The examination of ideologies in researches related to Chinese management is usually conducted from a historical perspective. This paper aims to pave the way for a broader research overcoming the historical perception and linking the ideological influences on Chinese managerial behavior with cross-cultural management concepts to support the economic cooperation of the People’s Republic of China and the European Union.

Chinese capital has an increasing importance in Hungary and in the other countries of the European Union (see Figure 1 and 2): the overall value of the imported products from China to the EU (Eurostat, 2018), as well as the amount of foreign direct investment from China to Hungary (KSH, 2018) has almost doubled during the past ten years, while the exports of the EU to China are triple of the 2016 amount. With the Belt and Road initiative, Chinese influence is expected to grow exponentially. Chinese firms are becoming strategic partners of Hungary with large-scale investments targeting the country. The growing number of Chinese organizations inevitably results in increasing interactions between the people of China and Europe. Chinese leaders and managers take part in cross-cultural preparation trainings to get acquainted with the European culture, business practices and other cultural differences, but it is equally important for us to have a basic knowledge of the Chinese business culture to make the cooperation more effective. Since each organization has its unique way on responding to internal and external challenges, considering the characteristics of the other culture and attempting to adapt to it can be crucial for managers engaged in multinational activities (Fekete – Dimény, 2012).

As the Chinese and European approach to business and management is inherently different, the understanding of the Chinese way starts from the historical and ideological background of the country. Considering this, the aim of this paper is to provide a basic insight to the most influential ideologies of China.

Keywords: Chinese management characteristics, cross-cultural management, Confucianism, Daoism, Legalism, Buddhism
The first centuries of Chinese history are only documented based on transliterations of ancient myths, for the existence of which there are no evidences, but as tradition they are an important factor for the country, and still have great importance in Chinese philosophy. The legends include mythical figures such as the Yellow Emperor (Huangdi 黄帝), who is believed to have invented some important tools (for example the axe, the mortar or well drilling), or Fuxi 伏羲, who taught people to hunt, to fish and to cook meat. One of the last heroes of the period were Yao 耀 and Shun 禹, who were the archetypes of the Confucian 'superior man'. The first dynasty proven to have existed was the Shang dynasty 商 (16th - 11th century BC) (Fung, 1997). The aristocratic social structure was formed during these times, the destabilization and transformation of which, at the end of the Zhou dynasty 周 (1046-221 BC), provided the basis for the formation of the most important ideologies. While the first roots of Confucianism1 date back to a historical period of social stability (the Western Zhou 西周, period, 1046-771 BC), and the development of the Confucian philosophy and Daoism started in an era of social transformation and economic prosperity (Chunqiu 春秋, 722-481 BC), the first representatives of Legalism lived in an era of wars, social and political unrest with the main purpose of the economy being to serve the military (The Warring States 战国 403-221BC) (Salát, 2013).

After the Warring States period, the country was unified by the Qin dynasty 秦 (221-206 BC) and Qin Shi Huangdi became the first emperor of China. He governed the country based on rigorous Legalist principles and strict regulations which resulted in his great unpopularity, therefore, shortly after his early death in 206 BC, the Qin dynasty has fallen. To avoid a similar fate, the first emperor of the succeeding Han dynasty started the consolidation of his predecessor’s legacy with the easing of regulations and tax burdens. The power of the central administration remained weak, but the country started to regain its strength and political, social and economic stability. This was the time when the first written evidences of Buddhism originate from, and starting from this period, the first religion and ideological school of foreign origin started to gain reputation and popularity in China (Fitzgerald, 1989).

Confucianism

Historical background

The name, which most of the Western world uses to address this ideology, originates from the 16th century, when Jesuit missionaries Latinized the name of the founder of the philosophical school (Kongzi 孔子 or Kongfuzi 孔夫子). In China, however, it is called ru 儒 (or rujia 儒家), originally referring to a certain group of literates. Only later, when Confucianism (or Rusim) was recognized as a prominent school, has this ideology become identified with Confucius and his disciples. Confucius and his discip-

STUDIES AND ARTICLES

Confucian teachings were an intention to contribute to the consolidation and to the restructuring of social and political circumstances, it can not only be regarded as an ideology of human life, but it is also an important theory of power and authority. The first unification of China was achieved based on legalist. Therefore, Confucius is regarded as interpreting, preserving and mediating the ancient heritage of China and, together with his disciples and followers, synthesizing it into a system of principles, virtues and ideologies suitable for different aspects of life, society and politics (Hofstede – Bond, 1988).

As in the background of Confucian teachings was an intention to contribute to the consolidation and to the restructuring of social and political circumstances, it can not only be regarded as an ideology of human life, but it is also an important theory of power and authority. The first unification of China was achieved based on legalist principles, and in this era (Qin Dynasty 秦, 221-206 BC) Confucianism was suppressed. Confucianism started to gain reputation again during the ruling of a Han Dynasty 漢 emperor, Dong Zhongshu (191-115 BC), and gradually, it became the official ideology of the country. The Taixue 太学, or the Imperial Academy was established 124 BC, which served as the educational institution for prospective government officials and bureaucrats (Salát, 2009).

Modern implications

Warner (2010), seeking the conception of Confucian HRM, finds, that with China being the first country to base its bureaucracy on education instead of bloodlines, with a solid Confucian foundation of civil service enduring through different historical circumstances and rulers, contributed greatly to the theory and practice of not only Chinese, but also to the Western management and bureaucracy (Warner, 2010). Until its abolition in 1905, the Confucian Four Books and Five Classics served as the basis of scholar official classes and the imperial exams of the examination system, which meant that those aspiring for highest ranking offices had to study these works in great detail (Csikszentmihalyi, 2005).

The most important principles of Confucianism are about preserving traditions, possessing good human qualities and adhere to the rules of social hierarchy (Fitzgerald, 1989). The ideal person, which everybody, especially leaders should strive to be, is called junzi 孔子, or ‘superior man’. The Confucian concept of junzi, or superior man is described as follows: “Is it not a pleasure, having learned something, to try it out at due intervals? Is it not a joy to have like-minded friends come from afar? Is it not gentlemanly not to take offence when others fail to appreciate your abilities?” (The Analects, I/1, cited by Lin and Ho, 2009). This idea is able to support the cooperation of people from different cultures working together in multinational corporations and provides a solid foundation for harmonious relations among the members of a diverse community on the long-term (Lin – Ho, 2009).

Hofstede and Bond (1988) pointed out, that beside the three cultural dimension applying to both East and West (Power Distance, Individualism/Collectivism, Masculinity/Femininity), there are two dimensions which are unique to the East and West respectively: Uncertainty Avoidance and Confucian Dynamism. The latter consists of values rooted in the teachings of Confucius: searching for Virtue, as opposed to seeking the absolute Truth in uncertainty-avoiding cultures. (Hofstede & Bond, 1988) These virtues are the necessities for one to become a junzi: ren (仁, benevolence, humaneness); yi (義, righteousness); li (禮, proper rite); zhi (智, knowledge); xin (信, integrity). Ren, or benevolence is the most important among them, and it can be associated with several qualities an ideal person has to hold, such as caring, perseverance, self-restraint or modesty. Chan (2008) attempts to define the relationship between business ethics and profit making in the Confucian value system. He notes, that even though in some cases profit making in Confucian works is associated with inferior personality or a ruining effect on the county, they don’t completely disparage business activity. Confucian thinkers argue that one should strive for human virtues (benevolence, righteousness, humanity, development of personality) instead of their wealth. However, this should not be interpreted as a necessity for complete cease of business activities, it rather suggests that one should find the balance in striving for profit and human virtue. The social harmony is a result of respecting social hierarchy which, according to the Confucian teaching, consists of five relationships and is described by ten morals (Kôsa, 2013). Two of these relationships are inside the family, while the remaining are related to society, and all of them describe connections between superiors and subordinates: father’s endearment, son’s filial devotion, elder brother’s gentleness, younger brother’s respect, husband’s fidelity, wife’s compliance, senior’s benevolence, youth’s submission, ruler’s kindness, and subordinate’s loyalty (Child – Warner, 2003). As Hill (2006) argues, the key Confucian principles have significant impact on Chinese leadership style, interpersonal relations and individual values. The paternalistic leadership style and the regarding of the corporation as family, as well as the preservation of hierarchy and avoiding self-interest can all be traced back to the principle of li and to the rigid system of connections (Hill, 2006). The roots of the paternalistic leadership, which is a hierarchical leadership method common in overseas and mainland Chinese family businesses, are in the traditional Chinese family structure, which is also defined by classical Confucian values. The father – son relationship is extended to superior – subordinate relationships of the company, where the superior has to guide, protect and care to the subordinate, who, in return is expected to be loyal and deferential (Farh – Liang – Chou – Cheng, 2008).

Chan (2008) argues that Confucian values and business ethics puts greater emphasis on hierarchy, guanxi and social harmony. The practice of guanxi (interpersonal relationships or connections) is based on the Confucian principles of reciprocity and interdependence and involves mutually beneficial social interactions (Chan G. K., 2008).
Harmony in a company refers to every participant knowing their place and role while complying with order and practicing benevolence towards each other (Wang – Chee, 2011). The outcome of the research of Wong et al. (2010) also supports the idea that hierarchy and the role of guanxi between subordinates and supervisors has an outstanding importance in Chinese management (Wong – Wong – Wong, 2010).

Wood and Lamond (2011) examine the presence of Confucian values in business ethics and how to reach self-regulation through them. They conclude, that business leaders in China today still consider being a junzi as the standard of personal integrity, which can be achieved by developing self-regulation. The Confucian practices to achieve this include rites and ritual, music, self-examination and mentoring. The virtue of rite (li) and rituals of the organization can help define the communication between people and strengthen their loyalty and integrity to the organization. Music can play a role in building unity (e.g. by starting the day with a song together) or developing interpersonal relationships among business partners or colleges (e.g. karaoke singing). The Confucian practice of self-examination includes one’s reflection and consideration of everyday events, behavior and attitudes which is also an important educational practice of developing ethical managerial skills. Employee orientation, education and career development would not be a sufficient way of mentoring in an organization, according to Confucius. It should rather include encouraging active discussions, with offering encouragement and corrections to the opinions of the participants (Wood – Lamond, 2011). A prerequisite to benevolent leadership is also the self-cultivation, and if one possesses this ability, they will be able to shape and to lead others (Yang – Peng – Lee, 2008).

**Daoism**

It is important to note, as the two concepts may differ from each other, that when describing Daoism in this paper we always refer to the Daoist philosophy, as opposed to religious Daoism.

**Historical background**

Traditionally, the author of the most important work of Daoism, the *Daodejing* (Classic of the Way and Virtue), is Laozi, however, there is no clear evidence supporting this, and it is widely accepted that the *Daodejing*, which is also called *Laozi*, is a collection of works of several different authors. Laozi was working in the Archives of the imperial court during the Zhou dynasty, but seeing the power of the dynasty decline made him leave the court. According to the tradition, during his journey he wrote down his thoughts about *dao* (lit. ‘way’) and *de* (‘virtue’) when he met a guard at the border who asked him to leave his wisdom for them before he leaves. After leaving, there is nothing known about him (Kósa, 2013).

The *Daodejing*, and the teachings of Daoism are interpreted in multiple ways. An important interpretation is that it was intended for the ruling class of the late Zhou pe-

Modern implications

An effective way of adapting Daoism to leadership is the water-metaphor. According to Laozi, the best human qualities are similar to that of water, so every people, especially leaders, have to pursue these water-like qualities, namely altruism, modesty, flexibility, transparency or honesty, and persistency. The leadership style of people should be also similar to water - gentle but persistent. When striving to achieve a goal, leaders should bear in mind how water is very soft, yet it can attack and form hard things due to its power and persistency (Lee – Han – Byron – Fan, 2008).

As it can also be seen from the above, according to Laozi, the Daoist leader is invisible (Helle, 2017). He should understand and predict the environment and help the organization adapt to it and maintain harmony. According to the findings of Jung et al (2010), the invisible leadership style is the less risk-taking, the less communicating, the less likely to articulate vision or monitor operations, relatively unlikely of authoritative behavior, but also not showing as much benevolence as the other leadership styles examined in the study (advanced, authoritative, progressing) (Jung – Chan – Chen – Chow, 2010). The importance of the concepts of the invisible leadership in modern Chinese organizations is also supported by the study of Wong et al. (2010), who find, that the trust of workers towards the management and towards the organization can-
not be clearly distinguished, as they conceive these two entities very similar (Wong – Wong – Wong, 2010).

The other important aspect of Daoism is the concept of de, which refers to a humanistic behavior, a character of virtue. According to Daoist principles, humans should be humble and modest, and shouldn’t have too many desires because those who have desires, are not content, they don’t know where their boundaries are. These might seem, to a certain extent, similar to Confucianism. However, Laozi has despised on Confucian values of humanity and righteousness, because these virtues mean that one has lost dao and de, where dao is superior.

Harmony, the balance of yin and yang is an essential part of Daoism, it should be priority for leaders to preserve this for the organization to be successful. Yin can be understood as the receptive, structural part of the organization while yang is the active, creative, functional part (Durbabghi, 2004). According to Wang and Chee (2011), the Daoist organization should be decentralized, with great autonomy to its departments and little interactions between them. The long-term policy is unchanged and aims to provide comfortable living for itself and its people, it maintains little communication towards outsiders and has a low public profile (Wang – Chee, 2011).

Legalism

Historical background

Legalism is both similar to and different from the other ideologies. It is similar, because its goal is to solve the social and political problems of its era, but it is also different, because instead of looking for experiences of the past, it believes that for the unprecedented problems, new, radical solutions are required. After the fall of the Zhou Dynasty, wars between the states became more and more frequent, which required a solid administrative background with the concentration of power to deal with the increasingly complex tasks. Governors started to implement the practical and effective ideas and were looking for people supporting them with such suggestions (Fung, 1997).

Legalism is also different from Daoism or Confucianism because it is not an organized philosophical school, there were no masters, teachers and disciples. Legalism is a term given by succeeding generations to a certain group of people, thinkers, advisors, who were engaged in similar activities and were dealing with related problems based on similar values. It was Han Fei who can be considered the founder of the school, he attempted to collect and improve the teachings of his predecessors according to his system. It is due to his work, that the works of numerous Legalist thinkers were preserved. At first glance, one could think that Legalism has no roots in Chinese history and cultural tradition, and after it supported the unification of China and the emergence of the Qin Dynasty (221-206 BC), it disappeared completely. In fact, there were several statesmen during the Chunqiu period (722-481 BC), who can be regarded as the forerunners of Legalism because of their pragmatic regulations, and, after the fall of Qin Dynasty, during the early years of Han Dynasty, Legalism continued to exist as an independent school, before its integration into Confucianism and becoming an important part of state ideology (Salát, 2013).

Because Legalism originates from a period of social and political instability and frequent battles between the concurring states, its principles are also different from those of other Chinese ideologies, they seek practical answer for the most urgent problem of the period: how to deal with the changing social structures and how to defeat the other states in order to rule the whole country. Basically, it attempts to give specific guidance on matters of leadership and organization methods, but from a totalitarian point of view (Fung, 1997). One common feature of the Legalist thinkers was the aim of their work: to defeat other states and to stabilize the position of the governor. From this aspect, Legalist principles are the exact opposite of Confucianism, Daoism or Buddhism. If war, punishment or betrayal serves the purpose of the governor, then these are more than acceptable methods to use. Legalism is very rigorous and shows no mercy to anyone, it was the first concept which placed law equally above everybody (Fu, 1996). According to their idea, there is no difference between civils and nobles, relatives and strangers, law imposes the same verdict on everyone regardless of their social status. This perception is an important legacy of Legalism. Three famous Legalist thinkers, Shen Buhai, Shen Dao and Shang Yang were the first to emphasize the importance of the concepts of shu (tactics), shi (power) and fa (rules or law). The three concepts were later synthesized by Han Fei. Obtaining and preserving power is one of the foundations of ruling, because it allows the ruler to impose his will on his subordinates, using different tactics. The ruler must use the power of law for the population, which imposes punishment on people harming the country and rewards them in case of being useful (Salát, 2013).

Modern Implications

Legalism was an important ideology behind China’s ruling, but usually it was combined with Confucian values, especially in times of social and political order and prosperity. In periods of turmoil and unrest, Legalism appeared more frequently than Confucianism. The theory can also be applied to modern organizations. Most importantly, as opposed to Confucianism, Legalism builds on the basic thought of all human behaviors being driven by self-interest. According to this belief, an organization following Legalist principles should establish a profit-driven culture, make sure, that every employee’s duties are clear and not overlapping with each other, the self-interest of people is satisfied by clear goals, and that every person, regardless of their position, is treated fairly and rationally (Wang – Chee, 2011).

In Legalism, or institutional theory (Wang – Chee, 2011), the position of a leader is defined by the three main concepts, shi (power or authority), fa (law) and shu (tactics). The first to obtain is power, once a leader has power, they can start using law and (management) techniques to govern subordinates. The basis of power is position (wei), however, according to Hanfei its rather considered as a
prerequisite to power, but is not sufficient to maintain it, one must have talent and capability to achieve organizational goals, which also includes assigning capable people to key positions.

One of the tools to manipulate subordinates is fa, or rules and regulations. According to Hanfei these should be initiated by the leader, however, the origin of the law is supposed to be the dao, as the fundamental principle and main driving force of the universe. The task of a good leader is using this to decide about right and wrong and establish the rules accordingly. This concept also underlines the importance of institutions in society and defines the relationship between people and the state, similar to the perception of homo-economicus or classical capitalism, where people are direct subordinates of the state without family ties or other subjective factors influencing the decision making (Sárvári, 2017). The other tool of the leader to manipulate its people and achieve organizational goals is shu, or management technique. This include the above mentioned assigning of capable people to key positions, as well as following the projects and controlling the results and evaluating contributions and granting rewards (Hwang, 2008). This perception of the single leader who directs his subordinates is a characteristic of individualistic societies, in collectivistic societies the common interpretation of the function of a leader is that he is solely responsible for any failures of the organization, but the successes of it are attributed to the whole collective (Dicken – Castano – Magomaeva – Den Hartog, 2012).

**Buddhism**

**Historical background**

Buddhism is one of the most important religions in China, and as opposed to the ideologies addressed above, it stems from outside the country and it developed its basic principles independently from Chinese history before arriving to China (Tőkei, 1996). During the first few hundred years of Buddhism in China, it received significant impacts from Chinese ideologies, mainly from Daoism. This is the reason why the terminology of Buddhism and Daoism is similar, for example they both use the concept of youwei (doing) and wuwei (non-doing). In fact, rather than claiming the values of Buddhism being misinterpreted in China, we can say that a Chinese “version” of Buddhism was created by synthesizing it with traditional Chinese ideologies (Chan W.-T., 1958). The Doctrine of the Mind and the School of Emptiness both had significant effect on the Chinese way of thinking. After the Doctrine of the Mind started to be suppressed, and from the merging of Daoism and the School of Emptiness, the Chan Buddhism came into being (Fung, 1997). As Chan Buddhism is the biggest school of the religion in China (Hamar, 2004) and the limitations of this paper do not allow to address the numerous other schools of Buddhism, in the following we always refer to Chan Buddhism.

According to the main principle of Buddhism, karma means the actions or deeds of the beings of the universe, which necessarily results in a consequence in the near or distant future. So, the life the individual is built from the succession of the karma (which is the cause of everything) and the impacts caused by the karma. This is not only interpreted to the life of people, but also to the whole universe, therefore, an action in the life of a sentient being can also result in causes in their subsequent life. This is the cycle of successive existence (Samsara), which is the basis of the sufferings of sentient beings. According to Buddhism, the suffering stems from the ignorance of people and their desire for and insisting to living, which makes them unable to quit the eternal cycle of births and rebirths. The liberation from this cycle means realizing nirvana (Fung, 1997).

**Modern implications**

Buddhist economics was first mentioned by Schumacher (1973) and it became a popular discipline since then. Its foundations are the values of Buddhism, and, as opposed to the homo-economicus, it describes the economic agents as (1) having only limited rationality, (2) being interdependent to each other and (3) aiming to minimize losses. The Buddhist approach distinguished two kinds of goods, those, which (1) satisfy human needs, and those, which (2) satisfy customer demand beyond basic human needs. The insisting or desire to consumption is considered as a cause of suffering, therefore Buddhism doesn’t accept this consumption pattern and defines economic effectiveness as satisfying human needs with optimal use of resources (Kovács, 2016). The ethics of Buddhism is in synergy with the concepts of sustainability and responsibility, the study of Du et al. (2014) finds a positive effect of Buddhism on corporate environmental responsibility. The study of Nemcsicsné Zsóka (2006) also supports this idea, it found, that the environmental values an organization possesses also manifest themselves in the organizational culture, which (Nemcsicsné Zsóka, 2006), which suggests, that a corporation with Buddhist values could be more likely to implement a responsible environmental strategy.

The purpose of a Buddhist organization must be in line with the Buddhist idea of the meaning of life, therefore, every function of the organization (execution, communication, strategy, R-D etc.) need to have a common goal of securing the spiritual development and harmony of the employees and stakeholders of the organization. This vision implies that materialism is only acceptable until it supports the functioning of the organization, the ethics followed by the organization and its people will not accept power-seeking or self-centered behavior, as these would have an isolating effect on the individual and an overall negative effect on the organization. Hence, managers and leaders of the Buddhist organization must have developed inner space and awareness towards their employees so that they can support the realization of the well-being and harmony of the people and the organization. They must reach a great quality of presence to be able to help the people with professional and personal struggles and to encourage them to work autonomously and constantly monitor themselves according to Buddhist values (Borden – Shek-
STUDIES AND ARTICLES

hawat, 2010). According to Kovács (2014), implementing Buddhist elements in current management practices could be a feasible solution to today’s global issues. The practice of meditation and improving mindfulness supports leaders in both adequate self-reflection and in being more effective in problem solving, decision making, avoiding mistakes and improving overall efficiency. By fostering compassion towards all sentient beings (i.e. the employees), the managerial body can transform into a group which supports sustainability on personal, organizational, social and environmental level without pursuing its own interest (Kovács, 2014).

Muyzenberg (2014) identifies three main concepts of Buddhism which can have an impact on organizational performance. The three laws of nature (1) underline that just like everything in the universe, organizations also depend on other organizations and external factors and they also have an influencing effect to the outside world (interdependence). Therefore, they should act accordingly and make the right choices considering how it affects others. Moreover, because everything has a cause and effects, and the effects will become causes of other things in the future, these form an endless chain in which each organization has to take responsibility for the changes caused by them. This is further emphasized by the law of impermanence, which points out that there is nothing which wouldn’t change over time. For businesses, it is important to consider these factors while making decisions, it is essential to understand the causes of their situation and to assess the alternative solutions according to the desired effect. The concept of emptiness (2) refers to similar phenomena. In Buddhism emptiness can be translated as a universal interdependence of everything, which can be applied to sentient beings as well as organizations. For the latter it means, that they should not consider themselves independent, as it can lead to big problems if they don’t recognize their dependence on human or natural resources. The dependent origination (3) refers to the 12 concepts of what happens in the mind: ignorance, mental formations, consciousness, mind-and-body, six senses, contact, sensation, craving, clinging, becoming, birth and decay-and-death. It is important to be conscious about these states of mind to avoid those leading to unethical actions (e.g. craving) (Muyzenberg, 2014).

Summary and implications

The most important Confucian values are respecting traditions and adhering to the rules of social hierarchy, and possessing the five virtues: ren (仁, benevolence, humanness); yi (義, rightousness); li (禮, proper rite); zhi (智, knowledge); xin (信, integrity). However, the theorists of Daoism place dao and de above the Confucian values of ren (humanity) and yi (rightousness). The Daoist qualities of altruism, modesty, flexibility, transparency or honesty and persistency can also be measured to determine the impact of ancient culture on managerial behavior.

The five relationships and their adequate behaviors (father’s endearment, son’s filial devotion, elder brother’s gentleness, younger brother’s respect, husband’s fidelity, wife’s compliance, senior’s benevolence, youth’s submission, ruler’s kindliness, and subordinate’s loyalty) can be extended to a corporate level to define the relations between leaders and subordinates. Another important aspect of business where Confucianism can be applied is business ethics, where Confucian values can show directions for leaders to become more effective by the five virtues, and to find balance between striving for profit and for human virtues.

Legalism attempts to give specific guidance on matters of leadership and organization methods with outstanding importance of law and regulations. Legalism was the ideology which formulated one of the most important and longest standing concepts of China, the superiority of law and its equal placement above everybody, regardless of social status. An organization following Legalist principles should establish in a profit-driven culture, make sure that every employee’s duties are clear and not overlapping with each other, the self-interest of people is satisfied by clear goals, and that every person, regardless of their position, is treated fairly and rationally. A Legalist leader must consider the three main concepts: shi (power or authority), fa (law) and shu (tactics).

The basic thought of Buddhism is that the suffering of sentient beings stems from the ignorance of people and their desire for and insisting to living, which makes them unable to quit the eternal cycle of births and rebirths, and that everyone should strive for having less desires to liberate themselves from this cycle and to reach nirvana. This principle is also an important part of Buddhist economics, which defines economic effectiveness as satisfying basic human needs with optimal use of resources and identifies desire to consumption, or insisting to consumption as a cause of suffering. A Buddhist organization needs to have a common goal of securing the spiritual development and harmony of the employees and stakeholders, and will not accept power-seeking or self-centered behavior. A Buddhist leader helps his people with professional and personal struggles, encourages them to work autonomously, and constantly monitors himself according to Buddhist values. Buddhism is also in synergy with the concepts of sustainability and responsibility, implementing Buddhist elements in current management practices could also be a feasible solution to today’s global issues, as studies have shown, Buddhism has a positive effect on corporate environmental responsibility.

According to cross-cultural management studies, the ability of cooperation of different cultures can be measured in different dimensions, such as individualism and collectivism (Ralston – Egri – Stewart – Terpstra – Yu, 1999) or avoiding and competing behavior in conflict management (Morris – Williams – Leung, 1998). To integrate the values of the ideologies and measure their impact on modern management, we assume that Confucian and Daoist values mostly influence the conflict avoiding behavior of the leader, while the impact of Legalist values is more detectable on the level of individualism and collectivism.
Conclusion

The summary highlights that most of the ideologies address the ideal human behavior and the qualities of an ideal leader. Based on this result, we believe that the most relevant fields of business administration to associate the ideologies with are leadership and management theories, and in particular the theories of different leadership styles.

Among the Chinese ideologies, Confucianism seems to be the most, and Legalism the least researched topic in connection with Chinese management characteristics. In fact, since some concepts of Legalism gradually integrated into Confucianism, these two are often examined together. The presence of Daoism in Chinese leadership methods is the most difficult to examine, since, even though Daoism also addresses the qualities of an ideal person, its rather dealing with problems of wider perspective, such as the meaning of life or the way life should ideally be conducted.

Buddhism is different from the other ideologies in multiple aspects. First, its development cannot be associated with social and political changes in China which was the motivation for the development of the other philosophies. Its first appearance in China is also dated several centuries later than the foundation of the Chinese ideologies. However, due to its global reputation, in relation with economics, it is the most researched ideology among the ones addressed in this paper. We should note that researches on Buddhism and on Buddhist economics are not necessarily specific to China, so it is a possible area of further research to define the impact of Buddhism on Chinese management and leadership practices.

In consideration of the context of the work, the authors concluded that fruitful collaboration between European companies and the increasing number of Chinese managers in Europe (and in Hungary in particular) could be supported by more precise research data. These data should shed light on the correlation between management styles and/or managerial roles, and the depth of a manager’s knowledge on these ideological principles.

Therefore, we have defined the following directions to be basis of further research:

1. Examine the impact of the specific cultural characteristics of certain geographical sub regions of China on the interpretation of cultural heritage and its impact on management practices.
2. Examine the impact of the status of the decision maker on the involvement of their cultural beliefs and values during decision making – as Kazainé Onodi (2010) pointed out, involving personal values into decision making is dependent on the status of the stakeholder (Kazainé Onodi, 2010).
3. Determine the impact of policies of Mao Zedong and the creation of the PRC on the presence of classical ideologies in the modern Chinese mindset through a comparison with the Republic of China (Taiwan).
4. Establish the framework for a qualitative research on the leadership styles of Chinese managers engaged in cross-cultural management with the European Union after the assessment of the possibilities of integrating the four ideologies into a common influential system or dealing with them separately.
