A novel synthesis, X-ray analysis and computational studies of (Z)-ethyl 2-((Z)-5-((dimethylamino)methylene)-4-oxo-3-phenylthiazolidin-2-ylidene)acetate as a potential anticancer agent

Yahia N. Mabkhot1*, Mohammed M. Alharbi2, Salim. S. Al-Showiman2, Saied M. Soliman3,4, Nabila A. Kheder5, Wolfgang Frey6, Abdulrhman Asayari7, Abdullatif Bin Muhsinah7 and H. Algarni8,9

Abstract
Background: 4-Thiazolidinone ring is reported to have almost all types of biological activities. Also, it present in many marketed drugs.

Results: Ethyl acetoacetate reacted with phenyl isothiocyanate and ethyl chloroacetate in presence of K₂CO₃ and DMF to afford the thiazolidinone derivative 5. Thiazolidinone 5 reacted with dimethylformamide-dimethylacetal to afford (Z)-ethyl 2-((Z)-5-((dimethylamino)methylene)-4-oxo-3-phenylthiazolidin-2-ylidene)acetate (6). The structure of thiazolidinone 6 was elucidated from its spectral analysis and X-ray crystallography and was optimized using B3LYP/6-31G(d,p) method. The geometric parameters and NMR spectra were discussed both experimentally and theoretically. Also, the natural charges at the different atomic sites were predicted. The synthesized compounds had moderate cytotoxic activity.

Conclusions: An unexpected synthesis of (Z)-ethyl 2-((Z)-5-((dimethylamino)methylene)-4-oxo-3-phenylthiazolidin-2-ylidene)acetate via deacetylation mechanism. The structure was established using X-ray and spectral analysis. The geometric parameters, and NMR spectra were discussed. The synthesized compounds showed moderate anticancer activity.

Keywords: Thiazolidinone, X-ray crystallography, Computational studies, DMF-DMA, Cytotoxic activity

Introduction
The thiazolidinone ring had diverse biological activities such as antimycobacterial [1], antimicrobial [2], anticancer [3], anticonvulsant [4], antiparasitic [5], antidiabetic [6], and antihypertensive [7]. Also, many clinically used drugs contain thiazolidinone ring in their skeletons such as antibiotic actithiazic acid [8], dual COX/LOX inhibitors (Darbufelone and CI-987) [9], Ralitoline, Etozoline, and Pioglitazone (Fig. 1).

Due to this diversity in the biological activities of 4-thiazolidinones, there are several procedures have been reported for their synthesis [10–14]. In this research, we synthesize new 4-thiazolidinone derivative 6 in a pure stat, also, we compare cytotoxic activity of synthesized compounds with standard anticancer drug Vinblastine against the colon carcinoma (HCT-116) cell line using MTT assay.
Results and discussion

Chemistry

The thiazolidinone derivative 5 was prepared according to the reported method [15]. Refluxing of the thiazolidinone 5 with dimethylformamide–dimethylacetal in DMF gave only one isolable product, the product of this reaction is (Z)-ethyl 2-((Z)-5-((dimethylamino)methylene)-4-oxo-3-phenylthiazolidin-2-ylidene)acetate (6) (Scheme 1). Spectral data (IR, NMR, and X-ray were in a complete agreement with the proposed structure.

The following reaction mechanism was suggested for the formation of thiazolidinone derivative 6 (Scheme 2). We assumed that the reaction was started between thiazolidinone 5 and dimethylformamide-dimethylacetal to
produce an intermediate 7, which underwent enolization of the carbonyl of the acetyl group, followed by elimination of ketene to give the thiazolidinone derivative 6 (Scheme 2). The configuration of thiazolidinone 6 was confirmed using X-ray analysis (Fig. 2) [16].

### Crystal structure determination

A crystal of dimensions 0.47 × 0.26 × 0.14 mm was selected for X-ray diffraction analysis. Data were collected on a Bruker APEX-II diffractometer equipped with CCD detector and graphite monochromatic Mo Kα radiation (λ = 71,073 Å) at 100 °K. SHELXS-97 [17, 18] was used to solve structure (Table 1). Cell refinement and data reduction were carried out by Bruker SAINT [19]. The final refinement was carried out by full-matrix least-squares techniques with anisotropic thermal data for nonhydrogen atoms on F2. All the hydrogen atoms were placed in calculated positions.
Geometry optimization

The optimized molecular geometry of thiazolidinone 6 is shown in Fig. 4. Table 3 listed the hydrogen bonding data for thiazolidinone 6, and the results of the calculated bond distances and angles are given in Table 4. It is clear that the calculated bond distances and angles agree very well with the experimental results. The bond distances and angles deviated only by 0.027 Å (C20–N7) and 1.6° (C20–C6–S1). The correlation coefficients given in the same table indicated the good agreement between the calculated structure and the X-ray results. Interestingly, the thiazole and phenyl ring planes are not coplanar and are twisted from one another by an angle of 77.1° (exp. 66.5°).

Charge population analysis

The natural population analysis is performed to predict the natural charges (NC) at the different atomic sites (Fig. 5). It is clear that the sulfur atom is electropositive. The C9 and C12 are the most electropositive C-atoms as these atomic sites are bonded to two strong electronegative atoms. In contrast, the O and N-atoms have electronegative nature where the ring N-atom (N3) is more electronegative than the imine one (N7). Among the O-atoms in the studied molecule, the carbonyl O-atoms are the most electronegative where the O-atom (O5) from the carbonyl group in the ester moiety is more negative than that of the cyclic ketone (O2). As revealed from the molecular electrostatic potential (MEP) map shown in Fig. 6, the most negative regions are located over the O-atoms while the positive region is mainly located over the protons of the two methyl groups.

Frontier molecular orbitals

The HOMO and LUMO levels of the thiazolidinone 6 are shown in Fig. 7. The HOMO and LUMO energies are −5.0584 and −0.9870 eV, respectively. As a result, the HOMO–LUMO energy gap is calculated to be 4.0714 eV. The HOMO and LUMO are mainly localized over the thiazole and phenyl ring, respectively. Since the HOMO and LUMO levels are mainly located over the π-system of the studied compound 6 so the HOMO–LUMO intramolecular charge transfer is mainly a π–π* transition.

Table 1 The crystal and experimental data of thiazolidinone 6

| Parameters                  | Values                           |

The crystal of thiazolidinone 6 (Fig. 2) was finally refined with R factor of 4.46% for 4622 unique reflections. Molecules were found to be packed in crystal lattice through intermolecular hydrogen bonding (Fig. 3). Table 2 summarized some selected geometric parameters for thiazolidinone 6.
The Gauge-independent atomic orbital (GIAO) calculations were used for accurate prediction of the $^1$H and $^{13}$C isotropic chemical shifts (C.S). The isotropic chemical shifts were used for the identification of organic compounds. The theoretical and experimental chemical shifts are presented in Table 5. Correlation graphs between the experimental and theoretical NMR chemical shifts are shown in Fig. 8. The correlations equations shown in this figure have high R2 values (0.974–0.983) indicating the good agreement between the theoretical and experimental data. The $^1$H-chemical shifts of the aromatic ring usually appear in the region of 7–8 ppm. In the present case, the aromatic protons were detected at 7.46–7.96 ppm which is in good agreement with B3LYP theoretical values (7.60–7.89 ppm). The aliphatic protons have lower chemical shifts than the aromatic ones (Table 5).

The chemical shifts of the aromatic carbons usually appear in the overlapped region of the spectrum between 100 and 200 ppm [20]. The atom C30 has higher chemical shift than the other aromatic carbons (Table 5). The high

### NMR spectra

The Gauge-independent atomic orbital (GIAO) calculations were used for accurate prediction of the $^1$H and $^{13}$C isotropic chemical shifts (C.S). The isotropic chemical shifts were used for the identification of organic compounds. The theoretical and experimental chemical shifts are presented in Table 5. Correlation graphs between the experimental and theoretical NMR chemical shifts are shown in Fig. 8. The correlations equations shown in this figure have high R2 values (0.974–0.983) indicating the good agreement between the theoretical and experimental data. The $^1$H-chemical shifts of the aromatic ring usually appear in the region of 7–8 ppm. In the present case, the aromatic protons were detected at 7.46–7.96 ppm which is in good agreement with B3LYP theoretical values (7.60–7.89 ppm). The aliphatic protons have lower chemical shifts than the aromatic ones (Table 5). The high 

The chemical shifts of the aromatic carbons usually appear in the overlapped region of the spectrum between 100 and 200 ppm [20]. The atom C30 has higher chemical shift than the other aromatic carbons (Table 5). The high
chemical shift of C30 is due to the deshielding effect of the electronegative N-atom. Since the oxygen and nitrogen atoms are more electronegative than carbons so the C-atoms (C4, C9, C12, and C20) attached to these electronegative sites were detected at high chemical shifts (162.4–177.4 ppm) compared to the rest of C-atoms.

Cytotoxic activity
The anti-cancer activity of the thiazolidine derivatives 5 and 6 was determined against the colon carcinoma (HCT-116) cell line in comparison with the anticancer drug vinblastine, using MTT assay [21]. The results of the cytotoxic activity were expressed as the mean IC50 of three independent experiments (Table 6). The results revealed that thiazolidinone derivatives 5 and 6 had moderate anticancer activity against colon carcinoma (HCT-116).

Experimental section
Chemistry
General
All the melting points were measured on a Gallenkamp apparatus in open glass capillaries and are uncorrected. The IR Spectra were recorded using Nicolet 6700 FT-IR spectrophotometer. 1H- and 13C-NMR spectra were recorded on a JEOL ECP 500 NMR spectrometer.

operating at 500 MHz. $^1$H spectra were run at 500 MHz and $^{13}$C spectra were run at 125 MHz in deuterated chloroform (CDCl$_3$). Chemical shifts were related to that of the solvent. Chemical shifts $\delta$ are expressed in ppm units.

Elemental analysis were carried out on a 2400 CHN Elemental Analyzer. The single-crystal X-ray diffraction measurements were accomplished on a Bruker SMART APEX II CCD diffractometer. The biological evaluations of the products were carried out in the Medical Mycology Laboratory of the Regional Center for Mycology and Biotechnology of Al-Azhar University, Cairo, Egypt. The thiazolidinone derivative 5 was prepared as described in the literature [15].

X-ray analysis
The thiazolidinone 6 was obtained as single crystals by slow evaporation from DMF solution of the pure compound at room temperature. The crystallographic data for thiazolidinone 6 (CCDC 1551169) can be obtained on request from the director, Cambridge Crystallographic Data Center, 12 Union Road, Cambridge CB2 1EW, UK http://www.ccdc.cam.ac.uk/data_request/cif.

Computational details
The X-ray structure coordinates of thiazolidinone 6 were used for geometry optimization followed by frequency calculations. For this task, we used Gaussian 03 software [22] and B3LYP/6-31G(d,p) method. All the obtained frequencies are positive and no imaginary modes were detected. GaussView4.1 [23] and Chemcraft [24] programs have been used to extract the calculation results and to visualize the optimized structures.

Cytotoxic activity
The cytotoxic activity of the synthesized compounds was carried out at the Regional Center for Mycology

Table 6  Viability values and $IC_{50}$ of thiazolidinone derivatives 5 and 6 against HCT-116 Cell Line

| S. No | Sample concentration (μg/mL) | viability % |
|-------|-----------------------------|-------------|
|       | 50  | 25  | 12.5 | 6.25 | 3.125 | 1.56 | 0   | $IC_{50}$ (μg) |
| Vinblastine | 23.08 | 27.35 | 43.59 | 53.85 | 69.23 | 82.54 | 100 | 9.8 |
| 5     | 42.51 | 76.82 | 84.19 | 93.72 | 98.56 | 100  | 100 | 44.5 |
| 6     | 39.43 | 58.15 | 79.51 | 86.42 | 92.63 | 96.47 | 100 | 35.9 |
and Biotechnology at Al-Azhar University, Cairo, Egypt according to the reported method [21].

Conclusions
A novel synthesis and DFT studies of (Z)-ethyl 2-[(Z)-5-((dimethylamino)methylene)-4-oxo-3-phenylthiazolidin-2-ylidene)acetate are presented. The NMR chemical shifts were described based on the GIAO calculations. The calculated results showed good correlations with the experimental data. The anticancer activity of the synthesized compounds against the colon carcinoma (HCT-116) cell line was tested and showed moderate activity.

Authors’ contributions
YNM designed research; YNM, MMA and WF performed research, analyzed the experimental data. The anticancer activity of the synthesized compounds against the colon carcinoma (HCT-116) cell line was tested and showed moderate activity.

Competing interests
The authors declare that they have no competing interests.

Availability of data and materials
The crystallographic data for this compound can be obtained free of charge from the Cambridge Crystallographic Data Centre (CCDC 1551169) can be obtained on request from the director, Cambridge Crystallographic Data Center, 12 Union Road, Cambridge CB2 1EW, UK http://www.ccdc.cam.ac.uk/data_request/cif.

Funding
The authors extend their appreciation to the Deanship of Scientific Research at King Khalid University for its funding this prolific research Group no. (R. G. P. 2/23/40/2019).
