ABSTRACT

Background: Pre-eclampsia is a multisystem disorder, which occurs only in pregnant women during the second and third trimesters of pregnancy and is associated with raised blood pressure and proteinuria. Liver function Test (LFT) abnormalities occur in 3% of the pregnancies and probably the lesion that causes elevated serum liver enzymes. This study was conducted to compare the liver function tests in pre-eclampsia with normal pregnancy.

Methods: This study was carried out on 60 pregnant women after 20 weeks of gestation admitted in Obstetrics and Gynaecology units of Shri Shankaracharya Institute of Medical Sciences, Bilai, and Chhattisgarh. The subjects were divided into two groups. Group A comprised of 30 cases of pre-eclampsia having blood pressure ≥ 140/90mm Hg, proteinuria in 24 hours ≥ 300 mg and edema. Group B had 30 normal pregnant women after 20 weeks of gestation. The data including parity, period of gestation, blood pressure and presenting complaints of all subjects were recorded. Serum bilirubin, total protein, albumin and plasma levels of liver enzymes ALT and AST were measured.

Results: The mean value of serum bilirubin in cases was 3.45 and in controls it was 0.50. The mean value of enzymes ALT in cases was 92.7 while in the controls it was 22.37. Mean serum AST in the cases was 85.43 and in the controls, it was 21.96. Total protein in cases was 7.77 and controls it was 7.26. Albumin level in cases was 4.62 and controls were 4.17.

Conclusions: Increased concentrations of serum bilirubin, total protein, albumin and liver enzymes ALT, AST were found in pre-eclampsia cases.

Keywords: Hypertension, Liver function Test (LFT), Morbidity, Pre-eclampsia, Pregnancy, Women

INTRODUCTION

Liver is a very vital organ of our body accompanied with multiple functions in our body. Hypertension is the most common medical disorders in pregnancy. Abnormal liver function test (LFT) occurs in 20% to 30% of pregnancies complicated by Pre-eclampsia and are associated with poor maternal and fetal outcomes. Pre-eclampsia and eclampsia are pregnancy induced hypertensive disease. Pregnancy Induce Hypertension (PIH) is raised blood pressure without proteinuria during the second half of pregnancy. Pre-eclampsia is a multisystem disorder, unique to pregnancy that is usually associated with raised blood pressure and proteinuria after 20 weeks of gestation. Eclampsia is one or more convulsions in association with syndrome of pre-eclampsia. In pre-eclampsia the systolic BP is ≥140 mm Hg and diastolic BP ≥90mm Hg in a woman with previously normal blood pressure and with proteinuria ≥0.3g in a 24 hour urine collection. The main cause of pre-eclampsia is vasoconstriction and thickening of vascular media which decreases vascular capacity and increases peripheral resistance. The factors that appear to have role include placenta, maternal immune response, maternal vascular disease, genetic predisposition and maternal low calcium level. The cellular cause of pre-eclampsia lies within the...
subjects were protective of this study was to compare, period of gestation, proteinuria in 24 hours ≥300 mg and edema. Group B had 30 normal pregnant women after 20 weeks of gestation admitted in Obstetrics and Gynaecology units of Shri Shankaracharya Institute of Medical Sciences, Bhilai, Chhattisgarh from July 2017 to July 2018 with convenience sampling. The subjects were divided into two groups. Group A comprised of 30 cases of pre-eclampsia having blood pressure ≥140/90mm Hg, proteinuria in 24 hours ≥300 mg and edema. Group B had 30 normal pregnant women after 20 weeks of gestation. The data including parity, period of gestation, blood pressure and presenting complaints of all subjects were recorded. Serum bilirubin, total protein, albumin and plasma levels of liver enzymes ALT and AST were measured.

Inclusion criteria

- Both the cases and controls were in the age group 15-45 years.

Exclusion criteria

- Those with a major systemic disease which may elevate the patient’s blood pressure, or which may change the liver function tests eg renal diseases, liver diseases, diabetes and cardiac disease were excluded.
- Patients using any drugs that affect liver function were not included.

Verbal and written consent was obtained from each subject. Complete obstetrical and family history was recorded on proforma designed for the study.

**Statistical analysis**

Four variables were measured for all cases and controls i.e. serum bilirubin level, total protein, albumin and plasma levels of liver enzymes ALT, AST were measured using auto quant Meril 200 analyzer. Mean and standard deviation were calculated. The data were calculated. The data were analyzed using SPSS-16. The mean values were compared between cases and controls using t-test at 5% level of significance.

**RESULTS**

The mean value of serum bilirubin in cases was 3.45 and in controls it was 0.50. The mean value of enzymes ALT in cases was 92.7 while in the controls it was 22.37. Mean serum AST in the cases was 85.43 and, in the controls, it was 21.96. Total protein in cases was 7.77 and controls it was 21.96. Albumin level in cases was 4.62 and controls were 4.17.

| Table 1: LFT.                          | Control mean (SD) | Cases mean (SD) | t-statistic | p-value |
|----------------------------------------|------------------|----------------|-------------|---------|
| Age                                    | 29.23 (6.08)     | 27.53 (5.15)   | 1.16        | 0.24    |
| Total bilirubin                         | 0.503 (0.19)     | 3.45 (0.78)    | -20.02      | 0.00001*|
| Direct bilirubin                        | 0.282 (0.05)     | 1.58 (0.34)    | -20.66      | 0.00001*|
| Indirect bilirubin                      | 0.302 (0.09)     | 4.02 (1.68)    | -12.06      | 0.00001*|
| SGPT                                    | 22.37 (6.97)     | 92.7 (19.91)   | -18.25      | 0.00001*|
| SGOT                                    | 21.96 (5.43)     | 85.43 (13.65)  | -23.64      | 0.00001*|
| TP                                      | 7.26 (0.65)      | 7.77 (0.91)    | -2.44       | 0.01785*|
| Albumin                                 | 4.17 (0.4)       | 4.62 (0.95)    | -2.37       | 0.02251*|
| Globumin                                | 2.77 (0.46)      | 3.12 (0.73)    | -2.22       | 0.0308*  |

*Statistically significant

The LFT variables were noted on cases as well as control. All the variables are continuous in nature. t-test for two independent samples has been applied to data as the samples are independent.
It has been observed that cases and controls were matched for age and there was no significant difference found in age of cases and control.

Table 2: RFT.

|          | Control mean (SD) | Cases mean (SD) | t-statistic | p-value |
|----------|-------------------|-----------------|-------------|---------|
| Urea     | 24.5 (6.01)       | 43.76 (6.03)    | -12.38      | 0.00001* |
| Creatinine| 0.80 (0.09)       | 1.51 (0.18)     | -18.62      | 0.00001* |
| Uric Acid| 4.45 (1.09)       | 5.41 (0.84)     | -3.8        | 0.00035* |

*Statistically significant

Total bilirubin levels were found to be higher in cases compared to control. The difference of total bilirubin turned out to be highly significant statistically.

Direct bilirubin readings show that the levels were elevated in cases and the difference between levels of direct bilirubin among cases and controls turned out to be highly significant.

Indirect bilirubin was found to be significant and the readings were observed to be higher in cases. SGPT and SGOT were found to be very high in cases and the difference was statistically highly significant.
DISCUSSION

Hypertensive disorders complicating pregnancies are common now a days and consists of both eclampsia and pre-eclampsia. Pre-eclampsia is a condition that develops in previously normotensive pregnant women after 20 weeks of gestation and is characterized by onset of hypertension and proteinuria. Pre-eclampsia can affect every maternal organ, predominantly the vascular, renal, hepatic, cerebral and coagulation system.\(^{5,9,10}\)

Concentration of serum bilirubin in the present study was significantly higher (P <0.001) in patients of pre-eclampsia before delivery than the control group of same age and parity with normal blood pressure. Malvino et al showed that in HELLP syndrome serum bilirubin...
concentration was elevated from its normal value to about >1.2 mg/dl. Similarly Jaleel et al noted that there was a highly significant rise in serum bilirubin, lactate dehydrogenase and aspartate aminotransferase level in pre-eclamptic women compared to normotensive pregnant women. Serum ALT of pre-eclamptic women in the present study was significantly (P<0.001) elevated from their normotensive pregnant counterparts. Malvino et al observed that in pre-eclampsia the serum transaminase level was raise to >10 U/L and that of ALT to 271±297 U/L.

In the present study the mean serum AST level in pre-eclamptic cases was found significantly higher (p <0.001) than the normotensive control group. Serum AST level in pre-eclampsia was also found more than 70 U/L by Malvino et al which rose up to 209±178 U/L in eclampsia.

Rath et al also noticed elevated level of ALT and AST in severe pre-eclampsia. Mechanism of raised liver enzymes hyper-vascularization and vasoconstriction of liver leading to cell injury, alteration of membrane permeability and damage to hepatocytes.

In present study the mean gestation age of pre-eclamptic patients was 35.4±4.18 weeks. This is in agreement with Kim et al who noted that among the abnormal liver function tests in pregnancy 39.4% occurred between 30 and 40 gestational weeks while 29% occurred between 10 and 20 weeks and common causes were hemolytic gravidarum followed by pre-eclampsia; viral hepatitis and HELLP syndrome.

The limitation of present study is that the study subjects are less and should be done on a larger population.

CONCLUSION

In the present study serum levels of total bilirubin, SGOT, SGPT, total protein was significantly raised in the cases compared to controls. During pre-eclamptic pregnancy, the placenta is under oxidative stress with increased production of lipid peroxides along with antioxidants. Maternal circulating oxidized lipids may be the cause of endothelial cell destruction leading to liver cell injury. These results in abnormal liver function tests. More studies are required to substantiate present hypothesis.
