Two-Point Gromov-Witten Formulas
for Symplectic Toric Manifolds

Alexandra Popa

May 1, 2014

Abstract

We show that the standard generating functions for genus 0 two-point twisted Gromov-Witten invariants arising from concave vector bundles over symplectic toric manifolds are explicit transforms of the corresponding one-point generating functions. The latter are, in turn, transforms of Givental’s $J$-function. We obtain closed formulas for them and, in particular, for two-point Gromov-Witten invariants of non-negative toric complete intersections. Such two-point formulas should play a key role in the computation of genus 1 Gromov-Witten invariants (closed, open, and unoriented) of toric complete intersections as they indeed do in the case of the projective complete intersections.

1 Introduction

Torus actions on moduli spaces of stable maps into a smooth projective variety facilitate the computation of equivariant Gromov-Witten invariants \([\text{Gi}1]\) via the Localization Theorem \([\text{ABo}], \text{GraPa}\). Equivariant formulas lead to other interesting consequences beyond the computation of non-equivariant Gromov-Witten invariants. In the case of the projective spaces, two-point equivariant Gromov-Witten formulas in \([\text{PoZ}]\) lead to the confirmation of mirror symmetry predictions concerning open and unoriented genus 1 Gromov-Witten invariants in the same paper and to the computation of closed genus 1 Gromov-Witten invariants in \([\text{Po}]\). In this paper we obtain equivariant formulas expressing the standard two-point closed genus 0 generating function for certain twisted Gromov-Witten invariants of symplectic toric manifolds in terms of the corresponding one-point generating functions. We also obtain explicit formulas for the latter. In particular, we show that the standard generating function for these two-point invariants is a fairly simple transform of the well-known Givental’s \(J\)-function. The formulas obtained in this paper compute, in particular, the twisted/un-twisted Gromov-Witten numbers \((1.2)/(1.3)\) below.

For a smooth projective variety \(X\) and a class \(A \in H_2(X; \mathbb{Z})\), \(\overline{\mathcal{M}}_{0,m}(X, A)\) denotes the moduli space of stable maps from genus 0 curves with \(m\) marked points into \(X\) representing \(A\). Let \(\psi_i \in H^2(\overline{\mathcal{M}}_{0,m}(X, A))\) be the first Chern class of the universal cotangent line bundle for the \(i\)-th marked point. Let

\[
\pi : \mathcal{U} \longrightarrow \overline{\mathcal{M}}_{0,m}(X, A)
\]

be the universal curve and \(ev : \mathcal{U} \longrightarrow X\) the natural evaluation map; see \([\text{MirSym} \text{ Section 24.3}]\). A holomorphic vector bundle \(E \longrightarrow X\) is called concavex if

\[
E = E^+ \oplus E^- , \quad \text{with} \quad H^1(\mathbb{P}^1, f^*E^+) = 0 , \quad H^0(\mathbb{P}^1, f^*E^-) = 0 \quad \forall f : \mathbb{P}^1 \longrightarrow X .
\]

Such a vector bundle induces a vector orb-i-bundle \(V_E\) over \(\overline{\mathcal{M}}_{0,m}(X, A)\):

\[
V_E = V_{E^+} \oplus V_{E^-} , \quad \text{where} \quad V_{E^+} = \pi_*ev^*E^+ , \quad V_{E^-} = R^1 \pi_*ev^*E^- . \quad (1.1)
\]

Given a class \(A \in H_2(X; \mathbb{Z})\) and classes \(\eta_1, \eta_2 \in H^*(X)\), the corresponding genus 0 twisted two-point Gromov-Witten (GW) invariants of \(X\) are:

\[
\left< \psi^{p_1} \eta_1, \psi^{p_2} \eta_2 \right>_{A,E}^{X} \equiv \int_{[\overline{\mathcal{M}}_{0,2}(X,A)]^{vir}} (\psi^{p_1}v_1^*\eta_1)(\psi^{p_2}v_2^*\eta_2)c(V_E) \in \mathbb{Q} . \quad (1.2)
\]
In particular, if \( E = E^+ \), the twisted Gromov-Witten invariants \([1,2]\) are the genus 0 two-point Gromov-Witten invariants of a complete intersection \( Y = s^{-1}(0) \hookrightarrow X \) defined by a generic holomorphic section \( s : X \rightarrow E^+ \):

\[
\langle \psi^p_1 \eta_1, \psi^p_2 \eta_2 \rangle_{A, E^+}^X = \langle \psi^p_1 \eta_1, \psi^p_2 \eta_2 \rangle_{A}^X \equiv \langle \psi^p_1 \eta_1, \psi^p_2 \eta_2 \rangle_{A,0}^Y \quad \forall \ \eta_1, \eta_2 \in H^8(Y); \tag{1.3}
\]

the first equality follows from \([6]\), Theorem 0.1.1, Remark 0.1.1].

The numbers \([1,2]\) have been computed in the \( X = \mathbb{P}^{n-1} \) case under various assumptions on \( E \) through various approaches. The case when \( E \) is a positive line bundle is solved in \([1,2]\) and \([1,2]\) and extended to the case when \( E \) is a sum of positive line bundles in \([1,2]\). The former led to the computation of the genus 1 Gromov-Witten invariants of Calabi-Yau hypersurfaces in \([3]\), while the latter to the computation of the genus 1 Gromov-Witten invariants of Calabi-Yau complete intersections in \([4]\). The case when \( E \) is a concave vector bundle has been solved in \([5,6]\) in the setting of \([7,8]\). More recently, genus 0 formulas with any number of \( \psi \) classes have been obtained in \([9,10]\). In this paper we extend the approaches of \([1,2]\) and \([6]\) to the case when \( X \) is an arbitrary compact symplectic toric manifold and \( E \) is a sum of non-negative and negative line bundles.

I thank Aleksey Zinger for proposing the questions answered in this paper, for his many suggestions which consistently improved it, for pointing out errors in previous versions, for explaining \([1,2]\) and parts of \([5,6]\) to me, and for his guidance and encouragement while I was working on this paper. I am also grateful to Melissa Liu for answering my many questions on toric manifolds, for his many suggestions which consistently improved it, for pointing out errors in previous versions, for explaining \([1,2]\) and \([5,6]\) to me, and for bringing \([7,8]\) to my attention.

### 1.1 Some results

If \( n \) is a non-negative integer, we write

\[
[n] = \{1, 2, \ldots, n\}.
\]

Let \( s \geq 1 \), \( N_1, \ldots, N_s \geq 2 \) and for each \( i \in [s] \) let

\[
H_i = \text{pr}_i^* H \in H^2 \left( \prod_{j=1}^{s} \mathbb{P}^{N_j-1} \right),
\]

where \( \text{pr}_i : \prod_{j=1}^{s} \mathbb{P}^{N_j-1} \longrightarrow \mathbb{P}^{N_i-1} \) is the projection onto the \( i \)-th component and \( H \in H^2(\mathbb{P}^{N_i-1}) \) is the hyperplane class on \( \mathbb{P}^{N_i-1} \).

**Theorem 1.1.** Let \( \mathbf{d} = (d_1, \ldots, d_s) \in (\mathbb{Z}^{>0})^s \). The degree \( d \) genus 0 two-point GW invariants \([1,3]\) of \( \prod_{i=1}^{s} \mathbb{P}^{N_i-1} \) are given by the following identity in \( \mathbb{C}[A_1, \ldots, A_s, B_1, \ldots, B_s, \forall \ i \in [s]]\) [\([h_1^{-1}, h_2^{-1}], \)]:

\[
\sum_{a_1, \ldots, a_s, b_1, \ldots, b_s \geq 0 \atop b_1 + \ldots + b_s = d} A_1^{a_1} \cdots A_s^{a_s} B_1^{b_1} \cdots B_s^{b_s} \left( \frac{H_1^{N_{1}-1-a_1} \cdots H_s^{N_{s}-1-a_s}}{h_1-\psi}, \frac{H_1^{N_{1}-1-b_1} \cdots H_s^{N_{s}-1-b_s}}{h_2-\psi} \right)_{\prod_{i=1}^{s} \mathbb{P}^{N_i-1}} = \frac{1}{h_1 + h_2} \sum_{a_i+b_i=NI-1 \atop a_i + b_i = N_i, e_i + f_i = d_i} (A_1 + e_i h_1)^{a_1} \cdots (A_s + e_s h_1)^{a_s} (B_1 + f_1 h_2)^{b_1} \cdots (B_s + f_s h_2)^{b_s} \prod_{i=1}^{s} \left( (A_i + r_i h_1)^{N_i}, \prod_{r=1}^{N_i} (B_i + r_i h_2)^{N_i} \right).
\]
This follows from Corollary 3.8 in Section 3.2.

The results below concern the GW invariants of a compact symplectic toric manifold $X_M^r$ defined by (2.2) from a minimal toric pair $(M, \tau)$ as in Definition 2.1. We assume that the vector bundle $E$ splits
\[ E = E^+ \oplus E^- \longrightarrow X_M^r, \quad \text{where} \quad E^+ = \bigoplus_{i=1}^a L_i^+, \quad E^- = \bigoplus_{i=1}^b L_i^-, \quad (1.4) \]

$L_i^+$ are non-trivial, non-negative line bundles and $L_i^-$ are negative line bundles.\footnote{Recall that a line bundle $L \longrightarrow X_M^r$ is called positive (respectively negative) if $c_1(L) \in H^2(X_M^r; \mathbb{R})$ (respectively $-c_1(L)$) can be represented by a Kähler form on $X_M^r$. A line bundle $L \longrightarrow X_M^r$ is called non-negative if $c_1(L) \in H^2(X_M^r; \mathbb{R})$ can be represented by a closed real (1,1)-form $\omega$ satisfying $\omega(v, Jv) \geq 0$ for all $v$. The assumptions that the line bundles $L_i^+$ are non-trivial and that $L_i^-$ are negative (that is, $c_1(L^-) < 0$ as opposed to just $c_1(L^-) \leq 0$) are only used in the theorems that rely on the one-point mirror theorem (5.2) of [LLY3], that is Theorem 3.5.}

Remark 1.3 below describe two-point twisted GW invariants in terms of one-point ones. As is usually done, the twisted GW invariants will be assembled into a generating function in the formal variables
\[ Q = (Q_1, \ldots, Q_k) \]

with powers indexed by
\[ \Lambda = \{ d \in H_2(X_M^r; \mathbb{Z}) : \langle \omega, d \rangle \geq 0 \quad \forall \omega \in \overline{K}_M \}, \quad (1.5) \]

where $\overline{K}_M$ is the closed Kähler cone of $X_M^r$.\footnote{By [31] Theorem 4.5], a non-empty closed convex subset of $\mathbb{R}^d$ is the intersection of its supporting half-spaces. The supporting half-spaces of a closed convex cone $C$ in $\mathbb{R}^d$ are all sets of the form $\{ v \in \mathbb{R}^d : \langle v, w \rangle \geq 0 \}$ for some $w \in \mathbb{R}^d$ such that $\langle v, w \rangle > 0$ for all $v \in C$. This implies that}

where $\mathcal{U}$ be the section of the universal curve given by the $i$-th marked point,
\[ \begin{align*}
V_E^+ &\equiv R^0\pi_* (ev^*E^+(-\sigma_1)) \oplus R^1\pi_* (ev^*E^-(-\sigma_1)) \longrightarrow \overline{M}_{0,m}(X_M^r, d), \quad \text{and} \\
V_E^- &\equiv R^0\pi_* (ev^*E^+(-\sigma_2)) \oplus R^1\pi_* (ev^*E^-(-\sigma_2)) \longrightarrow \overline{M}_{0,m}(X_M^r, d) \quad \text{whenever} \quad m \geq 2. \quad (1.6)
\end{align*} \]
If \( m \geq 3 \) and \( d = 0 \), \( \hat{V}_E \) and \( \check{V}_E \) are well-defined as well and they are 0. We next define the genus 0 two-point generating function \( \hat{Z} \):

\[
\hat{Z}(h_1, h_2, Q) = \frac{h_1 h_2}{h_1 + h_2} \sum_{\eta \in A} Q^d (ev_1 \times ev_2) \left[ \frac{e(\check{V}_E)}{h_1 - \psi_1} \frac{e(\hat{V}_E)}{h_2 - \psi_2} \right],
\]

where \( ev_1, ev_2 : \mathfrak{M}_{0,3}(X_M^r, d) \rightarrow X_M^r \) are the evaluation maps at the first two marked points. This is used - in the case of the projective spaces - for the computation of the genus 1 GW invariants of Calabi-Yau complete intersections.

The last two equations imply that \( \hat{Z}_\eta(h, Q) \) and \( \check{Z}_\eta(h, Q) \) are well-defined as well and they are 0. We next define the genus 0 two-point twisted GW invariants (1.2) are assembled into Theorem 1.2.

Let \( pr_i : X_M^r \times X_M^r \rightarrow X_M^r \) denote the projection onto the \( i \)-th component and let \( \eta_j, \check{\eta}_j \in H^*(X_M^r) \) be such that

\[
\sum_{j=1}^s pr_i^* \eta_j pr_2^* \check{\eta}_j \in H^{2(N-k)}(X_M^r \times X_M^r)
\]

is the Poincaré dual to the diagonal class, where \( N - k \) is the complex dimension of \( X_M^r \). Then,

\[
\hat{Z}(h_1, h_2, Q) = \frac{1}{h_1 + h_2} \sum_{j=1}^s pr_1^* \hat{Z}_\eta_j(h_1, Q) pr_2^* \check{Z}_\check{\eta}_j(h_2, Q).
\]

This follows from Theorem 1.6 below, which is an equivariant version of Theorem 1.2.

Remark 1.3. The genus 0 two-point twisted GW invariants (1.2) are assembled into

\[
Z^*(h_1, h_2, Q) = \sum_{\eta \in A} Q^d (ev_1 \times ev_2) \left[ \frac{e(V_E)}{h_1 - \psi_1} \frac{e(V_E)}{h_2 - \psi_2} \right] \in H^*(X_M^r \times X_M^r) [h_1^{-1}, h_2^{-1}][[\Lambda]],
\]

where \( ev_1, ev_2 : \mathfrak{M}_{0,3}(X_M^r, d) \rightarrow X_M^r \). By the string relation [MirSym Section 26.3],

\[
Z^*(h_1, h_2, Q) = \frac{h_1 h_2}{h_1 + h_2} \sum_{\eta \in A} (ev_1 \times ev_2) \left[ \frac{e(V_E)}{h_1 - \psi_1} \frac{e(V_E)}{h_2 - \psi_2} \right] \in H^*(X_M^r \times X_M^r) [h_1^{-1}, h_2^{-1}][[\Lambda]],
\]

where \( ev_1, ev_2 : \mathfrak{M}_{0,3}(X_M^r, d) \rightarrow X_M^r \). By (1.6) and (1.1),

\[
e(\check{V}_E)ev_1^*e(E^+) = e(\hat{V}_E)ev_1^*e(E^-).
\]

The last two equations imply that

\[
\hat{Z}^*(h_1, h_2, Q) pr_1^*e(E^+) = Z^*(h_1, h_2, Q) pr_1^*e(E^-),
\]

where \( \hat{Z}^* \) is obtained from \( \hat{Z} \) by disregarding the \( Q^0 \) term and \( pr_1 : X_M^r \times X_M^r \rightarrow X_M^r \) is the projection onto the first component. This together with Theorem 1.2 expresses \( Z^* \) in terms of \( \hat{Z}_\eta, \check{Z}_\eta \) in the \( E = E^+ \) case. In all other cases, \( Z^* \) can be expressed in terms of one-point GW generating functions which can be computed under one additional assumption; see Remark 3.9.
Remark 1.4. If $E = \mathcal{O}_{\mathbb{P}^2}(1) \oplus \mathcal{O}_{\mathbb{P}^2}(-2)$ and $H \in H^2(\mathbb{P}^2)$ is the hyperplane class, then

$$
\int_{\mathbb{M}_{0,2}(\mathbb{P}^2,d)} e(V_E)ev_1^*H^2ev_2^*H = \int_{\mathbb{M}_{0,2}(\mathbb{P}^2,d)} e(V_E)ev_1^*Hev_2^*H^2 = (-1)^d \frac{(2d)!}{2d(d!)^2} \quad \forall \ d \geq 1.
$$

If $E = \mathcal{O}_{\mathbb{P}^2}(-1) \oplus \mathcal{O}_{\mathbb{P}^2}(-1) \oplus \mathcal{O}_{\mathbb{P}^2}(-1)$ and $H \in H^2(\mathbb{P}^2)$ is the hyperplane class, then

$$
\int_{\mathbb{M}_{0,2}(\mathbb{P}^2,d)} e(V_E)ev_1^*H^2ev_2^*H^2 = \frac{(-1)^{d+1}}{d} \quad \forall \ d \geq 1.
$$

If $E = \mathcal{O}_{\mathbb{P}^1}(-1) \oplus \mathcal{O}_{\mathbb{P}^1}(-1)$ and $H \in H^2(\mathbb{P}^1)$ is the hyperplane class, then

$$
\int_{\mathbb{M}_{0,2}(\mathbb{P}^1,d)} e(V_E)ev_1^*Hev_2^*H = \frac{1}{d} \quad \forall \ d \geq 1.
$$

These follow from (3.36) in Section 3.2 which relies on Theorem 1.6 the equivariant version of Theorem 1.2 above. The first of these equations implies the first statement in [KlPa, Proposition 2] by the divisor relation of [MirSym, Section 26.3], the second recovers the first statement in [PaZ, Lemma 3.1], and the third implies the Aspinwall-Morrison formula.

1.2 Outline of the paper

Section 2 presents the facts about symplectic toric manifolds needed for the Gromov-Witten theory parts of the paper. This section is inspired by the view in [Gi2] of a symplectic toric manifold as given by a matrix and the choice of a certain regular value together with the holomorphic charts of [Ba]. It contains proofs of all statements or references to the ones that are omitted. The reader interested only in the Gromov-Witten theory part may want to skip all proofs in Section 2.

Section 3.2 gives formulas for the one-point GW generating functions $Z_\eta, \hat{Z}_\eta$ of (1.8) under an additional assumption in terms of explicit formal power series constructed in Section 3.1. It begins with a short setup.

The explicit GW formulas of Section 3.2 and Theorem 1.2 above follow from the equivariant statements of Section 4.2. In particular, equivariant versions of $Z_\eta$ and $\hat{Z}_\eta$ are expressed in terms of explicit power series constructed in Section 4.1. Section 4 also begins with a short setup.

An outline of the proofs of the equivariant theorems of Section 4.2 is given in Section 5.1. The remaining subsections of Section 5 provide the details.

2 Overview of symplectic toric manifolds

This section reviews the basics of symplectic toric manifolds and sets up notation that will be used throughout the rest of the paper. It combines the perspectives of [An, Chapter VII], [McDSa, Section 11.3], [Ba, Section 2], [CK, Section 3.3.4], [Gi2, Gi3], and [Sp, Sections 5,6].

Sections 2.1, 2.2 give the definition and describe the basic properties of a compact symplectic toric manifold. Section 2.3 is a preparation for localization computations in a toric setting; it describes the fixed points and curves and the equivariant cohomology.
2.1 Definition, charts, and Kähler classes

Throughout this paper, \(k\) and \(N\) denote fixed positive integers such that \(k \leq N\) and

\[
[N] = \{1, 2, \ldots, N\}.
\]

If \(v \in \mathbb{R}^k\) (or \(v \in \mathbb{C}^N\)) and \(j \in [k]\) (or \(j \in [N]\)), let \(v_j \in \mathbb{R}\) (or \(v_j \in \mathbb{C}\)) denote the \(j\)-th component of \(v\) and define

\[\text{supp}(v) = \{ j : v_j \neq 0 \} .\]

If \(J \subseteq [N]\), let

\[\mathbb{R}^J = \{ v \in \mathbb{R}^N : \text{supp}(v) \subseteq J \} \cong \mathbb{R}^{|J|}, \quad \mathbb{C}^J = \{ z \in \mathbb{C}^N : \text{supp}(z) \subseteq J \} \cong \mathbb{C}^{|J|} .\]

If \(A = (a_{ij})_{i \in [k], j \in [N]}\) is a \(k \times N\) matrix and \(J \subseteq [N]\), denote by \(A_J\) the \(k \times |J|\) submatrix of \(A\) consisting of the columns indexed by the elements of \(J\). Let

\[
\omega_{\text{std}} \equiv \frac{i}{2} \sum_{j=1}^N dz_j \wedge d\bar{z}_j
\]

be the standard symplectic form on \(\mathbb{C}^N\). Let

\[
\mu_{\text{std}} : \mathbb{C}^N \longrightarrow \mathbb{R}^N, \quad \mu_{\text{std}}(z_1, \ldots, z_N) \equiv (|z_1|^2, \ldots, |z_N|^2)
\]

be the moment map for the restriction of the standard action of \(T^N \equiv (\mathbb{C}^*)^N\) on \((\mathbb{C}^N, -2\omega_{\text{std}})\),

\[
(t_1, \ldots, t_N) \cdot (z_1, \ldots, z_N) = (t_1 z_1, \ldots, t_N z_N),
\]

to \((S^1)^N \subset T^N\).

An integer \(k \times N\) matrix \(M = (m_{ij})_{i \in [k], j \in [N]}\) induces an action of \(T^k \equiv (\mathbb{C}^*)^k\) on \((\mathbb{C}^N, -2\omega_{\text{std}})\),

\[
(t_1, \ldots, t_k) \cdot (z_1, \ldots, z_N) = (t_1^{m_{11}} t_2^{m_{21}} \ldots t_k^{m_{k1}} z_1, \ldots, t_1^{m_{1N}} t_2^{m_{2N}} \ldots t_k^{m_{kN}} z_N);
\]

the moment map of its restriction to \((S^1)^k \subset T^k\) is

\[
\mu_M \equiv M \circ \mu_{\text{std}} : \mathbb{C}^N \longrightarrow \mathbb{R}^k.
\]

If in addition \(\tau \in \mathbb{R}^k\), let

\[
P^\tau_M = M^{-1}(\tau) \cap (\mathbb{R}^{\geq 0})^N, \quad \tilde{X}^\tau_M = \mathbb{C}^N - \bigcup_{J \subseteq [N]} \mathbb{C}^J \setminus \{ z \in \mathbb{C}^N : C_{\text{supp}(z)} \cap \tilde{JM}^{-1}(\tau) \neq \emptyset \}, \quad X^\tau_M = \tilde{X}^\tau_M / T^k ;
\]

see diagram (2.3). By Proposition 2.2 below, \(X^\tau_M\) is a compact projective manifold if the pair \((M, \tau)\) is toric in the sense of Definition 2.1. In this case, \(\mu_{\text{std}}^{-1}(P^\tau_M) / (S^1)^k\) has a unique smooth structure making the projection

\[
\mu_{\text{std}}^{-1}(P^\tau_M) \longrightarrow \mu_{\text{std}}^{-1}(P^\tau_M) / (S^1)^k
\]
a submersion. With this smooth structure, \( \mu_{\text{std}}^{-1}(P^r_M)/(S^1)^k \) is diffeomorphic to \( X^*_M \) via a diffeomorphism induced by the inclusion \( \mu_{\text{std}}(P^r_M) \hookrightarrow \tilde{X}^*_M \). We summarize this setup in a diagram:

\[
P^r_M = M^{-1}(\tau) \cap (\mathbb{R}^0)^N
\]

![Diagram](image)

Given a pair \((M, \tau)\) consisting of an integer \(k \times N\) matrix \(M\) and a vector \(\tau \in \mathbb{R}^k\), we define

\[
\mathcal{V}^r_M = \left\{ J \subseteq [N] : |J| = k, P^r_M \cap \mathbb{R}^j \neq \emptyset \right\}
\]

\[
= \left\{ J \subseteq [N] : |J| = k, \exists v \in M^{-1}(\tau) \cap (\mathbb{R}^{\geq 0})^N \text{ s.t. supp}(v) \subseteq J \right\}.
\]

**Definition 2.1.** A pair \((M, \tau)\) consisting of an integer \(k \times N\) matrix \(M\) and a vector \(\tau \in \mathbb{R}^k\) is toric if

(i) \(\tau\) is a regular value of \(\mu_M\) and \(P^r_M \neq \emptyset\);

(ii) \(\det M_J \in \{\pm 1\}\) for all \(J \in \mathcal{V}^r_M\);

(iii) \(P^r_M = \{0\} \iff P^r_M\) is bounded).

A toric pair \((M, \tau)\) is minimal if

(iv) \(P^r_M \cap \mathbb{R}^{[N]-\{j\}} \neq \emptyset\) for all \(j \in [N]\).

If a pair \((M, \tau)\) satisfies (ii) in Definition 2.1 above, then

\[
z \in \mathbb{C}^N, \text{ supp}(z) \supseteq J \text{ for some } J \in \mathcal{V}^r_M \implies \exists t \in \mathbb{T}^k \text{ such that } (t \cdot z)_j = 1 \quad \forall j \in J.
\]

If \((M, \tau)\) is a toric pair, then a point \(z \in \mathbb{C}^N\) lies in \(\tilde{X}^*_M\) if and only if \(\text{supp}(z) \supseteq J\) for some \(J \in \mathcal{V}^r_M\) and the \(\mathbb{T}^N\)-fixed points of \(X^*_M\) are indexed by \(\mathcal{V}^r_M\); see Lemma 2.2(i) and Corollary 2.2(ii)

**Proposition 2.2.** If \((M, \tau)\) is a toric pair, then \(X^*_M\) is a connected compact projective manifold of complex dimension \(N-k\) endowed with a \(\mathbb{T}^N\)-action induced from the standard action of \(\mathbb{T}^N\) on \(\mathbb{C}^N\).

**Proof of Proposition 2.2.** By Lemmas 2.2(i)\[a\], \[g\] and \[h\] below, \(X^*_M\) is a connected, compact complex manifold. It admits a positive line bundle by Lemmas 2.13, 2.7\[b\] and 2.9 below. By the Kodaira Embedding Theorem [GriH, p181], \(X^*_M\) is then projective. \(\square\)

**Remark 2.3.** If \(X\) is a compact symplectic toric manifold in the sense of [Ca, Definition I.1.15], then the image of its moment map is a Delzant polytope \(P\) (a polytope with certain properties [Ca, Definition I.2.1]); see [At, Theorem 1] or [GuS, Theorem 5.2]. This polytope \(P\) determines a fan \(\Sigma_P\), which in turn determines a compact complex manifold \(X_{\Sigma_P}\); see [Au, Section VII.1.ac]. This complex manifold \(X_{\Sigma_P}\) is endowed with a symplectic form, a torus action, and a moment map.
Lemma 2.4. Let $(M, \tau)$ be a toric pair.

(a) The subset $P_M^\tau \subset (\mathbb{R}^{\geq 0})^N$ is a polytope (i.e. the convex hull of a finite set of points).

(b) Let $\eta \in \mathbb{R}^k$ be any regular value of $\mu_M$. If $w \in P_M^\eta$, then
\[ M : \{ v \in \mathbb{R}^N : \text{supp}(v) \subseteq \text{supp}(w) \} \rightarrow \mathbb{R}^k \]
is onto. In particular, if $w \in P_M^\eta$, then $|\text{supp}(w)| \geq k$.

(c) If $J \in \mathcal{Y}_M^\tau$, then $J = \text{supp}(y)$ for some $y \in \mu_M^{-1}(\tau)$.

(d) If $J \subseteq \{N\}$ and $\text{supp}(v) \subseteq J$ for some $v \in P_M^\tau$, then $\text{supp}(w) = J$ for some $w \in P_M^\tau$.

(e) The polytope $P_M^\tau$ has dimension $N - k$.

(f) If $v$ is a vertex of $P_M^\tau$, then $\text{supp}(v) \in \mathcal{Y}_M^\tau$.

(g) If $\text{Vertices}_M^\tau$ is the set of vertices of the polytope $P_M^\tau$, the map
\[ \text{supp} : \text{Vertices}_M^\tau \rightarrow \mathcal{Y}_M^\tau, \quad v \rightarrow \text{supp}(v), \]
is a bijection.

(h) If $y \in \mu_M^{-1}(\tau)$, then $\text{supp}(y) \supseteq J$ for some $J \in \mathcal{Y}_M^\tau$.

(i) Let $z \in \mathbb{C}^N$. Then, $z \in \tilde{X}_M^\tau$ if and only if $\text{supp}(z) \supseteq J$ for some $J \in \mathcal{Y}_M^\tau$.

(j) Let $I, J \in \mathcal{Y}_M^\tau$ and $t^{(n)} \in \mathbb{T}^k$. If $|t^{(n)}| \rightarrow \infty$ and there exists $\delta > 0$ such that $|t_i^{(n)}| \geq \delta$ for all $i \in [k]$, then $|t^{(n)}|_{M_i^{-1}M_J}$ is unbounded for some $j \in J$.

Proof. (a) By [Z1] Theorem 1.1], a subset of $\mathbb{R}^N$ is a polytope if and only if it is a bounded intersection of half-spaces. Thus, the claim follows from [iii] in Definition 2.1.

(b) This is immediate from the surjectivity of $d_{w, \mu_M}$.

(c) This follows from the second statement in (b).

(d) Assume that $\text{supp}(v) \subseteq I \subsetneq J$ and that there exists $v' \in P_M^\tau$ with $\text{supp}(v') = I$. Let $I_1 \supset I$ with
$I_1 \subseteq J$ and $|I_1| = |I| + 1$. We show that there exists $w \in P^r_M$ with $\text{supp}(w) = I_1$. By the first statement in \(d\) there exists $w' \in M^{-1}(\tau) \subset \mathbb{R}^N$ with $\text{supp}(w') = I_1$. Let $w = (1-\lambda)v + \lambda w'$ with $\lambda \in \mathbb{R}$ satisfying
\[
\lambda w'_j > 0 \text{ if } j \in I_1 - I \text{ and } \lambda \left(1 - \frac{w'_j}{v'_j}\right) < 1 \quad \forall j \in I.
\]

\(e\) By \(d\) together with the second condition in \(i\) in Definition 2.1, $\text{supp}(w) = [N]$ for some $w \in P^r_M$ and thus $\text{dim } P^r_M = N - k$, since $M$ has rank $k$ by \(b\).

\(f\) By \(e\), $|\text{supp}(v)| \leq k$; the opposite inequality follows from the second statement in \(b\).

\(g\) By \(f\), $\text{supp}(v) \in \mathcal{V}^r_M$ for every vertex $v$ of $P^r_M$. The map $\text{supp}$ is injective by \(ii\) in Definition 2.1 and surjective by \(e\) and \(ii\) in Definition 2.1.

\(h\) By \(Z\), Proposition 2.2, every polytope is the convex hull of its vertices; since $\mu_{\text{std}}(y) \in P^r_M$ and $P^r_M$ is a polytope by \(a\),
\[
\mu_{\text{std}}(y) = \sum_{s=1}^{r} \lambda_s v_s
\]
for some vertices $v_1, v_2, \ldots, v_r \in P^r_M$ and $\lambda_1, \lambda_2, \ldots, \lambda_r \in \mathbb{R}^{>0}$. Then, $\text{supp}(y) \supseteq \text{supp}(v_1)$ and $\text{supp}(v_1) \in \mathcal{V}^r_M$ by \(f\).

\(i\) If $z \in \hat{X}^r_M$, there exists $y \in \mathbb{C}^{\text{supp}(z) \cap \mu^{-1}_M(\tau)}$. By \(h\), there exists $J \in \mathcal{V}^r_M$ with $J \subseteq \text{supp}(y)$. Since $\text{supp}(y) \supseteq \text{supp}(z)$, it follows that $J \subseteq \text{supp}(z)$. The converse follows from \(c\).

\(j\) By \(e\), there exist $v, w \in \mathbb{R}^{>0}$ such that $M_f v = \tau = M_f w$. By \(ii\) in Definition 2.1 it follows that there exists $a \in \mathbb{Z}^{>0}$ such that $M_f^{-1}M_f a \in \mathbb{Z}^{>0}$.

Assume by contradiction that $|(t^{(n)}_j)^{M_f^{-1}M_f}|$ is a bounded sequence for all $j \in J$. By passing to subsequences, we may assume that $|(t^{(n)}_j)^{M_f^{-1}M_f}|$ is convergent for all $j \in J$. It follows that
\[
\prod_{j \in J} \left| (t^{(n)}_j)^{M_f^{-1}M_f} a_j \right| = \left| (t^{(n)}_j)^{M_f^{-1}M_f} a \right| = 0.
\]

(2.5) is also convergent. On the other hand, by passing to some subsequences, we may assume that for each $i \in [k]$, $|t^{(n)}_i|$ has a limit (possibly $\infty$). Since at least one of these limits is $\infty$ and none is 0, the right-hand side of (2.5) diverges leading to a contradiction.

For $z \in \mathbb{C}^N$ and $J = \{j_1 < j_2 < \ldots < j_n\} \subseteq [N]$, let
\[
z_J = (z_{j_1}, z_{j_2}, \ldots, z_{j_n}).
\]

For $z \in \hat{X}^r_M$, let $[z] \in X^r_M$ denote the corresponding class.

**Lemma 2.5.** Let $(M, \tau)$ be a toric pair.

(a) The space $\hat{X}^r_M$ is path-connected.

(b) The torus $\mathbb{T}^k$ acts freely on $\hat{X}^r_M$.

(c) The subset $\mathbb{T}^k \cdot \mu^{-1}_M(\tau)$ of $\mathbb{C}^N$ is open.

(d) The subset $\mathbb{T}^k \cdot \mu^{-1}_M(\tau)$ of $\hat{X}^r_M$ is closed.
(e) There is a unique map

\[ \rho^r_M : \tilde{X}^r_M \rightarrow (\mathbb{R}^{>0})^k \subset \mathbb{T}^k \quad \text{s.t.} \quad \rho^r_M(z) = \mu^{-1}_M(\tau) \quad \forall \, z \in \tilde{X}^r_M. \]

Furthermore, this map is smooth.

(1) The quotient \( \mu^{-1}_M(\tau)/(S^1)^k \) is a compact and Hausdorff.

(g) The inclusion \( \mu^{-1}_M(\tau) \hookrightarrow \tilde{X}^r_M \) induces a homeomorphism

\[ \mu^{-1}_M(\tau)/(S^1)^k \rightarrow X^r_M. \quad (2.6) \]

In particular, \( X^r_M \) is compact and Hausdorff.

(h) The space \( X^r_M \) is a complex manifold of complex dimension \( N-k \).

Proof. (a) This holds since \( \tilde{X}^r_M \) is the complement of coordinate subspaces in \( \mathbb{C}^N \).

(b) Let \( t \in \mathbb{T}^k \) and \( z \in \tilde{X}^r_M \) be such that \( t \cdot z = z \). By Lemma 2.4(ii) there exists \( J \) in \( \mathcal{V}^r_M \) such that \( J = \{ j_1 < \ldots < j_k \} \subseteq \text{supp}(z) \).

By (ii) in Definition 2.1 the group homomorphism

\[ \mathbb{T}^k \rightarrow \mathbb{T}^k, \quad t \mapsto (t^{M_{j_1}}, \ldots, t^{M_{j_k}}), \]

is injective and so \( t = (1, 1, \ldots, 1) \).

(c) For each \( z \in \mathbb{C}^N \), let

\[ M_z \equiv M \begin{pmatrix} |z_1| & 0 & \cdots \vspace{1em} \\ 0 \vspace{1em} & \ddots \vspace{1em} \\ 0 \vspace{1em} & \cdots & |z_N| \end{pmatrix}. \]

If \( z \in \mu^{-1}_M(\tau) \), \( \text{supp}(z) \supseteq J \) for some \( J \) in \( \mathcal{V}^r_M \) by Lemma 2.4(ii). Since \( M_J \) is invertible by (ii) in Definition 2.1 so are \((M_z)_J \) and \( \mu^{-1}_M(M_z)_J \). Since the differential of the map

\[ (\mathbb{R}^{>0})^k \rightarrow \mathbb{R}^k, \quad t \mapsto \mu_M(t \cdot z), \]

at \( t = (1, \ldots, 1) \in (\mathbb{R}^{>0})^k \subset \mathbb{T}^k \) is \( 2M_z(M_z)^\text{tr} \), the differential of the map

\[ \mathbb{T}^k \times \mu^{-1}_M(\tau) \rightarrow \mathbb{R}^k, \quad (t, z) \mapsto \mu_M(t \cdot z), \]

is surjective at \((1, z)\) for all \( z \in \mu^{-1}_M(\tau) \). Since the restriction of this differential to the second component vanishes, the differential of the map

\[ \mathbb{T}^k \times \mu^{-1}_M(\tau) \rightarrow \mathbb{C}^N, \quad (t, z) \mapsto t \cdot z, \quad (2.7) \]

is surjective at \((1, z)\) for all \( z \in \mu^{-1}_M(\tau) \) and so, by the Inverse Function Theorem, the image of \((2.7)\) contains an open neighborhood of \( \mu^{-1}_M(\tau) \) in \( \mathbb{C}^N \).

(d) Let \( z^{(n)} \in \tilde{X}^r_M \) and \( t^{(n)} \in \mathbb{T}^k \) be sequences such that

\[ \lim_{n \rightarrow \infty} z^{(n)} = z \in \tilde{X}^r_M \quad \text{and} \quad y^{(n)} \equiv t^{(n)} \cdot z^{(n)} \in \mu^{-1}_M(\tau). \]
By (iii) in Definition 2.1, we can assume that \( y^{(n)} \to y \in \mu^{-1}_M(\tau) \). By Lemma 2.4(i) there exist \( J(y), J(z) \in \mathcal{Y}_M' \) such that

\[
J(y) = \{ j_1 < \ldots < j_k \} \subseteq \text{supp}(y) \quad \text{and} \quad J(z) \subseteq \text{supp}(z);
\]
we can assume that \( J(y), J(z) \subseteq \text{supp}(y^{(n)}) = \text{supp}(z^{(n)}) \) for all \( n \). By (ii) in Definition 2.1, \( M_j(y) \) is invertible and so \( t^{(n)} = (\tilde{t}^{(n)})^\top \), where \( (\tilde{t}^{(n)})^{(n)} = \frac{(y^{(n)})^{(n)}}{(z^{(n)})^{(n)}} \quad \forall \, i = 1, \ldots, k. \)

Since \( (y^{(n)})_j \to y_j \neq 0 \) for all \( j \in J(y) \) and \( (z^{(n)})_j \to z_j \), \( |(\tilde{t}^{(n)})_i| \geq \delta \) for some \( \delta \in \mathbb{R} > 0 \) and for all \( n \) and \( i \). If \( |(\tilde{t}^{(n)})| \) is not bounded above, after passing to a subsequence we can assume that \( |(\tilde{t}^{(n)})| \to \infty \). By Lemma 2.4(j) there exists \( j \in J(z) \) such that, after passing to a subsequence,

\[
|(\tilde{t}^{(n)})_j| = |(\tilde{t}^{(n)})_j^{M_j}| \to \infty.
\]

Since \( \tilde{t}^{(n)} \cdot z^{(n)} \to y \), it follows that \( (z^{(n)})_j \to 0 \) and so \( j \notin \text{supp}(z) \), contrary to the assumption. Thus, \( \{\tilde{t}^{(n)}\} \) is a compact subset of \( \mathbb{T}^k \). After passing to a subsequence, we can thus assume that \( t^{(n)} \to t \in \mathbb{T}^k \). It follows that

\[
t \cdot z = \lim_{n \to \infty} t^{(n)} \cdot z^{(n)} = \lim_{n \to \infty} (\tilde{t}^{(n)} \cdot z^{(n)}) = \lim_{n \to \infty} y^{(n)} = y.
\]

Thus, \( z \in \mathbb{T}^k \cdot \mu^{-1}_M(\tau) \).

(e) By the proof of (e), \( \tau \) is a regular value of the smooth map

\[
\Phi : (\mathbb{R}^{>0})^k \times \tilde{X}_M^\tau \to \mathbb{R}^k, \quad (t, z) \to \mu_M(t \cdot z),
\]

and the projection map \( \pi_2 : \Phi^{-1}(\tau) \to \tilde{X}_M^\tau \) is a submersion. By (a), (c), and (d), this map is surjective. We show that it is also injective; by (a), (c), and (d), this is equivalent to showing that

\[
(r_1, \ldots, r_k) \in \mathbb{R}^k, \quad \text{and} \quad (e^{r_1}, \ldots, e^{r_k}) \cdot z \in \mu^{-1}_M(\tau) \quad \implies \quad r_i = 0 \quad \forall \, i = 1, \ldots, k,
\]

where the action of \((e^{r_1}, \ldots, e^{r_k}) \in \mathbb{T}^k \) on \( z \) is defined by (2.1) as above. We present the argument in the proof of [K1] 7.2 Lemma. Let

\[
f : \mathbb{R} \to \mathbb{R}, \quad f(u) = \left\langle \mu_M\left((e^{ur_1}, \ldots, e^{ur_k}) \cdot z\right), (r_1, \ldots, r_k) \right\rangle \quad \forall \, u \in \mathbb{R}.
\]

Since \( f(0) = f(1) \), there exists \( u_0 \in (0, 1) \) such that \( f'(u_0) = 0 \). Since

\[
f'(u_0) = 2 \sum_{j=1}^{N} e^{2u_0 (r_1, \ldots, r_k)_j} \left( r_1, \ldots, r_k, M_j \right) \left( z_j \right)^2,
\]

\( f'(u_0) = 0 \) implies that \( \left( (r_1, \ldots, r_k)_j \right)_z = 0 \) for all \( j \in [N] \). By Lemma 2.3(i), there exists \( J \in \mathcal{Y}_M^\tau \) such that \( J \subseteq \text{supp}(z) \) and so \( \left( (r_1, \ldots, r_k)_j \right)_z = 0 \) for all \( j \in J \). By (iii) in Definition 2.1, this implies that \( r_i = 0 \) for all \( i \in [k] \). The map \( \rho^{-1}_M \) is \( \pi_2^{-1} \) composed with the projection \( (\mathbb{R}^{>0})^k \times \tilde{X}_M^\tau \to (\mathbb{R}^{>0})^k \).

(f) Since \( \mu^{-1}_M(\tau) \) is compact by (iii) in Definition 2.1, so is the quotient space \( \mu^{-1}_M(\tau) / (S^1)^k \). If \( p \) is the quotient projection map and \( A \subset \mu^{-1}_M(\tau) \) is a closed subset,

\[
p^{-1}(p(A)) = (S^1)^k \cdot A \equiv \{ t \cdot z : z \in A, \ t \in (S^1)^k \}\]
is the image of the compact subset \((S^1)^k \times A\) in \(\mu^{-1}_M(\tau)\) under the continuous multiplication map

\[(S^1)^k \times \mu^{-1}_M(\tau) \to \mu^{-1}_M(\tau)\]

and thus compact. Since \(\mu^{-1}_M(\tau)\) is Hausdorff, it follows that \(p^{-1}(p(A))\) is a closed subset of \(\mu^{-1}_M(\tau)\). We conclude the quotient map \(p\) is a closed map. Since \(\mu^{-1}_M(\tau)\) is a normal topological space, by [Mu, Lemma 73.3] so is \(\mu^{-1}_M(\tau)/(S^1)^k\).

The map \(\tau\) is well-defined, since the inclusion \(\mu^{-1}_M(\tau) \hookrightarrow \tilde{X}_M^{\tau}\) is equivariant under the inclusion \((S^1)^k \hookrightarrow \mathbb{T}^k\), and is continuous by the defining property of the quotient topology. The map

\[\tilde{X}_M^{\tau} \to \mu^{-1}_M(\tau), \quad z \mapsto \rho_M^\tau(z) \cdot z,\]

is equivariant with respect to the natural projection \(\mathbb{T}^k \to (S^1)^k\) by the uniqueness property in \((e)\) and thus induces a continuous map in the opposite direction to \((2.6)\). Since \(\rho_M^\tau|_{\mu^{-1}_M(\tau)} = (1, \ldots, 1)\), the two maps are easily seen to be mutual inverses.

We cover \(X_M^{\tau}\) by holomorphic charts as in [Ba, Propositions 2.17, 2.18]. For each \(J \in \mathcal{Y}_M^{\tau}\), let

\[\{N\} - J \equiv \{i_1 < i_2 < \ldots < i_{N-k}\}, \quad \tilde{U}_J \equiv \{z \in \mathbb{C}^N : \text{supp}(z) \supseteq J\}, \quad U_J \equiv \tilde{U}_J / \mathbb{T}^k,\]

\[h_J : U_J \to \mathbb{C}^{N-k}, \quad h_J[z] = \left(\frac{z_{i_1}}{z_j^{M_j^{-1}M_{j_1}}}, \frac{z_{i_2}}{z_j^{M_j^{-1}M_{j_2}}}, \ldots, \frac{z_{i_{N-k}}}{z_j^{M_j^{-1}M_{j_{N-k}}}}\right). \tag{2.8}\]

By Lemma 2.2\(\{i\}\), the collections \(\{\tilde{U}_J : J \in \mathcal{Y}_M^{\tau}\}\) and \(\{U_J : J \in \mathcal{Y}_M^{\tau}\}\) cover \(\tilde{X}_M^{\tau}\) and \(X_M^{\tau}\), respectively. The map \(h_J\) is well-defined. First, \(M_j^{-1}\) exists and is an integer matrix by \((ii)\) in Definition 2.1. Second, if \(t \in \mathbb{T}^k, z \in \tilde{U}_J,\) and \(J = \{j_1 < j_2 < \ldots < j_k\}\), then

\[(t \cdot z)_j^{M_j^{-1}M_{i_s}}(t \cdot z)_{i_s} = \left((t^{M_{j_1}} z_{j_1})^{-(M_j^{-1}M_{j_1})_1} \ldots (t^{M_{j_k}} z_{j_k})^{-(M_j^{-1}M_{i_s})_k}\right) t^{M_j} z_{i_s} \]

\[= t^{-M_j(M_j^{-1}M_{i_s}) + M_{i_s} z_j^{M_j^{-1}M_{i_s}} z_{i_s}} = z_j^{-M_j^{-1}M_{i_s}} z_{i_s}, \quad \forall s \in [N-k].\]

The map \(h_J^{-1}\) is the composition of the continuous maps

\[\mathbb{C}^{N-k} \overset{h_J^{-1}}{\longrightarrow} \tilde{U}_J \overset{\text{projection}}{\longrightarrow} U_J, \quad \left(h_J^{-1}(z)\right)_i = \begin{cases} z_s, & \text{if } i = i_s, \\ 1, & \text{if } i \in J, \end{cases} \quad \forall i \in [N].\]

The composition \(\mathbb{C}^{N-k} \to U_J h_J \to \mathbb{C}^{N-k}\) is obviously the identity. The other relevant composition is given by \(U_J \ni [z] \to [y] \in U_J,\) where

\[y_i = \begin{cases} z_j^{-M_j^{-1}M_{i_s}} z_{i_s}, & \text{if } i = i_s, \\ 1, & \text{if } i \in J, \end{cases} \quad \forall j \in [N].\]

Let \(t_r = z_j^{-M_j^{-1}r},\) for all \(r \in [k];\) it follows that \(t \cdot z = y.\)

If in addition \(J' \in \mathcal{Y}_M^{\tau},\) the domain and image of the overlap map \(h_J \circ h_J^{-1}\) are complements of some the coordinate subspaces in \(\mathbb{C}^{N-k}\), and every component of this map is a ratio of monomials in the complex coordinates. In particular, this map is holomorphic. \(\square\)
Remark 2.6. Let \((M, \tau)\) be a toric pair. The projection \(\pi: \tilde{X}^\tau_M \to X^\tau_M\) is a holomorphic submersion; this can be seen using the charts (2.3).

Let \(K^\tau_M\) be the connected component of \(\tau\) inside the regular value locus of \(\mu_M\).

Lemma 2.7. Let \((M, \tau)\) be a toric pair.

(a) Let \(\eta \in \mathbb{R}^k\). Then, \(\eta\) is a regular value of \(\mu_M\) if and only if \(\eta \notin M_J(\mathbb{R}_{\geq 0}^{|J|})\) for every \(J \subset [N]\) with \(|J| \leq k-1\).

(b) The subset \(K^\tau_M\) of \(\mathbb{R}^k\) is an open cone (i.e. an open subset of \(\mathbb{R}^k\) such that \(\lambda \eta \in K^\tau_M\) whenever \(\lambda > 0\) and \(\eta \in K^\tau_M\)).

(c) For every \(\eta \in K^\tau_M\), \(\mathcal{V}^\eta_M = \mathcal{V}^\tau_M\).

(d) For every \(\eta \in K^\tau_M\), \((M, \eta)\) is a toric pair and \(X^\eta_M = X^\tau_M\).

Proof. (a) If \(\eta\) is a regular value of \(\mu_M\), \(\eta \notin M_J(\mathbb{R}_{\geq 0}^{|J|})\) for every \(J \subset [N]\) with \(|J| \leq k-1\) by the second statement in Lemma 2.4. Suppose \(\eta \notin M_J(\mathbb{R}_{\geq 0}^{|J|})\) for every \(J \subset [N]\) with \(|J| \leq k-1\). We prove that for every \(v \in P^\eta_M\) there exists \(J \subseteq \text{supp}(v)\) such that \(|J| = k\) and \(M_J \neq 0\). Suppose not, i.e. \(\text{det} M_J = 0\) for all \(J \subseteq \text{supp}(v)\) with \(|J| = k\). We show that there exists \(v' \in P^\eta_M\) with \(|\text{supp}(v')| < k\); this contradicts the assumption on \(\eta\). If \(|\text{supp}(v)| \geq k\), there exists \(w \in M^{-1}(0) \subset \mathbb{R}^N\) such that \(\text{supp}(w) \subseteq \text{supp}(v)\) and \(w_{j_0} > 0\) for some \(j_0 \in \text{supp}(v)\). Let

\[ \lambda = \min \left\{ \frac{v_j}{w_j} : j \in \text{supp}(v) \text{ such that } w_j > 0 \right\}. \]

It follows that \(v - \lambda w \in P^\eta_M\) and \(\text{supp}(v - \lambda w) \subseteq \text{supp}(v)\). Continuing in this way, we obtain \(v' \in P^\eta_M\) with \(|\text{supp}(v')| < k\).

(b) This follows immediately from (a).

(c) We show that the set \(\{\eta \in K^\tau_M : \mathcal{V}^\eta_M = \mathcal{V}^\tau_M\}\) is open and closed in \(K^\tau_M\) and thus equals \(K^\tau_M\). It suffices to show that for any \(\mathcal{P} \subseteq \{J \subseteq [N] : |J| = k\}\) the set

\[ \{\eta \in K^\tau_M : \mathcal{V}^\eta_M = \mathcal{P} \} = \bigcap_{J \in \mathcal{P}} \{\eta \in K^\tau_M : P^\eta_M \cap \mathbb{R}^{|J|} \neq \emptyset \} \cap \bigcup_{J \in [N], |J| = k} \{\eta \in K^\tau_M : P^\eta_M \cap \mathbb{R}^{|J|} = \emptyset \} \]

is open. We show that the set

\[ \{\eta \in K^\tau_M : P^\eta_M \cap \mathbb{R}^{|J|} = \emptyset \} \]

with \(J \subseteq [N]\) and \(|J| = k\) is open. Let \(\eta'\) be any of its elements and let \(w \in P^\eta'_M \cap \mathbb{R}^J\). By the surjectivity of \(d_{w\mu_M}\), \(\text{supp}(w) = J\) and \(\text{det} M_J \neq 0\); this shows that \(M_J(\mathbb{R}_{>0})^k\) is open and

\[ \eta' \in M_J(\mathbb{R}_{>0})^k \cap K^\tau_M \subseteq \{\eta \in K^\tau_M : P^\eta_M \cap \mathbb{R}^{|J|} = \emptyset \}. \]

The set

\[ \{\eta \in K^\tau_M : P^\eta_M \cap \mathbb{R}^{|J|} = \emptyset \} = K^\tau_M - M_J(\mathbb{R}_{>0})^{|J|} \]

with \(J \subseteq [N]\) and \(|J| = k\) is open as well.

(d) Since \(P^\eta_M \neq \emptyset\), \(\mu_M(\tau) \neq \emptyset\) and so \(\mathcal{V}^\tau_M \neq \emptyset\) by Lemma 2.4. Since \(\mathcal{V}^\tau_M \neq \emptyset\), \(\mathcal{V}^\eta_M \neq \emptyset\) by (c) and so \(P^\eta_M \neq \emptyset\). Since \((M, \tau)\) satisfies (iii) in Definition 2.1 by (c) so does \((M, \eta)\). Thus, \((M, \eta)\) is toric. The equality \(X^\eta_M = X^\tau_M\) follows from (c) together with Lemma 2.4.
Lemma 2.8. Let \((M, \tau)\) be a toric pair.

(a) The quotient \(\mu^{-1}_M(\tau)/(S^1)^k\) admits a unique smooth structure such that the projection

\[
\pi_\tau : \mu^{-1}_M(\tau) \longrightarrow \mu^{-1}_M(\tau)/(S^1)^k
\]

is a submersion.

(b) There exists a unique symplectic form \(\omega_\tau\) on \(\mu^{-1}_M(\tau)/(S^1)^k\) such that

\[
\pi_\tau^* \omega_\tau = \omega_{\text{std}}\big|_{\mu^{-1}_M(\tau)},
\]

where \(\pi_\tau\) is the projection \((2.9)\).

(c) The map \((2.6)\) is a diffeomorphism.

Proof. (a) By [tD, Proposition 5.2], if \(G\) is a compact Lie group acting freely and smoothly on a manifold \(M\), then the quotient \(M/G\) carries a unique differentiable structure such that the projection

\[
M \longrightarrow M/G
\]

is a submersion. Thus, the claim follows from \((i)\) in Definition 2.1 and Lemma 2.5\((b)\).

(b) This follows from the Marsden-Weinstein symplectic reduction theorem [MW, Theorem 1].

(c) By \((a)\) and Lemma 2.5\((g)\), it is enough to show that the restriction

\[
\pi\big|_{\mu^{-1}_M(\tau)} : \mu^{-1}_M(\tau) \longrightarrow X_M^\tau
\]

of the projection \(\pi : \tilde{X}_M^\tau \longrightarrow X_M^\tau\) is a submersion. This follows from the fact that the map

\[
T_k \times \mu^{-1}_M(\tau) \longrightarrow X_M^\tau, \quad (t, z) \mapsto [z],
\]

is a submersion whose differential at \((t, z)\) vanishes on \(T_t \mathbb{T}^k \times 0\). This map is a submersion because it is the composition of two submersions,

\[
T_k \times \mu^{-1}_M(\tau) \longrightarrow \tilde{X}_M^\tau, \quad (t, z) \mapsto t \cdot z \quad \text{and} \quad \pi : \tilde{X}_M^\tau \longrightarrow X_M^\tau.
\]

The former map is a submersion by the proof of Lemma 2.8\((c)\) while \(\pi\) is a submersion by Remark 2.6 \(\Box\).

If \((M, \tau)\) is a toric pair, we abuse notation and denote by \(\omega_\tau\) not only the form on \(\mu^{-1}_M(\tau)/(S^1)^k\) defined by Lemma 2.8\((b)\) but also the form it induces on \(X_M^\tau\) via the diffeomorphism \((2.6)\) of Lemma 2.8\((c)\). In this case, by Lemma 2.7\((d)\) and Lemma 2.8\((b)\) for every \(\eta \in K_M^\tau\), \(\omega_\eta\) is the unique symplectic form on \(X_M^\tau\) satisfying

\[
\pi^* \omega_\eta\big|_{\mu^{-1}_M(\eta)} = \omega_{\text{std}}\big|_{\mu^{-1}_M(\eta)}, \quad \text{where} \quad \pi : \tilde{X}_M^\tau \longrightarrow X_M^\tau
\]

is the projection; see also diagram \((2.3)\).

Lemma 2.9. Let \((M, \tau)\) be a toric pair. For every \(\eta \in K_M^\tau\), \(\omega_\eta\) is Kähler with respect to the complex structure on \(X_M^\tau\).
Proof. The form $\omega_j$ is positive with respect to the complex structure on $X^\tau_M$ by (2.10) together with the equality $\hat{T}^k \cdot \mu^{-1}_M(\eta) = \tilde{X}^\tau_M$ (justified by Lemmas 2.5(g) and 2.4(d)), Remark 2.10 and the positivity of $\omega_{\text{std}}$. \hfill $\square$

Remark 2.10. If $(M, \tau)$ is a toric pair and $J \subseteq [N]$, the pair $(M_J, \tau)$ is toric if and only if $P^\tau_{M_J} \neq \emptyset$. In this case, $X^\tau_{M_J}$ is a connected compact projective manifold of complex dimension $|J| - k$ by Proposition 2.2. It is biholomorphic to

$$X^\tau_M(J) \equiv \{ [z] \in X^\tau_M : \text{supp}(z) \subseteq J \}$$

via the map

$$X^\tau_{M_J} \ni [z] \mapsto ([z_j] \in X^\tau_M(J), \quad \text{where} \quad (r_{j,j'}(z))_j = \begin{cases} z_{j'}, & \text{if} \; j = j', \\ 0, & \text{if} \; j \neq j. \end{cases} \quad (2.11)$$

if $J = \{j_1 < j_2 < \ldots < j_r\}$. In particular, if $(M, \tau)$ is a minimal toric pair and $M_J$ is the matrix obtained from $M$ by deleting the $j$-th column, then $X^\tau_{M_J}$ is a connected compact projective manifold of complex dimension $N - 1$. The map (2.11) identifies $X^\tau_{M_J}$ with the hypersurface

$$X^\tau_M([N] - \{j\}) \equiv D_j = \{ [z] \in X^\tau_M : z_j = 0 \}. \quad (2.12)$$

If $J \in \mathcal{Y}^\tau_M$ with ${\mathcal{Y}^\tau_M}$ defined by (2.14), then $X^\tau_M(J)$ is the point

$$[J] = [z_1, \ldots, z_N], \quad \text{where} \quad z_j = \begin{cases} 1, & \text{if} \; j \in J; \\ 0, & \text{otherwise}. \end{cases} \quad (2.13)$$

This follows from Lemma 2.4(i) and (ii) in Definition 2.1.

If $J \subseteq [N]$ is such that $P^\tau_M \cap \mathbb{R}^J \neq \emptyset$ and $|J| = k + 1$, then $X^\tau_{M}(J)$ is a one-dimensional complex manifold and there exist exactly 2 multi-indices $I \in \mathcal{Y}^\tau_M$ with $I \subset J$. The latter follows since multi-indices $I \in \mathcal{Y}^\tau_M$ with $I \subset J$ correspond bijectively via $\iota_J$ to elements of $\mathcal{Y}^\tau_{M_J}$, which in turn correspond to the vertices of $P^\tau_{M_J}$ by Lemma 2.4(g) $P^\tau_{M_J}$ has dimension 1 by Lemma 2.4(e).

Remark 2.11. If $(M, \tau)$ is a toric pair with $M$ a $k \times N$ matrix, then $(VM, V\tau)$ is a toric pair whenever $V \in \text{GL}_k(\mathbb{Z})$. In this case, $\mathcal{Y}^\tau_M = \mathcal{Y}^\tau_{VM}$ and $X^\tau_M$ is biholomorphic to $X^\tau_{VM}$. The pair $(VM, V\tau)$ satisfies the first condition of (i) in Definition 2.1 since $V$ is an isomorphism. Since $P^\tau_M = P^\tau_{VM}$, $\mathcal{Y}^\tau_M = \mathcal{Y}^\tau_{VM}$ and so $(VM, V\tau)$ satisfies the second condition of (i), (ii) and (iii) in Definition 2.1 as well.

Remark 2.12. If $(M, \tau)$ is a toric pair with $M$ a $k \times (k + 1)$ matrix, then $X^\tau_M$ is biholomorphic to $\mathbb{P}^1$. In order to see this, note first that $|\mathcal{Y}^\tau_M| = 2$ by Lemma 2.4(g) and Lemma 2.4(e). By Remark 2.11 we can assume that $M_J = \text{Id}_k$ for some $J \in \mathcal{Y}^\tau_M$. The claim now follows from (2.8): $X^\tau_M$ is a compact manifold covered by two charts

$$h_{\tau_j} : U_{\tau_j} \sim \mathbb{C}, \quad h_{\tau_I} : U_I \sim \mathbb{C}$$

satisfying $h_{\tau_I}(U_{\tau_j} \cap U_I) = h_{\tau_I}(U_{\tau_j} \cap U_I) = \mathbb{C}^*$ since $I \cup J = [k + 1]$ and $h_{\tau_I} \circ h_{\tau_j}^{-1}(z) = z^{\pm 1}$ by (ii) in Definition 2.1.
2.2 Cohomology, Kähler cone, and Picard group

Throughout the remaining part of this paper, \((M, \tau)\) is a toric pair. In order to complete the proof in Section 2.1 that \(X^\tau_M\) is projective, we describe some holomorphic line bundles over it. For each \(p \in \mathbb{Z}^k\), let

\[
L_p = \tilde{X}^\tau_M \times_p \mathbb{C} = \tilde{X}^\tau_M / \sim, \quad \text{where} \quad (z, c) \sim (t^{-1} \cdot z, t P_c), \quad \forall t \in \mathbb{T}^k.
\]

(2.14)

Since \(\pi: \tilde{X}^\tau_M \to X^\tau_M\) with \(\pi(z) = [z]\) is a \(\mathbb{T}^k\)-principal bundle by Lemma 2.5(b) and Remark 2.6, \(L_p \to X^\tau_M, \quad [z, c] \to [z]\), is a holomorphic line bundle. Furthermore,

\[
L_0 = O_{X^\tau_M}, \quad L^*_p = L_{-p}, \quad L_p \otimes L_\tau = L_{p+\tau}.
\]

The line bundle \(L_{-M_j}\) admits a holomorphic section

\[
s_j : X^\tau_M \to L_{-M_j}, \quad [z] \to [z, z_j].
\]

(2.15)

Since \(s_j\) is transverse to the zero set by (2.8) and \(s_j^{-1}(0) = D_j\) by (2.12), \(c_1(L_{-M_j}) = PD(D_j)\).

For all \(j \in [N]\) and \(i \in [k]\), let

\[
U_j = c_1(L_{-M_j}), \quad \gamma_i = L_{e_i}, \quad H_i = c_1(\gamma_i^*)
\]

(2.16)

where \(\{e_i : i \in [k]\} \subset \mathbb{Z}^k\) is the standard basis. Thus,

\[
L_{-M_j} = \gamma_1^{* \otimes m_{1j}} \otimes \gamma_2^{* \otimes m_{2j}} \otimes \ldots \otimes \gamma_k^{* \otimes m_{kj}} \quad \implies \quad U_j = \sum_{i=1}^k m_{ij} H_i \quad \forall j \in [N].
\]

(2.17)

Lemma 2.13 below is used in the proof of Proposition 2.2 in Section 2.1 and to describe the Kähler cone of \(X^\tau_M\) in Proposition 2.16 below.

**Lemma 2.13.** For every \(\eta \in \mathbb{Z}^k \cap K^\tau_M\),

\[
c_1(L_{-\eta}) = \frac{1}{\pi} [\omega_\eta],
\]

where \(\omega_\eta\) is the Kähler form defined by (2.10).

**Proof.** We follow closely the proof of [Au, Proposition VII.3.1]. Let

\[
L^R_{-\eta} \to \mu^{-1}_M(\eta) / (S^1)^k
\]

be the pull-back of \(L_{-\eta}\) via the diffeomorphism (2.6) of Lemma 2.8(c) and

\[
L^S_{-\eta} = \mu^{-1}_M(\eta) \times_{-\eta} S^1 \to \mu^{-1}_M(\eta) / (S^1)^k
\]

17
be its sphere bundle. Let

\[ \mu_M^{-1}(\eta) \times S^1 \xrightarrow{\hat{p}} \mu_M^{-1}(\eta) \]

\[ \xrightarrow{q} L_{\eta}^{-S^1} \xrightarrow{p} \mu_M^{-1}(\eta)_{(S^1)p} \]

be the natural projections.

Let \( e_i^\# \) be the fundamental vector field on \( \mu_M^{-1}(\eta) \times S^1 \) corresponding to \( e_i \in \mathbb{R}^k \) for the \( \mathbb{T}^k \)-action given by (2.14) with \( p = -\eta \). Thus,

\[
e_i^\# = \frac{d}{dt} \bigg|_{t=0} (\exp(it e_i) \cdot (x_1 + iy_1, \ldots, x_N + iy_N, x + iy))
\]

\[
= \sum_{j=1}^{N} m_{ij} \left( y_j \frac{\partial}{\partial x_j} - x_j \frac{\partial}{\partial y_j} \right) + \eta_i \left( y \frac{\partial}{\partial x} - x \frac{\partial}{\partial y} \right),
\]

where \( x_j, y_j, x, y \) are the standard coordinates on \( \mathbb{C}^N = (\mathbb{R}^2)^N \) and \( \mathbb{C} = \mathbb{R}^2 \), respectively. Let

\[
\alpha = \sum_{j=1}^{N} (-x_j dy_j + y_j dx_j) \in \Omega^1(\mu_M^{-1}(\eta)) \quad \text{and} \quad \sigma = xdy - ydx \in \Omega^1(S^1).
\]

Since \( t_{e_i^\#}(\alpha \oplus \sigma) = 0 \) on \( \mu_M^{-1}(\eta) \times S^1 \) for all \( i \in [k] \), \( \alpha \oplus \sigma \) descends to a 1-form \( (\alpha \oplus \sigma)_{S^1} \) on \( L_{\eta}^{-S^1} \). This form is a connection 1-form for the principal \( S^1 \)-bundle \( L_{\eta}^{-S^1} \) because it satisfies

\[
\mathcal{L}_{X^\#}(\alpha \oplus \sigma)_{S^1} = 0, \quad \iota_{X^\#}(\alpha \oplus \sigma)_{S^1} = 1,
\]

where

\[
X^\# = -y \frac{\partial}{\partial x} + x \frac{\partial}{\partial y}
\]

is the fundamental vector field for the \( S^1 \)-action on \( L_{\eta}^{-S^1} \) as a principal \( S^1 \)-bundle; see [Au, Exercises V.4,V.5]. Let \( \beta \) denote the curvature form associated to \( (\alpha \oplus \sigma)_{S^1} \). By [Au, Section V.4.c], it is uniquely determined by

\[
p^* \beta = d(\alpha \oplus \sigma)_{S^1}.
\]

Since \( q^*d((\alpha \oplus \sigma)_{S^1}) = -2\hat{p}^* \omega_{\text{std}}, \beta = -2\omega_\eta \) by the uniqueness of reduced symplectic form \( \omega_\eta \) of Lemma 2.8(b). Thus, by [Au, Proposition VI.1.18] and [Au, Section VI.5.b],

\[
c_1(L_{\eta}^R) = -\frac{1}{2\pi} [\beta] = \frac{1}{\pi} [\omega_\eta] \in H^2_{dR}(\mu_M^{-1}(\eta)/(S^1)^k),
\]

as claimed. \( \square \)

We define

\[
\mathcal{E}_M = \left\{ J \subseteq [N] : \cap_{j \in J} D_j = \emptyset \right\} = \left\{ J \subseteq [N] : M_{f^{-1}}^J(\tau) \cap (\mathbb{R}^0)^{|J|} = \emptyset \right\};
\]

the second equality follows from Lemma 2.11(c,d) and (2.12).
Proposition 2.14. If \((M, \tau)\) is a toric pair,

\[
H^*(X^\tau_M) \cong \frac{\mathbb{Q}[H_1, H_2, \ldots, H_k, U_1, U_2, \ldots, U_N]}{\left( U_j - \sum_{i=1}^k m_{ij} H_i, \; 1 \leq j \leq [N] \right) + \left( \prod_{j \in J} U_j : J \in \mathcal{E}^\tau_M \right)}.
\]

If, in addition \((M, \tau)\) is minimal, \(H^2(X^\tau_M; \mathbb{Z})\) is free with basis \(\{H_1, H_2, \ldots, H_k\}\).

**Proof.** This follows from [McDSa, Section 11.3] together with Lemma 2.8(c). \(\Box\)

**Remark 2.15.** By Proposition 2.14, \(H^*(X^\tau_M)\) is generated as a \(\mathbb{Q}\)-algebra by \(\{H_1, H_2, \ldots, H_k\}\). Along with (ii) in Definition 2.1, this implies that \(H^*(X^\tau_M)\) is generated as a \(\mathbb{Q}\)-algebra by \(\{U_1, \ldots, U_N\}\).

Proposition 2.16. If \((M, \tau)\) is a minimal toric pair, there is a basis \(\{c_1(L_{-\eta_i}) : i \in [k]\}\) for \(H^2(X^\tau_M)\) formed by the first Chern classes of ample line bundles, with \(L_{-\eta_i}\) as in (2.17). In particular, the Kähler cone \(K^\tau_M\) of \(X^\tau_M\) has dimension \(k\).

**Proof.** By Lemmas 2.13, 2.9, and 2.7(b) (d), there exists a subset \(\{\eta_1, \ldots, \eta_k\} \subseteq \mathbb{Z}^k\), linearly independent over \(\mathbb{Q}\), such that the line bundles \(L_{-\eta_i}\) are positive. The first Chern classes of these line bundles form a \(\mathbb{Q}\)-basis of \(H^2(X^\tau_M)\) by the last statement in Proposition 2.14. \(\Box\)

Proposition 2.17. If \((M, \tau)\) is a minimal toric pair, the Picard group of \(X^\tau_M\) is free of rank \(k\) and has a \(\mathbb{Z}\)-basis given by \(\{\gamma_1, \ldots, \gamma_k\}\) defined by (2.16).

**Proof.** The first Chern class homomorphism is an isomorphism because \(h^0,1(X^\tau_M) = h^0,2(X^\tau_M) = 0\) which in turn follows from Proposition 2.14. \(\Box\)

**Remark 2.18.** If \((M, \tau)\) is a toric pair, there is a short exact sequence

\[
0 \longrightarrow \mathcal{O}_{X^\tau_M}^{\oplus k} \xrightarrow{F} \bigoplus_{j=1}^N L_{-\eta_j} \xrightarrow{G} TX^\tau_M \longrightarrow 0.
\]

(2.19)

Specifically, we can take

\[
F([z], e_i) \equiv [z, m_{i1}z_1, m_{i2}z_2, \ldots, m_{iN}z_N] \quad \forall i \in [k], \; [z] \in X^\tau_M,
\]

\[
G(z, y_1, \ldots, y_N) \equiv \sum_{j=1}^N y_j dz \left( \frac{\partial}{\partial z_j} \right)_{z[z]}, \quad \forall z \in \tilde{X}^\tau_M, \; y_1, \ldots, y_N \in \mathbb{C},
\]

where \(\{e_i : i \in [k]\}\) is the standard basis for \(\mathbb{C}^k\) and \(\pi : \tilde{X}^\tau_M \longrightarrow X^\tau_M\) is the projection. Thus,

\[
c_1(TX^\tau_M) = \sum_{j=1}^N U_j.
\]

(2.20)
2.3 Torus action and equivariant notation

The equivariant cohomology of a topological space $X$ endowed with a continuous $\mathbb{T}^N$-action is

$$H^*_\mathbb{T}^N(X) \equiv H^*(ET^N \times \mathbb{T}^N X),$$

where $ET^N \equiv (C^\infty - 0)^N$ is the classifying space for $\mathbb{T}^N$. In particular, the equivariant cohomology of a point is

$$H^*_\mathbb{T}^N(\text{point}) \cong H^*_\mathbb{T}^N \equiv H^*(\mathbb{P}^N) = \mathbb{Q}[\alpha_1, \ldots, \alpha_N] \equiv \mathbb{Q}[\alpha],$$

where $\alpha_j \equiv c_1(\pi_j^* O_{\mathbb{P}^N}(1))$, $\pi_j : (\mathbb{P}^N)^N \rightarrow \mathbb{P}^\infty$ is the projection onto the $j$-th component and $O_{\mathbb{P}^N}(1)$ is dual to the tautological line bundle over $\mathbb{P}^\infty$. The equivariant Euler class of an oriented vector bundle $V \rightarrow X$ endowed with a lift of the $\mathbb{T}^N$-action on $X$ is

$$e(V) \equiv e(ET^N \times \mathbb{T}^N V) \in H^*_\mathbb{T}^N(X).$$

A $\mathbb{T}^N$-equivariant map $f : X \rightarrow Y$ between compact oriented manifolds induces a push-forward map

$$f_* : H^*_\mathbb{T}^N(X) \rightarrow H^*_\mathbb{T}^N \dim Y - \dim X(Y)$$

classified by

$$\int_X (f^* \eta) \eta' = \int_Y \eta(f_* \eta') \quad \forall \eta \in H^*_\mathbb{T}^N(Y), \eta' \in H^*_\mathbb{T}^N(X). \quad (2.21)$$

If $Y$ is a point, $f_*$ is the integration along the fiber homomorphism $\int_X : H^*_\mathbb{T}^N(X) \rightarrow H^*(\mathbb{T}^N X)$.

The push-forward map $f_*$ extends to a homomorphism between the modules of fractions with denominators in $\mathbb{Q}[\alpha]$; in particular, the integration along the fiber homomorphism extends to

$$\int_X : H^*_\mathbb{T}^N(X) \otimes_{\mathbb{Q}[\alpha]} \mathbb{Q}(\alpha) \rightarrow \mathbb{Q}(\alpha), \quad \text{where} \quad \mathbb{Q}(\alpha) \equiv \mathbb{Q}(\alpha_1, \ldots, \alpha_N)$$

is the field of fractions of $\mathbb{Q}[\alpha]$. If $X$ is a compact oriented manifold on which $\mathbb{T}^N$ acts smoothly, then, by the classical Localization Theorem [ABG],

$$\mathbb{Q}[\alpha] \ni \int_X \eta = \sum_{F \subseteq X^\mathbb{T}^N} \int_F \frac{\eta}{\epsilon(N_{F/X})} \in \mathbb{Q}(\alpha), \quad \forall \eta \in H^*_\mathbb{T}^N(X), \quad (2.22)$$

where the sum runs over the components of the $\mathbb{T}^N$ pointwise fixed locus $X^\mathbb{T}^N$ of $X$.

**Lemma 2.19.** If $(M, \tau)$ is a toric pair, $(\mathbb{T}^N z / \mathbb{T}^k)$ is diffeomorphic to $\mathbb{T}^{|\text{supp}(z)| - k}$ for every $z \in \hat{X}_M^\tau$.

**Proof.** By Lemma 2.4(i) and (ii) in Definition 2.1, there exists $J \subseteq \text{supp}(z)$ with $|J| = k$ and $\det M_j \in \{1\}$. The map

$$\mathbb{T}^N z / \mathbb{T}^k \ni [y_1, \ldots, y_N] \rightarrow \left( y_j^{-M_j^{-1}M_s} y_s \right)_{s \in \text{supp}(z) - J} \in \mathbb{T}^{|\text{supp}(z)| - k}$$

is a diffeomorphism with inverse

$$\mathbb{T}^{|\text{supp}(z)| - k} \ni \lambda \rightarrow [t_1 z_1, \ldots, t_N z_N] \in \mathbb{T}^N z / \mathbb{T}^k,$$

where

$$t_j = \begin{cases} 1, & \text{if } j \notin \text{supp}(z), \\ \frac{\lambda_j}{\epsilon_j}, & \text{if } j = j_s, \\ \frac{1}{\epsilon_j}, & \text{if } j \in J, \end{cases}$$

and $\text{supp}(z) - J \equiv \{j_1 < \ldots < j_{|\text{supp}(z)| - k}\}$; see the proof of Lemma 2.4(ii) in Section 2.1. \qed

20
Corollary 2.20. (a) The $T^N$-fixed points in $X^*_M$ are the points $[J]$ of (2.13).

(b) The closed $T^N$-fixed curves in $X^*_M$ are the submanifolds $X^*_{J}(J)$ of Remark 2.10 with $|J|=k+1$; all such tuples $J$ are of the form $J=I_1 \cup I_2$ with $I_1, I_2 \in \nu^*_M$ and $|I_1 \cap I_2|=k-1$. These curves are biholomorphic to $\mathbb{P}^1$.

Proof. The first two statements follow from Lemma 2.19. The third follows from the last part of Remark 2.10. The last follows from Remarks 2.10 and 2.12. \qed

We next consider lifts of the standard action of $T^N$ on $X^*_M$ to the line bundles $L_p$ of (2.14) which will be used in describing the equivariant cohomology of $X^*_M$. One such lift is the canonical one

$$(t_1, \ldots, t_N) \cdot [z_1, \ldots, z_N, c] \equiv [t_1 z_1, \ldots, t_N z_N, c] \quad (2.23)$$

for all $(t_1, \ldots, t_N) \in T^N$, $(z_1, \ldots, z_N) \in \tilde{X}^*_M$, and $c \in \mathbb{C}$. We denote by

$$ET^N \times_{\text{triv}} L_p \longrightarrow ET^N \times_{T^N} X^*_M$$

the induced line bundle. Another lift is given by

$$(t_1, \ldots, t_N) \cdot [z_1, \ldots, z_N, c] \equiv [t_1 z_1, \ldots, t_N z_N, t_j c] \quad (2.24)$$

for all $(t_1, \ldots, t_N) \in T^N$, $(z_1, \ldots, z_N) \in \tilde{X}^*_M$, and $c \in \mathbb{C}$. We denote by

$$ET^N \times_j L_p \longrightarrow ET^N \times_{T^N} X^*_M$$

the induced line bundle. These line bundles are related by isomorphisms

$$(ET^N \times_{\text{triv}} L_p) \otimes (ET^N \times_j L_0) \cong ET^N \times_j L_p, \quad (2.25)$$

$$ET^N \times_j L_0 \cong pr_1^* \pi_j^* O_{P^N}(-1), \quad (2.26)$$

where $pr_1 : ET^N \times_{T^N} X^*_M \longrightarrow (P^N)^N$ denotes the natural projection. The first of these follows by considering the isomorphism

$$L_p \otimes L_0 \longrightarrow L_p, \quad [z, c_1] \otimes [z, c_2] \longrightarrow [z, c_1 c_2] \quad \forall \ z \in \tilde{X}^*_M, c_1, c_2 \in \mathbb{C}$$

which is $T^N$-equivariant with respect to the $T^N$ action on $L_p \otimes L_0$ obtained by tensoring (2.23) with (2.24) and the action (2.24) on $L_p$. The second is given by

$$ET^N \times_j L_0 \ni (e, z, c) \longrightarrow (e, z, e c_j) \in pr_1^* \pi_j^* O_{P^N}(-1) \quad \forall \ e = (e_1, \ldots, e_N) \in ET^N, z \in \tilde{X}^*_M, c \in \mathbb{C}.$$

For all $j \in [N], i \in [k]$ and with $\gamma_i$ defined by (2.16), let

$$[D_j] = ET^N \times_j L_{-M_j}, \quad \gamma_i = ET^N \times_{\text{triv}} \gamma_i; \quad u_j = c_1([D_j]), \quad x_i = c_1(\gamma_i) \in H^*_T(X^*_M). \quad (2.27)$$

For each $J \in \nu^*_M$, the inclusion $[J] \hookrightarrow X^*_M$ induces a restriction map

$$\cdot (J), \quad \cdot |_J : H^*_T(X^*_M) \longrightarrow H^*_T([J]) \cong H^*_T. \quad (2.28)$$

By (2.17), (2.25) and (2.26),

$$u_j = \sum_{i=1}^k m_{ij} x_i - \alpha_j \quad \forall \ j \in [N]. \quad (2.29)$$
On the other hand, if \( J \) does not vanish on \( \mathbb{T}^N \) and \( j \in J \), \( s_j \) does not vanish on \( E_{\mathbb{T}^N}^\tau \times \mathbb{T}^N \| \mathcal{D}_j \) over \( E_{\mathbb{T}^N}^\tau \times \mathbb{T}^N X_M^\tau \). If \( J \in \mathcal{Y}_M^\tau \) and \( j \in J \), \( s_j \) does not vanish on \( E_{\mathbb{T}^N}^\tau \times \mathbb{T}^N \| \mathcal{D}_j \) and thus

\[
J \in \mathcal{Y}_M^\tau \quad \implies \quad u_j(J) = 0 \quad \forall \ j \in J. \tag{2.30}
\]

On the other hand, if \( J \in \mathcal{E}_M^\tau \), then \( \mathcal{E}_M^\tau \) is an isomorphism of vector spaces. The relations in (2.32) hold by (2.29) and (2.31). We show

\[
J \in \mathcal{E}_M^\tau \quad \implies \quad \prod_{j \in J} u_j = 0 \in H_{\mathbb{T}^N}^\ast(X_M^\tau). \tag{2.31}
\]

**Proposition 2.21.** Let \((M, \tau)\) be a toric pair.

(a) If \( J = (j_1 < \ldots < j_k) \in \mathcal{Y}_M^\tau \),

\[
(x_1(J) \ x_2(J) \ldots x_k(J)) = (\alpha_{j_1} \alpha_{j_2} \ldots \alpha_{j_k})M^{-1}_j.
\]

(b) With \( x_i \) and \( u_j \) defined by (2.27),

\[
H_{\mathbb{T}^N}^\ast(X_M^\tau) = \frac{\mathbb{Q}[\alpha][x_1, x_2, \ldots, x_k, u_1, u_2, \ldots, u_N]}{(u_j - \sum_{i=1}^k m_{ij} x_i + \alpha_j, 1 \leq j \leq N) + \left( \prod_{j \in J} u_j : J \in \mathcal{E}_M^\tau \right)}. \tag{2.32}
\]

If in addition \( P \in H_{\mathbb{T}^N}^\ast(X_M^\tau) \), then \( P = 0 \) if and only if \( P(J) = 0 \) for all \( J \in \mathcal{Y}_M^\tau \).

**Proof.** (a) This follows from (2.29) and (2.30).

(b) By Remark 2.15 there exists \( B \subseteq (\mathbb{Z}^{\geq 0})^k \) such that \( \{HP : p \in B\} \) is a \( \mathbb{Q} \)-basis for \( H^\ast(X_M^\tau) \). The map

\[
H^\ast(X_M^\tau) \ni HP \longrightarrow x^P \in H_{\mathbb{T}^N}^\ast(X_M^\tau) \quad \forall p \in B
\]

defines a cohomology extension of the fiber for the fiber bundle \( E_{\mathbb{T}^N} \times \mathbb{T}^N X_M^\tau \longrightarrow (\mathbb{P}^\infty)^N \). Thus, by the Leray-Hirsch Theorem [Spa, Chapter 5], the map

\[
H_{\mathbb{T}^N}^\ast(X_M^\tau) \ni P \otimes HP \longrightarrow PxP \in H_{\mathbb{T}^N}^\ast(X_M^\tau) \quad \forall p \in B
\]

is an isomorphism of vector spaces. The relations in (2.32) hold by (2.29) and (2.30). We show below that there are no other relations and simultaneously verify the last claim.

Suppose \( P \in H_{\mathbb{T}^N}^\ast(X_M^\tau) \), \( P(J) = 0 \) for all \( J \in \mathcal{Y}_M^\tau \). By (ii) in Definition 2.1, any element \( P \) of \( H_{\mathbb{T}^N}^\ast(X_M^\tau) \) is a polynomial in \( u_1, \ldots, u_N \) with coefficients in \( \mathbb{Q}[\alpha] \). If \( J \in \mathcal{Y}_M^\tau \) and \( j \in [N] - J \), then

\[
u_j(J) \big|_{\alpha_i = 0 \forall i \in J} = -\alpha_j \tag{2.33}
\]

by (2.29) and \((a)\). By (2.30) and (2.33), whenever \( u_{i_1}^{a_1} \ldots u_{i_s}^{a_s} \) is a monomial appearing in \( P \) and \( J \in \mathcal{Y}_M^\tau \), \( \{i_1, \ldots, i_s\} \cap J \neq \emptyset \). This shows that

\[
P \in H_{\mathbb{T}^N}^\ast(X_M^\tau), P(J) = 0 \quad \forall J \in \mathcal{Y}_M^\tau \quad \implies \quad P \in H',
\]

where \( H' \) is the ideal

\[
H' = \left\langle u_{i_1} \ldots u_{i_s} : \{i_1, \ldots, i_s\} \cap J \neq \emptyset \ \forall J \in \mathcal{Y}_M^\tau \right\rangle \subseteq \mathbb{Q}[\alpha][u_1, \ldots, u_N].
\]
Since $H' \subseteq (\prod_{j \in J} u_j : J \in \mathcal{E}_M^\tau)$ by Lemma 2.4(i),

$$P \in H^\tau_{TN}(X^\tau_M), P(J) = 0 \quad \forall J \in \mathcal{Y}_M^\tau \quad \implies \quad P \in \left( \prod_{j \in J} u_j : J \in \mathcal{E}_M^\tau \right).$$

By (2.31), this implies that $P = 0 \in H^\tau_{TN}(X^\tau_M)$ if $P(J) = 0$ for all $J \in \mathcal{Y}_M^\tau$.

For every $J \in \mathcal{Y}_M^\tau$, let

$$\phi_J = \prod_{j \in [N] - J} u_j.$$

By (2.19) and (2.30),

$$\phi_J(J) = e(T[J]X^\tau_M), \quad \phi_J(I) = 0 \quad \forall I \in \mathcal{Y}_M^\tau - \{J\}. \quad (2.34)$$

Thus, by the Localization Theorem (2.22),

$$\int_{X^\tau_M} P \phi_J = P(J) \quad \forall P \in H^\tau_{TN}(X^\tau_M), J \in \mathcal{Y}_M^\tau, \quad (2.35)$$

i.e. $\phi_J$ is the equivariant Poincaré dual of the point $[J] \in X^\tau_M$.

### 2.4 Examples

**Example 2.22** (the complex projective space $\mathbb{P}^{N-1}$ with the standard action of $T^N$). If

$$M = (1, \ldots, 1) \in \mathbb{R}^N \quad \text{and} \quad \tau \in \mathbb{R}^{>0},$$

then

$$\mu_M : \mathbb{C}^N \longrightarrow \mathbb{R}, \quad \mu_M(z) = |z_1|^2 + \ldots + |z_N|^2, \quad P^\tau_M = \left\{ v \in (\mathbb{R}^{>0})^N : v_1 + \ldots + v_N = \tau \right\},$$

$(M, \tau)$ is a minimal toric pair, $\tilde{X}^\tau_M = \mathbb{C}^N - \{0\}$,

$$X^\tau_M = \mathbb{P}^{N-1} \cong (S^{2n-1}((\sqrt{\tau})))/S^1, \quad H^\tau_{TN}(\mathbb{P}^{N-1}) \cong \mathbb{Q}[\alpha_1, \ldots, \alpha_N][x]/\prod_{k=1}^N(x - \alpha_k).$$

**Example 2.23** (the Hirzebruch surfaces $\mathbb{F}_k = \mathbb{P}(O_{\mathbb{P}^1} \oplus O_{\mathbb{P}^1}(k))$). If $k \geq 0$,

$$M = \begin{pmatrix} 0 & 0 & 1 & 1 \\ 1 & 1 & 0 & k \end{pmatrix}, \quad \tau = \begin{pmatrix} 1 \\ k + 1 \end{pmatrix},$$

then

$$(t_1, t_2) : (z_1, z_2, z_3, z_4) \equiv \left( t_2 z_1, t_2 z_2, t_1 z_3, t_1 t_2 z_4 \right),$$

$$\mu_M : \mathbb{C}^4 \longrightarrow \mathbb{R}^2, \quad \mu_M(z) = \left( |z_3|^2 + |z_4|^2 \mid |z_1|^2 + |z_2|^2 + k|z_4|^2 \right),$$

$$P^\tau_M = \left\{ v \in (\mathbb{R}^{>0})^4 : v_3 + v_4 = 1, v_1 + v_2 + kv_4 = k + 1 \right\},$$

23
$(M, \tau)$ is a minimal toric pair,
\[ \tilde{X}_M = \mathbb{C}^4 - \left( \mathbb{C}^2 \times 0 \times 0 \times \mathbb{C}^2 \right), \quad X_M = \tilde{X}_M / \mathbb{T}^2. \]

The map
\[ X_M \cong \mathbb{F}_k, \quad [z_1, z_2, z_3, z_4] \mapsto \left[ (z_1, z_2), z_3, \left( (z_1, z_2)^{\mathbb{Q}k} \rightarrow z_4 \right) \right], \tag{2.36} \]
is a $\mathbb{T}^4$-equivariant biholomorphism with respect to the action of $\mathbb{T}^4$ on $\mathbb{F}_k$ given by
\[ (t_1, t_2, t_3, t_4) \cdot [(z_1, z_2), z_3, \varphi] = \left[ (t_1 z_1, t_2 z_2), t_3 z_3, (t_1 \varphi, t_2 \varphi)^{\mathbb{Q}k} \rightarrow t_4 \varphi \left( (y_1, y_2)^{\mathbb{Q}k} \right) \right], \]
\[ \forall [z_1, z_2] \in \mathbb{P}^1, z_3 \in \mathbb{C}, \varphi \in \mathcal{O}_{\mathbb{P}^1}(k)_{[z_1, z_2]}. \]

By Proposition 2.14
\[ H^*(\mathbb{F}_k) = \frac{\mathbb{Q}[H_1, H_2, U_1, U_2, U_3, U_4]}{(U_1 - H_2, U_2 - H_2, U_3 - H_1, U_4 - H_1 - kH_2) + (U_1 U_2, U_3 U_4)} \cong \frac{\mathbb{Q}[H_1, H_2]}{(H_2^2, H_1 (H_1 + kH_2))}. \]

Since the toric hypersurfaces $D_2$ and $D_3$ defined by (2.12) intersect at one point,
\[ H_1 H_2 = U_2 U_3 = 1, \quad H_1^2 = -kH_1 H_2 = -k. \]

The isomorphism (2.36) maps $D_4$ onto $E_0$ and $D_3$ onto $E_x$, where
\[ E_0 = \text{image of the section } (1, 0) \text{ in } \mathbb{F}_k, \]
\[ E_x = \text{closure of the image of } (0, \sigma) \text{ in } \mathbb{F}_k, \]
where $\sigma$ is any non-zero holomorphic section of $\mathcal{O}_{\mathbb{P}^1}(k)$.

Since $\mathcal{M}_M = \{(1, 3), (1, 4), (2, 3), (2, 4)\}$, by Corollary 2.20 the $\mathbb{T}^4$-fixed points in $X_M$ are
\[ [1, 0, 1, 0], [1, 0, 0, 1], [0, 1, 1, 0], \quad \text{and} \quad [0, 1, 0, 1], \]
while the closed $\mathbb{T}^4$-fixed curves are all 4 toric hypersurfaces $D_1$, $D_2$, $D_3$, and $D_4$. By Proposition 2.21(b)
\[ H^*_4(\mathbb{F}_k) = \frac{\mathbb{Q}[\alpha_1, \alpha_2, \alpha_3, \alpha_4][x_1, x_2]}{(x_2 - \alpha_1)(x_2 - \alpha_2), (x_1 - \alpha_3)(x_1 + kx_2 - \alpha_4)}. \]

**Example 2.24** (products). Let $(M_1, \tau_1)$ and $(M_2, \tau_2)$ be (minimal) toric pairs, where $M_j$ is a $k_j \times N_j$ matrix. Define
\[ M_1 \oplus M_2 = \begin{pmatrix} M_1 & 0 \\ 0 & M_2 \end{pmatrix}. \]

Then, $(M_1 \oplus M_2, (\tau_1, \tau_2))$ is a (minimal) toric pair,
\[ P_{M_1 \oplus M_2}^{(\tau_1, \tau_2)} = P_{M_1}^{\tau_1} \times P_{M_2}^{\tau_2}, \quad \text{and} \quad \tilde{X}_{M_1 \oplus M_2}^{(\tau_1, \tau_2)} = \tilde{X}_{M_1}^{\tau_1} \times \tilde{X}_{M_2}^{\tau_2}. \]

The projections $\pi_j : \mathbb{C}^{N_1+N_2} \rightarrow \mathbb{C}^{N_j}$ induce a $\mathbb{T}^{N_1+N_2}$-equivariant biholomorphism
\[ X_{M_1 \oplus M_2}^{(\tau_1, \tau_2)} \ni [z] \mapsto \left( [\pi_1(z)], [\pi_2(z)] \right) \in X_{M_1}^{\tau_1} \times X_{M_2}^{\tau_2}, \]

24
where the action of $\mathbb{T}^{N_1+N_2}$ on $X^{r_1}_{M_1} \times X^{r_2}_{M_2}$ is the product of the standard actions of $\mathbb{T}^{N_1}$ on $X^{r_1}_{M_1}$ and of $\mathbb{T}^{N_2}$ on $X^{r_2}_{M_2}$. By (2.4) and Lemma 2.4(a,g)

$$\mathcal{Y}^{(r_1,r_2)}_{M_1 \oplus M_2} = \mathcal{Y}^{r_1}_{M_1} \times \mathcal{Y}^{r_2}_{M_2}.$$ 

Thus, by Corollary 2.20(a), the $\mathbb{T}^{N_1+N_2}$-fixed points of $X^{r_1}_{M_1} \times X^{r_2}_{M_2}$ are the points $([I_1],[I_2])$ for all $I_j \in \mathcal{Y}^{r_1}_{M_j}$, with $[I_j]$ defined by (2.13). By Corollary 2.20(b) and the second statement in Lemma 2.4(b), the closed $\mathbb{T}^{N_1+N_2}$-fixed curves in $X^{r_1}_{M_1} \times X^{r_2}_{M_2}$ are all curves of the form $C_1 \times [I_2]$ and $[I_1] \times C_2$, where $C_j$ is any closed $\mathbb{T}^{N_j}$-fixed curve in $X^{r_j}_{M_j}$ and $I_j \in \mathcal{Y}^{r_j}_{M_j}$ is arbitrary.

In particular, $\mathbb{P}^{N_1-1} \times \ldots \times \mathbb{P}^{N_s-1}$ is given by the minimal toric pair

$$\begin{pmatrix}
1 \ldots 1 & \cdots & 0 \ldots 0 \\
0 \ldots 0 & \cdots & 0 \ldots 0 \\
\vdots & \ddots & \vdots \\
0 \ldots 0 & \cdots & 0 \ldots 0 \\
0 \ldots 0 & \cdots & 1 \ldots 1 \\
\end{pmatrix}, \quad \tau = \begin{pmatrix} t_1 \\
\vdots \\
t_s \end{pmatrix} \in (\mathbb{R}^{>0})^s. \quad (2.37)
$$

By Proposition 2.21(b)

$$H^*_{\mathbb{T}^N} \left( \mathbb{P}^{N_1-1} \times \ldots \times \mathbb{P}^{N_s-1} \right) = Q \left[ \alpha_j^{(i)}, 1 \leq i \leq s, 1 \leq j \leq N_i \right] [x_1, \ldots, x_s] / \prod_{j=1}^{N_i} (x_i - \alpha_j^{(i)}), 1 \leq i \leq s. \quad (2.38)
$$

**Remark 2.25.** Let $\sigma : [N] \rightarrow [N]$ be a permutation and $(M, \tau)$ be a (minimal) toric pair. Let

$$M^\sigma = \left( m_{i \sigma(j)} \right)_{1 \leq i \leq k, 1 \leq j \leq N} = M \circ \text{Id}^\sigma$$

be the matrix obtained from $M$ by permuting its columns as dictated by $\sigma$. Then $(M^\sigma, \tau)$ is a (minimal) toric pair as well and $\text{Id}^\sigma^{-1}$ induces a biholomorphism between $X^t_M$ and $X^t_{M^\sigma}$ (since $\mu_{M^\sigma} = \mu_M \circ \text{Id}^\sigma$) equivariant with respect to

$$\mathbb{T}^N \rightarrow \mathbb{T}^N, \quad (t_1, t_2, \ldots, t_N) \rightarrow (t_{\sigma(1)}, t_{\sigma(2)}, \ldots, t_{\sigma(N)}).$$

In particular, taking $k = 0$ in Example 2.23 gives - via (2.37) - $\mathbb{P}^1 \times \mathbb{P}^1$ as expected, since the corresponding matrices differ by a permutation of columns.

### 3 Explicit Gromov-Witten formulas

For the remaining part of this paper, $X^r_M$ is the compact projective manifold defined by (2.2), where $(M, \tau)$ is a minimal toric pair as in Definition 2.1. Theorem 3.1 in Section 3.2 below computes the one-point GW generating functions $\hat{Z}_\eta$ and $\tilde{Z}_\eta$ of (1.8) if $\eta \in H^*(X^r_M)$ is of the form $\eta = HP$, where $\{H_1, \ldots, H_k\}$ is the basis for $H^2(X^r_M; \mathbb{Z})$ referred to in Proposition 2.14 and

$$HP = H_1^{p_1} \ldots H_k^{p_k} \quad \forall \ p = (p_1, \ldots, p_k) \in (\mathbb{Z}^{>0})^k.$$
We denote
\[ \hat{Z}_p = \hat{Z}_{HP} \quad \text{and} \quad \check{Z}_p = \check{Z}_{HP}. \tag{3.1} \]
Section 3.1 constructs the explicit formal power series in terms of which \( \hat{Z}_p \) and \( \check{Z}_p \) are expressed in Theorem 3.5. Throughout this construction, which extends the constructions in [22, Section 2.3] and [PoZ, Sections 2, 3.1] from \( \mathbb{P}^{n-1} \) to an arbitrary toric manifold \( X_M^* \), we assume that
\[ \nu_E(d) \geq 0 \quad \forall d \in \Lambda, \tag{3.2} \]
with \( \nu_E \) as in (3.3), and identify
\[ H_2(X_M^*; \mathbb{Z}) \cong \mathbb{Z}^k \]
via the basis \( \{ H_1, \ldots, H_k \} \). Via this identification \( \Lambda \hookrightarrow \mathbb{Z}^k \), with \( \Lambda \) as in (1.5).

3.1 Notation and construction of explicit power series
If \( R \) is a ring, we denote by \( R \llbracket h \rrbracket \) the ring of formal Laurent series in \( h^{-1} \) with finite principal part:
\[ R \llbracket h \rrbracket = R[[h^{-1}]] + R[h]. \]
Given \( f, g \in R \llbracket h \rrbracket \) and \( s \in \mathbb{Z} \geq 0 \), we write
\[ f \equiv g \mod h^{-s} \quad \text{if} \quad f - g \in R[h] + \left\{ \sum_{i=1}^{s-1} a_i h^{-i} : a_i \in R \quad \forall i \in [s-1] \right\}. \]
If \( R \) is a field, we view \( R(h) \) as a subring of \( R \llbracket h \rrbracket \) by associating to each element of \( R(h) \) its Laurent series at \( h^{-1} = 0 \).

With the line bundles \( L_i^\pm \) as in (1.4) and \( U_j \) as in (2.16) and \( d \in H_2(X_M^*; \mathbb{Z}) \), we define
\[ D_j(d) \equiv \langle U_j, d \rangle, \quad L_i^+(d) \equiv \langle c_1(L_i^+), d \rangle, \]
\[ \nu_E(d) = \sum_{j=1}^{N} D_j(d) - \sum_{i=1}^{a} L_i^+(d) + \sum_{i=1}^{b} L_i^-(d). \tag{3.3} \]
If in addition \( Y \subset X \) is a one-dimensional submanifold, let
\[ D_j(Y) \equiv D_j(\langle Y \rangle_{X_M^*}), \quad L_i^+(Y) \equiv L_i^+(\langle Y \rangle_{X_M^*}), \]
where \( \langle Y \rangle_{X_M^*} \in H_2(X_M^*; \mathbb{Z}) \) is the homology class represented by \( Y \). By (2.20), our assumption (3.2), and Footnote 2
\[ c_1(TX_M^*) - \sum_{i=1}^{a} c_1(L_i^+) + \sum_{i=1}^{b} c_1(L_i^-) \in K_M. \]
Thus, if \( E \neq E^+ \), then \( X_M^* \) is Fano. In this case, the Cone Theorem [La, Theorem 1.5.33] implies that the closed \( \mathbb{R} \)-cone of curves is a polytope spanned by classes of rational curves. By [La, Proposition 1.4.28] and [La, Theorem 1.4.23(i)], this closed cone is the \( \mathbb{R} \)-cone spanned by \( \Lambda \). Thus, \( L_i^-(d) < 0 \) for all \( d \in \Lambda - \{ 0 \} \) and all \( i \in \{ b \} \).

\[ ^3 \text{By (1.4) and (2.20), } \nu_E(d) = \langle c_1(T(E^+|Y)), d \rangle \text{ if } Y \text{ is a smooth complete intersection defined by a holomorphic section of } E^+ \text{ and } T(E^+|Y) \text{ is the tangent bundle of the total space of } E^+|Y. \]

\[ ^4 \text{In the notation of [La], } N^1(X_M^*) = H^1(X_M^*) \cap H^2(X_M^*; \mathbb{R}) \text{ as can be seen from Poincaré Duality, Lefschetz Theorem on (1,1)-classes, and Hard Lefschetz Theorem.} \]
Let $R$ be a ring. Similarly to Section 1.1, we denote by $R[[\Lambda - 0]]$ and $R[[\Lambda; \nu_E = 0]]$ the subalgebras of $R[[\Lambda]]$ given by

$$R[[\Lambda - 0]] = \left\{ \sum_{d \in \Lambda} a_d Q^d \in R[[\Lambda]] : a_0 = 0 \right\},$$

$$R[[\Lambda; \nu_E = 0]] = \left\{ \sum_{d \in \Lambda} a_d Q^d \in R[[\Lambda]] : a_d = 0 \text{ if } \nu_E(d) \neq 0 \right\}.$$ 

In some cases, the formal variables whose powers are indexed by $\Lambda$ within $R[[\Lambda]]$ will be denoted by $Q = (Q_1, \ldots, Q_k)$ as in Section 1.1, while in other cases the formal variables will be $q = (q_1, \ldots, q_k)$. If $f \in R[[\Lambda]]$ and $d \in \Lambda$, we write $[f]_{q,d} \in R$ for the coefficient of $q^d$ in $f$. By Proposition 2.16 the set $\{s \in \Lambda : d - s \in \Lambda\}$ is finite for every $d \in \Lambda$; thus,

$$f \in R[[\Lambda]] \text{ is invertible } \iff [f]_{q,0} \in R \text{ is invertible.}$$

If $f = \sum_{d \in \Lambda} f_d q^d \in R[[\Lambda]]$, we define

$$[f]_{\nu_E = 0} = \sum_{d \in \Lambda, \nu_E(d) = 0} f_d q^d \in R[[\Lambda; \nu_E = 0]].$$

Let $A = (A_1, \ldots, A_k)$ be a tuple of formal variables. If $f = \sum_{d \in \Lambda} f_d(A) q^d \in R[[\Lambda]][[\Lambda]]$ and $p \geq 0$, we write

$$[f]_{\Lambda,p} = \sum_{d \in \Lambda} [f_d(A)]_{\Lambda,p} q^d \in R[\Lambda]_p[[\Lambda]],$$

where $[f_d(A)]_{\Lambda,p} \in R[\Lambda]$ denotes the degree $p$ homogeneous part of $f_d(A)$ and $R[\Lambda]_p$ the space of homogeneous polynomials of degree $p$ in $A_1, \ldots, A_k$ with coefficients in $R$. Finally, we write

$$|p| = p_1 + p_2 + \ldots + p_k \quad \forall p = (p_1, p_2, \ldots, p_k) \in (\mathbb{Z}^\geq 0)^k.$$ 

For each $d \in \Lambda$, let

$$U(d; A, h) = \prod_{j \in [N]} \prod_{s = D_j(d) < 0}^{D_j(d) < 0} \prod_{s = D_j(d) + 1}^{D_j(d)} \left( \sum_{i=1}^{k} m_{ij} A_i + sh \right) \in \mathbb{Q}[\Lambda][[h]]. \quad (3.4)$$

By Proposition 2.17, the line bundles $\gamma_i^\pm$ of (2.16) form a basis for the Picard group of $X^*_M$. Thus, there are well-defined integers $\ell^\pm_{ri}$ such that

$$L_i^\pm = \gamma_1^{\ell^1_{i1}} \otimes \cdots \otimes \gamma_k^{\ell^k_{ki}}. \quad (3.5)$$

With $A$ and $d$ as above, let

$$\tilde{E}(d; A, h) = \prod_{i=1}^{a} \prod_{s=1}^{L^+_{i1}(d)} \left( \sum_{r=1}^{k} \ell^+_{ri} A_r + sh \right) \prod_{i=1}^{b} \prod_{s=0}^{L^-_{i1}(d)-1} \left( \sum_{r=1}^{k} \ell^-_{ri} A_r - sh \right) \in Z[A, h], \quad (3.6)$$

$$\check{E}(d; A, h) = \prod_{i=1}^{a} \prod_{s=0}^{L^+_{i1}(d)-1} \left( \sum_{r=1}^{k} \ell^+_{ri} A_r + sh \right) \prod_{i=1}^{b} \prod_{s=1}^{L^-_{i1}(d)} \left( \sum_{r=1}^{k} \ell^-_{ri} A_r - sh \right) \in Z[A, h].$$

27
The formal power series computing $\hat{Z}_p$ and $\hat{Z}_p$ in Theorem 3.5 are obtained from

$$\hat{Y}(A,h,q) = \sum_{d \in \Lambda} q^d U(d; A, h) \hat{E}(d; A, h) \in \mathbb{Q}[A][[h^{-1}, \Lambda]],$$

$$\hat{Y}(A,h,q) = \sum_{d \in \Lambda} q^d U(d; A, h) \hat{E}(d; A, h) \in \mathbb{Q}[A][[h^{-1}, \Lambda]].$$

(3.7)

We define

$$\hat{I}_0(q) \equiv \hat{Y}(A,h,q) \mod h^{-1}, \quad \hat{I}_0(q) \equiv \hat{Y}(A,h,q) \mod h^{-1},$$

(3.8)

and so

$$\hat{I}_0(q) = 1 + \delta_{b,0} \sum_{d \in \Lambda, \nu_E(d) = 0} \frac{\prod_{i=1}^{a} (L_i^+(d)!) \prod_{j=1}^{N} (D_j(d)!)!}{\prod_{j=1}^{N} \left( \prod_{i=1}^{b} \left( -L_i^-(d) \right)! \right)},$$

$$\hat{I}_0(q) = 1 + \sum_{d \in \Lambda, \nu_E(d) = 0} \frac{\prod_{i=1}^{a} (L_i^+(d)!) \prod_{j=1}^{N} (D_j(d)!)!}{\prod_{j=1}^{N} \left( \prod_{i=1}^{b} \left( -L_i^-(d) \right)! \right)}.$$
By \((3.9)\), we can define \(J_0(Y) \in \mathbb{Q}[\mathbb{A}; \nu_E = 0]\) and \(D^0 Y \in \mathbb{Q}(A, h)[[\mathbb{A}]]\) by
\[
\{J_0(Y)\}(1) = Y(A, h, q) \mod h^{-1}, \quad D^0 Y(A, h, q) = [(J_0(Y))(1)]^{-1} Y(A, h, q).
\]

Suppose next that \(p \geq 0\) and we have constructed an operator \(J_p(Y)\) and power series \(D^p Y\) for all \(p \in (\mathbb{Z}^{\geq 0})^k\) with \(|p| = p\) satisfying the above properties. For each \(p \in (\mathbb{Z}^{\geq 0})^k\) with \(|p| = p + 1\), let
\[
\tilde{D}^p Y(A, h, q) = \frac{1}{|\text{supp}(p)|} \sum_{i \in \text{supp}(p)} \left\{ A_i + h q_i \frac{d}{dq_i} \right\} D^{p-e_i} Y(A, h, q) \in \mathbb{Q}(A, h)[[\mathbb{A}]],
\]
\[
\{J_{p+1}(Y)\}(AP) = \left[ \tilde{D}^p Y(A, h, q) \mod h^{-1} \right]_{A_p+1},
\]
where \(\{e_1, \ldots, e_k\}\) is the canonical basis for \(\mathbb{Z}^k\). By \((P2)\)
\[
\{J_{p+1}(Y)\}(AP) = \frac{1}{|\text{supp}(p)|} \sum_{i \in \text{supp}(p)} \left[ \sum_{|r| = p} C^{(r)}_{p-e_i, p} A_i \cdot A^r + \sum_{|r| = p+1} q_i \frac{dC^{(r)}_{p-e_i, p+1}}{dq_i} A^r \right]
\]
\[
= \frac{1}{|\text{supp}(p)|} \sum_{|r| = p+1} \sum_{i \in \text{supp}(p)} \left( C^{(r-e_i)}_{p-te_i, p+1} + q_i \frac{dC^{(r-e_i)}_{p-te_i, p+1}}{dq_i} \right) \frac{A^r}{A^r},
\]
where we set \(C^{(r-e_i)}_{p-te_i, p+1} = 0\) if \(i \notin \text{supp}(r)\). By \((3.14)\) and \((3.11)\),
\[
\{J_{p+1}(Y)\}(AP) \in \mathbb{Q}[\mathbb{A}; \nu_E = 0][A]_{p+1} \quad \text{and} \quad \{J_{p+1}(Y)\}(AP)_{q=0} = AP,
\]
in particular, \(J_{p+1}(Y)\) is invertible. With \(c_{p,p'}(q) \in \mathbb{Q}[\mathbb{A}; \nu_E = 0]\) for \(p, p' \in (\mathbb{Z}^{\geq 0})^k\) with \(|p|, |p'| = p+1\) given by
\[
\{J_{p+1}(Y)\}^{-1}(AP) = \sum_{p' \in (\mathbb{Z}^{\geq 0})^k, |p'| = p+1} c_{p,p'}(q) AP',
\]
we define
\[
D^p Y(A, h, q) = \sum_{p' \in (\mathbb{Z}^{\geq 0})^k, |p'| = p+1} c_{p,p'}(q) \tilde{D}^p Y(A, h, q).
\]
By \((3.17)\) and the inductive assumption \((3.10)\),
\[
D^p Y(A, h, q) = h^{p+1} \sum_{s=0}^{\infty} \sum_{r \in (\mathbb{Z}^{\geq 0})^k} C^{(r)}_{p,s}(q) A^r h^{-s}, \quad \text{where}
\]
\[
C^{(r)}_{p,s}(q) = \sum_{p' \in (\mathbb{Z}^{\geq 0})^k, |p'| = p+1} \left| c_{p,p'} \right| \sum_{i \in \text{supp}(p')} C^{(r-e_i)}_{p'-e_i, s-1} + q_i \frac{dC^{(r-e_i)}_{p'-e_i, s-1}}{dq_i},
\]
where we set \(C^{(r-e_i)}_{p-te_i, s-1} = 0\) if \(i \notin \text{supp}(r)\) or \(s = 0\). By the first property in \((3.11)\) with \(p\) replaced by \(p' - e_i\) with \(|p'| = p+1\) and \(i \in \text{supp}(p')\), \(C^{(r)}_{p,s}\) satisfies this property as well. By the second property in \((3.11)\) with \(p\) replaced by \(p' - e_i\) with \(|p'| = p+1\) and \(i \in \text{supp}(p')\), \(C^{(r)}_{p,s}\) satisfies the second property in \((3.11)\). By the second statement in \((3.15)\) and \((3.16)\), \(c_{p,p'}(q)_{q=0} = \delta_{p,p'}\). Thus, by the
third property in (3.11) with \( p \) replaced by \( p' - e_i \) with \( |p'| = p + 1 \) and \( i \in \text{supp}(p') \), \( C^{(r)}_{p,s} \) satisfies the last property in (3.11) as well.

Define \( \tilde{C}^{(r)}_{p,s} = \tilde{C}^{(r)}_{p,s}(Y) \in \mathbb{Q}[[\Lambda]] \) for \( p, s \in (\mathbb{Z}^{\geq 0})^k \) and \( r \in \mathbb{Z}^{\geq 0} \) with \( |s| \leq |p| - r \) and \( r \leq |p| \) by

\[
\sum_{t=0}^{r} \sum_{s \in (\mathbb{Z}^{\geq 0})^k \atop |s| \leq |p| - t} \tilde{C}_{p,s}^{(t)} C_{s,r+t-t}^{(r)} = \delta_{p,s} \delta_{r,0} \quad \forall \ r \in (\mathbb{Z}^{\geq 0})^k, |r| \leq |p| - r.
\]

Equations (3.19) indeed uniquely determine \( \tilde{C}^{(r)}_{p,s} \), since

\[
\sum_{t=0}^{r} \sum_{s \in (\mathbb{Z}^{\geq 0})^k \atop |s| \leq |p| - t} \tilde{C}_{p,s}^{(t)} C_{s,r+t-t}^{(r)} = \sum_{t=0}^{r-1} \sum_{s \in (\mathbb{Z}^{\geq 0})^k \atop |s| \leq |p| - t} \tilde{C}_{p,s}^{(t)} C_{s,r+t-t}^{(r)} + \sum_{s \in (\mathbb{Z}^{\geq 0})^k \atop |s| < |r|} \tilde{C}_{p,s}^{(r)} C_{s,r|} + \tilde{C}_{p,r},
\]

as follows from (3.11). By (3.19) together with the first and third statements in (3.11),

\[
\left[ \tilde{C}_{p,s}^{(r)} \right]_{q,0} = \delta_{p,s} \delta_{r,0}.
\]

By (3.19), (3.20), and induction on \( |s| \),

\[
\tilde{C}_{p,s}^{(0)}(q) = \delta_{p,s} \quad \forall \ p, s \in (\mathbb{Z}^{\geq 0})^k \quad \text{with} \ |s| \leq |p|.
\]

By (3.19), (3.20), the first statement in (3.11), and induction on \( |s| \) and \( r \),

\[
\left[ \tilde{C}_{p,s}^{(r)} \right]_{q,d} = 0 \quad \text{if} \ \nu_E(d) \neq r.
\]

**Remark 3.1.** With \( \tilde{Y}, \tilde{Y} \) as in (3.7) and \( \tilde{I}_0, \tilde{I}_0 \) as in (3.8),

\[
\left\{ J_0(\tilde{Y}) \right\} (1) = \tilde{I}_0(q), \quad \mathbf{D}^0 \tilde{Y}(A, h, q) = \frac{1}{\tilde{I}_0(q)} \tilde{Y}(A, h, q),
\]

\[
\left\{ J_0(\tilde{Y}) \right\} (1) = \tilde{I}_0(q), \quad \mathbf{D}^0 \tilde{Y}(A, h, q) = \frac{1}{\tilde{I}_0(q)} \tilde{Y}(A, h, q),
\]

by (3.12).

Define

\[
\left\{ A + h q \frac{d}{dq} \right\}^\mathbf{P} = \left\{ A_1 + h q_1 \frac{d}{dq} \right\}^{p_1} \ldots \left\{ A_k + h q_k \frac{d}{dq} \right\}^{p_k} \quad \forall \ p = (p_1, \ldots, p_k) \in (\mathbb{Z}^{\geq 0})^k.
\]

**Remark 3.2.** If \( \nu_E(d) > 0 \) for all \( d \in \Lambda - \{0\} \) and \( Y(A, h, q) \in \mathbb{Q}(A, h)[[\Lambda]] \) satisfies (3.5), then \( J_p(Y) = \text{Id} \) for all \( p \in \mathbb{Z}^{\geq 0} \) by (P1) above. Along with the first equation in (3.13), (3.16), (3.17), and induction on \( |p| \), this implies that

\[
\mathbf{D}^p Y(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}^\mathbf{P} Y(A, h, q)
\]

for all \( p \in (\mathbb{Z}^{\geq 0})^k. \)
Remark 3.3. Suppose \( p^* \in \mathbb{Z}_{\geq 0} \), \( Y(A, h, q) \in \mathbb{Q}(A, h)[[\Lambda]] \) satisfies (3.9), and
\[
\deg_h f_d(A, h) - \deg_h g_d(A, h) < -p^* \quad \forall \, d \in \Lambda - \{0\}.
\]
By the same reasoning as in Remark 3.2, we again find that
\[
J_p(Y) = \text{Id}, \quad \mathcal{D}^p Y(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}^p Y(A, h, q),
\]
for all \( p \in \mathbb{Z}_{\geq 0} \) and \( p \in (\mathbb{Z}_{\geq 0})^k \) such that \( p, |p| \leq p^* \).

Remark 3.4. Let \((M, \tau)\) be the toric pair of Example 2.22 with \( N = n \) so that \( X_M^\tau = \mathbb{P}^{n-1} \). Let
\[
E \equiv \bigoplus_{i=1}^a \mathcal{O}_{\mathbb{P}^{n-1}}(\ell^+_i) + \bigoplus_{i=1}^b \mathcal{O}_{\mathbb{P}^{n-1}}(\ell^-_i)
\]
with \( a, b \geq 0 \), \( \ell^+_i > 0 \) for all \( i \in [a] \), \( \ell^-_i < 0 \) for all \( i \in [b] \), and \( \sum_{i=1}^a \ell^+_i - \sum_{i=1}^b \ell^-_i \leq n \). Thus,
\[
\nu_E(d) = \left( n - \sum_{i=1}^a \ell^+_i + \sum_{i=1}^b \ell^-_i \right) \cdot d
\]
for all \( d \in \mathbb{Z}_{\geq 0} \). By (3.7),
\[
\hat{Y}(A, h, q) = \sum_{d=0}^{\infty} q^d \prod_{i=1}^a \prod_{s=1}^{\ell^+_i d} (\ell^+_i A + sh) \prod_{i=1}^b \prod_{s=1}^{\ell^-_i d - 1} (\ell^-_i A - sh) \frac{\prod_{i=1}^a \prod_{s=1}^{\ell^+_i d - 1} (\ell^+_i A + sh) \prod_{i=1}^b \prod_{s=1}^{\ell^-_i d} (\ell^-_i A - sh)}{(A + sh)^n},
\]
\[
\check{Y}(A, h, q) = \sum_{d=0}^{\infty} q^d \prod_{i=1}^a \prod_{s=0}^{\ell^+_i d} (\ell^+_i A + sh) \prod_{i=1}^b \prod_{s=1}^{\ell^-_i d} (\ell^-_i A - sh) \frac{\prod_{i=1}^a \prod_{s=0}^{\ell^+_i d - 1} (\ell^+_i A + sh) \prod_{i=1}^b \prod_{s=1}^{\ell^-_i d - 1} (\ell^-_i A - sh)}{(A + sh)^n}.
\]
By Remark 3.3
\[
J_p(\hat{Y}) = \text{Id}, \quad \mathcal{D}^p \hat{Y}(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}^p \hat{Y}(A, h, q) \quad \forall \, p < b,
\]
\[
J_p(\check{Y}) = \text{Id}, \quad \mathcal{D}^p \check{Y}(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}^p \check{Y}(A, h, q) \quad \forall \, p < a.
\]
If \( \sum_{i=1}^a \ell^+_i - \sum_{i=1}^b \ell^-_i < n \), then
\[
J_p(\hat{Y}), J_p(\check{Y}) = \text{Id}, \quad \mathcal{D}^p \hat{Y} = \left\{ A + h q \frac{d}{dq} \right\}^p \hat{Y}, \quad \mathcal{D}^p \check{Y} = \left\{ A + h q \frac{d}{dq} \right\}^p \check{Y}
\]
for all $p$ by Remark 3.2 If $\sum_{i=1}^{a} \ell_i^+ - \sum_{i=1}^{b} \ell_i^- = n$, then we follow [PoZ, (1.1)] and set

$$F(w, q) = \prod_{d=0}^{\infty} q^d \frac{\prod_{r=1}^{d} (\ell_i^+ w + r)^{\ell_i^+} \prod_{r=1}^{d} (\ell_i^- w - r)^{\ell_i^-}}{\prod_{r=1}^{d} (w + r)^n},$$

(3.24)

$$MF(w, q) = \left\{ 1 + \frac{q d}{w dq} \right\} \left( \frac{F(w, q)}{F(0, q)} \right), \quad I_p(q) = MF^pF(0, q).$$

By (3.13) and (3.17) above,

$$J_p(\hat{Y}) = I_{p-b}(q)Id, \quad D^p\hat{Y}(A, h, q) = Ap \frac{1}{I_{p-b}(q)}MF^{p-b}F(A/H, q) \quad \forall p \geq b,$n

$$J_p(\hat{Y}) = I_{p-a}(q)Id, \quad D^p\hat{Y}(A, h, q) = Ap \frac{1}{I_{p-a}(q)}MF^{p-a}F(A/H, q) \quad \forall p \geq a.$n

3.2 Statements

The statements and proofs of the theorems below rely on the one-point mirror formula (5.2) below, which is proved in [LLY3]. We begin by defining the mirror map occurring in this formula.

For each $i\in[k]$, let

$$f_i(q) = \frac{1}{I_0(q)} \sum_{d\in\Lambda, \nu_E(d)\geq 0} q^d \left\{ \frac{U(d; A, 1)E(d; A, 1)}{\partial A_i} \right\} \big\vert_{A_0 = 0} \in \mathbb{Q}[\Lambda - 0],$$

(3.25)

with $I_0(q)$ defined by (3.8). The mirror map is the change of variables $q \rightarrow Q$, where

$$(Q_1, \ldots, Q_k) = (q_1 e^{f_1(q)}, \ldots, q_k e^{f_k(q)}).$$

(3.26)

Finally, let

$$G(q) = \frac{\delta_{b, 0}}{I_0(q) I_{0}(q)_{d\in\Lambda, \nu_E(d)=1} \prod_{j=1}^{N} (D_j(d)!)} \sum_{d\in\Lambda} q^d \prod_{i=1}^{a} (L_i^+(d)!)] \in \mathbb{Q}[\Lambda - 0].$$

(3.27)

Theorem 3.5. If $\nu_E(d) \geq 0$ for all $d\in\Lambda$, then $\hat{Z}_p$ and $\tilde{Z}_p$ of (3.1) and (3.8) are given by

$$\hat{Z}_p(h, Q) = e^{-\frac{1}{\hbar} \left[ G(q) + \sum_{i=1}^{k} H_i f_i(q) \right]} \hat{Y}_p(H, h, q) \in H^*(X^*_M)[h^{-1}][\Lambda],$$

$$\tilde{Z}_p(h, Q) = e^{-\frac{1}{\hbar} \left[ G(q) + \sum_{i=1}^{k} H_i f_i(q) \right]} \tilde{Y}_p(H, h, q) \in H^*(X^*_M)[h^{-1}][\Lambda].$$
where

\[ \hat{Y}_p(A, \hbar, q) \equiv D^p \hat{Y}(A, \hbar, q) + \sum_{r=1}^{[p]} \sum_{|s|=0}^{[p]-r} \hat{C}^{(r)}_{p,s}(q)\hbar^{r-s}D^s \hat{Y}(A, \hbar, q) \in \mathcal{Q}(A, \hbar)[[A]], \]

\[ \check{Y}_p(A, \hbar, q) \equiv D^p \check{Y}(A, \hbar, q) + \sum_{r=1}^{[p]} \sum_{|s|=0}^{[p]-r} \check{C}^{(r)}_{p,s}(q)\hbar^{r-s}D^s \check{Y}(A, \hbar, q) \in \mathcal{Q}(A, \hbar)[[A]], \]

with \( \hat{C}^{(r)}_{p,s}(q) \) and \( \check{C}^{(r)}_{p,s}(q) \) defined by (3.19), \( Q \) and \( q \) related by the mirror map (3.26), \( G \) and \( f_i \) given by (3.27) and (3.25), and the operator \( D^p \) defined by (3.13) and (3.17).

If \( |p| < b \), \( D^p \hat{Y} = \{A + \hbar q \frac{d}{dq}\}^p \hat{Y} \) and \( \hat{C}^{(r)}_{p,s} = 0 \) for all \( r \in \mathcal{Q}[p] \). If \( |p| > a \) and \( L_i^+(d) \geq 1 \) for all \( i \in [a] \) and \( d \in \Lambda - \{0\} \), then \( D^p \check{Y} = \{A + \hbar q \frac{d}{dq}\}^p \check{Y} \) and \( \check{C}^{(r)}_{p,s} = 0 \) for all \( r \in \mathcal{Q}[p] \).

This follows from Theorem 4.8 together with (4.18) and (EP1) below; Theorem 4.8 is an equivariant version of Theorem 3.5.

**Remark 3.6.** In the inductive construction of \( D^p Y \) with \( Y = \hat{Y} \) or \( Y = \check{Y} \), the first equation in (3.13) may be replaced by

\[ \hat{D}^p Y(A, \hbar, q) \equiv \sum_{i \in \text{supp}(p)} c_{p,i} \left\{ A_i + \hbar q_i \frac{d}{dq_i} \right\} D^{p-i} Y(A, \hbar, q) \in \mathcal{Q}(A, \hbar)[[A]] \]

for any tuple \( (c_{p,i})_{i \in \text{supp}(p)} \) of rational numbers with \( \sum_{i \in \text{supp}(p)} c_{p,i} = 1 \). The endomorphism \( J_{p+1}(Y) \) and the power series \( D^p Y \) defined by the second equation in (3.13) and (3.17) in terms of the new “weighted” \( \hat{D}^p Y \) satisfy (P1) and (P2) by the same arguments as in the case when \( c_{p,i} = \frac{1}{|\text{supp}(p)|} \) for all \( i \in \text{supp}(p) \). Therefore, (3.19) continues to define power series \( \hat{C}^{(r)}_{p,s}(Y) \) in terms of the “new weighted” \( C^{(r)}_{p,s}(Y) \). The resulting “weighted” power series \( Y_p \) of (3.23) do not depend on the “weights” \( c_{p,i} \) as elements of \( H^*(X^n_{\mathcal{M}})[[\hbar]][[A]] \); this follows from Remark 1.11.

**Corollary 3.7.** If \( \nu_E(d) = 0 \) or \( \nu_E(d) > |p| \) for all \( d \in \Lambda - \{0\} \), then

\[ \hat{Z}_p(h, Q) = e^{-\frac{1}{\hbar} \left[ G(q) + \sum_{i=1}^{s} H_i f_i(q) \right]} D^p \hat{Y}(H, h, q), \quad \check{Z}_p(h, Q) = e^{-\frac{1}{\hbar} \left[ G(q) + \sum_{i=1}^{s} H_i f_i(q) \right]} D^p \check{Y}(H, h, q), \]

with \( Q \) and \( q \) related by the mirror map (3.20) and \( G \) and \( f_i \) given by (3.27) and (3.25).

This follows from Theorem 3.5 together with (3.23).

Let \( \text{pr}_i : X^n_{\mathcal{M}} \times X^n_{\mathcal{M}} \rightarrow X^n_{\mathcal{M}} \) denote the projection onto the \( i \)-th component.

**Corollary 3.8.** Let \( g_{ps} \in \mathfrak{Q} \) be such that \( \sum_{|p|+|s|=N-k} g_{ps} \text{pr}^*_1 H^p \text{pr}^*_2 H^s \) is the Poincaré dual to the diagonal class in \( X^n_{\mathcal{M}} \), where \( N-k \) is the complex dimension of \( X^n_{\mathcal{M}} \). If \( N > k \) and \( \nu_E(d) > N-k \) for all \( d \in \Lambda - \{0\} \), then the two-point function \( \hat{Z} \) of (1.7) is given by

\[ \hat{Z}(h_1, h_2, q) = \frac{1}{h_1 + h_2} \sum_{|p|+|s|=N-k} g_{ps} \text{pr}^*_1 \left\{ H + h_1 \frac{d}{dq} \right\}^p \hat{Y}(H, h_1, q) \text{pr}^*_2 \left\{ H + h_2 \frac{d}{dq} \right\}^s \hat{Y}(H, h_2, q). \]
Remark 3.9. If
\[
P(A) = \prod_{i=1}^{a} \left( \sum_{r=1}^{k} \ell_{ri}^r A_r \right) \prod_{i=1}^{b} \left( \sum_{r=1}^{k} \ell_{ri}^r A_i \right) \in \mathbb{Q}[A],
\]
then
\[
Z^*(h_1, h_2, Q) = \hat{Z}^*(h_1, h_2, Q) pr_1^*P(H),
\]
where \( pr_1 : X^r_M \times X^r_M \longrightarrow X^r_M \) is the projection onto the first component, while \( \hat{Z}^* \) and \( Z^* \) are as in Remark 1.3. Via Theorem 1.2, this expresses the two-point function \( Z^* \) in terms of the one-point functions \( \hat{Z}_{\eta} \), \( \hat{Z}_{\eta} \). In this case and if \( \nu_E(d) \geq 0 \) for all \( d \in \Lambda \), \( Z^* \) can be computed explicitly in terms of \( \hat{Y} \) and \( \bar{Y} \) via Theorem 3.3.

We next use an idea from [Z1] to express \( Z^* \) in terms of one-point GW generating functions and then show how to compute the latter in the \( b > 0 \) case. If \( pr_1 : X^r_M \times X^r_M \longrightarrow X^r_M \) and \( g_{ps} \in \mathbb{Q} \) are as in Corollary 3.3, then
\[
Z^*(h_1, h_2, Q) = \frac{1}{h_1 + h_2} \sum_{|p|+|s|=N-k} g_{ps} \left[ pr_1^*H^p pr_2^* Z^*_p(h_2, Q) + pr_1^* Z^*_p(h_1, Q) pr_2^* Z^*_s(h_2, Q) \right], \tag{3.29}
\]
where
\[
Z^*_p(h, Q) = \sum_{d \in \Lambda - 0} Q^d_{ev_1} \left[ \frac{e(V_E) e v_2(\bar{H}^p)}{h - \psi_1} \right] \in H^*(X^r_M)[h^{-1}][\Lambda]
\]
and \( ev_1 : \overline{M}_{0,2}(X^r_M, d) \longrightarrow X^r_M \). This follows from (4.27).

We next assume that \( b > 0 \) and \( \nu_E(d) \geq 0 \) for all \( d \in \Lambda \) and express \( Z^*_p(h, Q) \) in terms of explicit power series. Along with (3.29) and Theorem 3.3, this will conclude the computation of \( Z^* \).

With \( U(d; A, h) \) given by (3.4), we define
\[
\hat{Y}(A, h, q) = \sum_{d \in \Lambda} q^d U(d; A, h) \prod_{i=1}^{a} \prod_{s=1}^{L^+_i(d)} \left( \sum_{r=1}^{k} \ell_{ri}^+ A_r + sh \right) \prod_{i=1}^{b} \prod_{s=1}^{L^-_i(d)} \left( \sum_{r=1}^{k} \ell_{ri}^- A_r - sh \right). \tag{3.30}
\]
As \( \hat{Y} \) satisfies (3.9), we may define \( D^p \hat{Y} \) and \( \hat{C}^{(r)}_{p,s} = \hat{C}^{(r)}_{p,s}(\hat{Y}) \) by (3.17) and (3.19). We define \( \hat{Y}_p(A, h, q) \) by the right-hand side of (3.28) above, with \( \hat{Y} \) replaced by \( \hat{Y} \) and \( \hat{C}^{(r)}_{p,s} \) by \( \hat{C}^{(r)}_{p,s} \).

Let
\[
\hat{Y}^*(A, h, q) = \sum_{d \in \Lambda - 0} q^d U(d; A, h) \prod_{i=1}^{a} \prod_{s=1}^{L^+_i(d)} \left( \sum_{r=1}^{k} \ell_{ri}^+ A_r + sh \right) \prod_{i=1}^{b} \prod_{s=1}^{L^-_i(d)-1} \left( \sum_{r=1}^{k} \ell_{ri}^- A_r - sh \right). \tag{3.31}
\]
We define \( E^{(r)}_{p,s} \in \mathbb{Q}[[\Lambda]] \) by
\[
\left\{ A + h q \frac{d}{dq} \right\}^p \hat{Y}^*(A, h, q) \equiv \sum_{s=0}^{b-h} \sum_{|r|=0} E^{(r)}_{p,s} A^r h^s \mod h^{-1}. \tag{3.32}
\]
It follows that \( \left[ E_p^{(r)} \right]_{q,d} = 0 \) unless \( |p| = b + s + \nu_E(d) + |r| \). Whenever \( b \geq 2 \),

\[
Z^*_p(h, q) = e(E^+) \left[ \left( H + h q \frac{d}{dq} \right)^p \tilde{Y}^*(H, h, q) - \sum_{s=0}^{\frac{|p|-b}{|r|-0}} \sum_{r=0}^{\frac{|p|-b-s}{|r|-s}} E_p^{(r)} h^s \tilde{Y}_r(H, h, q) \right].
\]  
(3.33)

If \( b = 1 \) and \( Q \) and \( q \) are related by the mirror map \( (3.26) \),

\[
Z^*_p(h, Q) = e(E^+) e^{-\frac{e(E^-) f_0(q)}{h}} \left[ \left( H + h q \frac{d}{dq} \right)^p \tilde{Y}^*(H, h, q) - \sum_{s=0}^{\frac{|p|-b}{|r|-0}} \sum_{r=0}^{\frac{|p|-b-s}{|r|-s}} E_p^{(r)} h^s \tilde{Y}_r(H, h, q) \right] - \frac{e(E^+) H P}{h} f_0(q) \sum_{n=0}^{\infty} \frac{1}{(n+1)!} \left[ -\frac{e(E^-) f_0(q)}{h} \right]^n,
\]  
(3.34)

where

\[
f_0(q) = \sum_{d \in \Lambda - 0, \nu_E(d) = 0} q^d (-1)^{L_i^+(d)+1} \left( -L_i^-(d)-1 \right)! \frac{\prod_{j=1}^{\alpha} (L_i^+(d)!) \prod_{j=1}^{\beta} (D_j(d)!) \prod_{j=1}^{\gamma} (D_j(d)!)}{N}\]  
(3.35)

Identities \( (3.33) \) and \( (3.34) \) follow by setting \( \alpha = 0 \) in \( (3.35) \) and \( (3.36) \).

As in \( [Z1] \), if \( X^*_M = \mathbb{P}^{n-1} \) and \( b \geq 2 \), \( (3.33) \) can be be replaced by a simpler formula in terms of the power series \( F(w, q) \) in \( (3.24) \) above. Assume that \( E \rightarrow \mathbb{P}^{n-1} \) is as in Remark \( 3.4 \) and \( \sum_{i=1}^{a} \ell_i^+ - \sum_{i=1}^{b} \ell_i^- = n \). Similarly to \( [Z1] \) Section 2.3,

\[
Z^*_p(h, q) = e(E^+) \left\{ \left( H + h q \frac{d}{dq} \right)^p \tilde{Y}^*(H, h, q) - H P \frac{M^{p-b} F(d)^{1,q}}{I_{p-a}(q)} \right\},
\]

where the right-hand side should be first simplified in \( Q(H, h)[[q]] \) to eliminate division by \( H \) and only afterwards viewed as an element in \( H^*(\mathbb{P}^{n-1})[[h]][[[q]] \). This follows from Remarks \( 4.5 \) and \( 3.4 \) together with Theorem \( 4.8 \) By Theorem \( 3.5 \) and Remark \( 3.4 \)

\[
\tilde{Z}_p(h, q) = \left\{ \left( H + h q \frac{d}{dq} \right)^p \tilde{Y}^*(H, h, q) \right\},
\]

\[
\text{if } p < a,
\]

\[
\text{if } p \geq a.
\]

The last two displayed equations together with \( (3.29) \) imply that

\[
\sum_{d=1}^{\infty} dq \int_{[0,2]^{(\mathbb{P}^{n-1},d)}} e(\mathcal{V}_E) e v_1^H e v_2^H c^2 - (I_{c1+1-b}(q)-1) \quad \text{and} \quad I_{c1+1-b} = I_{c2+1-b}, \]

(3.36)

whenever \( c_1 + c_2 = n - 2 - a + b \) and with \( I_p(q) \) defined by \( (3.24) \) if \( p \geq 0 \) and \( I_p(q) \equiv 1 \) if \( p < 0 \).

\[5\text{In this case, } f_i(q) = \ell_i^+ f_0(q) \text{ with } \ell_i^+ \in \mathbb{Z} \text{ given by (3.5).}\]
4 Equivariant theorems

In this section we introduce equivariant versions of the GW generating functions \( \hat{Z}, \hat{Z}_\eta, \) and \( \check{Z}_\eta \) of \((1.7)\) and \((1.8)\). We then present theorems about them which imply the non-equivariant statements of Section 3.2

With \( \alpha = (\alpha_1, \ldots, \alpha_N) \) denoting the \( \mathbb{T}^N \)-weights of Section 2.3 \( H^*_\mathbb{T}^N(X^\tau_M) \) is generated over \( \mathbb{Q}[\alpha] \) by \( \{x_1, \ldots, x_k\} \); see Proposition 2.21. The classes \( x_i \) of \((2.27)\) satisfy

\[
H^2_{\mathbb{T}^N}(X^\tau_M) \ni x_i \quad \text{restriction} \\
H_i \in H^2(X^\tau_M) \quad \forall i \in [k], \quad e(\gamma_i^*) = x_i \quad \forall i \in [k],
\]

where \( e(\gamma_i^*) \) is defined by the lift \((2.23)\) of the action of \( \mathbb{T}^N \) on \( X^\tau_M \) to the line bundle \( \gamma_i^* \). Let

\[
x \equiv (x_1, \ldots, x_k), \quad x^p \equiv x_1^{p_1} \cdots x_k^{p_k} \quad \forall p = (p_1, \ldots, p_k) \in (\mathbb{Z}_{\geq 0})^k.
\]

The action of \( \mathbb{T}^N \) on \( X^\tau_M \) induces an action on \( \overline{\mathcal{M}}_{0, m}(X^\tau_M, d) \) which lifts to an action on the vector orbibundles \( \mathcal{V}_E, \hat{\mathcal{V}}_E, \) and \( \check{\mathcal{V}}_E \) of \((1.1)\) and \((1.6)\). It also lifts to an action on the universal cotangent line bundle to the \( i \)-th marked point whose equivariant Euler class will also be denoted by \( \psi_i \). The evaluation maps \( \text{ev}_1, \text{ev}_2 : \overline{\mathcal{M}}_{0, m}(X^\tau_M, d) \rightarrow X^\tau_M \) are \( \mathbb{T}^N \)-equivariant.

With \( \text{ev}_1, \text{ev}_2 : \overline{\mathcal{M}}_{0, 2}(X^\tau_M, d) \rightarrow X^\tau_M \) denoting the evaluation maps at the first two marked points, let

\[
\hat{Z}(h_1, h_2, Q) \equiv \frac{h_1 h_2}{h_1 + h_2} \sum_{d \in \Lambda} Q^d (\text{ev}_1 \times \text{ev}_2)_* \left[ \frac{e(\hat{\mathcal{V}}_E)}{(h_1 - \psi_1)(h_2 - \psi_2)} \right], \quad (4.1)
\]

With \( \text{ev}_1, \text{ev}_2 : \overline{\mathcal{M}}_{0, 2}(X^\tau_M, d) \rightarrow X^\tau_M \) denoting the evaluation maps at the two marked points and for all \( \eta \in H^*_\mathbb{T}^N(X^\tau_M) \), let

\[
\hat{Z}_\eta(h, Q) \equiv \eta + \sum_{d \in \Lambda - 0} Q^d (\text{ev}_1)_* \left[ \frac{e(\hat{\mathcal{V}}_E) \text{ev}_1^* \eta}{h - \psi_1} \right] \in H^*_\mathbb{T}^N(X^\tau_M) [[h^{-1}, \Lambda]], \quad (4.2)
\]

\[
\check{Z}_\eta(h, Q) \equiv \eta + \sum_{d \in \Lambda - 0} Q^d (\text{ev}_1)_* \left[ \frac{e(\hat{\mathcal{V}}_E) \text{ev}_1^* \eta}{h - \psi_1} \right] \in H^*_\mathbb{T}^N(X^\tau_M) [[h^{-1}, \Lambda]].
\]

In the \( \eta = x^p \) cases, these are equivariant versions of \( \hat{Z}_p \) and \( \check{Z}_p \) in \((3.1)\):

\[
\hat{Z}_p(h, Q) = \hat{Z}_x(p, h, Q), \quad \check{Z}_p(h, Q) = \check{Z}_x(p, h, Q) \in H^*_\mathbb{T}^N(X^\tau_M) [[h^{-1}, \Lambda]]. \quad (4.3)
\]

In particular, \( \hat{Z}_0 \equiv \hat{Z}_1 \), with \( 0 \in \mathbb{Z}^k \) and \( 1 \in H^*_\mathbb{T}^N(X^\tau_M) \).

Section 4.1 below constructs the explicit formal power series in terms of which \( \hat{Z}_p \) and \( \check{Z}_p \) are expressed in Theorem 4.8. Throughout this construction, which extends the constructions in \[ZZ\] Section 2.3] and [PoZ, Section 3.1] from \( \mathbb{P}^{n-1} \) to an arbitrary toric manifold \( X^\tau_M \), we assume that \( \nu_E(d) \geq 0 \) for all \( d \in \Lambda \) and identify \( H_2(X^\tau_M; \mathbb{Z}) \cong \mathbb{Z}^k \) via the basis \( \{H_1, \ldots, H_k\} \) of \( H^2(X^\tau_M; \mathbb{Z}) \). Via this identification \( \Lambda \hookrightarrow \mathbb{Z}^k \).

4.1 Construction of equivariant power series

We begin by defining equivariant versions \( \hat{Y} \) and \( \check{Y} \) of the power series \( \hat{Y} \) and \( \check{Y} \) in \((3.4)\) as these will compute \( \hat{Z}_p \) and \( \check{Z}_p \) in Theorem 4.8. We consider the lift \((2.23)\) of the \( \mathbb{T}^N \)-action on \( X^\tau_M \) to
the line bundles $L_i^\pm$ of (1.4) and (3.5) so that
\[
\lambda_i^\pm = e(L_i^\pm) = \sum_{r=1}^k \ell_{r_i}^\pm x_r.
\]

An equivariant version of the power series $U(d; A, h)$ in (3.4) is given by
\[
u(d) = \prod_{j \in [N]} \prod_{s = D_j(d)+1}^0 \left( \sum_{r=1}^k m_{ij} A_i - \alpha_j + sh \right)
\]
\[
u(d) = \prod_{j \in [N]} \prod_{s = 1}^{D_j(d)} \left( \sum_{r=1}^k m_{ij} A_i - \alpha_j + sh \right) \in \mathbb{Q}[[\alpha, A]][h].
\]

By (2.29),
\[
u(d) = \prod_{j \in [N]} \prod_{s = 0}^{D_j(d)+1} (u_j + sh)
\]

With $\tilde{E}(d; A, h)$ and $\hat{E}(d; A, h)$ as in (3.6), let
\[
\hat{Y}(A, h, q) = \sum_{d \in A} q^d u(d; A, h) \hat{E}(d; A, h) \in \mathbb{Q}[[\alpha, A]][[h^{-1}, A]],
\]
\[
\hat{Y}(A, h, q) = \sum_{d \in A} q^d u(d; A, h) \hat{E}(d; A, h) \in \mathbb{Q}[[\alpha, A]][[h^{-1}, A]].
\]

In the above definitions of $\hat{Y}$ and $\hat{Y}$ and throughout the construction below, the torus weights $\alpha$ should be thought of as formal variables, in the same way in which $A$ of Section 3.1 are formal variables. With $A$ replaced by $x$, $\hat{Y}$ and $\hat{Y}$ become well-defined elements in $H^\ast_T(X^T_M)[[h^{-1}, A]]$. However, this is irrelevant for the purposes of this subsection and becomes relevant only when we use $\hat{Y}$ and $\hat{Y}$ in the formulas for $\hat{Z}_p$ and $\hat{Z}_p$.

As before, $\mathbb{Q}_\alpha = \mathbb{Q}(\alpha)$. We next describe an operator $\mathcal{D}^p$ acting on a subset of $\mathbb{Q}_\alpha(A, h)[[A]]$ and certain associated “equivariant structure coefficients” in $\mathbb{Q}[\alpha][[A]]$ which occur in the formulas for $\hat{Z}_p$ and $\hat{Z}_p$. Fix an element $\hat{Y}(A, h, q) \in \mathbb{Q}_\alpha(A, h)[[A]]$ such that for all $d \in A$
\[
[\hat{Y}(A, h, q)]_{q,d} = \frac{f(d, A, h)}{g(d, A, h)}
\]

for some homogeneous polynomials $f(d, A, h), g(d, A, h) \in \mathbb{Q}[\alpha, A, h]$ satisfying
\[
f_0(A, h) = g_0(A, h), \quad \deg f - \deg g = -\nu_E(d), \quad g(d)_{A=0} \neq 0 \quad \forall d \in A.
\]

This condition is satisfied by the power series $\hat{Y}$ and $\hat{Y}$ of (1.7) and so the construction below applies to $\hat{Y} = \hat{Y}$ and $\hat{Y} = \hat{Y}$. We inductively define $\mathcal{D}^p Y(A, h, q)$ in $\mathbb{Q}_\alpha(A, h)[[A]]$ satisfying

37
(EP1) with $D^p$ defined in Section 3.1

$$D^p\mathcal{Y}(A, h, q)\big|_{\alpha=0} = D^p \left( \mathcal{Y}(A, h, q)\big|_{\alpha=0} \right);$$

(EP2) there exist $C^{(r)}_{p,s} = C^{(r)}_{p,s}(\mathcal{Y}) \in \mathbb{Q}[\alpha][[\Lambda]]$ with $p, r \in (\mathbb{Z}_{\geq 0})^k$, $s \in \mathbb{Z}_{\geq 0}$, such that $C^{(r)}_{p,s} \equiv \delta_{p,r}\delta_{|r|,s}$ is a homogeneous polynomial in $\alpha$ of degree $-\nu_E(d) - |r| + s$,

$$D^p\mathcal{Y}(A, h, q) = h^{\left|p\right|} \sum_{s=0}^{\infty} \sum_{r \in (\mathbb{Z}_{\geq 0})^k} \delta_{p,r}\delta_{|r|,s} A^r h^{-s},\quad (4.9)$$

$$\left[C^{(r)}_{p,s}\right]_{q,0} = \delta_{p,r}\delta_{|r|,s} \quad \forall \ p, r \in (\mathbb{Z}_{\geq 0})^k, \ s \in \mathbb{Z}_{\geq 0}.\quad (4.10)$$

By (4.8), (3.12), and since $[\{J_0(\mathcal{Y})_{|\alpha=0}\}]_{q,0} = 1$ by (P1), we can define

$$D^0\mathcal{Y}(A, h, q) = \left[\{J_0(\mathcal{Y})_{|\alpha=0}\}\right]_{q,0}^{-1} \mathcal{Y}(A, h, q) \in \mathcal{Q}_{\alpha}(A, h)[[\Lambda]].\quad (4.11)$$

Suppose next that $p \geq 0$ and we have constructed power series $D^p\mathcal{Y}(A, h, q)$ for all $p' \in (\mathbb{Z}_{\geq 0})^k$ with $|p'| = p$ satisfying the above properties. For each $p \in (\mathbb{Z}_{\geq 0})^k$ with $|p| = p + 1$, let

$$\tilde{D}^p\mathcal{Y}(A, h, q) = \frac{1}{|\text{supp}(p)|} \sum_{i \in \text{supp}(p)} \left\{ A_i + h q_i \frac{d}{dq_i} \right\} D^{p-e_i}\mathcal{Y}(A, h, q) \in \mathcal{Q}_{\alpha}(A, h)[[\Lambda]],$$

$$D^p\mathcal{Y}(A, h, q) = \sum_{p' \in (\mathbb{Z}_{\geq 0})^k, |p'| = p + 1} c_{p,p'}(q) \tilde{D}^p\mathcal{Y}(A, h, q),\quad (4.12)$$

where $c_{p,p'}(q) \in \mathcal{Q}(\Lambda; \nu_E = 0)$ are defined by (3.16) with $\mathcal{Y} \equiv \mathcal{Y}_{|\alpha=0}$ and where $\{e_1, \ldots, e_k\}$ is the standard basis of $\mathbb{Z}^k$. Since [EP1] holds with $p$ replaced by any $p'$ with $|p'| = p$,

$$\tilde{D}^p\mathcal{Y}(A, h, q)\big|_{\alpha=0} = \tilde{D}^p \left( \mathcal{Y}(A, h, q)\big|_{\alpha=0} \right)$$

by (3.13); thus, by the second equation in (4.12) and (3.17), $D^p\mathcal{Y}$ satisfies [EP1]. It is immediate to verify that $D^p\mathcal{Y}(A, h, q)$ admits an expansion as in (4.9). Since $[c_{p,p'}]_{q,0} = \delta_{p,p'}$ by the second statement in (3.15) and (3.16) and (4.10) holds for $p - e_i$ with $i \in \text{supp}(p)$ instead of $p$, (4.10) also holds for $p$ with $|p| = p + 1$

By (EP1), (3.10), and (4.9),

$$C^{(r)}_{p,s}(\mathcal{Y})\big|_{\alpha=0} = C^{(r)}_{p,s} \left( \mathcal{Y}\big|_{\alpha=0} \right),\quad (4.13)$$

with $C^{(r)}_{p,s}$ as in (P2).

Define $\tilde{c}^{(r)}_{p,s} = \tilde{c}^{(r)}_{p,s}(\mathcal{Y}) \in \mathcal{Q}[\alpha][[\Lambda]]$ for $p, s \in (\mathbb{Z}_{\geq 0})^k$ and $r \in \mathbb{Z}_{\geq 0}$ with $|s| \leq |p| - r$ and $r \leq |p|$ by

$$\sum_{t=0}^{r} \sum_{s \in (\mathbb{Z}_{\geq 0})^k} \tilde{c}^{(t)}_{p,s} \delta_{p,s,|r|+r-t} = \delta_{p,r}\delta_{|r|,0} \quad \forall \ r \in (\mathbb{Z}_{\geq 0})^k, \ |r| \leq |p| - r.\quad (4.14)$$
Equations (4.14) indeed uniquely determine $\tilde{c}_{p,s}^{(r)}$, since
\begin{equation}
\sum_{t=0}^{r} \sum_{s \in \mathbb{Z} \geq 0} \tilde{c}_{p,s}^{(r)} c_{s,r+t}^{(r)} + \sum_{t=0}^{r-1} \sum_{s \in \mathbb{Z} \geq 0} \tilde{c}_{p,s}^{(r)} c_{s,r+t}^{(r)} + \sum_{s \in \mathbb{Z} \geq 0} \tilde{c}_{p,s}^{(r)} c_{s,r-t}^{(r)} + \tilde{c}_{p,r}^{(r)}.
\end{equation}

This follows from
\begin{equation}
c_{p,r}^{(r)} = \delta_{p,r} \text{ if } |r| \leq |p|,
\end{equation}
which in turn follows from (4.13), the second equation in (3.11), and the first property in (EP2).

By (4.14) and (4.10),
\begin{equation}
\left[ \tilde{c}_{p,s}^{(r)} \right]_{q,0} = \delta_{p,s} \delta_{r,0}.
\end{equation}

By (4.13), (3.19), (3.20), (4.14), (4.15), and induction,
\begin{equation}
\tilde{c}_{p,s}^{(r)}(Y)|_{\alpha = 0} = \tilde{c}_{p,s}^{(r)}(Y)|_{\alpha = 0}.
\end{equation}

By (4.17) in the $d = 0$ case and (4.14), (4.15), (EP2) and induction in all other cases, $\left[ \tilde{c}_{p,s}^{(r)}(q) \right]_{q,d}$ is a degree $r - \nu_E(d)$ homogeneous polynomial in $\alpha$. In particular, $\tilde{c}_{p,s}^{(0)}(q) \in \mathbb{Q}[[\Lambda]]$. This together with (4.18) and (3.22) implies that,
\begin{equation}
\tilde{c}_{p,s}^{(0)}(q) = \delta_{p,s}, \quad \forall p, s \in \mathbb{Z} \geq 0 \text{ with } |s| \leq |p|.
\end{equation}

**Remark 4.1.** If columns $i$ and $j$ of $M$ are equal, then $u(d; A, h)$ of (4.5) is invariant under the permutation
\begin{equation}
\alpha_i \rightarrow \alpha_j, \quad \alpha_j \rightarrow \alpha_i, \quad \alpha_k \rightarrow \alpha_k \quad \forall k \neq i, j,
\end{equation}
for all $d \in \Lambda$. In this case, the structure coefficients $\tilde{c}_{p,s}^{(r)}$ are also invariant under this permutation by (4.15).

In particular, if $X^r_M = \mathbb{P}^{N_1 - 1} \times \cdots \times \mathbb{P}^{N_s - 1}$ as in (2.37) and the $T^N$-weights are $\alpha_j^{(i)}$ with $1 \leq i \leq s$ and $1 \leq j \leq N_i$ as in (2.38), then the structure coefficients $\tilde{c}_{p,s}^{(r)}$ are symmetric in $\alpha_1^{(i)}, \ldots, \alpha_N^{(i)}$ for each $i = 1, \ldots, s$. In the case of $\mathbb{P}^{N-1}$, this remark was used in the computation of the genus 1 GW invariants of Calabi-Yau complete intersections in $\mathbb{Z}^3$ and then in [P3].

**Remark 4.2.** By (4.11), $\tilde{Y}|_{\alpha = 0} = \tilde{Y}$, $\tilde{Y}|_{\alpha = 0} = \tilde{Y}$, and Remark 3.1
\begin{equation}
D^0 \tilde{Y}(A, h, q) = \frac{1}{I_0(q)} \tilde{Y}(A, h, q), \quad D^0 \tilde{Y}(A, h, q) = \frac{1}{I_0(q)} \tilde{Y}(A, h, q).
\end{equation}

**Remark 4.3.** If $\nu_E(d) > 0$ for all $d \in \Lambda \setminus \{0\}$ and $Y(A, h, q) \in \mathbb{Q}[\Lambda][A]$ satisfies (4.8), then
\begin{equation}
D^p Y(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}^p Y(A, h, q) \quad \forall p = (p_1, \ldots, p_k) \in \mathbb{Z} \geq 0.
\end{equation}

This follows by induction on $|p|$ from (4.12) since $c_{p,p'}(Y)|_{\alpha = 0} = \delta_{p,p'}$ with $c_{p,p'}$ defined by (3.16). The latter follows since $J_p(Y)|_{\alpha = 0} = \text{Id}$ by Remark 3.2.
Remark 4.4. Suppose \( p^* \in \mathbb{Z}^{>0} \), \( \mathcal{Y}(A, h, q) \in \mathbb{Q}_\alpha(A, h)[[A]] \) satisfies (4.8), and
\[
\deg_h f_d(A, h) - \deg_h g_d(A, h) < -p^* \quad \forall d \in \Lambda - 1.
\]
By the same reasoning as in Remark 4.3, but using Remark 3.3 instead of 3.2,
\[
\mathcal{D}^p \mathcal{Y}(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}_p \mathcal{Y}(A, h, q) \quad \text{if} \quad |p| \leq p^*.
\]
(4.20)
By (4.14), (4.15), and (4.19),
\[
\mathcal{C}_{p,0+r}^{(r)} + \sum_{t=1}^{r-1} \sum_{s \geq 0} \mathcal{C}_{p,s}^{(r)} + \sum_{s \geq 0} \mathcal{C}_{p,s}^{(r)} + \mathcal{C}_{p,0}^{(r)} = 0
\]
(4.21)
if \( r \geq 1 \) and \( |r| \leq |p| - r \). By (4.20) and (4.10),
\[
\mathcal{D}^p \mathcal{Y}(A, h, q) \equiv A^p \mod h^{-1} \quad \text{if} \quad |p| \leq p^*.
\]
This together with (4.9) implies that whenever \( |p| \leq p^* \),
\[
\mathcal{C}_{p,0+r}^{(r)} = 0 \quad \text{if} \quad r \geq 1 \quad \text{and} \quad |r| \leq |p| - r.
\]
(4.22)
Finally, using (4.21), (4.22), and induction, we find that
\[
\mathcal{C}_{p,s}^{(r)} = 0 \quad \text{if} \quad r \geq 1, \quad |p| \leq p^*, \quad |s| \leq |p| - r.
\]
Remark 4.5. Let \((M, \tau)\) be the toric pair of Example 2.22 with \( N = n \) so that \( X_M^\tau = \mathbb{P}^{n-1} \) and \( E \to \mathbb{P}^{n-1} \) be as in Remark 3.4. By (4.7),
\[
\hat{\mathcal{Y}}(A, h, q) = \sum_{d=0}^{\infty} q^d \prod_{i=1}^{\alpha} \left( \ell_i^+ A + sh \right) \prod_{i=1}^{\beta} \left( \ell_i^- A - sh \right)
\]
\[
\hat{\mathcal{Y}}(A, h, q) = \sum_{d=0}^{\infty} q^d \prod_{i=1}^{\alpha} \left( \ell_i^+ A + sh \right) \prod_{i=1}^{\beta} \left( \ell_i^- A - sh \right)
\]
By Remark 4.4,
\[
\mathcal{D}^p \hat{\mathcal{Y}}(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}_p \hat{\mathcal{Y}}(A, h, q) \quad \text{and} \quad \mathcal{C}_{p,s}^{(r)}(\hat{\mathcal{Y}}) = 0 \quad \forall p < b, \ 1 \leq r \leq p,
\]
\[
\mathcal{D}^p \hat{\mathcal{Y}}(A, h, q) = \left\{ A + h q \frac{d}{dq} \right\}_p \hat{\mathcal{Y}}(A, h, q) \quad \text{and} \quad \mathcal{C}_{p,s}^{(r)}(\hat{\mathcal{Y}}) = 0 \quad \forall p < a, \ 1 \leq r \leq p.
\]
If \( \sum_{i=1}^{a} \ell_i^+ - \sum_{i=1}^{b} \ell_i^- < n \), then

\[
\mathcal{D}^p \hat{\gamma} = \left\{ A + h q \frac{d}{dq} \right\}^p \hat{\gamma}, \quad \mathcal{D}^p \tilde{\gamma} = \left\{ A + h q \frac{d}{dq} \right\}^p \tilde{\gamma},
\]

for all \( p \) by Remark 4.3. If \( \sum_{i=1}^{a} \ell_i^+ - \sum_{i=1}^{b} \ell_i^- = n \), then

\[
\begin{align*}
\mathcal{D}^b \hat{\gamma} &= \frac{1}{I_0(q)} \left\{ A + h q \frac{d}{dq} \right\}^b \hat{\gamma}, \\
\mathcal{D}^a \tilde{\gamma} &= \frac{1}{I_0(q)} \left\{ A + h q \frac{d}{dq} \right\}^a \tilde{\gamma},
\end{align*}
\]

\[
\begin{align*}
\mathcal{D}^p \hat{\gamma} &= \frac{1}{I_{p-b}(q)} \left\{ A + h q \frac{d}{dq} \right\}^{p-1} \hat{\gamma} \quad \forall p > b, \\
\mathcal{D}^p \tilde{\gamma} &= \frac{1}{I_{p-a}(q)} \left\{ A + h q \frac{d}{dq} \right\}^{p-1} \tilde{\gamma} \quad \forall p > a,
\end{align*}
\]

by (4.12) and Remark 3.4.

### 4.2 Equivariant statements

**Theorem 4.6.** Suppose \((M, \tau)\) is a minimal toric pair and \( \text{pr}_i: X_M^r \times X_M^r \rightarrow X_M^r \) is the projection onto the \( i \)-th component. If \( \eta_j, \tilde{\eta}_j \in H^*_{\mathbb{T}^N}(X^r_M) \) are such that

\[
\sum_{j=1}^{s} \text{pr}_1^* \eta_j \text{pr}_2^* \tilde{\eta}_j \in H^2(N-k)_{\mathbb{T}^N}(X^r_M \times X^r_M)
\]

is the equivariant Poincaré dual of the diagonal, then

\[
\hat{\mathcal{Z}}(h_1, h_2, Q) = \frac{1}{h_1 + h_2} \sum_{j=1}^{s} \text{pr}_1^* \hat{\mathcal{Z}}_{\eta_j}(h_1, Q) \text{pr}_2^* \hat{\mathcal{Z}}_{\tilde{\eta}_j}(h_2, Q).
\]

**Corollary 4.7.** Let \((M, \tau)\) be the minimal toric pair \((\mathbb{Z}, \mathcal{M})\) so that \( X^r_M = \prod_{i=1}^{s} \mathbb{P}^{N_i-1}, N = \sum_{i=1}^{s} N_i \), and

\[
H^*_{\mathbb{T}^N}(\prod_{i=1}^{s} \mathbb{P}^{N_i-1})
\]

is given by (2.33). Let \( \text{pr}_j: X^r_M \times X^r_M \rightarrow X^r_M \) denote the projection onto the \( j \)-th component. For all \( i \in \{s\} \) and \( r \in \mathbb{Z}_{\geq 0} \), denote by \( \sigma_r^{(i)} \) the \( r \)-th elementary symmetric polynomial in \( \alpha_1^{(i)}, \ldots, \alpha_{N_i}^{(i)} \). Then,

\[
\hat{\mathcal{Z}}(h_1, h_2, Q) = \frac{1}{h_1 + h_2} \sum_{r_i+a_i+b_i=N_i-1 \forall i \in \{s\}} (-1)^{r_i} \sigma_{r_1}^{(1)} \cdots \sigma_{r_s}^{(s)} \text{pr}_1^* \hat{\mathcal{Z}}_{(a_1, \ldots, a_s)}(h_1, Q) \text{pr}_2^* \hat{\mathcal{Z}}_{(b_1, \ldots, b_s)}(h_2, Q).
\]

This follows from Theorem 4.6 as the equivariant Poincaré dual to the diagonal in \( \prod_{i=1}^{s} \mathbb{P}^{N_i-1} \) is

\[
\sum_{r_i+a_i+b_i=N_i-1 \forall i \in \{s\}} (-1)^{r_i} \sigma_{r_1}^{(1)} \cdots \sigma_{r_s}^{(s)} \text{pr}_1^*(x_1^{a_1} \cdots x_s^{a_s}) \text{pr}_2^*(x_1^{b_1} \cdots x_s^{b_s}).
\]
Theorem 4.8. Let \((M, \tau)\) be a minimal toric pair. If \(\nu_E(d) \geq 0\) for all \(d \in \Lambda\), then \(\hat{Z}_p\) and \(\hat{Z}_p\) of (4.14) and (4.12) are given by

\[
\hat{Z}_p(h, Q) = e^{-\frac{i}{\hbar} \left[ (G(q) + \sum_{i=1}^{N} x_i f_i(q) + \sum_{j=1}^{N} \alpha_j g_j(q)) \right]} \hat{Y}_p(x, h, q) \in H^*_\tau(X^*_M)[[\hbar]][[\Lambda]], \tag{4.24}
\]

\[
\hat{Z}_p(h, Q) = e^{-\frac{i}{\hbar} \left[ (G(q) + \sum_{i=1}^{N} x_i f_i(q) + \sum_{j=1}^{N} \alpha_j g_j(q)) \right]} \hat{Y}_p(x, h, q) \in H^*_\tau(X^*_M)[[\hbar]][[\Lambda]],
\]

where

\[
\hat{Y}_p(x, h, q) \equiv \mathcal{D}^p \hat{Y}(x, h, q) + \sum_{r=1}^{\lfloor p \rfloor} \sum_{|s|=0} \hat{c}(r)_{p,s}(q) h^{(|p|-r-|s|)} \mathcal{D}^s \hat{Y}(x, h, q),
\]

\[
\hat{Y}_p(x, h, q) \equiv \mathcal{D}^p \hat{Y}(x, h, q) + \sum_{r=1}^{\lfloor p \rfloor} \sum_{|s|=0} \hat{c}(r)_{p,s}(q) h^{(|p|-r-|s|)} \mathcal{D}^s \hat{Y}(x, h, q),
\]

with \(\hat{c}(r)_{p,s} \equiv \hat{c}(r)_{p,s}(\hat{Y})\) and \(\hat{c}(r)_{p,s} \equiv \hat{c}(r)_{p,s}(\hat{Y})\) defined by (4.14), \(Q\) and \(q\) related by the mirror map (3.26), \(G, f_i\) and \(g_j\) in \(\mathbb{Q}[\Lambda - 0; \nu_E = 0]\) given by (3.27), (3.25), and (5.1), and the operator \(\mathcal{D}^p\) defined by (4.13). The coefficient of \(q^d\) within each of \(\hat{c}(r)_{p,s}\) and \(\hat{c}(r)_{p,s}\) is a degree \(r - \nu_E(d)\) homogeneous polynomial in \(\alpha_1, \ldots, \alpha_N\).

If \(|p| < b\), \(\mathcal{D}^p \hat{Y} = (A + h q \frac{d}{dq})^p \hat{Y}\) and \(\hat{c}(r)_{p,s} = 0\) for all \(r \in [|p|]\). If \(|p| < a\) and \(L_i^+(d) \geq 1\) for all \(i \in [a]\) and \(d \in \Lambda - \{0\}\), then \(\mathcal{D}^p \hat{Y} = (A + h q \frac{d}{dq})^p \hat{Y}\) and \(\hat{c}(r)_{p,s} = 0\) for all \(r \in [|p|]\).

Corollary 4.9. If \(p \in (\mathbb{Z}^+)^k\) and \(\max(|p|, 1) < \nu_E(d)\) for all \(d \in \Lambda - \{0\}\), then

\[
\hat{Z}_p(h, Q) = \left\{ x + h q \frac{d}{dq} \right\}^p \hat{Y}(x, h, q), \quad \hat{Z}_p(h, Q) = \left\{ x + h q \frac{d}{dq} \right\}^p \hat{Y}(x, h, q).
\]

This follows from Theorem 4.8 and Remark 4.3.

Corollary 4.10. Let \(g_{ps} \in \mathbb{Q}[\alpha]\) be homogeneous polynomials such that \(\sum_{|p| + |s| \leq N - k} g_{ps} \mathcal{D}^1 x \mathcal{D}^2 x^a\) is the equivariant Poincaré dual to the diagonal in \(X^*_M\), where \(N - k\) is the complex dimension of \(X^*_M\). If \(N > k\) and \(\nu_E(d) > N - k\) for all \(d \in \Lambda - \{0\}\), then the two-point function \(\hat{Z}\) of (4.1) is given by

\[
\hat{Z}(h_1, h_2, q) = \frac{1}{h_1 + h_2} \sum_{|p| + |s| \leq N - k} g_{ps} \mathcal{D}^1 \left\{ x + h_1 q \frac{d}{dq} \right\}^p \hat{Y}(x, h_1, q) \mathcal{D}^2 \left\{ x + h_2 q \frac{d}{dq} \right\}^s \hat{Y}(x, h_2, q).
\]

This follows from Theorem 4.6 and Corollary 4.9.

Remark 4.11. In the inductive construction of \(\mathcal{D}^p \hat{Y}\) with \(\mathcal{Y} = \hat{Y}\) or \(\mathcal{Y} = \hat{Y}\), the first equation in (4.12) may be replaced by

\[
\mathcal{D}^p \hat{Y}(A, h, q) = \sum_{i \in \text{supp}(p)} c_{p,i} \left\{ A + h q \frac{d}{dq} \right\} \mathcal{D}^{p-c_i} \hat{Y}(A, h, q) \in \mathbb{Q}[[A, h]][[\Lambda]],
\]

\(^6\)Furthermore, \(g_j = 0\) if \(b > 0\) or \(D_j(d) \in \{-1, 0\}\) for all \(d \in \Lambda\) with \(\nu_E(d) = 0\).
for any tuple \((c_{p; i})_{i \in \text{supp}(p)}\) of rational numbers with \(\sum_{i \in \text{supp}(p)} c_{p; i} = 1\). The power series \(\mathcal{D}^p \mathcal{Y}\) defined by the second equation in (4.12) in terms of the “new weighted” \(\tilde{\mathcal{D}}^p \mathcal{Y}\) satisfy (EP1) and (EP2) with \(\mathcal{D}^p\) correspondingly “weighted” as in Remark 3.6. This follows by the same arguments as in the case when \(c_{p; i} = \frac{1}{|\text{supp}(p)|}\) for all \(i \in \text{supp}(p)\). Therefore, (4.14) continues to define power series \(\tilde{Z}^r_p(Y)\) in terms of the “new weighted” \(c_{p; i}^{(r)}\). The resulting “weighted” power series \(\mathcal{Y}_p^r\) of (4.25) do not depend on the “weights” \(c_{p; i}\) as elements of \(H^*_T(X_M^r)[[\hbar]][[\Lambda]]\) by the proof of Theorem 4.8 outlined in Section 5.1.

**Remark 4.12.** We define an equivariant version of \(Z^*\) in (1.9). Let

\[
Z^*(h_1, h_2, Q) = \sum_{d \in \Lambda < 0} Q^d (\text{ev}_1 \times \text{ev}_2)_* \left[ \frac{e(V_E)}{(h_1 - \psi_1)(h_2 - \psi_2)} \right],
\]

(4.26)

where \(\text{ev}_1, \text{ev}_2 : \mathbb{M}_{0,2}(X_M^r, d) \to X_M^r\). Since \(e(V_E)\text{ev}_1^* e(E^+) = e(V_E)\text{ev}_2^* e(E^-)\),

\[
\tilde{Z}^*(h_1, h_2, Q)\text{pr}_1^* e(E^+) = Z^*(h_1, h_2, Q)\text{pr}_1^* e(E^-),
\]

where \(\tilde{Z}^*\) is obtained from \(\tilde{Z}\) by disregarding the \(Q^0\) term and \(\text{pr}_1 : X_M^r \times X_M^r \to X_M^r\) is the projection onto the first component. This together with Theorem 4.6 expresses \(Z^*\) in terms of \(\tilde{Z}_{\eta}\) and \(\tilde{Z}^r_{\eta}\) in the \(E = E^+\) case.

Using an idea from [Z1, Section 3.3], we derive a formula for \(Z^*\) in terms of one-point GW generating functions that holds in all cases. Following [Z1], we then show how to express the latter in terms of explicit power series if \(b > 0\). If \(\text{pr}_1 : X_M^r \times X_M^r \to X_M^r\) and \(g_{ps} \in \mathbb{Q}[\alpha]\) are as in Corollary 4.10 then

\[
Z^*(h_1, h_2, Q) = \frac{1}{h_1 + h_2} \sum_{|p| + |s| \leq N - k} g_{ps} \left[ \text{pr}_1^* x^p \text{pr}_2^* Z_s^*(h_2, Q) + \text{pr}_1^* Z_p^s(h_1, Q) \text{pr}_2^* Z_s^s(h_2, Q) \right],
\]

(4.27)

where

\[
Z_p^s(h, Q) = \sum_{d \in \Lambda < 0} Q^d \text{ev}_1^* \left[ \frac{e(V_E)\text{ev}_2^* x^p}{h - \psi_1} \right] \in H^*_T(X_M^r)[[h^{-1}, \Lambda]] .
\]

This follows from Theorem 4.6, using that \(\text{pr}_1^* (e(E^+)/e(E^-))(\tilde{Z} - [\tilde{Z}]_{Q, 0}) = Z^*\), and

\[
\text{pr}_1^* \left( \frac{e(E^+)}{e(E^-)} \right) \sum_{|p| + |s| \leq N - k} g_{ps} \text{pr}_1^* x^p \text{pr}_2^* (Z_s(h, Q) - x^s) = \sum_{|p| + |s| \leq N - k} g_{ps} \text{pr}_1^* x^p \text{pr}_2^* Z_s^s(h, Q).
\]

(4.28)

In the \(X_M^r = \mathbb{P}^{n-1}\) case, (4.27) is the GW version of [Z1] (3.28) and the proof of the \(X_M^r = \mathbb{P}^{n-1}\) case of (4.28) in [Z1] extends to the case of an arbitrary toric manifold.

We give another proof of (4.28), using the Virtual Localization Theorem (5.16) on \(\mathbb{M}_{0,2}(X_M^r, d)\) as in Section 5.4. We prove that (4.28) holds when restricted to \([I] \times [J]\) for arbitrary \(I, J \in V_M^r\). The left-hand side of (4.28) restricted to \([I] \times [J]\) is

\[
\frac{e(E^+)}{e(E^-)} [I] \sum_{|p| + |s| \leq N - k} g_{ps} x^p [I] \sum_{d \in \Lambda < 0} Q^d \int_{\mathbb{M}_{0,2}(X_M^r, d)} \frac{e(V_E)\text{ev}_2^* x^s \text{ev}_1^* \phi_{J}}{h - \psi_1} .
\]

(4.29)
The right-hand side of (4.28) restricted to \([I] \times [J]\) is

\[
\sum_{|p|+|s| \leq N-k} g_{ps} x^p |I| \sum_{d \in \Lambda - 0} Q^d \int_{[\mathcal{M}_{0,2}(X_M^r,d)]^{ev}} \frac{e(T_E)ev_{2,s}x^s \phi J}{\hbar - \psi_1}.
\]

(4.30)

Since \(\phi J\) is the equivariant Poincaré dual of \([I]\),

\[
\sum_{p,s} g_{ps} pr_{1}^{x} p \cdot pr_{2}^{x} s |I| \times [J] = \int_{\Delta(X_M^r)} pr_{1}^{x} \phi J pr_{2}^{x} \phi J = \int_{X_M^r} \phi J \phi J = \phi J(0) = 0 \quad \forall I \neq J \in X_M^r,
\]

where \(\Delta(X_M^r) \subset X_M^r \times X_M^r\) denotes the diagonal. Thus, by the Virtual Localization Theorem (5.10), a graph \(\Gamma\) as in Section 5.4 may contribute to (4.29) or (4.30) only if its second marked point is mapped into \([I]\). Finally, (4.28) follows from the above since

\[
\frac{e(E^+)}{e(E^-)} \bigg|_{[I]} \quad e(T_E) \bigg|_{Z_T} = e(T_E) \bigg|_{Z_T},
\]

whenever \(Z_T \subset [\mathcal{M}_{0,2}(X_M^r,d)]^{ev}\) is the \(\mathbb{T}^N\)-pointwise fixed locus corresponding to a graph \(\Gamma\) whose second marked point is mapped into \([I]\).

We next assume that \(b > 0\) and \(\nu_E(d) > 0\) for all \(d \in \Lambda\) and express \(Z_p^\ast(h, Q)\) in terms of explicit power series. Along with (4.27) and Theorem 4.8 this will conclude the computation of \(Z^\ast\).

We define

\[
\hat{Y}(A, h, q) = \sum_{d \in \Lambda} q^d u(d; A, h) \prod_{i=1}^{a} \prod_{s=1}^{L_i^+ (d)} \left( \sum_{r=1}^{k} \ell_{r_i} A_r + sh \right) \prod_{i=1}^{b} \prod_{s=1}^{L_i^- (d)} \left( \sum_{r=1}^{k} \ell_{r_i} A_r - sh \right).
\]

(4.31)

As \(\hat{Y}\) satisfies (4.8), we may define \(\mathcal{Y}\) and \(\hat{C}_{p,s}^{(r)} = \hat{C}_{p,s}^{(r)}(\hat{Y})\) by (4.12) and (4.14). We define \(\hat{Y}_p(A, h, q)\) by the right-hand side of (4.25) above, with \(\hat{Y}\) replaced by \(\hat{Y}\) and \(\hat{C}_{p,s}^{(r)}\) by \(\hat{C}_{p,s}^{(r)}\). Let

\[
\hat{Y}_p^\ast(A, h, q) = \sum_{d \in \Lambda - 0} q^d u(d; A, h) \prod_{i=1}^{a} \prod_{s=1}^{L_i^+ (d)} \left( \sum_{r=1}^{k} \ell_{r_i} A_r + sh \right) \prod_{i=1}^{b} \prod_{s=1}^{L_i^- (d)-1} \left( \sum_{r=1}^{k} \ell_{r_i} A_r - sh \right).
\]

(4.32)

Define \(\hat{C}_{p,s}^{(r)} \in \mathbb{Q}[\alpha][[\Lambda]]\) by

\[
\left\{ A + h q \frac{d}{dq} \right\} \hat{Y}_p^\ast(A, h, q) \cong \sum_{s=0}^{r} \sum_{s=0}^{r} \hat{C}_{p,s}^{(r)} A^r h^s \quad \mod h^{-1}.
\]

(4.33)

It follows that \(\hat{C}_{p,s}^{(r)} \) is a degree \(|p| - b - s - \nu_E(d) - |r|\) homogeneous polynomial in \(\alpha\). Then,

\[
\hat{Y}_p(x, h, Q) = \left\{ x + h q \frac{d}{dq} \right\} \hat{Y}(x, h, q) - e(E^-) \sum_{s=0}^{r} \sum_{s=0}^{r} \hat{C}_{p,s}^{(r)} h^s \hat{Y}_r(x, h, q).
\]

(4.34)

where \(\hat{Y}_p\) is defined by (4.25); see Section 5.1 for a proof of (4.34).
Whenever $b \geq 2$,
\[
Z_{p}^{*}(h, q) = e^{(E^{+})} \left\{ x + h \left( \frac{d}{dq} \right)^{P} \tilde{Y}^{*}(x, h, q) - \sum_{s=0}^{\lvert p \rvert - b} \sum_{\lvert r \rvert = 0}^{\lvert p \rvert - b - s} \xi^{(x)}_{p, s} \tilde{Y}_{r}(x, h, q) \right\}.
\] (4.35)

If $b = 1$,
\[
Z_{p}^{*}(h, Q) = e^{(E^{+})} e^{-\frac{e^{(E^{-})} f_{0}(q)}{h}} \left\{ x + h \left( \frac{d}{dq} \right)^{P} \tilde{Y}^{*}(x, h, q) - \sum_{s=0}^{\lvert p \rvert - b} \sum_{\lvert r \rvert = 0}^{\lvert p \rvert - b - s} \xi^{(x)}_{p, s} \tilde{Y}_{r}(x, h, q) \right\} - \frac{e^{(E^{+})} x^{p} f_{0}(q)}{h} \sum_{n=0}^{\infty} \frac{1}{(n + 1)!} \left[ - \frac{e^{(E^{-})} f_{0}(q)}{h} \right]^{n},
\] (4.36)

with $Q$ and $q$ related by the mirror map (3.26) and $f_{0}(q) \in \mathbb{Q}[[\Lambda]]$ given by (3.35). Equations (4.35) and (4.36) follow from $Z_{p}^{*} = \frac{e^{(E^{+})}}{e^{(E^{-})}} \left( \tilde{Z}_{p} - x^{b} \right)$, (4.24), and (4.34).

5 Proofs

5.1 Outline

In this section, we prove Theorems 4.6 and 4.8 and the identity (4.34). The proofs of the two theorems are in the spirit of the proof of mirror symmetry in [Gi1] and [Gi2] but with a twist. Similarly to [Gi1] and [Gi2], our argument revolves around the restrictions on power series imposed by certain recursivity and polynomiality conditions. The concept of $C$-recursivity was first introduced in [Gi1] in the $X_{\tau}^{\tau} = \mathbb{P}^{n-1}$ case, extended to an arbitrary $X_{\tau}^{\tau}$ in [Gi2], and re-defined in [Z2]; all these definitions involve an explicit collection $C$ of structure coefficients. Our concept of $C$-recursivity introduced in Definition 5.2 extends the notion of $C$-recursivity with an arbitrary collection of structure coefficients from the $X_{\tau}^{\tau} = \mathbb{P}^{n-1}$ case considered in [PoZ] to an arbitrary $X_{\tau}^{\tau}$. The concept of (self-) polynomiality introduced in [Gi1] in the $X_{\tau}^{\tau} = \mathbb{P}^{n-1}$ case and extended to an arbitrary $X_{\tau}^{\tau}$ in [Gi2] was modified into the concept of mutual polynomiality for a pair of power series in the $X_{\tau}^{\tau} = \mathbb{P}^{n-1}$ case in [Z2]; we extend the latter to an arbitrary $X_{\tau}^{\tau}$ in Definition 5.5. By Proposition 5.6, which extends [Z2, Proposition 2.1] from the $X_{\tau}^{\tau} = \mathbb{P}^{n-1}$ case to an arbitrary $X_{\tau}^{\tau}$, $C$-recursivity and mutual polynomiality impose severe restrictions on power series, more severe than the restrictions imposed by recursivity and self-polynomiality as discovered in [Gi1].

Analogous to [Z2] and [PoZ], the proof of Theorem 4.8 relies on the one-point mirror theorem of [LLY3]. We begin by stating it. The coefficient of $\alpha_{j}/h$ for $j \in [N]$ in the Laurent expansion of
\[
\frac{1}{\hat{I}_0(q)} \hat{Y}_l|_{A=0} \text{ at } h^{-1} = 0 \text{ is given by }
\]
\[
g_j(q) = \frac{\delta_{b,0}}{\hat{I}_0(q)} \left[ \sum_{d \in \Lambda, \nu_E(d) = 0} q^d \prod_{i=1}^{a} \left[ L_i^+(d) \right] \prod_{r=1}^{N} \left[ D_r(d) \right] \left( \sum_{s=1}^{1} \frac{1}{s} \right) \right] + \sum_{d \in \Lambda, \nu_E(d) = 0} q^d (-1)^{D_j(d)} \left[-D_j(d) - 1\right] \prod_{s \in \mathbb{N} - \{j\}} \left[ D_s(d) \right].
\]

By [LLY3] Theorem 4.7 together with [LLY3] Section 5.2, if \( \nu_E(d) \geq 0 \) for all \( d \in \Lambda \), then
\[
\hat{Z}_0(h, Q) = \frac{1}{\hat{I}_0(q)} e^{-\frac{1}{h} \left[ G(q) + \sum_{i=1}^{k} x_i f_i(q) + \sum_{j=1}^{N} \alpha_j g_j(q) \right]} \hat{Y}(x, h, q),
\]
with \( Q \) and \( q \) related by the mirror map \( \text{(3.26)} \), \( G, f_i, \) and \( g_j \) defined by \( \text{(3.27)}, \text{(3.25)}, \) and \( \text{(5.1)} \).\(^7\)

**Remark 5.1.** By \( \text{(4.7)}, \text{(3.27)}, \) and \( \text{(3.25)} \),
\[
\hat{I}_0(q) G(q) = \left[ \hat{Y}(A, h, q) \right]_{A=0, h^{-1} = 1} \text{ and } \hat{I}_0(q) f_i(q) = \left[ \hat{Y}(A, h, q) \right]_{A=0, h^{-1} = 1} \forall i \in [k],
\]
where \( \left[ \right]_{h^{-1}} \) and \( \left[ \right]_{A=0, h^{-1}} \) denote the coefficients of \( h^{-1} \) and \( A = 0 \) respectively within the Laurent expansion around \( h^{-1} = 0 \) of the power series inside of the brackets. Thus,
\[
\left[ \hat{Y}(A, h, q) \right]_{h^{-1} = 1} = \hat{I}_0(q) \left[ G(q) + \sum_{i=1}^{k} A_i f_i(q) + \sum_{j=1}^{N} \alpha_j g_j(q) \right].
\]

Some of the proofs in this section also hold if we replace \( \mathbb{Q} \) by any field \( R \supseteq \mathbb{Q} \). Given such a field \( R \), let
\[
R_\alpha = \mathbb{Q}_\alpha \otimes \mathbb{Q} R = R[\alpha_1, \ldots, \alpha_N]_{(P, \mathbb{P} \in \mathbb{Q}[\alpha]_0)} \text{ and } H^*_TN(X_M^*; R) = H^*_TN(X_M^*) \otimes \mathbb{Q} R.
\]
An element in \( H^*_TN(X_M^*; R)[h][[A]] \) admits a lift to an element in \( R[\alpha, x][h][[A]] \) and an element in \( R[\alpha, x][h][[A]] \) induces an element in \( H^*_TN(X_M^*; R)[h][[A]] \) via Proposition \( \text{(2.21)} \). Given \( Y(h, Q) \in H^*_TN(X_M^*; R)[h][[A]] \) and \( J \in \mathcal{Y}_M^* \), we write
\[
Y(h, Q)|_J \text{ or } Y(h, Q)|_J \text{ or } Y(x(J), h, Q) \in R[\alpha][h][[A]]
\]
for the power series obtained from \( Y \) by replacing each coefficient of \( h^a Q^d \) in \( Y \) by its image via the restriction map \( \cdot(J) \) of \( \text{(2.28)} \).

In proving Theorem \( \text{4.8} \) we follow the steps outlined in [Z2] Section 1.3 and used for proving [Z2] Theorem 1.1: \(^8\)

\(^7\)See Appendix [A] for the correspondence between the relevant notation in [LLY3] and ours and detailed references within [LLY3] indicating how [LLY3] Theorem 4.7 together with [LLY3] Section 5.2 implies \( \text{(5.2)} \).

\(^8\)
(M1) if $R \supseteq \mathbb{Q}$ is any field, $Y, Z \in H^*_N(X_M^*; R)[[h]][[\Lambda]]$, $Z(h, Q)$ is $C$-recursive in the sense of Definition 5.2 and satisfies the mutual polynomiability condition (MPC) of Definition 5.3 with respect to $Y(h, Q)$, the transforms of $Z(h, Q)$ of Lemma 5.8 are also $C$-recursive and satisfy the MPC with respect to appropriate transforms of $Y(h, Q)$;

(M2) if $R \supseteq \mathbb{Q}$ is any field, $Z \in H^*_N(X_M^*; R)[[h]][[\Lambda]]$ is recursive in the sense of Definition 5.2 and $(Y, Z)$ satisfies the MPC for some $Y \in H^*_N(X_M^*; R)[[h]][[\Lambda]]$ with $[Y(h, Q)]_I, Q \in R^*_N$ for all $I \in \mathcal{V}^*_M$, then $Z$ is determined by its ‘mod $h^{-1}$ part’ (see Proposition 5.6);

(M3) $\hat{Y}_p$ of (4.25) and $\hat{Z}_c$ of (4.2) are $\mathcal{E}$-recursive in the sense of Definition 5.2 with $\mathcal{E}$ given by (5.20), while $\hat{Y}_p$ of (4.25) and $\hat{Z}_c$ of (4.2) are $\mathcal{E}$-recursive with $\mathcal{E}$ given by (5.20);

(M4) $(\hat{Y}, \hat{Y}_p), (\hat{Y}, \hat{Y}_p), (\hat{Z}, \hat{Z}_c)$, and $(\hat{Z}, \hat{Z}_c)$ satisfy the MPC;

(M5) the two sides of (4.21) viewed as powers series in $h^{-1}$, agree mod $h^{-1}$.

The proof of Theorem 4.6 described below follows the same ideas and extends the proof of [Z2, (1.17)].

Claims (M3) and (M4) concerning $\hat{Z}_c$ and $\hat{Z}_c$ follow from Lemmas 5.12 and 5.13 since by the string equation of [MirSym, Section 26.3] and (5.21),

$$\hat{Z}_c(h, Q) = h\hat{Z}_{q, \beta}(h, Q) \quad \text{and} \quad \hat{Z}_c(h, Q) = h\hat{Z}_{q, \beta}(h, Q),$$

if $m = 3, \beta_1 = 0, \eta_2 = \zeta$, and $\eta_3 = 1$.

By Lemmas 5.16 and 5.17 $\hat{Y}$ is $\mathcal{E}$-recursive and $\hat{Y}$ is $\mathcal{E}$-recursive, while $(\hat{Y}, \hat{Y})$ and $(\hat{Y}, \hat{Y})$ satisfy the MPC. This together with the admissibility of transforms (a) and (b) of Lemma 5.8 proves claims (M3) and (M4) for $\hat{Y}_p$ and $\hat{Y}_p$.

Claims (M3) and (M4) together with (5.2), the admissibility of transforms (c) and (d) of Lemma 5.8 and Proposition 5.6 prove that verifying (4.24) amounts to showing that the two sides of each of these equations agree mod $h^{-1}$; this is in turn equivalent to (4.14).

Lemma 5.7 Lemma 5.8 and Proposition 5.6 are proved in Section 5.3 the preparation for this section and the ones following it are made in Section 5.2. Lemmas 5.12 and 5.13 are proved in Sections 5.5 and 5.6 respectively. Both proofs rely on the Virtual Localization Theorem [GraPa, (1)]. The localization data provided by [Sp] is presented in Section 5.4. Lemmas 5.16 and 5.17 are proved in Section 5.7.

Proof of (4.34). Define $E_p^{-} \in \mathbb{Z}$ with $p \in (\mathbb{Z}^{\geq 0})^k$ by

$$\prod_{i=1}^{b} \left( \prod_{r=1}^{k} \ell_{\tau_i} A_r \right) = \sum_{p \in (\mathbb{Z}^{\geq 0})^k} E_p^{-} A_p.$$

By (4.7) and (4.31),

$$e(E^{-})\hat{Y}(h, q) = \sum_{p \in (\mathbb{Z}^{\geq 0})^k} E_p^{-} \left\{ x + h q \frac{d}{dq} \right\}^p \hat{Y}(h, q). \quad (5.3)$$

Since $\hat{Y}$ is $\mathcal{E}$-recursive by Lemma 5.16 and $(\hat{Y}, \hat{Y})$ satisfies the MPC by Lemmas 5.7 and 5.17 $e(E^{-})\hat{Y}$ is $\mathcal{E}$-recursive and $(\hat{Y}, e(E^{-})\hat{Y})$ satisfies the MPC by (5.3) and Lemma 5.8(a). This
together with Lemma 5.8(b) implies that the right-hand side of (4.34) is \( \mathcal{C} \)-recursive and satisfies the MPC with respect to \( \mathcal{Y} \). Since \( \hat{Y}_p \) also satisfies these two properties by (M3) and (M4), the claim follows from (M2) and the fact that both sides of (4.34) are congruent to \( x^p \) modulo \( h^{-1} \). The latter follows from the fact that \( \hat{Y}_p(x, h, Q) \) and \( \hat{Y}_p(x, h, Q) \) are congruent to \( x^p \) modulo \( h^{-1} \) by (4.14) together with (4.17), (4.32), and (4.33).

**Proof of Theorem 4.6.** By (4.1), (2.35), and (2.21),

\[
(h_1 + h_2)\mathcal{Z}(h_1, h_2, Q)|_{[I] \times [J]} = h_1 h_2 \sum_{d \in \Lambda} Q^d \int_{\mathbb{P}_{0,2}(X_M, d)}^{\text{vir}} \frac{e^{(\hat{Y}_E)ev_1^* \phi_1 ev_2^* \phi_2}}{(h_1 - \psi_1)(h_2 - \psi_2)} (5.4)
\]

for all \( I, J \in \mathcal{V}_M \). Applying Lemmas 5.12 and 5.13 for \( \mathcal{Z}_{\eta, \beta} (h_1, Q) \) with

\[
m = 3, \quad \beta_2 = n, \quad \beta_3 = 0, \quad \eta_2 = \phi_1, \quad \eta_3 = 1,
\]

along with Lemma 5.8(b) we obtain that the coefficient of \( h_2^{-n} \) in \( (h_1 + h_2)\mathcal{Z}(h_1, h_2, Q) \) is \( \mathcal{C} \)-recursive with \( \hat{C} \) given by (5.20) and satisfies the MPC with respect to \( \mathcal{Z}_1(h_1, Q) \) for all \( n \geq 0 \). Using this, Proposition 2.2(b) (M3) (M4) and (M2) it follows that in order to prove (4.23) it suffices to show that

\[
(h_1 + h_2)\mathcal{Z}(h_1, h_2, Q)|_{[I] \times [J]} \equiv \sum_{j=1}^{s} \mathcal{Z}_{\eta_j} (h_1, Q)|_{[I]} \mathcal{Z}_{\eta_j} (h_2, Q)|_{[J]} \mod h_1^{-1} (5.5)
\]

for all \( I, J \in \mathcal{V}_M \). By (5.3) and the string equation, the left-hand side of (5.5) mod \( h_1^{-1} \) is

\[
\phi_I(J) + h_2 \sum_{d \in \Lambda-0} Q^d \int_{\mathbb{P}_{0,2}(X_M, d)}^{\text{vir}} \frac{e^{(\hat{Y}_E)ev_1^* \phi_1 ev_2^* \phi_2}}{h_2 - \psi_2} = \Delta_1|_{[I] \times [J]} + \sum_{d \in \Lambda-0} Q^d \int_{\mathbb{P}_{0,2}(X_M, d)}^{\text{vir}} \frac{e^{(\hat{Y}_E)ev_1^* \phi_1 ev_2^* \phi_2}}{h_2 - \psi_2}, (5.6)
\]

where \( \Delta: X_M \to X_M \times X_M, \Delta(z) = ([z], [z]) \). The right-hand side of (5.5) mod \( h_1^{-1} \) is

\[
\sum_{j=1}^{s} \eta_j \mathcal{Z}_{\eta_j} (h_2, Q)|_{[J]}, (5.7)
\]

Applying Lemmas 5.12 and 5.13 for \( \mathcal{Z}_{\eta, \beta} (h_2, Q) \) with

\[
m = 3, \quad \beta_2 = \beta_3 = 0, \quad \eta_2 = \phi_1, \quad \eta_3 = 1,
\]

along with Lemma 5.8(b) we obtain that (5.6) is the restriction to \( [J] \) of a \( \mathcal{C} \)-recursive formal power series which satisfies the MPC with respect to \( \mathcal{Z}_1(h_2, Q) \). Since (5.7) also satisfies these two properties, by Proposition 5.6 the power series (5.6) and (5.7) agree if and only if they agree mod \( h_1^{-1} \). The latter is the case since (5.7) mod \( h^{-1} \) is the equivariant Poincaré dual to the diagonal in \( X_M^r \times X_M^r \) restricted to the point \( [I] \times [J] \). \( \square \)
5.2 Notation for fixed points and curves

With $\mathcal{V}_M^\tau$ as in (2.4) and for all $I, J \in \mathcal{V}_M^\tau$ with $|I \cap J| = k - 1$, we denote by

$$\mathcal{T} = X_M^\tau (I \cup J) \subseteq X_M^\tau \quad \text{and} \quad \deg \mathcal{T} = \left[ \mathcal{T} \right]_{X_M^\tau} \in \Lambda \quad (5.8)$$

the $\mathbb{P}^1$ passing through the points $[I]$ and $[J]$ and its homology class, respectively; see Corollary 2.20. Given $I \in \mathcal{V}_M^\tau$ and $j \in [N] - I$, we denote by

$$\mathcal{T}_j = X_M^\tau (I \cup \{j\}) \quad \text{and} \quad \deg \mathcal{T}_j = \left[ \mathcal{T}_j \right]_{X_M^\tau} \in \Lambda \quad (5.8)$$

the compact one-dimensional complex submanifold of $X_M^\tau$ defined by Remark 2.10 and its homology class, respectively. Since $X_M^\tau$ admits a Kähler form,

$$\deg \mathcal{T}, \deg \mathcal{T}_j \in \Lambda - \{0\}$$

by [GriH], Chapter 0, Section 7. By the last part of Remark 2.10 there exists a unique element $v(I, j)$ of $\mathcal{V}_M^\tau$ such that

$$v(I, j) \neq I \quad \text{and} \quad v(I, j) \subset I \cup \{j\}.$$ 

Since $v(I, j) \cup I = \{j\} \cup I$, $j \in v(I, j)$ and $\mathcal{T}_j = \mathcal{T} v(I, j)$. Let $\mathcal{T} = I - v(I, j)$. Applying the Localization Theorem (2.22) to the integral of 1 over $\mathcal{T} \cong \mathbb{P}^1$ and using (2.34) and Corollary 2.20 we find that

$$u_j(I) + u_j(v(I, j)) = 0 \quad \forall I \in \mathcal{V}_M^\tau, j \in [N] - I. \quad (5.9)$$

Applying the Localization Theorem (2.22) to the integrals of $x_i, \lambda_i^\pm, \text{ and } u_s$ over $\mathcal{T}_j$ and using Corollary 2.20, (2.34), and (5.9), we find that

$$x_i(I) - x_i(v(I, j)) = \langle H_i, \deg \mathcal{T}_j \rangle u_j(I) \quad \forall I \in \mathcal{V}_M^\tau, j \in [N] - I, i \in [k], \quad (5.10)$$

$$\lambda_i^+(I) - \lambda_i^+(v(I, j)) = L_i^+ \left[ \mathcal{T}_j \right] u_j(I) \quad \forall I \in \mathcal{V}_M^\tau, j \in [N] - I, i \in [a] \quad (i \in [b]), \quad (5.11)$$

$$u_s(I) - u_s(v(I, j)) = D_s \left[ \mathcal{T}_j \right] u_j(I) \quad \forall I \in \mathcal{V}_M^\tau, j \in [N] - I, s \in [N]. \quad (5.12)$$

By (5.12), (5.9), (2.30), and (2.33),

$$D_j \left( \mathcal{T}_j \right) = D_j \left( \mathcal{T}_j \right), \quad D_s \left( \mathcal{T}_j \right) = 0 \quad \forall s \in I \cap v(I, j). \quad (5.13)$$

The last five identities are stated in [Gii2].

5.3 Recursivity, polynomiality, and admissible transforms

As in [Gii2], we introduce a partial order on $\Lambda$: if $s, d \in \Lambda$, we define $s \leq d$ if $d - s \in \Lambda$. By Proposition 2.16

$$d \in \Lambda \quad \implies \quad \{s \in \Lambda : s \leq d\} \text{ is finite.} \quad (5.14)$$

This implies that for every non-empty subset $S$ of $\Lambda$, there exists $d \in S$ such that

$$s \in \Lambda, s < d \quad \implies \quad s \notin S.$$
Remark 5.3. Let \( R \supseteq \mathbb{Q} \) be any field. If \( Z \in H^s_{T_N}(X_M^r; R)[[h]][[\Lambda]] \) is \( \alpha \)-recursive for some \( \alpha \in \Lambda \), then so is \( f_1Z_1 + f_2Z_2 \) for any \( f_1, f_2 \in R_\alpha \). By Lemma 5.8(b), \( \alpha \)-recursivity is actually an \( R_\alpha[[h]][[\Lambda]] \)-linear property.

Remark 5.4. For all \( I \in \mathcal{V}_M^r \), \( j \in [N] - I \), all \( d \in \mathbb{Q} - \{1\} \), and all \( s \in [N] \),

\[ u_j(I) + d \cdot u_s(v(I, j)) \neq 0. \]

Proof. Assume that

\[ u_j(I) + d \cdot u_s(v(I, j)) = 0 \quad (5.15) \]

for some \( I \in \mathcal{V}_M^r \), \( j \in [N] - I \), \( d \in \mathbb{Q} - \{1\} \), and \( s \in [N] \). If \( d = 0 \) or \( s \in v(I, j) \), then \( u_j(I) = 0 \) by \( (2.30) \) which contradicts \( (2.33) \). If \( d \neq 0 \) and \( s \notin (I - v(I, j)) \), then \( u_j(I)(1 - d) = 0 \) by \( (5.15) \) and \( (5.9) \), which again contradicts \( (2.33) \). If \( d \neq 0 \) and \( s \notin (I \cup v(I, j)) \), then setting \( \alpha_i = 0 \) for all \( i \in (I \cup v(I, j)) \) in \( (5.15) \) and using \( (2.33) \), we find that \( -d\alpha_s = 0 \), which is false.

For the purposes of Definition 5.2 and the transforms \( [a] \) and \( [d] \) in Lemma 5.8 below as well as all statements involving them, we identify \( H_2(X_M^r; \mathbb{Z}) \) with \( \mathbb{Z}^k \) via the dual basis to \( \{H_1, \ldots, H_k\} \) so that \( \Lambda \subset \mathbb{Z}^k \).
Definition 5.5. For any $Y = Y(h, Q), Z = Z(h, Q) \in H_{MN}^*(X_M^*; R)[h][[\Lambda]]$, define $\Phi_{Y,Z} \in R_\alpha[h][[z, \Lambda]]$ by

$$
\Phi_{Y,Z}(h, z, Q) = \sum_{I \in \mathcal{Y}_M} \frac{e^{x(I)z}}{\prod_{j \in [N] - I} u_j(I)} Y(x(I), h, Q e^{hz}) Z(x(I), -h, Q),
$$

where $z = (z_1, \ldots, z_k)$, $x(I) \cdot z = \sum_{i=1}^k x_i(I) z_i$, and $Q e^{hz} = (Q_1 e^{hz_1}, \ldots, Q_k e^{hz_k})$.

If $Y, Z \in H_{MN}^*(X_M^*; R)[h][[\Lambda]]$, the pair $(Y, Z)$ satisfies the mutual polynomiality condition (MPC) if $\Phi_{Y,Z} \in R_\alpha[h][[z, \Lambda]]$.

Proposition 5.6. Let $R \supseteq Q$ be a field. Assume that $Z \in H_{MN}^*(X_M^*; R)[h][[\Lambda]]$ is recursive and that $(Y, Z)$ satisfies the MPC for some $Y \in H_{MN}^*(X_M^*; R)[h][[\Lambda]]$ with

$$
\left[ Y(h, Q) \right]_{I,0} \in R_\alpha^* \quad \forall I \in \mathcal{V}_M^*.
$$

Then, $Z(h, Q) \equiv 0 \pmod{h^{-1}}$ if and only if $Z(h, Q) = 0$.

Proof. By the second statement in Proposition 2.21(b)

$$
Z(h, Q) = 0 \iff Z(h, Q)_{I,0} = 0 \quad \forall I \in \mathcal{V}_M^*.
$$

Set $f_I = \left[ Y(-h, Q) \right]_{I,0}^Q$ and assume that $\left[ Z(h, Q) \right]_{I,0}^Q = 0$ for all $0 \leq d' < d$ and all $I \in \mathcal{V}_M^*$. Since $Z$ is recursive and $Z(h, Q) \equiv 0$ modulo $h^{-1}$,

$$
\left[ Z(h, Q) \right]_{I,d} = \sum_{r=1}^{N_d} Z_{I,d}^{(r)} h^{-r}
$$

for some $N_d \geq 0$ and some $Z_{I,d}^{(r)} \in R_\alpha$. Thus,

$$
\left[ \Phi_{Y,Z}(-h, z, Q) \right]_{Q,d} = \sum_{I \in \mathcal{Y}_M} \frac{e^{x(I)z}}{\prod_{j \in [N] - I} u_j(I)} f_I \left( \sum_{r=1}^{N_d} Z_{I,d}^{(r)} h^{-r} \right) \in R_\alpha[h][[z]].
$$

This implies that

$$
\sum_{I \in \mathcal{Y}_M} \frac{(x(I) \cdot z)^m}{\prod_{j \in [N] - I} u_j(I)} f_I \left( \sum_{r=1}^{N_d} Z_{I,d}^{(r)} h^{-r} \right) \in R_\alpha[h, z] \quad \forall m \geq 0.
$$

In particular,

$$
\sum_{I \in \mathcal{Y}_M} \frac{(x(I) \cdot z)^m}{\prod_{j \in [N] - I} u_j(I)} f_I Z_{I,d}^{(r)} = 0 \quad \forall 0 \leq m \leq |\mathcal{Y}_M^*| - 1, \forall r \in [N_d].
$$

For each $r \in [N_d]$, this is a linear system in the ‘unknowns’ $f_I Z_{I,d}^{(r)} / \prod_{j \in [N] - I} u_j(I)$ with $I \in \mathcal{V}_M^*$. Its coefficient matrix has a non-zero Vandermonde determinant, since

$$
x(I) \neq x(J) \quad \forall I \neq J \in \mathcal{V}_M^*
$$

by Proposition 2.21(a). It follows that $Z_{I,d}^{(r)} = 0$ for all $I \in \mathcal{V}_M^*$ and all $r \in [N_d]$. $\Box$
Lemmas 5.7 and 5.8 below extend [Z2] Lemmas 2.2, 2.3 from the $X_M^r = \mathbb{P}^{n-1}$ case to an arbitrary $X_M^r$. Our proof of the former is completely different from and much simpler than the one in [Z2]. For the latter, the arguments in [Z2] go through with only two significant changes required.

**Lemma 5.7.** Let $R \supseteq Q$ be a field and $Y, Z \in H^*_{TN}(X_M^r; R)[[h]][[\Lambda]]$. Then,

$$
\Phi_{Y,Z} \in R_\alpha[h][[z, \Lambda]] \iff \Phi_{Z,Y} \in R_\alpha[h][[z, \Lambda]].
$$

**Proof.** Let $Y_d(h) \equiv [Y(h, Q)]_{Q,d}$ and $Z_d(h) \equiv [Z(h, Q)]_{Q,d}$. It follows that $[\Phi_{Y,Z}(h, z, Q)]_{Q,d}$ is

$$
\sum_{I \in Y_M^r} \sum_{j \in [N]-I} \prod_{0 \leq d' \leq d, j \in [N]-I} e^{\epsilon(I) - z} u_j(I) Y_d'(h) \left( e^{h_z} Z_{d'}(-h) \right)_I = \sum_{I \in Y_M^r} \prod_{0 \leq d' \leq d, j \in [N]-I} e^{\epsilon(I) - z} u_j(I) Y_d'(h) \left( e^{h_z} Z_{d'}(-h) \right)_I,
$$

where $e^{h_z} \equiv (e^{h_1}, \ldots, e^{h_k})$. The right-hand side is $e^{h_z} \times [\Phi_{Z,Y}(-h, z, Q)]_{Q,d}$. 

**Lemma 5.8.** Let $R \supseteq Q$ be any field and $C \equiv (C_{I, j}(d))_{I \in Y_M^r, j \in [N]-I}$ any collection of elements of $R_\alpha$. Let $Y_1, Y_2, Y_3 \in H^*_{TN}(X_M^r; R)[[h]][[\Lambda]]$. If $Y_1$ is $C$-recursive and $(Y_2, Y_3)$ satisfies the MPC, then

(a) if $Y_i \equiv \left\{ x_i + h Q_s \cdot dQ_s \right\}$ for all $i$ and $s \in [k]$, then $Y_i$ is $C$-recursive and $\Phi_{Y_2, Y_3} \in R_\alpha[h][[z, \Lambda]]$;

(b) if $f \in R_\alpha[h][[A]]$, then $f Y_1$ is $C$-recursive and $\Phi_{Y_2, f Y_3} \in R_\alpha[h][[z, \Lambda]]$;

(c) if $f \in R_\alpha[[A-0]]$ and $Y_i \equiv e^{f/h} Y_i$ for all $i$, then $Y_i$ is $C$-recursive and $\Phi_{Y_2, Y_3} \in R_\alpha[h][[z, \Lambda]]$;

(d) if $f_r \in R_\alpha[[A-0]]$ for all $r \in [k]$ and $Y_i(h, Q) \equiv e^{f/x/y} Y_i(h, Q e^f)$ for all $i$, where $f \cdot x \equiv \sum_{r=1}^k f_r x_r$ and $Q e^f \equiv (Q, e^{h_1}, \ldots, Q, e^{h_k})$, then $Y_i$ is $C$-recursive and $\Phi_{Y_2, Y_3} \in R_\alpha[h][[z, \Lambda]]$.

**Proof.** For all $I \in Y_M^r$,

$$
\left\{ x(I) + h Q_s \cdot dQ_s \right\} \left( \frac{C_{I, j}(d)}{h + u_j(I)} Q^{d deg} T_I^I \left( x(v(I, j)), -\frac{u_j(I)}{d}, Q \right) \right) = \frac{C_{I, j}(d)}{h + u_j(I)} Q^{d deg} T_I^I \left( x(v(I, j)), -\frac{u_j(I)}{d}, Q \right) + \frac{C_{I, j}(d)}{h + u_j(I)} Q^{d deg} T_I^I \times \left( \frac{h + u_j(I)}{d} Q_s \cdot dQ_s + h deg s T_I^I x(I) - h x(I) \right) Y_I \left( x(v(I, j)), -\frac{u_j(I)}{d}, Q \right).
$$

The first claim in (a) now follows from Remark 5.3 and 5.10. The second claim in (a) and the claims in (b), (d) follow similarly to the proof of [Z2] Lemma 2.3 for the $X_M^r = \mathbb{P}^{n-1}$ case, using Lemma 5.7, Remark 5.3, 5.14, and 5.10. Equation (5.10) and property (5.14) are used in the proof of the recursivity claim in (d) when showing that

$$
\frac{1}{h + u_j(I)} \left( e^{f(Q)/d deg} T_I^I + \frac{f(Q) x(I)}{h} - \frac{f(Q) x(I) d}{u_j(I)} \right) \in R_\alpha[h, h^{-1}][[\Lambda]].
$$

Property (5.14) is also used to show that transforms (c) and (d) preserve $H^*_{TN}(X_M^r; R_\alpha)[h, h^{-1}][[\Lambda]]$, that

$$
\frac{e^{f/h} - e^{-f/u_j(I)}}{h + u_j(I)} \in R_\alpha[h, h^{-1}][[\Lambda]], \quad \frac{e^{f(Q) h^{-1}} - e^{f(Q)}}{h} \in R_\alpha[h][[z, Q]],
$$

52
in the case of (c) and that
\[ z_r + \frac{f_r(Q e^h z) - f_r(Q)}{h} \in R_\alpha[h, z][[\Lambda]] \quad \forall r \in [k] \]
in the case of (d).

5.4 Torus action on the moduli space of stable maps

An action of $\mathbb{T}^N$ on a smooth projective variety $X$ induces an action on $\overline{\mathcal{M}}_{0, m}(X, d)$ as in Section 4 and an integration along the fiber homomorphism as in Section 2.3. The Virtual Localization Theorem [GraPa, (1)] implies that
\[ \int_{[\mathcal{M}_{0, m}(X, d)]^{vir}} \eta = \sum_{F \subseteq \mathcal{M}_{0, m}(X, d)^{\mathbb{T}^N}} \int_{[F]^{vir}} \frac{\eta}{e(N_F^{vir})} \in \mathbb{Q}[\alpha] \quad \forall \eta \in H^*_{\mathbb{T}^N}(\overline{\mathcal{M}}_{0, m}(X, d)), \] (5.16)
where the sum runs over the components of the $\mathbb{T}^N$ pointwise fixed locus $\overline{\mathcal{M}}_{0, m}(X, d)^{\mathbb{T}^N} \subseteq \overline{\mathcal{M}}_{0, m}(X, d)$.

This section describes $\overline{\mathcal{M}}_{0, m}(X^r_M, d)^{\mathbb{T}^N}$, the equivariant Euler class $e(N_F^{vir})$ of the virtual normal bundle to each component $F$ of $\overline{\mathcal{M}}_{0, m}(X^r_M, d)^{\mathbb{T}^N}$, and the restriction of $e(V_F)$ to $F$. We follow [Sp] where the corresponding statements are formulated in the language of fans rather than toric pairs.

If $f : (\Sigma, z_1, \ldots, z_m) \rightarrow X^r_M$ is a $\mathbb{T}^N$-fixed stable map, then the images of its marked points, nodes, contracted components, and ramification points are $\mathbb{T}^N$-fixed points and so points of the form $[I]$ for some $I \in \mathcal{V}_M^r$ by Corollary 2.20(a). Each non-contracted component $\Sigma_e$ of $\Sigma$ maps to a closed $\mathbb{T}^N$-fixed curve which is of the form $\mathcal{T}J$ for some $I, J \in \mathcal{V}_M^r$ with $|I \cap J| = k - 1$ by Corollary 2.20(b). Since all such curves $\mathcal{T}J$ are biholomorphic to $\mathbb{P}^1$ by Corollary 2.20(b), the map
\[ f \big|_{\Sigma_e} : \Sigma_e \rightarrow \mathcal{T}J \]
is a degree $d(e)$ covering map ramified only over $[I]$ and $[J]$. To each such map we associate a decorated graph as in Definition 5.9 below; the vertices of this graph correspond to the nodes and contracted components of $\Sigma$ or the ramification points of $f$; the edges $e$ correspond to non-contracted components $\Sigma_e$ of $\Sigma$, and $d(e)$ describes the degree of $f|_{\Sigma_e}$.

**Definition 5.9.** A genus $0$ $m$-point decorated graph $\Gamma$ is a collection of vertices $\text{Ver}(\Gamma)$, edges $\text{Edg}(\Gamma)$, and maps
\[ \hat{d} : \text{Edg}(\Gamma) \rightarrow \mathbb{Z}^+, \quad \hat{p} : \text{Ver}(\Gamma) \rightarrow \mathcal{V}_M^r, \quad \text{dec} : [m] \rightarrow \text{Ver}(\Gamma) \]
satisfying the following properties:

1. the underlying graph $(\text{Ver}(\Gamma), \text{Edg}(\Gamma))$ has no loops;

2. if two vertices $v$ and $v'$ are connected by an edge, then $|\hat{p}(v) \cap \hat{p}(v')| = k - 1$.

Such a decorated graph is said to be of degree $d \in \Lambda$ if
\[ \sum_{e \in \text{Edg}(\Gamma)} \hat{d}(e) \deg \left(\hat{p}(v)\hat{p}(v')\right) = d, \]
where $\hat{e} = \{v, v'\}$ for an edge $e$ joining vertices $v$ and $v'$.
For a decorated graph $\Gamma$ as in Definition 5.9 we denote by $\text{Aut}(\Gamma)$ the group of automorphisms of $(\text{Ver}(\Gamma), \text{Edg}(\Gamma))$. It acts naturally on $\prod_{e \in \text{Edg}(\Gamma)} \mathbb{Z}_{q(e)}$; let

$$A_{\Gamma} \equiv \prod_{e \in \text{Edg}(\Gamma)} \mathbb{Z}_{q(e)} \rtimes \text{Aut}(\Gamma)$$

denote the corresponding semidirect product.

For any $v \in \text{Ver}(\Gamma)$, let

$$\text{Edg}(v) \equiv |\{e \in \text{Edg}(\Gamma) : v \in \partial e\}| \quad \text{and} \quad \text{val}(v) \equiv |\text{dec}^{-1}(v)| + \text{Edg}(v)$$

denote the number of edges to which the vertex $v$ belongs and its valence, respectively. A flag $F$ in $\Gamma$ is a pair $(v, e)$, where $e$ is an edge and $v$ is a vertex of $e$. For a flag $F = (v, e)$, let $\text{val}(F) \equiv \text{val}(v)$. For a flag $F = (v, e)$, let $\omega_F \equiv e(T_{f^{-1}(p(v))} \mathbb{P}^1)$, where $f : \mathbb{P}^1 \rightarrow p(v)\mathbb{P}(v')$ is the degree $\partial(e)$ cover of $p(v)\mathbb{P}(v')$ corresponding to $e$, $\partial(e) = \{v, v'\}$, and the $T_{\mathbb{P}^1}$-action on $\mathbb{P}^1$ is induced from the action on $X_M^r$ via $f$. If $\{j\} \equiv p(v') - p(v)$,

$$\omega_F = \frac{u_j(p(v))}{\partial(e)}$$  \hspace{1cm} (5.17)

by (2.31). If $v$ is a vertex that belongs to exactly 2 edges $e_1$ and $e_2$, then we write $F_i(v) \equiv (v, e_i)$.

Given a decorated graph $\Gamma$ as above, let

$$M_{\Gamma} \equiv \prod_{v \in \text{Ver}(\Gamma)} \overline{m}_{0, \text{val}(v)},$$

where $\overline{m}_{0, m} = \text{point}$, whenever $m \leq 2$. For a flag $F = (v, e)$, let $\psi_F \in H^2_{\mathbb{P}^1}(M_{\Gamma})$ denote the equivariant Euler class of the universal cotangent line bundle on $M_{\Gamma}$ corresponding to $F$ (that is, the pull-back of the $\psi$ class on $\overline{m}_{0, \text{val}(v)}$ corresponding to $e$).

**Proposition 5.10** ([Sp, Lemma 6.9]). There is a morphism $\gamma : M_{\Gamma} \rightarrow \overline{m}_{0, m}(X_M^r, d)$ whose image is a component of $\overline{m}_{0, m}(X_M^r, d)_{\mathbb{P}^N}$ and every such component occurs as the image of such a morphism corresponding to some degree $d$ decorated graph. With $\prod_{e \in \text{Edg}(\Gamma)} \mathbb{Z}_{q(e)}$ acting trivially on $M_{\Gamma}$, the induced map

$$\gamma/A_{\Gamma} : M_{\Gamma}/A_{\Gamma} \rightarrow \overline{m}_{0, m}(X_M^r, d)$$

identifies $M_{\Gamma}/A_{\Gamma}$ with the corresponding component of $\overline{m}_{0, m}(X_M^r, d)_{\mathbb{P}^N}$.

**Proposition 5.11** ([Sp, Theorem 7.8]). Let $\Gamma$ be a degree $d$ genus 0 $m$-point decorated graph and $N_{\Gamma}^{\text{vir}}$ the virtual normal bundle to $\gamma : M_{\Gamma} \rightarrow \overline{m}_{0, m}(X_M^r, d)$. Then,

$$e(N_{\Gamma}^{\text{vir}}) = \prod_{\text{flags } F \text{ of } \Gamma} \prod_{\text{val}(F) \geq 3} \frac{1}{\prod_{v \in \text{Ver}(\Gamma)} \langle \phi_{p(v)}(p(v)) \rangle} \prod_{\text{val}(v) = 2} \langle \text{dec}^{-1}(v) = \emptyset \rangle \prod_{\text{flags } F \text{ of } \Gamma} \prod_{\text{val}(F) = 1} \frac{1}{\omega_F}$$

$$\times \prod_{e \in \text{Edg}(\Gamma)} \frac{1}{\partial(e)} \langle \partial(e) \rangle \langle \partial(e) \rangle \prod_{s = 0}^{\partial(e)} \langle \text{dec}(I_j) \rangle \prod_{r \in [N] - \{I \cup \{j\}\}} \prod_{s = \partial(e) \text{ dec}(I_j) + 1}^{-1} \langle u_r(I) - \frac{s}{\partial(e)} u_j(I) \rangle \bigg|_{I = p(v)} \bigg|_{j = p(v') - 1}.$$
By (5.9) and (5.12),

\[
(-1)^{2\theta(e)} (u_j(I))^{2\theta(e)} \bigg|_{I=p(v) \atop \{j\}=p(v')-I} = u_{p(v')-p(v)}^{\theta(e)}(p(v)) u_{p(v')-p(v)}^{\theta(e)}(p(v')) u_{p(v)}(p(v')),
\]

\[
u_{r}(I) - \frac{s}{d(e)} u_j(I) \bigg|_{I=p(v) \atop \{j\}=p(v')-I} = \begin{cases} \frac{\theta(e) d_r(p(v')-s)}{\theta(e) D_r(p(v')-s)} u_r(p(v)) + s u_r(p(v')) & \text{if } D_r(p(v')-s) \neq 0, \\ u_r(p(v')) & \text{if } D_r(p(v')-s) = 0, \end{cases} \]

so the edge contributions to \(e(N^{vir}_i)\) in Proposition 5.11 are indeed symmetric in the vertices of each edge.

Let \(f: (\mathbb{P}^1, z_1, \ldots, z_m) \longrightarrow \overline{IJ}\) be a \(\mathbb{P}^1\)-fixed stable map. Thus, \(f\) is a degree \(d\) cover of \(\overline{IJ}\) for some \(d \in \mathbb{Z}^>0\). By (1.1),

\[
\mathcal{V}_E|_{\mathbb{P}^1, z_1, \ldots, z_m, f} = H^0(\mathbb{P}^1, f^*E^+) \oplus H^1(\mathbb{P}^1, f^*E^-).
\]

By [MirSym] Exercise 27.2.3] together with (5.9) and (5.11), and with \(\{j\} \equiv J-I\),

\[
e(N^{vir}_i)|_{\mathbb{P}^1, z_1, \ldots, z_m, f} = \prod_{i=1}^a \prod_{s=0}^{dL_i(J)} \left[ \lambda_i^+ - \frac{s}{d} u_j(I) \right] \prod_{i=1}^b \prod_{s=0}^{-1} \left[ \lambda_i^- - \frac{s}{d} u_j(I) \right]. \tag{5.18}
\]

By (5.11),

\[
\lambda_i^+ - \frac{s}{d} u_j(I) = \begin{cases} \frac{dL_i(J) - s}{dL_i(J)} \lambda_i^+ - s \lambda_i^+ + s \lambda_i^+ & \text{if } L_i^+ J \neq 0, \\ \lambda_i^+ = \lambda_i^+ & \text{if } L_i^+ J = 0, \end{cases}
\]

\[
\lambda_i^- - \frac{s}{d} u_j(I) = \begin{cases} \frac{dL_i(J) - s}{dL_i(J)} \lambda_i^- - s \lambda_i^- + s \lambda_i^- & \text{if } L_i^- J \neq 0, \\ \lambda_i^- = \lambda_i^- & \text{if } L_i^- J = 0, \end{cases}
\]

### 5.5 Recursivity for the GW power series

For all \(d \in \mathbb{Z}^>0, I \in \mathcal{V}_M^\tau, j \in [N] - I\), let

\[
\tilde{\mathcal{C}}_{I,j}(d) \equiv \frac{(-1)^d d^{2d-1}}{(d!)^2} \left[ u_j(I) \right]^{2d-1} \prod_{r \in [N]-(I \cup \{j\})} \frac{0}{s=dD_r(T_j)+1} \left[ u_r(I) - \frac{s}{d} u_j(I) \right] \in \mathbb{Q}_\alpha, \tag{5.19}
\]

\[
\tilde{C}_{I,j}(d) \equiv \tilde{\mathcal{C}}_{I,j}(d) \prod_{i=1}^a \prod_{s=1}^{dL_i^+(T_j)} \left[ \lambda_i^+ - \frac{s}{d} u_j(I) \right] \prod_{i=1}^b \prod_{s=0}^{-1} \left[ \lambda_i^- + \frac{s}{d} u_j(I) \right] \in \mathbb{Q}_\alpha,
\]

\[
\tilde{C}_{I,j}(d) \equiv \tilde{\mathcal{C}}_{I,j}(d) \prod_{i=1}^a \prod_{s=0}^{dL_i^+(T_j)-1} \left[ \lambda_i^+ - \frac{s}{d} u_j(I) \right] \prod_{i=1}^b \prod_{s=0}^{-1} \left[ \lambda_i^- + \frac{s}{d} u_j(I) \right] \in \mathbb{Q}_\alpha. \tag{5.20}
\]
Lemma 5.12. If \( m \geq 3 \), \( \ev_j : \overline{\mathcal{M}}_{0,m}(X_M^\tau, \d) \to X_M^\tau \) is the evaluation map at the \( j \)-th marked point, \( \eta_j \in H^*_T(X_M^\tau) \) and \( \beta_j \in \mathbb{Z}_{\geq 0} \) for \( j = 2, \ldots, m \), then the power series

\[
\hat{Z}_{\eta, \beta}(h, Q) = \sum_{d \in \Lambda} Q^d \ev_{1*} \left[ \frac{e(\hat{v}_E)}{h-\psi_1} \prod_{j=2}^m \left( \beta_j e^{\hat{v}_j^\# \eta_j} \right) \right] \in H^*_T(X_M^\tau)[[h]][[\Lambda]] \\
\hat{Z}_\eta(h, Q) = \sum_{d \in \Lambda} Q^d \ev_{1*} \left[ \frac{e(\hat{v}_E)}{h-\psi_1} \prod_{j=2}^m \left( \beta_j e^{\hat{v}_j^\# \eta_j} \right) \right] \in H^*_T(X_M^\tau)[[h]][[\Lambda]]
\]

are \( \hat{E} \)- and \( \hat{E} \)-recursive, respectively, with \( \hat{E} \) and \( \hat{E} \) given by (5.20).

Proof. This is obtained by applying the Virtual Localization Theorem (5.16) on \( \overline{\mathcal{M}}_{0,m}(X_M^\tau, \d) \), using Section 5.4, and extending the proof of [Z2, Lemma 1.1] from the case of a positive line bundle over \( \mathbb{P}^{n-1} \) to that of a split vector bundle \( E = E^+ \oplus E^- \) as in (5.14) over an arbitrary symplectic toric manifold \( X_M^\tau \). By (2.35), (2.21), (5.16), and the second equation in (2.34), a decorated graph may contribute to \( \hat{Z}_{\eta, \beta}(h, Q)(I) \) and \( \hat{Z}_{\eta, \beta}(h, Q)(I) \) only if \( p(\text{dec}(1)) = I \). There are thus two types of contributing graphs: the \( A_I \) and the \( B_I \) graphs, where \( I \in \mathcal{V}_M^\tau \). In an \( A_I \) graph the first marked point is attached to a vertex \( v_0 \) of valence 2, while in a \( B_I \) graph the first marked point is attached to a vertex \( v_0 \) of valence at least 3. If \( \Gamma \) is a \( \mathcal{B}_I \) graph and \( \hat{Z}_\Gamma \) the corresponding component of \( \overline{\mathcal{M}}_{0,m}(X_M^\tau, \d)^{\tau_N} \), then

\[
\psi_I^n = 0 \quad \forall \ n > \text{val}(v_0) - 3.
\]

Thus, \( \Gamma \) contributes a polynomial in \( h^{-1} \) to the coefficient of \( Q^d \) in \( \hat{Z}_{\eta, \beta}(h, Q)(I) \) and \( \hat{Z}_{\eta, \beta}(h, Q)(I) \).

In an \( A_I \) graph there is a unique vertex \( v \) joined to \( v_0 \) by an edge. Let \( A_{(I,j)}(d_0) \) be the set of all \( A_I \) graphs such that \( p(v) = v(I, j) \) and the edge having \( v_0 \) as a vertex is labeled \( d_0 \). Thus,

\[
A_I = \bigcup_{d_0=1}^\infty \bigcup_{j \neq I} A_{(I,j)}(d_0).
\]

We fix \( \Gamma \in A_{(I,j)}(d_0) \) and denote by \( \Gamma_0 \) and \( \Gamma_c \) the two graphs obtained by breaking \( \Gamma \) at \( v \), adding a second marked point to the vertex \( v \) in \( \Gamma_0 \) and a first marked point to \( v \) in \( \Gamma_c \), and requiring that marked points \( 2, \ldots, m \) are in \( \Gamma_c \); see Figure 2. Thus, \( \Gamma_0 \) consists only of the vertices \( v_0 \) and \( v \) and

---

8Figure 2 is [Z2, Figure 2] adapted to the toric setting.
the marked points 1 and 2 attached to $v_0$ and $v$, respectively. With $Z_\Gamma$ denoting the component in $\mathcal{M}_{0,m}(X_M^\Gamma, \alpha)^{\mathbb{T}^N}$ corresponding to $\Gamma$,

$$Z_\Gamma \cong Z_{\Gamma_0} \times Z_{\Gamma_c};$$

we denote by $\pi_0$ and $\pi_c$ the two projections. Thus,

$$\hat{\mathcal{V}}_E = \pi_0^* \mathcal{V}_E \otimes \pi_c^* \mathcal{V}_E \quad \text{and} \quad \check{\mathcal{V}}_E = \pi_0^* \check{\mathcal{V}}_E \otimes \pi_c^* \check{\mathcal{V}}_E. \tag{5.22}$$

These identities are obtained by considering the short exact sequence of sheaves

$$0 \to f^* E^\pm \to f_0^* E^\pm \otimes f_c^* E^\pm \to E^\pm|_p \to 0,$$

where $f: \Sigma \to X_M^\Gamma$ is a $\mathbb{T}^N$-fixed stable map whose corresponding graph is $\Gamma$, while $f_0$ and $f_c$ are its restrictions to the components of $\Sigma$ corresponding to the edge leaving $v_0$ and the rest of $\Gamma$. Let

$$\eta^\beta = \prod_{j=2}^{m} (\psi_j^\beta \epsilon v_j^* \eta_j).$$

By (5.22),

$$\frac{e(\check{\mathcal{V}}_E) \eta^\beta}{h-\psi_1} \big|_{Z_{\Gamma}} = \pi_0^* \left( \frac{e(\check{\mathcal{V}}_E)}{h-\psi_1} \right) \pi_c^* \left( \frac{e(\check{\mathcal{V}}_E) \eta^\beta}{h-\psi_1} \right) = \pi_0^* \left( \frac{e(\check{\mathcal{V}}_E)}{h-\psi_1} \right) \pi_c^* \left( \frac{e(\check{\mathcal{V}}_E) \eta^\beta}{h-\psi_1} \right). \tag{5.23}$$

By Proposition 5.11, 5.17, and 5.9,

$$\frac{ev_i^* \phi I |_{Z_{\Gamma}}}{e(N_{\Gamma_0}^{vir})} = \pi_0^* \left( \frac{ev_i^* \phi I}{e(N_{\Gamma_0}^{vir})} \right) \pi_c^* \left( \frac{ev_i^* \phi I}{e(N_{\Gamma_c}^{vir})} \right) \frac{1}{-\frac{u_j(I)}{d_0} - \pi_c^* \psi_1}. \tag{5.24}$$

By (5.18) and (5.11), on $Z_{\Gamma_0}$

$$e(\check{\mathcal{V}}_E) = \prod_{i=1}^{a} \prod_{s=1}^{d_0 L_+^{\Gamma}(T)} \left[ \lambda_i^+ (I) - s \frac{u_j(I)}{d_0} \right] \prod_{i=1}^{b} \prod_{s=0}^{-d_0 L_+^{\Gamma}(T)-1} \left[ \lambda_i^- (I) + \frac{s}{d_0} u_j(I) \right],$$

\[ \text{ev}_i^* \phi I \big|_{Z_{\Gamma_0}} = \prod_{i=1}^{a} \prod_{s=0}^{d_0 L_+^{\Gamma}(T)-1} \left[ \lambda_i^+ (I) - s \frac{u_j(I)}{d_0} \right] \prod_{i=1}^{b} \prod_{s=d_0 D_+(T)+1}^{-d_0 L_+^{\Gamma}(T)-1} \left[ \lambda_i^- (I) + \frac{s}{d_0} u_j(I) \right]. \tag{5.25} \]

By Proposition 5.11

$$e(N_{\Gamma_0}^{vir}) = \frac{(-1)^{d_0} (d_0)!^2}{d_0^{2d_0}} \left[ u_j(I) \right]^{2d_0} \prod_{r \in [N]-(I \cup (j))} \prod_{s=d_0 D_+(T)+1}^{d_0 D_+(T)} \left[ u_r(I) - \frac{s}{d_0} u_j(I) \right]. \tag{5.26}$$

By (5.24), (5.25), and (5.26),

$$\int_{Z_{\Gamma_0}} \frac{e(\check{\mathcal{V}}_E) \text{ev}_i^* \phi I}{(h-\psi_1) e(N_{\Gamma_0}^{vir})} = \frac{\check{c}_{I,j}(d_0)}{h + \frac{u_j(I)}{d_0}} \quad \text{and} \quad \int_{Z_{\Gamma_0}} \frac{e(\check{\mathcal{V}}_E) \text{ev}_i^* \phi I}{(h-\psi_1) e(N_{\Gamma_0}^{vir})} = \frac{\check{c}_{I,j}(d_0)}{h + \frac{u_j(I)}{d_0}}. \tag{5.27}$$
By (5.23), (5.24), and (5.27),
\[
\int_{Z_F} \frac{e(\hat{V}_E) v^* \phi_{\mathcal{I}} H^\beta}{h - \psi_1} \bigg|_{Z_F} e(N_F^{\text{vir}}) = \hat{\mathcal{C}}_{I,I}(d_0) h + \frac{u_j(I)}{d_0} \int_{Z_F} \frac{e(\hat{V}_E) v^* \phi_{\mathcal{I}} H^\beta}{h - \psi_1} e(N_F^{\text{vir}}) \bigg|_{h = -\frac{u_j(I)}{d_0}},
\]
\[
\int_{Z_F} \frac{e(\hat{V}_E) v^* \phi_{\mathcal{I}} H^\beta}{h - \psi_1} \bigg|_{Z_F} e(N_F^{\text{vir}}) = \hat{\mathcal{C}}_{I,I}(d_0) h + \frac{u_j(I)}{d_0} \int_{Z_F} \frac{e(\hat{V}_E) v^* \phi_{\mathcal{I}} H^\beta}{h - \psi_1} e(N_F^{\text{vir}}) \bigg|_{h = -\frac{u_j(I)}{d_0}}.
\]
By the first equation in (5.28) and the Virtual Localization Theorem (5.16), the contribution of the $A_I$ graphs to the coefficient of $Q^d$ in $\hat{Z}_{q,\beta,I}$ is
\[
\sum_{d_0 \geq 1} \sum_{j \in \mathcal{N}^{-1}_I} \sum_{d_0 \cdot \deg T_j \leq d} \hat{\mathcal{C}}_{I,I}(d_0) \left[ \hat{Z}_{q,\beta}(x(v(I,j)), h, Q) \right]_{Q \cdot d - d_0 \cdot \deg T_j} \bigg|_{h = -\frac{u_j(I)}{d_0}}
\]
whenever $d = d^*$ satisfies the two properties in Definition 5.2 (which make evaluation at $h = -\frac{u_j(I)}{d_0}$ meaningful). An analogous statement holds when summing in the second equation in (5.28). □

5.6 MPC for the GW power series

Let $\tilde{Z}_1$ and $\hat{Z}_1$ be as in (4.2) and $\hat{Z}_{q,\beta}$ be as in (5.21).

**Lemma 5.13.** For all $m \geq 3$, $\eta_j \in H^*_X(M^\tau)$, $\beta_j \in \mathbb{Z}^{>0}$, the pairs $(\hat{Z}_1(h, Q), h^{m-2} \hat{Z}_{q,\beta}^\tau(h, Q))$ and $(\hat{Z}_1(h, Q), h^{m-2} \hat{Z}_{q,\beta}(h, Q))$ satisfy the MPC.

Lemma 5.13 extends [Z2] Lemma 1.2 from the case of a positive line bundle over $\mathbb{P}^{n-1}$ to that of a split vector bundle $E = E^+ \oplus E^-$ as in (1.4) over an arbitrary symplectic toric manifold $X^\tau_M$. While [Z2] Lemma 1.2 follows from [Z2] Lemma 3.1, Lemma 5.13 follows from Lemma 5.15 below, which extends [Z2] Lemma 3.1 to the general toric case. The proof of Lemma 5.13 uses the Virtual Localization Theorem (5.16) instead of the classical one used in the $X^\tau_M = \mathbb{P}^{n-1}$ case and Lemma 5.14 which is a general toric version of the first displayed formula in [Z2] after (3.32).

As in [G11] and [Z2], we consider the action of $T^1$ on $V = \mathbb{C}^2$ given by $\xi \cdot (z_0, z_1) = (z_0, \xi^{-1} z_1)$ and the induced action on $\mathbb{P}V$. Let $h$ be the weight of the standard action of $T^1$ on $\mathbb{C}$. For any $d \in \Lambda$, let
\[
\mathcal{X}_d(X^\tau_M) = \{ f \in \mathbb{P}^{0,m}(\mathbb{P}V \times X^\tau_M, (1, d)) : ev_1(f) \in [1, 0] \times X^\tau_M, ev_2(f) \in [0, 1] \times X^\tau_M \}.
\]

By Proposition 5.10 the components of the fixed locus $\mathcal{X}_d(X^\tau_M)^{T^1 \times T^N}$ of the $T^1 \times T^N$-action on $\mathcal{X}_d(X^\tau_M)$ are indexed by decorated graphs $\Gamma$ of the following form. Such a graph $\Gamma$ has a unique edge of positive $\mathbb{P}V$-degree; this special edge corresponds to a degree-one map $f : \mathbb{P}^1 \to \mathbb{P}V \times [I]$ for some $I = Y^\tau_M$. Edges to the left (respectively right) of this edge are mapped into $[1, 0] \times X^\tau_M$ (respectively $[0, 1] \times X^\tau_M$); see Figure 2 where we dropped the $\mathbb{P}V$-label of the vertices. Thus, the first marked point is attached to some vertex to the left of the special edge, while the second marked point is attached to some vertex to the right of the special edge.

Let
\[
d_L = d_L(\Gamma), \quad d_R = d_R(\Gamma) \in \Lambda
\]

\footnote{Figure 2 is [Z2] Figure 3 adapted to the toric setting.}
denote the $X^r_M$-degrees of the left- and right-hand side (with respect to the special edge) subgraphs, respectively; thus, $d = d_L + d_R$. Let $Z_\Gamma$ be the component of $\mathcal{X}_d(X^r_M)^{T^1 \times T^n}$ corresponding to $\Gamma$.

Lemma 5.14. For every $i \in [k]$ and $d \in \Delta$, there exists

$$\Omega_i \in H^2_{T^1 \times T^n}(\mathcal{X}_d(X^r_M)) \text{ such that } \Omega_i|_{Z_\Gamma} = x_i(I) + (d_L(\Gamma)), h$$

for all graphs $\Gamma$ corresponding to components of $\mathcal{X}_d(X^r_M)^{T^1 \times T^n}$, with $d_L(\Gamma)$ and $I$ depending on $\Gamma$ as above.

Proof. We follow the proof in [Gi1, Section 11] and [Gi2, Section 2].

Given $s \in \mathbb{Z}^{\geq 0}$ and $n \geq 1$, let

$$\text{Poly}^n_s = \mathbb{P}\left(\{P \in \mathbb{C}[z_0, z_1] : P \text{ homogeneous of degree } s\}^{\otimes n}\right).$$

We next define a morphism

$$\theta_0 : \mathcal{W}_{0,0}(PV \times \mathbb{P}^{n-1}, (1, s)) \longrightarrow \text{Poly}^n_s.$$  

If $[\Sigma, f]$ is an element of $\mathcal{W}_{0,0}(PV \times \mathbb{P}^{n-1}, (1, s))$, $\Sigma = \Sigma_0 \cup \Sigma_1 \cup \ldots \cup \Sigma_r$, where $\Sigma_0$ is a $\mathbb{P}^1$, $f|_{\Sigma_0}$ has degree $(1, s_0)$, $\Sigma_i$ is connected for all $i \in [r]$, and $f|_{\Sigma_i}$ has degree $(0, s_i)$ for all $i \in [r]$. Thus,

$$f(\Sigma_i) \subseteq \{[A_i, B_i] \times \mathbb{P}^{n-1} \text{ for some } [A_i, B_i] \in PV \forall i \in [r]\}.$$  

Let $\theta_0[\Sigma, f] = [P_1 g, \ldots, P_n g]$, where

$$f|_{\Sigma_0} = (f_1, f_2), \quad f_2 \circ f_1^{-1} = [P_1, \ldots, P_n] \in \text{Poly}^n_{s_0}, \quad g = \prod_{i=1}^r (A_i z_1 - B_i z_0)^{s_i}.$$  

Let $\theta = \theta_0 \circ \text{fgt}$, where

$$\text{fgt} : \mathcal{W}_{0,0}(PV \times \mathbb{P}^{n-1}, (1, s)) \longrightarrow \mathcal{W}_{0,0}(PV \times \mathbb{P}^{n-1}, (1, s))$$

is the forgetful morphism. By [Gi1, Section 11, Main Lemma], $\theta|_{\mathcal{X}_d(\mathbb{P}^{n-1})}$ is continuous. The torus $T^1 \times T^n$ acts on $\text{Poly}^n_s$ by

$$(\xi, t_1, \ldots, t_n) \cdot (P_1[z_0, z_1], \ldots, P_n[z_0, z_1]) = (t_1 P_1[z_0, \xi z_1], \ldots, t_n P_n[z_0, \xi z_1]).$$
This action naturally lifts to the hyperplane line bundle over Poly\textsuperscript{\textit{n}}. The map θ₀ is T\textsuperscript{1} × T\textsuperscript{n}-equivariant and hence so is θ.

Let \( L → X_M^r \) be any very ample line bundle. For any \( d ∈ Λ \), let \( L(d) = \langle c_1(L), d \rangle \). Consider the canonical lift of the T\textsuperscript{N}-action on X_M^r to L given by Proposition 2.17 together with 2.23. Thus, there exists \( n \), an injective group homomorphism \( ν_T : T\textsuperscript{N} → T\textsuperscript{n} \), and an \( \iota_T \)-equivariant embedding \( \iota : X_M^r → \mathbb{P}^{n-1} \) such that \( \iota^* \mathcal{O}_{\mathbb{P}^{n-1}}(1) = L \). We consider the T\textsuperscript{N}-action on \( \mathbb{P}^{n-1} \) induced by \( \iota_T \). The embedding \( \iota \) induces a T\textsuperscript{1} × T\textsuperscript{n}-equivariant embedding

\[
X_d(X_M^r) → X_L(d)(\mathbb{P}^{n-1}).
\]

The composition

\[
X_d(X_M^r) → X_L(d)(\mathbb{P}^{n-1}) → \text{Poly}_L(d)
\]

maps \( Z_T \) onto \([z_0^{L(d_r)}, z_1^{L(d_l)} a_1, \ldots, z_0^{L(d_r)}, z_1^{L(d_l)} a_n] \), where \([a_1, \ldots, a_n] = \iota([I])\).

Let \( Ω ∈ H^2_T(\text{Poly}_L(d)) \) be the equivariant Euler class of the hyperplane line bundle and

\[
Ω(L) = F^* θ^* Ω ∈ H^2_T(\text{Poly}_d(L)).
\]

It follows that

\[
Ω(L)|_{Z_T} = Ω_0 \left[ z_0^{L(d_r)} z_1^{L(d_l)} a_1, \ldots, z_0^{L(d_r)} z_1^{L(d_l)} a_n \right] = e(L)(I) + \langle c_1(L), d_L \rangle h \quad (5.29)
\]

where \( e(L) \) is the T\textsuperscript{N}-equivariant Euler class of \( L \).

By Proposition 2.16 there exist very ample line bundles \( L_i \) for all \( i ∈ [k] \) such that \( \{ c_1(L_i) : i ∈ [k] \} \) is a basis for \( H^2(X_M^r) \); so, using the T\textsuperscript{N}-action on each \( L_i \) defined by 2.23, we find that

\[
\text{Span}_Q \{ e(L_i) : i ∈ [k] \} = \text{Span}_Q \{ x_i : i ∈ [k] \}.
\]

Via Proposition 2.21(b), this shows that \( \{ e(L_i), α_j : i ∈ [k], j ∈ [N] \} \) is a basis for \( H^2_T(X_M^r) \). As in 12, we define a \( Q \)-linear map from \( H^2_T(X_M^r) \) to \( H^2_T(\text{Poly}_L(d)) \) by sending \( e(L_i) \) to \( Ω(L_i) \) for all \( i ∈ [k] \) and \( α_j \) to \( α_j \) for all \( j ∈ [N] \). Let \( Ω_i ∈ H^2_T(\text{Poly}_L(d)) \) be the image of \( e(x_i) \) under this map. The claim now follows from (5.29).

\[\text{Lemma 5.15.} \quad \text{Let } η^β = \prod_{j=2}^m \left( ψ_j^β e_j e_j^\star η_j \right) \text{ in } H^*_T(\mathcal{M}_{0,m}(X_M^r), d) \text{ and let}
\]

\[
π : \mathcal{M}_{0,m}(\mathbb{P}V × X_M^r, (1, d)) → \mathcal{M}_{0,m}(X_M^r, d)
\]

denote the natural projection. With \( Φ \) as in Definition 5.3 and \( Ω_i \) as in Lemma 5.14.

\[
(-h)^{-m-2} Φ_{z_1, z_{n, β}} (h, z, Q) = \sum_{d ∈ Λ} Q^d \int_{[\mathcal{M}(X_M^r)]_{vir}} \frac{1}{x_1 z_i} Ω z_i \pi^* \left[ e \left( \nabla_E \right) η^β \right] \prod_{j=3}^m e_j^\star e(\mathcal{O}_{PV}(1)),
\]

\[
(-h)^{-m-2} Φ_{z_1, z_{n, β}} (h, z, Q) = \sum_{d ∈ Λ} Q^d \int_{[\mathcal{M}(X_M^r)]_{vir}} \frac{1}{x_1 z_i} Ω z_i \pi^* \left[ e \left( \nabla_E \right) η^β \right] \prod_{j=3}^m e_j^\star e(\mathcal{O}_{PV}(1)).
\]

60
Proof. We apply the Virtual Localization Theorem \((5.16)\) to the right-hand side of each of the two equations in \((5.30)\), using Section \(5.4\) and extending the proof of \([22\) Lemma 3.1] from the case of a positive line bundle over \(\mathbb{P}^{n-1}\) to that of a split vector bundle \(E = E^+ \oplus E^-\) as in \((1.4)\) over an arbitrary symplectic toric manifold \(X_M\). The possible contributing fixed loci graphs are described above. Given such a fixed locus graph \(\Gamma\), we denote by \(N_{\Gamma}^{vir}\) the virtual normal bundle to the corresponding component of the fixed locus inside the moduli space. We denote by \(A_L\) the set of all \(T^1 \times T^N\)-fixed loci graphs whose unique edge of positive \(\mathbb{P}V\)-degree corresponds to a map \(\mathbb{P}^1 \to \mathbb{P}V \times [I]\), where \(I \in \mathcal{Y}_M\). A graph \(\Gamma \in A_L\) breaks into 3 graphs - \(\Gamma_L, \Gamma_R, \) and \(\Gamma_0\) - as follows; see also Figure 3\(^{10}\). The graph \(\Gamma_L\) is obtained by considering all vertices and edges of \(\Gamma\) to the left of the special edge (of positive \(\mathbb{P}V\)-degree) and adding a marked point labeled 2 at the vertex belonging to the special edge. Given that all vertices in this “left-hand side graph” are labeled \(([1,0], I)\) for some \(I \in \mathcal{Y}_M\), it defines a component of \(\mathbb{M}_{0,2}(X_M^\tau, d_L)^{T_N}\). The graph \(\Gamma_R\) is obtained by considering all vertices of \(\Gamma\) to the right of the special edge and adding a marked point labeled 1 at the vertex belonging to the special edge. Given that all vertices in this “right-hand side graph” are labeled \(([0,1], I)\) for some \(I \in \mathcal{Y}_M\), it defines a component of \(\mathbb{M}_{0,1}(X_M^\tau, d_R)^{T_N}\). Finally, \(\Gamma_0\) is the special edge with 2 marked points added. They are labeled 1 in the left-hand side and 2 in the right-hand side. Thus, 
\[Z_\Gamma \cong Z_{\Gamma_L} \times Z_{\Gamma_0} \times Z_{\Gamma_R};\]

we denote by \(\pi_L, \pi_0, \) and \(\pi_R\) the corresponding projections.

It follows that
\[\pi^* \hat{V}_E = \pi_L^* \hat{V}_E \oplus \pi_R^* \hat{V}_E, \quad \pi^* \tilde{V}_E = \pi_L^* \tilde{V}_E \oplus \pi_R^* \tilde{V}_E,\]

\[\frac{N^{vir}_L}{T[I]X^\tau_M} = \pi_L^* \left( \frac{N^{vir}_L}{T[I]X^\tau_M} \right) \oplus \pi_R^* \left( \frac{N^{vir}_R}{T[I]X^\tau_M} \right) \oplus \pi_L^* L_2 \oplus \pi_0^* L_1 \oplus \pi_0^* L_2 \oplus \pi_R^* L_1,\]

where \(L_2 \to Z_{\Gamma_L}, L_1, L_2 \to Z_{\Gamma_0}, \) and \(L_1 \to Z_{\Gamma_R}\) are the tautological tangent line bundles. The first two equations in (5.31) follow similarly to (5.22).

By (5.31) and (2.34),
\[\pi^* \left[ e \left( \hat{V}_E \right) \eta^{\beta} \right] \prod_{j=3}^m \text{ev}_j^* \left[ e \left( \mathcal{O}_{\mathbb{P}V}(1) \right) \right]_{Z_\Gamma} = \pi_L^* \left[ e \left( \hat{V}_E \right) \right] \left[ e \left( \hat{V}_E \right) \eta^{\beta} \left( -h \right)^{m-2} \right],\]

\[(5.32)\]

\[\frac{e(T[I]X^\tau_M)}{e(N^{vir}_L)} = \frac{e(T[I]X^\tau_M)}{N^{vir}_L} = \frac{ev_2^* \phi_I}{e(N^{vir}_L)} = \frac{ev_2^* \phi_I}{N^{vir}_L}, \quad \frac{ev_2^* \phi_I}{N^{vir}_L} \frac{1}{(h - \pi_L^* \psi_2) \left( (-h) - \pi_R^* \psi_1 \right)},\]

\(^{10}\)Figure 3 is [22 Figure 4] adapted to the toric setting.
and the first equation in (5.32) with \( \hat{Y}_E \) replaced by \( \hat{V}_E \) also holds. By (5.32) and Lemma 5.14

\[
\int_{Z_L} \frac{\sum_{i=1}^{k} \Omega_{zi} \pi^{\ast} \left[ e \left( \hat{V}_E \right) \eta^{\beta} \prod_{j=3}^{m} ev_j^{\ast} e \left( O_{PV} \left( 1 \right) \right) \right]_{Z_L}}{e \left( N^v_L \right)} \cdot \frac{1}{e \left( N^v_L \right)} = \left( -h \right)^{m-2} \frac{\sum_{i=1}^{k} \xi_i(I) z_i}{e(T_{[I]} X^v_M)} \times \left\{ \frac{\sum_{i=1}^{k} \left( d_L \right)_{z_i h}}{h - \psi_2} \int_{Z_L} e \left( \hat{V}_E \right) e^{\ast \phi_I} \right\} \left\{ \int_{Z_R} e \left( \hat{V}_E \right) \eta^{\beta} e^{\ast \phi_I} \right\}
\]

(5.33) with \( \hat{Y}_E \) replaced by \( \hat{V}_E \) also holds. In the \( d_L = 0 \) case, the first curly bracket on the right-hand side of (5.33) is defined to be 1. By the Virtual Localization Theorem (5.16) and (2.21),

\[
\sum_{\Gamma_L} Q_{d_L} \left\{ \frac{\sum_{i=1}^{k} \left( d_L \right)_{z_i h}}{h - \psi_2} \int_{Z_L} e \left( \hat{V}_E \right) e^{\ast \phi_I} \right\} \cdot \left\{ \int_{Z_R} e \left( \hat{V}_E \right) \eta^{\beta} e^{\ast \phi_I} \right\} = \tilde{Z}_1 \left( h, Q e^{S} \right) \left|_{I} \right.,
\]

(5.34)

where the first sum is taken after all graphs \( \Gamma_L \) corresponding to components of \( \overline{X}_{m,2}^v (X_M, d_L) \) such that the first marked point is mapped to \( [I] \), while the second is taken after all graphs corresponding to components of \( \overline{X}_{m,0} (X_M, \Gamma_R) \) such that the first marked point is mapped to \( [I] \). The equation obtained from (5.33) by replacing \( \hat{Y}_E \) by \( \hat{V}_E \), \( \tilde{Z}_1 \) by \( \tilde{Z}_1 \), and \( \tilde{Z}_{\eta, \beta} \) by \( \tilde{Z}_{\eta, \beta} \) also holds. The claims follow from (5.33) and (5.34) (and their \( \hat{Y}_E \) analogues), by summing the left-hand side of (5.33) over all graphs \( \Gamma \in A_I \) and all \( I \in \gamma_M^r \).

5.7 Recursivity and MPC for the explicit power series

As in [Gi2], for each \( I \in \gamma_M^r \) we define

\[
\Delta_i^r \equiv \left\{ d \in \Lambda : D_j(d) \geq 0 \quad \forall j \in I \right\}.
\]

(5.35)

By (4.6), (4.7), and (2.30),

\[
\left\| \hat{Y}(x(I), h, q) \right\|_{q, d} \neq 0 \implies d \in \Delta_i^r \quad \text{and} \quad \left\| \hat{Y}(x(I), h, q) \right\|_{q, d} \neq 0 \implies d \in \Delta_i^r.
\]

(5.36)

**Lemma 5.16.** The power series \( \hat{Y}(x, h, q) \) of (4.14) is \( \hat{E} \)-recursive with \( \hat{E} \) given by (5.26). The power series \( \hat{Y}(x, h, q) \) of (4.14) is \( \hat{E} \)-recursive with \( \hat{E} \) given by (5.26).

**Proof.** The recursivity of \( \hat{Y} \) in the \( E = E^+ \) case is [Gi2] Proposition 6.3. The proof of the recursivity of \( \hat{Y} \) in the general case is similar and so is the proof of the recursivity of \( \hat{Y} \). We prove below the recursivity of \( \hat{Y} \) extending the proof of (a) in [Z2] Section 2.3 and the proof of [Gi2] Proposition 6.3. 62
Let \( I \in \mathcal{Y}_M \), \( j \in [N] - I \), \( J \equiv v(I, j) \), \( \{ j \} \equiv I - J \). By (5.36), (4.7), Remark 5.4 and (5.9),

\[
\dot{J}(x(J), -\frac{u_j(I)}{d}, q) = \sum_{d_0 \in \Delta^*_{j}} D_{d_0}^{d' < 0} \left[ \prod_{r \in [N]} u_r(J) - \frac{\partial}{\partial q} u_{ij}(I) \right]
\]

\[
\times \prod_{i=1}^{a} L_i^{i+1}(d')^{-1} \prod_{s=0}^{b} L_i^{i+1}(d') \left[ \lambda_i^{i+1}(J) - \frac{s}{d} u_{ij}(I) \right] \prod_{s=1}^{0} \left[ \lambda_i^{i+1}(J) + \frac{s}{d} u_{ij}(I) \right].
\]

By (5.37), (5.12), and (5.11),

\[
\dot{J}(x(J), -\frac{u_j(I)}{d}, q) = \sum_{d_0 \in \Delta^*_{j}} D_{d_0}^{d' < 0} \left[ \prod_{r \in [N]} u_r(I) - \frac{\partial}{\partial q} u_{ij}(I) \right]
\]

\[
\times \prod_{i=1}^{a} L_i^{i+1}(d')^{-1+1+dL_i^{i+1}(d') \prod_{s=1+1+dL_i^{i+1}(d') \prod_{s=1}^{0} \left[ \lambda_i^{i+1}(I) + \frac{s}{d} u_{ij}(I) \right].
\]

By (5.13) and (5.19),

\[
\dot{C}_{I,j}(d) = \frac{(-1)^d d^{2d-1}}{(d!)^2} \frac{1}{[u_j(I)]^{2d-1}} \prod_{s=1+1+dL_i^{i+1}(d') \prod_{s=1}^{0} \left[ u_r(I) - \frac{\partial}{\partial q} u_{ij}(I) \right].
\]

If \( d \geq 1 \), \( d^* \in \Lambda \), \( d' \equiv d^* - d \cdot \deg \mathcal{J}_{j} \in \Lambda \), then,

\[
\left[ d^* \in \Delta^*_{j} \right. \text{ and } \left. D_J(d^*) \geq d \right] \iff \left[ d' \in \Delta^*_{j} \right. \text{ and } \left. D_J(d') \geq -d \right]
\]

by (5.13). By (5.36), (4.7), (5.38), (5.39), and (5.20),

\[
\text{Res}_{z=-\frac{u_j(I)}{d}} \left\{ \frac{1}{h-z} \left[ \dot{J}(x(I), z, q) \right]_{q,d^*} \right\} = \frac{\dot{C}_{I,j}(d)}{h+\frac{u_j(I)}{d}} \left[ \dot{J}(x(J), -\frac{u_j(I)}{d}, q) \right]_{q,d^* - d \cdot \deg \mathcal{J}_{j}}
\]

for all \( d^* \in \Lambda \). Finally, viewing \( \frac{1}{h-z} \left[ \dot{J}(x(I), z, q) \right]_{q,d^*} \) as a rational function in \( h, z \), and \( \alpha_j \) and using the Residue Theorem on \( \mathbb{P}^1 \), we obtain

\[
\sum_{d \geq 1} \sum_{j \in [N] - I} \frac{\dot{C}_{I,j}(d)}{h+\frac{u_j(I)}{d}} \left[ \dot{J}(x(J), -\frac{u_j(I)}{d}, q) \right]_{q,d^* - d \cdot \deg \mathcal{J}_{j}} = \left[ \dot{J}(x(I), h, q) \right]_{q,d^*}
\]

\[
-\text{Res}_{z=0,\infty} \left\{ \frac{1}{h-z} \left[ \dot{J}(x(I), z, q) \right]_{q,d^*} \right\},
\]

63
where \( \text{Res}_{z=0, \infty} F \equiv \text{Res}_{z=0} F + \text{Res}_{z=\infty} F \). Since

\[
\text{Res}_{z=0, \infty} \left\{ \frac{1}{\hbar - z} \left[ \mathcal{Y}(x(I), z, q) \right]_{q.d} \right\} \in \mathbb{Q}[\hbar, \hbar^{-1}],
\]

this concludes the proof.

\( \square \)

**Lemma 5.17.** With \( \mathcal{Y} \) and \( \mathcal{Y} \) defined by (4.7), \( (\mathcal{Y}, \mathcal{Y}) \) satisfies the MPC.

We follow the idea of the proof of \([\text{Gi}2, \text{Proposition 6.2}] \) and begin with some preparations. Let \( d \in \bigcup_{j \in J_M} \Delta_i^j \)

\[ J \equiv J(d) \equiv \{ j \in [N] : D_j(d) = 0 \}, \quad S \equiv |J| + \sum_{j \in J} D_j(d). \]

Let \( A \) be the \([J] \times S \) matrix giving \( \prod_{j \in J} \mathbb{P}^{D_j(d)} \) as in (2.37). Denote the coordinates of a point \( y \in C^S \) by

\[ (y_j; 0, y_j; 1, \ldots, y_j; D_j(d))_{j \in J}. \]

The pair \((M_J A, \tau)\) is toric in the sense of Definition 2.1. It satisfies (ii) in Definition 2.1 since

\[ \mathcal{Y}_{M_J A} = \{ ((i_1; p_1), \ldots, (i_k; p_k)) : \{ i_1, \ldots, i_k \} \subseteq \mathcal{I}, \{ p_1, \ldots, p_k \} \subseteq \mathcal{J}, 0 \leq p_r \leq D_{i_r}(d) \quad \forall r \in [k] \} \quad (5.41) \]

by the second statement in Lemma 2.2(b). We identify \( C^S \) with \( \bigoplus_{j \in J} H^0(\mathbb{P}^1, \mathcal{O}_{\mathbb{P}^1}(D_j(d))) \) via

\[ (y_j; 0, y_j; 1, \ldots, y_j; D_j(d))_{j \in J} \rightarrow \left( \sum_{r=0}^{D_j(d)} y_j; r \delta_{0}^{D_j(d)-r} z_1^{r} \right)_{j \in J}. \]

and set \( X_d = X_{M_J A} \). The torus \( T^1 \times T^{|J|} \) acts on \( \bigoplus_{j \in J} H^0(\mathbb{P}^1, \mathcal{O}_{\mathbb{P}^1}(D_j(d))) \) by

\[ (\xi, (t_j)_{j \in J}) \cdot (P_j(z_0, z_1))_{j \in J} = (t_j P_j(z_0, \xi z_1))_{j \in J}, \quad (5.42) \]

while the torus \( T^{|J|} \) acts on \( \bigoplus_{j \in J} H^0(\mathbb{P}^1, \mathcal{O}_{\mathbb{P}^1}(D_j(d))) \) by restricting this action via

\[ T^{|J|} \ni t \mapsto (1, t) \in T^1 \times T^{|J|}; \]

these actions descend to actions on \( X_d \).

**Lemma 5.18.** (a) The fixed points of the \( T^1 \times T^{|J|} \)-action on \( X_d \) are

\[ [I, \mathbf{p}] \equiv \left( P_j(z_0, z_1) \right)_{j \in I}, \quad (5.43) \]

where \( I \in \mathcal{Y}_{M}^\tau, I \subseteq J, \mathbf{p} = (p_i)_{i \in J} \in \mathbb{Z}^k, 0 \leq p_i \leq D_i(d) \) for all \( i \in I \), and \( P_j(z_0, z_1) \equiv \begin{cases} z_0^{D_j(d)-p_j} z_1^{P_j}, & \text{if } j \in I; \\ 0, & \text{otherwise}. \end{cases} \]
(b) Let \( I \in \mathcal{V}_M^+ \) and \( p = (p_i)_{i \in I} \in \mathbb{Z}^k \). Then

\[
0 \leq p_i \leq D_i(d) \quad \forall i \in I \iff p M_I^{-1}, d - p M_I^{-1} \in \Delta_i^+.
\]

**Proof.** Let \( \{(P_j(z_0, z_1))_{j \in J}\} \) be any fixed point of the \( T^1 \times T^j \)-action on \( X_d \) and \( (\xi_0, \xi_1) \in \mathbb{C}^2 \) be such that \( P_j(\xi_0, \xi_1) \neq 0 \) whenever \( P_j \neq 0 \). By Lemma 2.41 and (5.41), \( (P_j(\xi_0, \xi_1))_{j \in J} \in \hat{X}^+_{M,J}. \) Since \( \{(P_j(z_0, z_1))_{j \in J}\} \) is a \( T^1 \times T^j \)-fixed point in \( X^+_M \), there exists \( I \in \mathcal{V}_M^+ \) with \( I \subseteq J \) such that \( P_j \neq 0 \) if and only if \( j \in I \); see Corollary 2.20(a). This concludes the proof of (a). Part (b) follows from (5.35) and the identity \( (D_i(r))_{i \in I} = r M_I \) for \( r = p M_I^{-1} \); see the second equation in (2.17).

We consider the \( T^1 \times T^N \)-action on \( X_d \) obtained by composing the projection \( T^1 \times T^N \rightarrow T^1 \times T^j \) induced by \( J \mapsto [N] \) with the action (5.42) of \( T^1 \times T^j \) on \( X_d \). We denote by \( \tilde{e}(T_{[I,p]}X_d) \) the \( T^1 \times T^N \)-equivariant Euler class of \( T_{[I,p]}X_d \) and by

\[
(I, p) : H^\ast_{T^1 \times T^N}(X_d) \rightarrow H^\ast_{T^1 \times T^N}
\]

the restriction map induced by the inclusion \( [I, p] \hookrightarrow X_d \), where \( [I, p] \) is the \( T^1 \times T^N \)-fixed point defined by (5.43). Let \( h \) denote the weight of the standard action of \( T^1 \) on \( X \).

**Lemma 5.19.** There exist classes \( (x_i)_{i \in [k]}, \lambda^+_i, \lambda^-_i \) such that

\[
x_r = \sum_{i=1}^k m_{ir} x_i - \alpha_r \quad \forall r \in [N],
\]

and such that for all \( (I, d') \) with \( I \in V^+_M, J \subseteq I, d', d - d' \in \Delta_i^+ \), and all \( [I, p] \) as in (5.43),

\[
(x_1(I, d'M_I), \ldots, x_k(I, d'M_I)) = (x_1(I), \ldots, x_k(I)) + h d',
\]

\[
\tilde{e}(T_{[I,p]}X_d) = \prod_{j \in J - I} \prod_{0 \leq s \leq D_j(d)} [u_j(I, p) - s h] \times \prod_{j \in I \setminus 0 \leq s \leq D_j(d) \setminus s \neq p_j} [u_j(I, p) - s h],
\]

\[
\lambda^+_i (I, d'M_I) = \lambda^+_i (I) + h L_i^+(d') \quad \forall i \in [a] \quad (\forall i \in [b]).
\]

**Proof.** We define the classes \( \tilde{x}_1, \ldots, \tilde{x}_k \) and \( u_{j,s} \) in \( H^\ast_{T^S}(X_d) \) with \( j \in [J] \) and \( 0 \leq s \leq D_j(d) \) by (2.27) with \( (M, \tau) \) replaced by \( (M_J A, \tau) \). By (2.29),

\[
u_{j,s} = \sum_{i=1}^k m_{ij} \tilde{x}_i - \alpha_{j,s},
\]

where \( \alpha_{j,s} \equiv \pi^{+}_{j,s} c_1(O_{P^\times}(1)) \) and \( \pi^{+}_{j,s} : (P^\times)^S \rightarrow P^\times \) is the projection onto the \( (j; s) \) component. By Corollary 2.20(a), (5.41), and (2.34), the \( T^S \)-fixed points in \( X_d \) are the points \( [I, p] \) and

\[
e^{T^S}(T_{[I,p]}X_d) = \prod_{j \in J - I} \prod_{0 \leq s \leq D_j(d)} [u_{j,s}|_{[I,p]}] \times \prod_{j \in I \setminus 0 \leq s \leq D_j(d) \setminus s \neq p_j} [u_{j,s}|_{[I,p]}].
\]
the restriction homomorphism induced by $[I, p] \rightarrow X_d$. The map

$$F : (\mathbb{C}^\infty - \{0\})^{N+1} \rightarrow (\mathbb{C}^\infty - \{0\})^S, \quad F(e_0, e_1, \ldots, e_N) \equiv (e_j, e_j \cdot e_0, e_j \cdot e_0^2, \ldots, e_j \cdot e_0^{D_j(d)})_{j \in J},$$

where

$$(z_1, z_2, \ldots)^d \equiv (z_1^d, z_2^d, \ldots) \quad \forall d \geq 1, (z_1, z_2, \ldots) \in \mathbb{C}^\infty - \{0\}, \quad \text{and}$$

$$(z_1, z_2, \ldots) \cdot (y_1, y_2, \ldots) \equiv (z_1 y_j)_{(i,j) \in \mathbb{Z}_+ \times \mathbb{Z}_+} \quad \forall (z_1, z_2, \ldots), (y_1, y_2, \ldots) \in \mathbb{C}^\infty - \{0\}$$

is equivariant with respect to the homomorphism

$$f : T^1 \times T^N \rightarrow T^S, \quad f(\xi, t_1, \ldots, t_N) \equiv (t_j, t_j \xi, t_j \xi^2, \ldots, t_j \xi^{D_j(d)})_{j \in J}.$$

It induces a map

$$F : (\mathbb{C}^\infty - \{0\})^{N+1} \times_{T^1 \times T^N} X_d \rightarrow (\mathbb{C}^\infty - \{0\})^S \times_{T^S} X_d,$$

and thus a homomorphism

$$F^\ast : H_{T^S}^\ast(X_d) \rightarrow H_{T^1 \times T^N}^\ast(X_d).$$

It follows that

$$F^\ast \alpha_{j,s} = \alpha_j + sh \quad \forall (j; s) \text{ with } j \in J, 0 \leq s \leq D_j(d). \quad (5.50)$$

We define $x_i$ and $u_r$ as the $T^1 \times T^N$-equivariant Euler classes of the line bundles

$$\tilde{X}_{M_J A}^r \times \mathbb{C} / \sim_i \rightarrow X_d \quad \text{and} \quad \tilde{X}_{M_J A}^r \times \mathbb{C} / \sim_r \rightarrow X_d,$$

where

$$((P_j)_{j \in J}, c) \sim_i (t^{M_J} P_j)_{j \in J}, t_i c) \quad \forall t \in T^k, ((P_j)_{j \in J}, c) \in \tilde{X}_{M_J A}^r \times \mathbb{C}$$

$$((P_j)_{j \in J}, c) \sim_r (t^{M_J} P_j)_{j \in J}, t_r c)$$

with respect to the lifts of the $T^1 \times T^N$-action on $X_d$ given by

$$(\xi, t_1, \ldots, t_N) \cdot (P_j(z_0, z_1))_{j \in J}, c) \equiv [(t_j P_j(z_0, \xi z_1))_{j \in J}, c] \quad \text{and}$$

$$(\xi, t_1, \ldots, t_N) \cdot (P_j(z_0, z_1))_{j \in J}, c) \equiv [(t_j P_j(z_0, \xi z_1))_{j \in J}, t_r c]$$

respectively. It follows that

$$x_i = F^\ast \tilde{x}_i \quad (5.53)$$

and $u_j$ satisfy (5.41). The latter follows similarly to the proof of (2.29) using equations analogous to (2.25) and (2.26) with $T^N$ replaced by $T^1 \times T^N$. Equation (5.45) follows from (5.33), Proposition 2.22(a) and (5.50). Equation (5.53) follows from (5.44), (5.45), and (2.29). Equation (5.46) follows from (5.49) together with (5.48), (5.50), (5.53), and (5.44). Finally, define

$$\lambda_i^+ = \sum_{r=1}^k \ell^+_r x_r \quad \text{and} \quad \lambda_i^- = \sum_{r=1}^k \ell^-_r x_r, \quad (5.54)$$

with $\ell^+_r, \ell^-_r$ as in (3.5). Equations (5.47) then follow from (5.54), (5.45), and (4.4). \qed
With \( u_j \) and \( (I, d') \) as in Lemma 5.19
\[
u_j(I, d'M_I) = u_j(I) + h D_j(d') \quad \forall j \in [N],
\]
by (5.44), (5.45), and (2.22).

**Lemma 5.20.** There exists a vector bundle \( V_d \to X_d \) and a lift of the \( T^1 \times T^N \)-action to \( V_d \) such that the \( T^1 \times T^N \)-equivariant Euler class \( \tilde{e}(V_d) \) satisfies
\[
\tilde{e}(V_d)(I, p) = \prod_{j=1}^{N} \prod_{s=1}^{D_j(d) - 1} [u_j(I, p) + s h]
\]
for all \( T^1 \times T^N \)-fixed points \( [I, p] \) defined by (5.43) and with \( u_j \in H^*_{T^1 \times T^N}(X_d) \) as in Lemma 5.19.

**Proof.** Let
\[
\tilde{V}_d = \left\{ (P_j)_{j \in [N] - J} \in \bigoplus_{j \in [N] - J} H^0(P^1, \mathcal{O}_{P^1}(-D_j(d) - 1)) : P_j(1, 0) = 0 \quad \forall j \in [N] - J \right\},
\]
\[
V_d \xrightarrow{\sim} X_d, \quad \left( (P_j)_{j \in J}, (P_j)_{j \in [N] - J} \right) \sim \left( (t^M_j P_j)_{j \in J}, (t^M_j P_j)_{j \in [N] - J} \right) \quad \forall t \in T^k.
\]
Since \( \tilde{X}_{M,A} \to X_d \) is a principal bundle, \( V_d \to X_d \) is a holomorphic vector bundle. The \( T^1 \times T^N \)-action on \( X_d \) lifts to \( V_d \) via
\[
(\xi, t_1, \ldots, t_N) \left[ (P_j(z_0, z_1))_{j \in J}, (P_j(z_0, z_1))_{j \in [N] - J} \right] = \left[ (t_j P_j(z_0, \xi z_1))_{j \in J}, (t_j P_j(z_0, \xi z_1))_{j \in [N] - J} \right].
\]
The lemma now follows from the definition of \( u_j \) in (5.51) and (5.52). \( \square \)

By the Localization Theorem (2.22), Lemma 5.18, Lemma 5.20, and (5.46),
\[
\int_{X_d} f \tilde{e}(V_d) = \sum_{d', \ d'' \in \Delta^+_J} \left[ \sum_{d'' \in \Delta^+_{J}} \prod_{j \in J} \prod_{0 \leq s \leq D_j(d)} [u_j(I, d'M_I) - sh] \prod_{s \neq D_j(d')} [u_j(I, d'M_I) - sh] \right]^{N-1} \prod_{j \in [N] - J} \prod_{s=1}^{D_j(d)-1} [u_j(I) + s h],
\]
for all \( f \in H^*_{T^1 \times T^N}(X_d) \).

**Proof of Lemma 5.17.** By Definition 5.5, (5.36), (4.7), (5.50), (5.45), (5.55), and (5.47),
\[
\Phi_{\gamma_\nu, \gamma_\rho}(h, z, Q) = \sum_{I \in \mathcal{I}_{\delta}} \sum_{d \in \Delta^+_{J}} Q_d \left\{ \sum_{d', d'' \in \Delta^+_{J}} \prod_{j \in J - I} u_j(I) \prod_{D_j(d) < 0} \prod_{D_j(d') < 0} \prod_{s \neq D_j(d')} [u_j(I) + s h] \right\}
\]
\[
\times \prod_{i=1}^{a} L^+_{i}(d') \prod_{i=1}^{b} L^-_{i}(d') [\lambda^+_{i}(I) + sh] \prod_{i=1}^{a} L^+_{i}(d') \prod_{i=1}^{b} L^-_{i}(d') [\lambda^-_{i}(I) + sh].
\]

\[
= \sum_{d \in \Delta^+_{J}} Q_d \int_{X_d} \tilde{e}(V_d)e^{Nz} \prod_{i=1}^{a} \prod_{s=-L^+_{i}(d') + 1}^{0} \prod_{i=1}^{b} \prod_{s=-L^-_{i}(d') + 1}^{0} \prod_{s=1}^{[\lambda^+ + sh]}.\]
The last expression is in \( \mathbb{Q}[\alpha, h][[z, \Lambda]] \).

\[ \square \]

A Derivation of (5.2) from [LLY3]

| [LLY3] | our notation |
|--------|-------------|
| \( m \) | \( k \) |
| \( e_j \) | \( q_j \) |
| \( R \) | \( \mathbb{C}(\alpha_1, \ldots, \alpha_N)[h] \) |
| \( \mathbb{C}[T^*] \) | \( \mathbb{Q}[\alpha_1, \ldots, \alpha_N] \) |
| \( \alpha \) | \( h \) |
| \( T \) | \( T^N \) |
| \( e_T \) | \( e \) |
| \( c_1(L_d) \) | \( -\psi_1 \in H^2(\overline{\mathcal{M}}_{0,1}(X_M^r, \mathbf{d})) \) |
| \( \rho \) | forgetful morphism \( \overline{\mathcal{M}}_{0,1}(X, \mathbf{d}) \rightarrow \overline{\mathcal{M}}_{0,0}(X, \mathbf{d}) \) |
| \( e^X_d \) | \( \text{ev}_1: \overline{\mathcal{M}}_{0,1}(X, \mathbf{d}) \rightarrow X \) |
| \( LT_{0,1}(d, X) \) | \( \overline{\mathcal{M}}_{0,1}(X, \mathbf{d}) \) |
| \( V_d \) | \( V_E \rightarrow \overline{\mathcal{M}}_{0,0}(X, \mathbf{d}) \) |
| \( U_d = \rho^*V_d \) | \( V_E \rightarrow \overline{\mathcal{M}}_{0,1}(X, \mathbf{d}) \) |
| \( (D_{\alpha})_{\alpha \in [N]} \) | \( (u_j)_{j \in [N]} \) |

In [LLY3, Section 3.2], we take \( b_T \equiv e_T \) (that is, \( e \)), \( X = X_M^r \), and \( V \equiv E \). By [LLY3, Section 3.2],

\[
A^{V, b_T}(t) = A(t) = e^{-H \cdot t/\alpha} \left[ \frac{\text{e}(E^+)}{\text{e}(E^-)} + \sum_{d \in \Lambda - 0} A_d e^d t \right], \quad A_d = e^X \left( \frac{\rho^*b_T(V_d) \cap LT_{0,1}(d, X)}{e_G(F_0/M_d(X))} \right),
\]

where \( \{H_d\} \subset H^2_{T^N}(X^r_M) \) is a basis whose restriction to \( H^2(X^r_M) \) is a basis of first Chern classes of ample line bundles; see [LLY3, Section 3,viii]. By [LLY3, Lemma 3.5],

\[
e_G(F_0/M_d(X)) = \alpha(\alpha - c_1(L_d)).
\]

Thus, in our notation,

\[
A(t) = e^{-H \cdot t/h} \left\{ \frac{\text{e}(E^+)}{\text{e}(E^-)} + \sum_{d \in \Lambda - 0} e^d t \text{ev}_1^* \left[ \frac{\text{e}(V_E)}{h(h + \psi_1)} \right] \right\}, \quad (A.1)
\]

where \( \text{ev}_1: \overline{\mathcal{M}}_{0,1}(X_M^r, \mathbf{d}) \rightarrow X_M^r \) is the evaluation map at the marked point. By [MirSym, (A.2), (A.1), and the string relation [MirSym, Section 26.3],

\[
A(t) = e^{-H \cdot t/h} \frac{\text{e}(E^+)}{\text{e}(E^-)} Z_1(-h, e^t). \quad (A.2)
\]

By [4.1], Remark 5.1, and (4.4), (5.2), is independent of the choice of a \( \mathbb{Q}[\alpha] \)-basis for \( H^2_{T^N}(X^r_M) \) and so it is not necessary to assume that the restrictions of \( x_i \) to \( H^2(X^r_M) \) are Chern classes of.
ample line bundles. Thus, we may take $H = (x_1, \ldots, x_k)$ in [LLY3]. By [LLY3 (5.2)] and [LLY3 Theorem 4.9],

$$B(t) = e^{-Ht/\hbar} \frac{e(E^+)}{e(E^-)} \chi(x, -\hbar, \epsilon')$$

in [LLY3 Theorem 4.7]. In the notation of the proof of [LLY3 Theorem 4.7] correlated with Remark 5.1,

$$C = \hat{I}_0(q), \quad C' = -\hat{I}_0(q) \left( G(q) + \sum_{j=1}^{N} \alpha_j g_j(q) \right), \quad C'' = -\hat{I}_0(q) \cdot (f_1(q), \ldots, f_k(q)),$$

$$e^{\frac{f/\alpha}{C}} = e^{-\log C \cdot \frac{C'}{C}} = \frac{1}{\hat{I}_0(q)} e^{\frac{1}{\hat{I}_0(q)} \left[ G(q) + \sum_{j=1}^{N} \alpha_j g_j(q) \right]}, \quad g = -\frac{C''}{C} = (f_1(q), \ldots, f_k(q)).$$

Finally, by [LLY3, Section 5.2] and [LLY3 Corollary 4.11], the hypothesis of [LLY3 Theorem 4.7] are satisfied with $A(t)$ and $B(t)$ as in (A.2) and (A.3) if $\nu_E(d) \geq 0$ for all $d \in \Lambda$, since $e(E^+)$ and $e(E^-)$ are non-zero whenever restricted to any $\mathbb{T}^N$-fixed point; see Proposition 2.21(a).

Thus, (5.2) follows from [LLY3 Theorem 4.7], (A.2), (A.3), and (A.4).
