Abstract

**Objective:** The best combination of questions to define asthma in epidemiological asthma studies is not known. We summarized the operational definitions of asthma used in prevalence studies and empirically assess how asthma prevalence estimates vary depending on the definition used.

**Methods:** We searched the Thomson Reuters ISI Web of knowledge and included (1) cross-sectional studies (2) on asthma prevalence (3) conducted in the general population and (4) containing an explicit definition of asthma. The search was limited to the 100 most-cited papers or published since January 2010. For each paper, we recorded the asthma definition used and other variables. Then we applied the definitions to the data of the Portuguese National Asthma survey (INAsma) and of the 2005–2006 National Health and Nutrition Examination Survey (NHANES) computing asthma prevalence estimates for the different definitions.

**Results:** Of 1738 papers retrieved, 117 were included for analysis. Lifetime asthma, diagnosed asthma and current asthma were defined in 8, 12 and 29 different ways, respectively. By applying definitions of current asthma on INAsma and NHANES data, the prevalence ranged between 5.3%-24.4% and 1.1%-17.2%, respectively.

**Conclusions:** There is considerable heterogeneity in the definitions of asthma used in epidemiological studies leading to highly variable estimates of asthma prevalence. Studies to inform a standardized operational definition are needed. Meanwhile, we propose a set of questions to be reported when defining asthma in epidemiological studies.

**Keywords:** Asthma, Definition, Epidemiology, Prevalence, Review

Introduction

The World Health Organization recommends assessing population needs concerning chronic respiratory diseases to better define adequate health policies [1]. Epidemiological studies at a population level, and prevalence studies in particular, are essential for this purpose.

The main multinational studies on asthma prevalence are the European Community Respiratory Health Survey (ECRHS) in adults [2], and the International Study of Asthma and Allergies in Childhood (ISAAC) in children and adolescents [3]. The European Union–funded Global Allergy and Asthma European Network (GA²LEN) recently conducted a large survey on the prevalence of airway and allergic diseases, built mainly on the questions and definitions used in the ECRHS [4].

Although the definitions used to diagnose asthma has a great impact on prevalence estimates [5], a standardized operational definition of asthma is still lacking. Asthma should ideally be defined by a combination of symptoms, clinical diagnosis, pulmonary function tests and studies of either bronchial hyperresponsiveness (BHR) or reversibility of airflow obstruction [6-8]. However, this is rarely feasible. In fact, in the context of population studies, only a few have combined the use of an initial symptoms questionnaire followed by clinical assessment including lung function tests in subsamples of symptomatic and asymptomatic individuals [2,3].

The aim of this paper is 1) to provide an overview of the operational definitions of asthma used in recent prevalence studies and 2) to empirically assess the impact of the definition used on the prevalence of asthma estimates using data
from the first Portuguese National Asthma survey, *Inquérito Nacional sobre Asma* (INAsma) [9] and National Health and Nutrition Examination Survey (NHANES) 2005–2006 [10]. Based on this approach we propose a set of questions to be used when defining asthma in epidemiological studies, until a standardized operational definition based on prospective data can be established.

**Methods**

**Literature search strategy and inclusion criteria**

We performed a systematic literature search of the Thomson Reuters ISI Web of Knowledge. The initial search targeted papers with the terms “asthma” and “prevalence” in the title and the final selection included (i) cross-sectional studies (ii) on asthma prevalence (iii) conducted in the general population.

To have a comprehensive overview of the definitions of asthma, with both the most recent definitions and most cited ones, we had two criteria in the papers selection: 1) The search was limited to the studies published between January 2010 and October 2013 and 2) the 100 most-cited papers on the topic were included in the initial search (Figure 1).

Papers written in languages other than English, Portuguese, Spanish or French were excluded, as were those without an explicit definition of asthma or with definitions of asthma based on the International Classification of Diseases (ICD).

**Data extraction from published studies**

Papers were screened by a single author (AS-S) in two phases (title and abstract and full-text screening) to exclude duplicates and articles that did not meet the eligibility criteria. Papers satisfying the inclusion criteria were examined and data on country, number and age of participants, site of screening, questionnaire used, prevalence

value and 95% confidence interval (CI) and definition of asthma were recorded on a purpose-designed form. Doubts regarding the inclusion of papers and data extraction were clarified in agreement with a second investigator.

Epidemiologic studies datasets

The Inquérito Nacional sobre Asma (INAsma) was conducted in 2010 under the auspices of the Portuguese Health Directorate and estimated a prevalence of current asthma (defined as affirmative to the question “Have you...
Table 1 Definitions of “current asthma” and prevalence estimates computed using data from INAsma survey (n = 6257) and from NHANES 2009 (n = 10348)

| Current asthma definition                                                                 | INAsma     | NHANES 05/06 |
|------------------------------------------------------------------------------------------|------------|--------------|
|                                                                                         | % [95% CI] | % [95% CI]   |
| Ever had asthma and wheeze in the last 12 months [13]                                   | 9.3 [8.8-10.0] | n.a.        |
| Ever had asthma and this was confirmed by a physician and at least one in the last 12 months: wheeze, waking with tightness in the chest, waking with breathlessness, waking with cough [14] | 8.5 [7.7-9.3]* | n.a.        |
| Ever had asthma and at least one of 3 symptoms in the last 12 months: wheezing, waking with breathlessness or having an asthma attack [9] | 10.3 [9.5-11.0] | n.a.        |
| Ever had asthma and still have asthma [15,16]                                           | n.a.       | n.a.        |
| Ever had asthma and was this confirmed by a physician and wheeze and/or taking medication(s) for asthma or wheeze in the past 12 months [17] | n.a.       | n.a.        |
| At least one of the following: 1) Ever had asthma and was confirmed by a doctor and still have asthma or 2) significant bronchodilator response according to reversibility [18] | n.a.       | n.a.        |
| Ever had asthma and still have asthma and was confirmed by a physician [19]             | n.a.       | n.a.        |
| At least one of the following: 1) Ever had asthma and wheezing in the last 12 months or 2) wheezing 4 times or more during the last 12 months or 3) physician diagnosis and wheezing in the last 12 months or 4) current use of inhalation steroids [20] | n.a.       | n.a.        |
| Diagnosed with asthma by a physician and wheeze in the last 12 months [21]               | 7.6 [6.9-8.3]* | 1.7 [1.5-1.9] |
| Diagnosed with asthma by a physician and currently taking asthma medication [22]       | 7.4 [6.7-8.1]* | 1.1 [0.9-1.3] |
| Diagnosed with asthma by a physician and use of asthma medication in the last 12 months and cough or wheeze in the last 12 months [23] | 5.3 [4.7-5.9]* | n.a.        |
| Diagnosed with asthma by a physician and at least one: currently taking asthma medication, attacks of shortness of breath or recurrent wheeze in the last 12 months [24] | 6.3 [5.6-6.0]*† | n.a.        |
| Diagnosed with asthma by a physician and still have asthma [25-37]                     | n.a.       | 8.4 [7.9-8.4] |
| Diagnosed with asthma by a physician and any of the following in the previous 2 years: wheezing following a common cold, dyspneal feeling at night or early in the morning, cough or wheeze during exercise [38] | n.a.       | n.a.        |
| Physician stated that (you) had asthma in the last 2 years or on 2 or more separate occasions had wheezing in the last 2 years [39,40] | n.a.       | n.a.        |
| At least one of the following: 1) Diagnosed with asthma by a physician and at least 1 symptom in the last 12 months: wheeze, wheezes with attacks of shortness of breath, nocturnal attacks of shortness of breath, use of asthma medication or 2) reversible airways obstruction [41] | n.a.       | n.a.        |
| Wheeze in the last 12 months [42-54]                                                    | 22.9 [21.9-23.9] | 12.9 [12.2-13.5] |
| Wheeze in the last 12 months or currently taking asthma medication [55]                 | 24.4 [23.3-25.5] | 12.9 [12.2-13.5] |
| Current wheeze and 1 of the following: 1) ever had an asthma attack or 2) ever had asthma or 3) taking medication(s) for asthma or wheeze [56] | 9.3 [8.6-10.0]** | n.a.        |
| Asthma attack or currently taking asthma medication [2]                                  | 9.0 [8.3-9.7] | n.a.        |
| At least one in the last 12 months: Waking at night by shortness of breath, had an asthma attack or currently taking any medicines (including inhalers, aerosols or tablets) for asthma [57] | 14.5 [13.6-15.4] | n.a.        |
| At least one of the following symptoms: wheeze in the last 12 months, coughing constantly for more than 3 weeks in any time in your life, attack of asthma in the last 12 months, or nasal allergies including hay fever in the last 12 months [58] | n.a.       | 17.2 [16.5-17.9]** |
| Wheeze in the last 12 months and at least 1 of the following in the last 12 months: any lifetime episode of asthma; wheezing during physical exercise; four or more episodes of wheezing in the previous year; or waking at night at least once a week due to wheezing [59] | n.a.       | 8.8 [8.3-9.3]* |
| Asthma in the last 12 months [60-66]                                                    | n.a.       | n.a.        |
| Had a condition which causes difficulty in breathing, with wheezing noises in the chest in the last 12 months [67] | n.a.       | n.a.        |
ever had asthma?” and at least one of 3 symptoms in the last 12 months: wheezing, waking with breathlessness or having an asthma attack) of 6.8% for the Portuguese population [9]. The INAsma survey comprised two phases: estimation of the prevalence of current asthma and estimation of the proportion of asthmatic patients with controlled disease. The INAsma survey and current study were reported in accordance with the STrengthening the Reporting of Observational studies in Epidemiology (STROBE) statement guidelines [11].

The National Health and Nutrition Examination Survey (NHANES) 2005–2006 assessed the health and nutritional status of the United States population. And estimated a prevalence of asthma (defined as affirmative to the following questions: 1) Has a doctor or other health professional ever told you that you have asthma? 2) Do you still have asthma?) of 8.8% for the U.S. population [12].

Further details on databases can be found in Additional file 1.

Data analysis
For each asthma definition recorded, we presented the corresponding prevalence value and 95% CI (if available) and computed the proportion of individuals with asthma using data from the INAsma survey and NHANES 2005–2006.

The definitions found were reproduced as they appeared in each paper and were grouped into 3 general subgroups: (i) current asthma (if the definition included current asthma features such as symptoms, current use of medication or the “still have asthma” expression); (ii) diagnosed asthma (if the definition included an asthma diagnosis by a health care professional or ever use of medication for asthma, but not any current asthma feature) and (iii) lifetime asthma (if the definition included having ever had asthma, but not any current asthma feature or asthma diagnosis).

Results
Of the 1738 papers retrieved from the Web of Knowledge database, 117 were included for analysis (Figure 1). The characteristics of the studies included are summarized in Additional file 2 and 3. They described prevalence studies conducted all over the world, on children (27.4%), on adolescents (10.3%), on children and adolescents (25.6%), on adults (25.6%), on elders (1.7%) and on all population (8.5%). Several questionnaires were applied, but the most common one was the ISAAC questionnaire, used in 45.5% of studies.

Lifetime asthma was defined in 34 papers, diagnosed asthma in 54 and current asthma in 61 (see Additional file 4). The 3 subgroups were defined in 8, 12 and 29 different ways, respectively (Tables 1 and 2).
The definition of current asthma in each paper was based on a combination of elements. The most common elements were "wheeze in the last 12 months" (in 30 definitions) and "ever diagnosed with asthma by a physician or health professional" (in 21 definitions) (Figure 2). "Current asthma treatment" was used in 12 definitions. Other common symptoms were "shortness of breath at rest" (n = 8), "asthma attack" (n = 7), "shortness of breath/dyspnea" (n = 4), "nocturnal cough" (n = 4) and "cough" (n = 3) in the last 12 months. Only 3 papers used "bronchial hyperresponsiveness" or "reversibility of airflow obstruction" in their definition of asthma. The most common combination used to define current asthma was "Ever diagnosed with asthma by a health professional" together with "still have asthma" (n = 13).

Most of the papers using "wheeze in the last 12 months" as an element to define current asthma described the prevalence of asthma in children, adolescents or both (n = 21, 70% - data not shown).

Table 2 Definitions of “Lifetime asthma” and “Diagnosed asthma” and prevalence estimates computed using data from INAsma survey (n = 6257) and from NHANES 2009 (n = 10348)

| Ever diagnosed with asthma by a physician or health professional and use of medication for asthma [47] | 7.4 [6.7-8.1]*           | 1.1 [0.9-1.3]              |
| History of asthma and physical examination and skin-prick tests and peak flow measurements [53] | n.a.                     | n.a.                       |
| History of asthma and physical signs of asthma (rhonchi or chest deformity) [124] | n.a.                     | n.a.                       |
| Diagnosed with asthma by a physician or symptoms (presence of wheezing, history of dry cough, recurrent wheeze, dyspnea/ recurrent difficulty in breathing or recurrent chest tightness) with clinical assessment [125] | n.a.                     | n.a.                       |
| Recurrent wheezing episodes, clinically confirmed by a physician, exactly a pediatrician or a pediatric pulmonologist [126] | n.a.                     | n.a.                       |
| Physician stated that (you) had asthma in the last 2 years, on 2 or more separate occasions had wheezing in the last 2 years, or had asthma prior to 2 years ago or on 2 or more separate occasions had wheezing prior to 2 years ago [39,40] | n.a.                     | n.a.                       |

*Questions related to this variable were only asked in the second phase of INAsma; therefore the total number of participants was corrected for non-response in phase II (total n = 4949). n.a. – not available – Questions related to this variable were not asked in the INAsma survey. † "Apart from cold or the flu" was not considered for estimation purposes.
The prevalence of asthma estimates based on the applicable definitions of current asthma ranged between 5.3% and 39.5% in the Portuguese population for the 13 (45%) applicable definitions and between 1.1% and 17.2% in the U.S. population for the 7 (24%) applicable definitions (Table 1).

The definitions varied even in papers that used the same questionnaire. For instance, eight different definitions were used in 18 studies of the ISAAC questionnaire (see Additional file 5 and Figure 3). Using the eight variants of the definition of current asthma based on the ISAAC questionnaire, the proportion of children and adolescents with asthma estimated from the INAsma data varied between 9.0% and 20.5% (Figure 3).

Concerning definitions of lifetime asthma, three definitions could be used with data from INAsma with prevalence estimates ranging between 9.5% and 28.1%; none of the definitions were applicable to NHANES data (Table 2).

**Discussion**

The operational definitions of asthma varied extensively among studies and do not allow to compare estimates between studies, even if similar data collection methods were used. Additionally, when we applied the definitions of current asthma to two datasets from population studies, we found that the prevalence of asthma ranged from 5.3% to 39.5% in Portuguese population and from 1.1% to 17.2% in U.S. population depending on the definition used. Current asthma was most frequently defined by the combination of “ever diagnosed with asthma by a health professional” with “still having asthma”. Wheeze was the most frequently used current symptom, especially in children.

The Web of Knowledge was the only database used for the search. While this may be seen as a limitation of the present study, this approach allowed the inclusion of the most-cited papers on asthma prevalence conducted in both children and adults.

The wide variability of the estimates computed for different definitions is in accordance with the results of a study in children [5]. The variety of definitions identified in the present study illustrates both the difficulty of identifying people with asthma by questionnaire and the difficulty of establishing an internationally accepted definition, even when the same questionnaire is used.

The few published studies that have validated asthma questionnaires, used BHR tests or a physician’s diagnosis as gold-standard [8,127,128]. These reports concluded that questions on wheeze are the most sensitive and questions such as “Have you ever had asthma?” or questions on “waking with attacks of shortness of breath” and “morning tightness” have high specificity for asthma [8,127,128]. In our review, wheeze was the most commonly used symptom, especially in children. However, it should be noted that a diagnosis of asthma based on wheeze is only accurate during some stages of childhood [129,130] and the use of a comprehensive description of asthma symptoms might reduce the risk of misclassification of asthma in

---

**Figure 3** Prevalence of asthma according to several definitions of the “Current asthma” based on ISAAC questionnaire. Prevalence estimates for Portuguese children aged 6, 7, 13 and 14 years old were computed using data from the INAsma survey (also see Additional file 5).

children. Pekkanen and coworkers also suggested that definitions using a combination of asthma symptoms increase specificity against self-report of ever having asthma and BHR and that the use of a continuous asthma score based on asthma symptoms increases both the specificity and power for predicting asthma [7].

The present study shows that prior asthma diagnosis by a health professional was commonly used to define asthma. However, in some countries and cultural contexts, the use of prior diagnosis may lead to an under- or overestimation of asthma prevalence [131]. Attention to this potential problem is especially important in multinational studies and, in fact, ISAAC [3] and ECRHS [2] do not consider a prior diagnosis definitive for asthma.

Standardized definitions are necessary for prevalence comparisons worldwide. This should be achieved by the validation of self-reported features, against objective measure, such as (i) variability of airflow obstruction, reversibility

| No |
| Have you been woken by an attack of shortness of breath at any time in the last 12 months? |
| Yes |
| No |
| Have you been woken by an attack of coughing at any time in the last 12 months? |
| Yes |
| No |
| In the last 12 months, have you had a dry cough apart from a cough associated with a cold or a chest infection? |
| Yes |
| No |

Consider including chronic bronchitis and allergic rhinitis questions such as "Have you been coughing constantly for more than 3 weeks in any time in your life?" and "Do you have any nasal allergies, including hay fever?"
and BHR, (ii) physician classification including current therapy and (iii) persistence of diagnosis at clinical long-term follow-up. By reporting the sensitivity and specificity of different approaches, these validation studies would inform the decision on a standardized operational definition of asthma for epidemiological purposes.

Based on the data presented, we propose an initial comprehensive set of questions (Figure 4) that can be used in validation studies while allowing comparisons with previous prevalence studies of asthma. As this is an early step to achieve a standardized definition of asthma, we suggest that at this time, the data items proposed in Figure 4 should be reported separately to increase the inter-study comparability.

Conclusions

The operational definition of asthma has an important effect on estimates of asthma prevalence in epidemiologic studies. There is a need for an accurate standardized operational definition of asthma. To inform this definition it is important to estimate the sensitivity and specificity of a set of questions (Figure 4) against reversibility/variability of the airflow obstruction, BHR and clinical assessment.

Additional files

Additional file 1: Databases details.

Additional file 2: Summary of the included studies.

Additional file 3: Definitions in the ten most cited and the ten most recent papers from the 117 included by Average citations per year at the end of 2013.

Additional file 4: Studies presenting three different subgroups of the definition of asthma. Of the 117 papers included, 34 provided a definition for lifetime asthma, 54 for diagnosed asthma and 61 for current asthma; 5 papers defined the three types of asthma.

Additional file 5: Summary of studies with Current asthma definitions that used the International Study of Asthma and Allergies in Childhood (ISAAC) questionnaire (n = 18).
