Unsymmetrically substituted imidazolium salts were synthesized and characterized using 1H-NMR and 13C-NMR. The antimicrobial activities of the salts were evaluated using the agar-well diffusion method against 14 bacteria and five yeasts. The minimal inhibitory concentrations (MIC) against seven bacteria and one yeast were also determined. Among the test compounds applied, 1, 2, 3, 6 and 11 showed activities against Micrococcus luteus ATCC 9341, Staphylococcus aureus ATCC 25923, Staphylococcus epidermidis ATCC 12228, Bacillus cereus ATCC 11778, Bacillus subtilis ATCC 6633, Bacillus thuringiensis, Listeria monocytogenes ATCC 19112 and Candida tropicalis. However, compounds 1, 2 and 3 showed the highest antimicrobial activities against Micrococcus luteus ATCC 9341, Staphylococcus aureus ATCC 25923, Staphylococcus epidermidis ATCC 12228, Bacillus cereus ATCC 11778 and Bacillus subtilis ATCC 6633 with inhibition zones of 14-20 mm. In addition, compound 6 have only demonstrated activities against Candida tropicalis while compounds 4, 5, 7, 8, 9, 10, 12, 13 and 14 had no effect on test microorganisms.

Unitersms: Imidazolium salts/characterization. N-heterocyclic carbenes. Imidazolium salts/antimicrobial activity. Imidazolium salts/Minimum inhibitory concentration.

INTRODUCTION

Imidazolium salts (IMs) are best known for their applications in organic synthesis at room-temperature ionic liquids, or as precursors of stable carbenes, but they also show important biological properties such as antimicrobial activity. A large variety of these salts have been used as anti-inflammatory, antibacterial, antifungal and thromboxane synthetase enzyme inhibitor (Dominianni, Yen, 1989; Odžak, SkocˇkiBušić, Maravić, 2013; Riduan, Zhang, 2013; Elshaarawy et al., 2014; Reinhardt et al., 2014).

Imidazole derived NHC precursors are known in the field of organometallic chemistry for more than five decades and the imidazole ring presents a structural fragment that plays an important role in many biological systems such as enzymes, metallo-proteins as well as in natural products and anticancer drugs (Jaouen, 2006). It also serves as a good ligand in various transition metal complexes (Navarro, Lippert, 2001).

Several sites around IMs are amenable to modification: (i) the nitrogen substituents (1 and 12) and (ii) the backbone carbon substituents (2 and 13). IMs were prepared with different alkyl and aryl groups to establish the contributions of the type and size of the substituents to the activity. The introduction of sterically hindered groups to the nitrogen atoms that are the part of aromatic rings were believed to influence the activity.

One of the first instances of the use of IMs as an antimicrobial agent was reported by Demberelnymba et al. (2004), in which a series of N-alkyl-N-methylimidazolium halides, and N-alkyl-N-hydroxyethylimidazolium chlorides were found to possess low MIC values against a range of microbes. They stated that the antibacterial and fungicidal activities were greatly affected by their chain length, the type of substituted functional groups, and their position in the imidazolium ring.

Based on these studies, we have discussed the synthesis and characterization of unsymmetrically substituted imidazolium salts and evaluated their antimicrobial properties.
MATERIAL AND METHODS

Material and measurements

$^1$H- and $^{13}$C-NMR measurements were performed using a Varian Mercury 400 spectrometer operating at 400 and 100 MHz, respectively. NMR multiplicities are abbreviated as follows: s, singlet; d, doublet; t, triplet; m, multiplet signal. Coupling constants $J$ are given in Hz. Melting points were measured in open capillary tubes with a Stuart-SMP30 melting point apparatus.

Synthesis of 1-5

A solution of N-(2,4,6-trimethylphenyl) imidazole (2.0 mmol) (Zeng et al., 2010) in toluene (10.0 mL) was added slowly to 2,4,6-trimethylbenzyl bromide/2,4,5,6-tetramethylbenzyl bromide/2,3,4,5,6-pentamethylbenzyl bromide (Van der Made, Van der Made, 1993) /1-bromoethaneol/2-chloroethyamine hydrochloride (2.0 mmol) at 110 °C for 18 h. Diethyl ether (15.0 mL) was added to obtain a white crystalline solid which was filtered off. The solid was washed with Et$_2$O (3 × 15.0 mL), and dried under vacuum. The crude product was recrystallized from CH$_2$Cl$_2$/Et$_2$O (Compound for 1-3 Güney, Çağaoğlu, Fırmıncı (2015), compound 4,5 for Gençay (2013)).

Compound 1: N-(2,4,6-trimethylphenyl)-N’-(2,4,6-trimethylbenzyl)imidazolium bromide

Yield: %80. m.p.: 273-275 °C. $^1$H-NMR (δ, 400 MHz, CDCl$_3$): 1.96 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 2.03 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 2.25 [s, 3H, C$_6$H$_3$(CH$_3$)$_3$-p-CH$_3$] 2.29 [s, 3H, C$_6$H$_3$(CH$_3$)$_3$-p-CH$_3$] 5.92 [s, 2H, NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 6.89 [s, 1H, NCHCHN] 6.94 [s, 1H, NCHCHN] 7.17 [d, 2H, NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 7.21 [7H, NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 10.39 [s, 1H, NCHCHN] $^{13}$C-NMR (δ, 400 MHz, CDCl$_3$): 17.6 [C$_6$H$_3$(CH$_3$)$_3$] 19.9 [C$_6$H$_3$(CH$_3$)$_3$] 21.0 [CH$_3$C$_6$H$_2$(CH$_3$)$_3$] 21.0 [CH$_3$C$_6$H$_2$(CH$_3$)$_3$] 48.6 [NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 121.7 [NCHCHN] 123.6 [NCHCHN] 125.7 [C$_6$H$_3$(CH$_3$)$_3$] 129.8 [C$_6$H$_3$(CH$_3$)$_3$] 129.9 [C$_6$H$_3$(CH$_3$)$_3$] 130.6 [C$_6$H$_3$(CH$_3$)$_3$] 134.1 [CH$_3$C$_6$H$_2$(CH$_3$)$_3$] 137.3 [CH$_3$C$_6$H$_2$(CH$_3$)$_3$] 138.1 [CH$_3$C$_6$H$_2$(CH$_3$)$_3$] 139.9 [CH$_3$C$_6$H$_2$(CH$_3$)$_3$] 141.2 [NCHCHN].

Compound 2: N-(2,4,6-trimethylphenyl)-N’-(2,4,5,6-tetramethylbenzyl)imidazolium bromide

Yield: %80. m.p.: 280-283 °C. $^1$H-NMR (δ, 400 MHz, CDCl$_3$): 2.01 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 2.18 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 2.23 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-m-CH$_3$] 2.26 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-p-CH$_3$] 5.95 [s, 2H, NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 6.91 [t, 1H, NCHCHN] 6.99 [t, 1H, NCHCHN] 7.15 [s, 2H, NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 7.27 [s, 1H, C$_6$H$_3$(CH$_3$)$_3$-m-CH$_3$] 10.29 [s, 1H, NCHCHN]. $^{13}$C-NMR (δ, 100 MHz, CDCl$_3$): 15.8 [C$_6$H$_3$(CH$_3$)$_3$] 17.6 [C$_6$H$_3$(CH$_3$)$_3$] 20.4 [C$_6$H$_3$(CH$_3$)$_3$] 21.0 [C$_6$H$_3$(CH$_3$)$_3$] 49.1 [NCH$_2$C$_6$H$_5$(CH$_3$)$_3$] 121.8 [NCHCHN] 123.7 [NCHCHN] 128.4 [C$_6$H$_3$(CH$_3$)$_3$] 129.8 [C$_6$H$_3$(CH$_3$)$_3$] 130.6 [C$_6$H$_3$(CH$_3$)$_3$] 133.4 [C$_6$H$_3$(CH$_3$)$_3$] 134.0 [C$_6$H$_3$(CH$_3$)$_3$] 134.1 [C$_6$H$_3$(CH$_3$)$_3$] 134.9 [C$_6$H$_3$(CH$_3$)$_3$] 137.2 [C$_6$H$_3$(CH$_3$)$_3$] 141.2 [NCHCHN].

Compound 3: N-(2,4,6-trimethylphenyl)-N’-(2,3,4,5,6-pentamethylbenzyl)imidazolium bromide

Yield: %85. m.p.: 260-265 °C. $^1$H-NMR (δ, 400 MHz, DMSO): 2.01 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 2.31 [s, 3H, C$_6$H$_3$(CH$_3$)$_3$-p-CH$_3$] 3.81 [t, J = 5.0 Hz, 2H, NCH$_2$CH$_2$OH] 4.36 [t, J = 5.0 Hz, 2H, NCH$_2$CH$_2$OH] 7.12 [s, 2H, C$_6$H$_3$(CH$_3$)$_3$] 7.91 [s, 1H, NCHCHN] 8.08 [s, 1H, NCHCHN] 9.47 [s, 1H, NCHCHN] $^{13}$C-NMR (δ, 100 MHz, DMSO): 17.6 [C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 21.2 [C$_6$H$_3$(CH$_3$)$_3$-p-CH$_3$] 52.6 [NCH$_2$CH$_2$OH] 59.7 [NCH$_2$CH$_2$OH] 124.1 [NCHCHN] 124.4 [NCHCHN] 129.9 [C$_6$H$_3$(CH$_3$)$_3$] 131.9 [C$_6$H$_3$(CH$_3$)$_3$] 135.0 [C$_6$H$_3$(CH$_3$)$_3$] 138.4 [C$_6$H$_3$(CH$_3$)$_3$] 140.9 [NCHCHN].

Compound 4: N-(2,4,6-trimethylphenyl)-N’-(hydroxyethyl)imidazolium chloride hydrochloride

Yield: %80. m.p.: 203-205 °C. $^1$H-NMR (δ, 400 MHz, DMSO): 2.06 [s, 6H, C$_6$H$_3$(CH$_3$)$_3$-o-CH$_3$] 2.29 [s, 3H, C$_6$H$_3$(CH$_3$)$_3$-p-CH$_3$] 3.86 [t, J = 5.85 Hz, 2H, NCH$_2$CH$_2$NH,HCl] 4.68 [t, J = 5.85 Hz, 2H, NCH$_2$CH$_2$NH,HCl] 7.09 [s, 2H, C$_6$H$_3$(CH$_3$)$_3$] 7.93 [s, 1H, NCHCHN] 8.24 [s, 1H, NCHCHN] 8.55 [br, 1H, NH$_2$,HCl] 9.68 [s, 1H, NCHCHN]. $^{13}$C-NMR (δ, 100 MHz,

C₃₆; 120.6 [N₂₂H₂C₂H₂₃H₃₂C₂H₂₃H₃]; 134.8 [C₆H₂(CH₃)]; 138.7 [C₆H₂(CH₃)]; 140.6 [NCHN].

Synthesis of 6

1-Ferrocenylethanol (1.0 mmol) and N-(2,4,6-trimethylphenyl)imidazole (1.1 mmol) were dissolved in acetic acid (3.0 mL) and stirred at 60 °C for 7 h. After removing most of acetic acid, a solution of LiCl (4.0 mmol) in EtOH (20.0 mL) was added, and stirred for 8 h at room temperature. After removing the volatiles, filtered through Celite, the crude was purified from CH₂Cl₂/EtO (Yenisar, 2014; Seo et al., 2003).

Compound 6: N-(ferrocenylethyl)-N’-(2,4,6-trimethylphenyl)imidazolium chloride

Yield: 62%. ¹H-NMR (δ, 400 MHz, DMSO): 1.97 [s, 9H, C₆H₂(CH₃)]; 2.30 [s, 3H, FeCHCH₂]; 4.23 [s, 5H, Fe-H]; 4.39 [s, 2H, Fe-H]; 4.44 [s, 2H, Fe-H]; 5.68-5.82 [m, 1H, FeCHCH₂]; 7.11 [d, J = 6.7 Hz, 2H, C₆H₂(CH₃)]; 7.92 [s, 1H, NCHCN]; 8.18 [s, 1H, NCHCN]; 9.87 [s, 1H, NCHN]. ¹³C-NMR (δ, 100 MHz, DMSO): 16.8 [C₆H₂(CH₃)]; 16.9 [C₆H₂(CH₃)]; 20.2 [C₆H₂(CH₃)]; 21.1 [FeCHCH₂]; 55.8 [FeCHCH₂]; 65.9 [Fe-C]; 67.3 [Fe-C]; 68.1 [Fe-C]; 68.6 [Fe-C]; 78.8 [Fe-C]; 79.1 [Fe-C]; 87.3 [Fe-C]; 121.4 [NCHCN]; 128.9 [C₆H₂(CH₃)]; 131.1 [C₆H₂(CH₃)]; 134.0 [C₆H₂(CH₃)]; 136.5 [C₆H₂(CH₃)]; 140.0 [NCHN].

Synthesis of 7-9

These compounds were synthesized according to the method in the literature (Günay et al., 2009).
CH₂CH₃CH₂CH₂N]: 2.09 [s, 6H, C₆H(CH₃)₃-O-CH₃]; 2.14 [s, 6H, C₆H(CH₃)₃-m-CH₃]; 4.29 [t, 2H, J = 7.4 Hz, CH₂CH₂CH₂CH₂N]; 5.57 [s, 2H, NCH₃CH;N]; 6.81 [s, 1H, NCHCN]; 6.95 [s, 1H, C₆H(CH₃)]; 7.59 [s, 1H, NCHCN]; 10.27 [s, 1H, NCHCN]. ¹³C-NMR (δ, 100 MHz, CDCl₃): 13.4 [CH₂CH₃CH₂CH₂N]; 15.8 [CH₂CH₃CH₂CH₂N]; 19.4 [C₆H(CH₃)-o-CH₃]; 20.4 [C₆H(CH₃)-p-CH₃]; 32.1 [CH₂CH₂CH₂CH₂N]; 48.5 [CH₂CH₃CH₂CH₂N]; 50.0 [NCH₃CH₃(CH₃)]; 120.8 [NCHCN]; 122.4 [NCH(N)]; 128.0 [C₆H(CH₃)]; 129.7 [C₆H(CH₃)]; 133.4 [C₆H(CH₃)]; 134.0 [C₆H(CH₃)]; 135.0 [C₆H(CH₃)]; 135.8 [NCHN]; 136.4 [C₆H(CH₃)].

**Compound 12:** N-(butyl)-N’-(2,3,4,5,6-pentamethylbenzylimidazolium bromide

Yield: 89%; m.p.: 117 °C. ¹H-NMR (δ, 400 MHz, CDCl₃): 0.86 [t, 3H, J = 7.4 Hz, CH₃CH₂CH₂CH₂N]; 1.29 [m, 2H, CH₂CH₃CH₂CH₂N]; 1.83 [m, 2H, CH₂CH₃CH₂CH₂N]; 2.13 [s, 6H, C₆H(CH₃)-o-CH₃]; 2.14 [s, 6H, C₆H(CH₃)-m-CH₃]; 2.17 [s, 3H, C₆H(CH₃)-p-CH₃]; 4.29 [t, 2H, J = 7.2 Hz, CH₂CH₂CH₂CH₂N]; 5.57 [s, 2H, NCH₃CH;N]; 6.83 [s, 1H, J = 1.7 Hz, NCHCN]; 7.54 [t, 1H, J = 1.7 Hz, NCHCN]; 10.14 [s, 1H, NCHN]. ¹³C-NMR (δ, 100 MHz, CDCl₃): 13.4 [CH₂CH₃CH₂CH₂N]; 16.8 [CH₂CH₂CH₂CH₂N]; 16.9 [C₆H(CH₃)-o-CH₃]; 17.2 [C₆H(CH₃)-m-CH₃]; 19.4 [C₆H(CH₃)-p-CH₃]; 32.1 [CH₂CH₂CH₂CH₂N]; 49.0 [CH₂CH₂CH₂CH₂N]; 50.0 [NCH₃CH₃(CH₃)]; 120.8 [NCHCN]; 122.2 [NCHCN]; 125.3 [C₆H(CH₃)]; 133.5 [C₆H(CH₃)]; 133.7 [C₆H(CH₃)]; 136.4 [C₆H(CH₃)]; 137.2 [NCHN].

**Synthesis of 13, 14**

These compounds were synthesized according to the literature method (Meyer, Taige, Strassner, 2009).

**Compound 13:** N-(1-methyl-2-oxopropyl)-N’-(2,3,5,6-tetramethylbenzylimidazolium bromide

Yield: 79%; m.p.: 187 °C. ¹H-NMR (δ, 400 MHz, CDCl₃): 1.81 [d, J = 7.4 Hz, 3H, CH₃]; 2.10 [s, 6H, C₆H(CH₃)-o-CH₃]; 2.14 [s, 6H, C₆H(CH₃)-m-CH₃]; 3.68 [s, 3H, OCH₃]; 5.57 [s, 2H, NCH₃CH₃(CH₃)]; 5.90 [q, J = 6.9 Hz, 2H, CH₂]; 6.89 [s, 1H, NCHCN]; 6.95 [s, 1H, C₆H(CH₃)]; 7.69 [s, 1H, NCHCN]; 10.27 [s, 1H, NCHN]. ¹³C-NMR (δ, 100 MHz, CDCl₃): 15.4 [NCH₃CH₃(CH₃)]; 17.9 [CH₂]; 20.1 [NCH₃CH₃(CH₃)]; 48.3 [CH₂]; 53.2 [NCH₃CH₃(CH₃)]; 57.2 [OCH₃]; 120.2 [NCHCN]; 121.4 [NCHCN]; 127.4 [C₆H(CH₃)]; 133.2 [C₆H(CH₃)]; 133.7 [C₆H(CH₃)]; 134.6 [C₆H(CH₃)]; 136.6 [NCHN]; 168.8 (C=O).

**Compound 14:** N-(1-methyl-2-oxopropyl)-N’-(2,3,4,5,6-pentamethylbenzylimidazolium bromide

Yield: 82%; m.p.: 193 °C. ¹H-NMR (δ, 400 MHz, CDCl₃): 1.83 [d, J = 7.4 Hz, 3H, CH₃]; 2.14 [s, 6H, C₆H(CH₃)-o-CH₃]; 2.16 [s, 6H, C₆H(CH₃)-m-CH₃]; 2.18 [s, 3H, C₆H(CH₃)-p-CH₃]; 3.70 [s, 3H, OCH₃]; 5.58 [s, 2H, NCH₃CH₃(CH₃)]; 5.94 [q, J = 7.2 Hz, 2H, CH₂]; 6.90 [s, 1H, NCHCN]; 7.67 [s, 1H, NCHCN]; 10.30 [s, 1H, NCHN]. ¹³C-NMR (δ, 100 MHz, CDCl₃): 17.0 [NCH₃CH₃(CH₃)]; 17.1 [NCH₃CH₃(CH₃)]; 17.4 [NCH₃CH₃(CH₃)]; 18.4 [CH₂]; 49.5 [CH₂]; 53.7 [NCH₃CH₃(CH₃)]; 57.8 [OCH₃]; 120.9 [NCHCN]; 122.3 [NCHCN]; 125.4 [C₆H(CH₃)]; 133.8 [C₆H(CH₃)]; 134.0 [C₆H(CH₃)]; 136.9 [C₆H(CH₃)]; 137.5 [NCHN]; 169.4 (C=O).

**Antimicrobial assays**

Antimicrobial activity was determined using the following microorganisms. The Gram-negative (Gr-): were: Escherichia coli ATCC 35218, Salmonella typhimurium ATCC 14028, Proteus vulgaris ATCC 33420, Serratia marcescens ATCC 13880, Enterobacter aerogenes ATCC 13048, and the Gram-positive (Gr+): were: Micrococcus luteus ATCC 9341, Staphylococcus aureus ATCC 25923, Staphylococcus epidermidis ATCC 12228, Bacillus cereus ATCC 11778, Bacillus subtilis ATCC 6633, Bacillus thuringiensis, Enterococcus faecalis ATCC 29212, Streptococcus pneumoniae ATCC 27336 and Listeria monocytogenes ATCC 19112, and the yeasts: Candida albicans ATCC 10231, Candida utilis ATCC 9950, Candida tropicalis, Candida glabrata and Saccharomyces cerevisiae ATCC 9763. Thirteen bacterial strains and three yeast strains were obtained from the American Type Culture Collection (ATCC, Rockville, MD, USA). Other strains were obtained from Faculty of Medicine, Adnan Menderes University.

Screenings for antimicrobial activities were carried out by the agar well diffusion method against test microorganisms (Collins et al., 2004; Clinical and Laboratory Standards Institute, 2015). Fresh stock solutions (1000 µg mL⁻¹) of the compounds were prepared in DMSO according to the needed concentrations for the experiments. The inoculum suspensions of the tested bacteria and yeasts were prepared from the broth cultures (18–24 h) and the turbidity equivalent adjusted to 0.5 McFarland standard tubes to give a concentration of 1 x 10⁸ bacterial cells and 1 x 10⁷ yeast cells/mL. To test the antimicrobial activity of each unsymmetrically substituted imidazolium salts, Mueller Hinton Agar medium (25 mL) was poured into each petri plate and was inoculated with 0.1 mL broth culture of bacteria or yeasts. Then using
sterile cork borer of 6 mm diameter, wells were bored into the seeded agar plates and were loaded with a 50 µL volume of unsymmetrically substituted imidazolium salts. Plates inoculated with E. coli ATCC 35218, S. typhimurium ATCC 14028, S. aureus ATCC 25923, S. epidermidis ATCC 12228, E. faecalis ATCC 29212, S. pneumoniae ATCC 27336, S. marcescens ATCC 13880, P. vulgaris ATCC 33420, L. monocytogenes ATCC 19112, and E. aerogenes ATCC 13048 were incubated at 37 °C for 24 h and those inoculated with M. luteus ATCC 9341, B. cereus ATCC 11778, B. subtilis ATCC 6633, B. thuringiensis, C. albicans ATCC 10231, C. utilis ATCC 9950 C. tropicalis, C. glabrata and S. cerevisiae ATCC 9763 were incubated at 30 °C for 24 h. After incubation, the diameter of the inhibition zone was measured. Discs of Chloramphenicol (C30, Oxoid), Gentamycin (GN10 Oxoid), Tetracycline (TE30), Erytromycine (E15), Ampicillin (AMP10) and Nystatine (NS100) were used as positive controls.

The minimum inhibitory concentrations (MIC) were determined for antimicrobial activities by preparing a microdilution broth (Jones et al., 1985; Jorgensen, Ferraro, 2009; CLSI, 2009). All the bacteria were inoculated in the Nutrient Broth and incubated at 30-37 °C for 24 h while the yeasts were inoculated in Malt Extract Broth and incubated at 30 °C for 48 h. The compounds were dissolved in DMSO (2 mg mL⁻¹). From the stock solution, two fold serial dilutions of the compounds were employed to determine the MIC ranging from 256 to 0.125 µg mL⁻¹. The lowest concentration of antimicrobial agent that resulted in complete inhibition of the microorganisms was represented as MIC (µg mL⁻¹). As positive controls, Streptomycin (I.E. Ulagay) for bacteria and Nystatine (NS100, Oxoid) for yeast were used in the dilution method.

RESULTS AND DISCUSSION

Imidazole has been easily converted into IMSs by attachment of a wide variety of functional groups onto positions 1 and 3 of the imidazole ring. The target salts (1-14) shown in Figure 1 have been obtained by quaternization of 1-substituted imidazole by variously substituted benzyl halides. The IMSs were obtained as solids, which have been observed to be air stable, except compound 9, and soluble in chlorinated solvents and alcohol. The salts could be purified by recrystallization from ethanol or CH₂Cl₂ (DCM) and by addition of Et₂O. The IMSs were identified by NMR spectroscopy. ¹H-NMR chemical shifts were consistent with the proposed structures; the resonances for NCHN protons were observed as a sharp singlet between δ 9.47 and 10.39 ppm. ¹³C-NMR of these salts showed the C2 carbon between δ 136.4 and 141.3 ppm. The representative ¹H- and ¹³C-NMR spectra of the compounds 1, 2, 3, 6, 11 were given as Supplementary Data (Figure 1-10).

FIGURE 1- Synthesis and formula of the imidazolium salts (1-14) used for antimicrobial activity.
All of the compounds used in this study were tested for their in vitro antimicrobial activity by the agar well diffusion method. After that compounds showing antimicrobial activity were examined by MIC. Inhibition zones (mm) of the compounds were listed in Table I. In addition, the assay, were compared with knowing reference antibiotic and antifungal reagents. MIC values forming inhibition zone (mm) of the compounds were listed in Table II.

Compounds 1, 2, 3 and 6 demonstrated stronger activity against *M. luteus*, ATCC 9341, *S. aureus* ATCC 25923, *S. epidermidis* ATCC 12228, *B. cereus* ATCC 11778, *B. subtilis* ATCC 6633 and *C. tropicalis*. The other compounds had effect as follows: compounds 1 and 2; 18-20 mm against *S. aureus* ATCC 25923 and *S. epidermidis* ATCC 12228 (Figure 2a), compounds 1 and 3; 14-18 mm against *M. luteus* ATCC 9341 (Figure 2b), compound 1; 15-18 mm against *B. cereus* ATCC 11778 and *B. subtilis* ATCC 6633 (Figure 3a, 3b) compound 6; 15 mm against *C. tropicalis*. In addition, compounds 1, 2 and 3 showed effects slightly against *L. monocytogenes* ATCC 19112, *M. luteus*, ATCC 9341 and *S. aureus* ATCC 25923, respectively.

However, 1, 2 and 11 showed the lowest effects against *B. thrungiensis*, *B. cereus* ATCC 11778 and *S. epidermidis* ATCC 12228, respectively. For example, compound 1, 2 and 11 had effect 10 mm *B. thrungiensis*, 8 mm *B. cereus* ATCC 11778 and 9 mm *S. epidermidis* ATCC 12228, respectively. On the other hand, 4, 5, 7, 8, 9, 10, 12, 13 and 14 had no effect on the test microorganisms examined (Table I).

MIC values in Table II have also showed that some of the compounds tested presented noteworthy antimicrobial activity on the tested microorganisms. Compounds 1, 2 and 3 have revealed a strong activity against some bacterial cultures such as *M. luteus* ATCC 9341 (compound 1 = 16 μg mL⁻¹, 2 = 64 μg mL⁻¹, 3 = 32 μg mL⁻¹), *S. aureus* ATCC 25923, (compound 1 = 8 μg mL⁻¹, 2 = 16 μg mL⁻¹), *S. epidermidis* ATCC 12228 (compound 1 = 8 μg mL⁻¹, 2 = 16 μg mL⁻¹), *B. subtilis* ATCC 6633 (1 = 16 μg mL⁻¹), *B. cereus* ATCC 11778 (1 = 32 μg mL⁻¹), *L. monocytogenes* ATCC 19112 (compound 1 = 64 μg mL⁻¹), *C. tropicalis* (compound 6 = 32 μg mL⁻¹). However, compounds 1, 2, 3 and 11 have displayed lower effect against *Bacillus thrungiensis* (compound 1 = 128 μg mL⁻¹, 2 = 256 μg mL⁻¹), *S. aureus* ATCC 25923 (compound 3 = 128 μg mL⁻¹), *S. epidermidis* ATCC 12228 (compound 11 = 256 μg mL⁻¹).

*Micrococcus luteus* does not regard as a pathogen bacteria but it can cause skin infections in individual with a decreased immune system such as new-born infants or patients with AIDS. The skin infections or chronic cutaneous infections result in pruritic eruptions of the skin in some areas as well as scattered papule lesions with or without central ulcerations (Smith et al., 1999). Recently, this organism was recognized as an opportunistic pathogen and has been implicated in recurrent bacteraemia, septic shock, septic arthritis, endocarditis, meningitis, intracranial suppuration, and cavitating pneumonia in immunosuppressed patients (Greenblatt et al., 2004).

*Staphylococcus epidermidis* generates biofilms to grow on plastic devices placed within the body (Costerton, Stewart, Greenberg, 2009). This happens most commonly on intravenous catheters and medical prostheses (Hedin, 1993). Infection can also appear in dialysis patients or anyone with an implanted plastic device that may have been contaminated. It also causes endocarditis, most often in patients with defective heart valves. In some other cases, sepsis can occur in hospital patients. The spread of the infection has been shown reduced with the hand washing (Otto, 2009).
Unsymmetrically substituted imidazolium salts: synthesis, characterization and antimicrobial activity

(-): Zone did not occur. NT: Not tested; Compounds 4, 5, 7, 8, 9, 10, 12, 13 and 14 showed no antimicrobial activity. *Special gift from the Faculty of Medicine, Adnan Menderes University. 1: N-(2,4,6-trimethylphenyl)-N’-(2,4,6-trimethylbenzyl)imidazolium bromide, 2: N-(2,4,6-trimethylphenyl)-N’-(2,3,5,6-tetramethylbenzyl)imidazolium bromide, 3: N-(2,4,6-trimethylphenyl)-N’-(2,3,4,5,6-pentamethylbenzyl)imidazolium bromide, 4: N-(2,4,6-trimethylphenyl)-N’-(hydroxyethyl)imidazolium bromide, 5: N-(2,4,6-trimethylphenyl)-N’-(ethylamine)imidazolium chloride, 6: N-(2,4,6-trimethylphenyl)imidazolium chloride, 7: N-(2,4,6-trimethylphenyl)-N’-(2,3,5,6-tetramethylbenzyl)imidazolium bromide, 8: N-(methyl)-N’-(2,3,4,5,6-pentamethylbenzyl)imidazolium bromide, 9: N-(methyl)-N’-(2-methoxyethyl)imidazolium chloride, 10: N-(butyl)-N’-(2,4,6-trimethylbenzyl)imidazolium bromide, 11: N-(butyl)-N’-(2,3,5,6-tetramethylbenzyl)imidazolium bromide, 12: N-(butyl)-N’-(2,3,4,5,6-pentamethylbenzyl)imidazolium bromide, 13: N-(1-methyl-2-oxopropyl)-N’-(2,3,5,6-tetramethylbenzyl)imidazolium bromide, 14: N-(1-methyl-2-oxopropyl)-N’-(2,3,4,5,6-pentamethylbenzyl)imidazolium bromide. C30: Chloramphenicol (30 mg Oxoid); CN10: Gentamycin (10 mg, Oxoid); TE30: Tetracycline (30 mg, Oxoid); E15: Erytromycin (15 mg, Oxoid); AMP10: Ampicillin (10 mg, Oxoid); NS: Nystatine (100 mg, Oxoid).
Members of the genus *Bacillus* are aerobic spore forming rods which are ubiquitous in nature (Tuazon, 2000). Despite their widespread distribution, even as a normal skin flora, *Bacillus* spp. rarely causes infections. The exception is *Bacillus cereus*, which is a well-known cause of food poisoning and a dreaded cause of posttraumatic endophthalmitis (Tuazon, 2000). *B. cereus* can also cause opportunistic infections, mainly in the immunocompromised host (Tuazon, 2000; Drobniweski, 1993). Besides, *B. subtilis* is only known as a cause of disease in severely immunocompromised patients and it rarely causes food poisoning. (Oggioni et al., 1998; Ryan, Ray, 2004).

*Listeria monocytogenes* is the bacterium that causes the infection listeriosis. This bacterium results in septicemia, meningitis, encephalitis, corneal ulcer, pneumonia (Armstrong, Fung, 1993).

*Candida tropicalis* has emerged as a potentially dangerous opportunistic fungus. This may be due to an increased awareness and specific identification of *C. tropicalis* as an etiologic agent of infection and an increase in the number of compromised patients susceptible to opportunistic fungi (Horn et al., 1985). *C. tropicalis* also causes variety of infections including pyelonephritis (Seidenfeld et al., 1982) lower urinary tract infections, thrombophlebitis, arthritis, bursitis, meningitis, multiple organ infection, pericarditis and candidia vulvovaginitis (Seidenfeld et al., 1982; Finberg et al., 2004).

As a result, imidazolium salts containing ferrocene (compound 6) were determined to be inactive against microorganisms, ii) binding of the alkyl group instead of the aryl group (compounds 2 and 3), except 1 and 11, to one of the nitrogen atoms of the imidazole ring decreased the activity against microorganisms, iii) a decrease were identified in activity against microorganisms with increasing steric hindrance.

**CONCLUSION**

In summary, we have investigated antimicrobial activity of some *N*-substituted imidazolium salts (1-14). The compounds were characterized by NMR spectroscopy (1H- and 13C-NMR). Compounds 1 and 2 were found that the methyl bearing benzyl group as substituent on imidazolium ring had the specific activity against Gram-positive bacteria. Remarkable activity was found in compound 2 carrying a methyl bearing benzyl substituent on the imidazolium ring. MIC of the most active derivatives (1 and 2) were shown to be as low as 8 µg/mL against *S. aureus* ATCC 25923 and *S. epidermidis* ATCC 12228, and 16 µg/mL against *S. aureus* ATCC 25923 and *S. epidermidis* ATCC 12228. Only one of the compounds synthesized (6) was effective against yeast (*C. tropicalis*). It is worthy to mention that the introduction of the alkylated benzyl group to the nitrogen atom on the imidazolium ring increased MIC values.
