \frac{k-\sqrt{k^2+4}}{2} \).

This completes the proof.

3.2. Catalan’s Identity

Catalan’s identity for Fibonacci numbers was found in 1879 by Eugene Charles Catalan a Belgian mathematician who worked for the Belgian Academy of Science in the field of number theory.

**Theorem 2:** (Catalan’s identity)

\[ S_{k,n-r-1}S_{k,n-r+1} - S_{k,n-1}^2 = (-1)^{r+1}S_{k,r-1}^2 \]  (3.3)

**Proof:** By Binet’s formula (3.2), we have

\[ S_{k,n-r-1}S_{k,n-r+1} - S_{k,n-1}^2 \]

\[ = 4 \left( \frac{R_1^{r+r} - R_2^{r+r}}{R_1 - R_2} \right) - 4 \left( \frac{R_1^r - R_2^r}{R_1 - R_2} \right) \]

\[ = 4 \left( \frac{R_1^{r+1} - R_2^{r+1}}{R_1 - R_2} \right) \]

\[ = 4 \left( -1 \right)^{r+1} \left( \frac{R_1^r + R_2^r}{R_1 - R_2} \right) \]

\[ = 4 \left( -1 \right)^{r+1} \left( \frac{R_1^r - R_2^r}{R_1 - R_2} \right) \]

\[ = (-1)^{r+1} \left( \frac{R_1^r - R_2^r}{R_1 - R_2} \right) \]

Thus, the formula is true for any positive integer $n$. This completes the proof.

3.3. Cassini’s Identity

This is one of the oldest identities involving the Fibonacci numbers. It was discovered in 1680 by Jean-Dominique Cassini a French astronomer.

**Theorem 3:** (Cassini’s identity or Simpson’s identity)

\[ S_{k,n-2}S_{k,n} - S_{k,n-1}^2 = 4(-1)^n \]  (3.4)

**Proof:** Taking $r = 1$ in Catalan’s identity (3.3) the proof is completed.

In a similar way that before the following identity is proven:

3.4. d’Ocagne’s Identity

**Theorem 4:** (d’ocagne’s Identity) If $m > n$ then

\[ S_{k,m-n} - S_{k,m}S_{k,n-1} = (-1)^nS_{k,m-n-1} \]  (3.5)

3.5. Limit of the Quotient of Two Consecutive Terms

A useful property in these sequences is that the limit of the quotient of two consecutive terms is equal to the positive root of the corresponding characteristic equation

**Theorem 5:**

\[ \lim_{n \to \infty} \left( \frac{S_{k,n-1}}{S_{k,n-2}} \right) = R_1 \]  (3.6)

**Proof:** By Binet’s formula (3.2), we have
\[
\lim_{n \to \infty} \left( \frac{S_{k,n-1}}{S_{k,n-2}} \right) = \lim_{n \to \infty} \frac{r_1^n - r_2^n}{r_1^{n-1} - r_2^{n-1}} = \lim_{n \to \infty} \frac{1}{r_1} \left( \frac{r_2}{r_1} \right)^n = \frac{1}{r_1} \left( \frac{r_2}{r_1} \right)^n
\]

and taking into account that \( \lim_{n \to \infty} \left( \frac{r_2}{r_1} \right)^n = 0 \), since \(|r_2| < |r_1|\), Eq. (3.6) is obtained.

**Theorem 6**: If \( Y_{k,n} = \sum_{i=0}^{n} S_{k,i-1} \), then
\[
Y_{k,n} = \frac{1}{k} \left( S_{k,n} + S_{k,n-1} \right) - \frac{2}{k} \tag{3.7}
\]

**Proof.** By Binet’s formula (3.2), we have
\[
Y_{k,n} = \sum_{i=0}^{n} \frac{r_1^i - r_2^i}{r_1 - r_2} = \frac{2}{(r_1 - r_2)^2} \left( \frac{r_1^{n+1} - 1}{r_1 - 1} - \frac{r_2^{n+1} - 1}{r_2 - 1} \right) = \frac{2}{(r_1 - 1)(r_2 - 1)} \left( \frac{r_1^n - r_2^n}{r_1 - r_2} \right) = \frac{1}{k} \left( S_{k,n} + S_{k,n-1} \right) - \frac{2}{k}
\]

This completes the Proof.

**Proposition 7**: For any integer \( n \geq 0 \),
\[
r_1^{n+2} = k r_1^{n+1} + r_1^n \quad r_2^{n+2} = k r_2^{n+1} + r_2^n \tag{3.8}
\]

**Theorem 8**: For any integer \( n \geq 0 \),
\[
\sum_{i=0}^{n} \binom{n}{i} k^i S_{k,i-1} = S_{k,2n-1} \tag{3.9}
\]

**Proof.** By Binet’s formula (3.2), we have
\[
\sum_{i=0}^{n} \binom{n}{i} k^i S_{k,i-1} = \sum_{i=0}^{n} \binom{n}{i} k^i \left( \frac{r_1^i - r_2^i}{r_1 - r_2} \right) = \frac{2}{(r_1 - r_2)^2} \sum_{i=0}^{n} \binom{n}{i} \left( k r_1^i - k r_2^i \right)
\]

By summing up the geometric partial sums \( \sum_{i=0}^{n} r_j^i \) for \( j = 1, 2 \), we obtain
\[
\sum_{i=0}^{n} \binom{n}{i} k^i S_{k,i-1} = \frac{2}{(r_1 - r_2)} \left( (1 + k r_1)^n - (1 + k r_2)^n \right) = \frac{2}{(r_1 - r_2)} \left( r_1^{2n} - r_2^{2n} \right)
\]

This completes the Proof.

### 3.6. Generating Function for k-Fibonacci-Like Sequence:

Generating functions provide a powerful technique for solving linear homogeneous recurrence relations. Even though generating functions are typically used in conjunction with linear recurrence relations with constant coefficients, we will systematically make use of them for linear recurrence relations with non constant coefficients. In this paragraph, the generating function for k-Fibonacci-Like sequence is given. As a result, k- Fibonacci-Like sequence is seen as the coefficients of the corresponding generating function. Function defined in such a way is called the generating function of the k- Fibonacci-Like sequence. So,
\[
S_k = S_{k,0} + x S_{k,1} + x^2 S_{k,2} + x^3 S_{k,3} + \ldots + x^n S_{k,n} + \ldots
\]

and then,
\[
k x S_k = k x S_{k,0} + k x^2 S_{k,1} + k x^3 S_{k,2} + \ldots + k x^{n+1} S_{k,n} + \ldots
\]

\[
x^2 S_k = x^2 S_{k,0} + x S_{k,1} + x^2 S_{k,2} + \ldots + x^{n+2} S_{k,n} + \ldots
\]

\[
\rightarrow (1 - kx - x^2) S_k = 2 + 2x(1-k)
\]

\[
\rightarrow S_k = \frac{2 + 2x(1-k)}{1 - kx - x^2}
\]

### 4. Conclusion

In this paper, k-Fibonacci pattern based sequence introduced which is known as k-Fibonacci-Like sequence.

Many of the properties of this sequence are proved by simple algebra and Binet’s formula. Finally we present properties like Catalan’s identity, Cassini’s identity or Simpson’s identity and d’ocagnes’s identity for k-Fibonacci-Like numbers. Further generating function of k-Fibonacci-Like sequence is presented.
