General

All melting points were determined on a Jasco SRS OptiMelt apparatus and are uncorrected. ¹H and ¹³C NMR spectra were recorded in CDCl₃ solution at room temperature, on a Varian Unity Inova 500 spectrometer (500 and 125 MHz for ¹H and APT NMR spectra, respectively), and on a Varian Unity Inova 300 spectrometer (282 MHz for ¹⁹F NMR spectra), with the deuterium signal of the solvent as the lock and TMS as the internal standard. Chemical shifts (δ) and coupling constants (J) are given in ppm and Hz, respectively. High resolution mass spectra were recorded on a Waters Q-TOF Premier mass spectrometer in positive ESI ionization mode. The microwave reactions were conducted in an Anton Paar Monowave 300 microwave reactor. The reactions were followed by analytical thin layer chromatography on silica gel 60 F₂₅₄ and HPLC–MS chromatography with a Shimadzu LCMS-2020 device using a Reprospher 100 C18 (5 µm; 100x3mm) column and positive-negative double ion source (DUIS±) with a quadrupole MS analysator in a range of 50−1000 m/z. All reagents were purchased from commercial sources. Analytical samples of new compounds were obtained by trituration or recrystallization from the solvents or solvent mixtures given below in parentheses. Single crystal X-ray measurements were carried on a Rigaku R-Axis Rapid imaging plate area detector with graphite monochromated Cu-Kα radiation.

Photophysical measurements

The fluorescence and absorbance measurements were carried out on a Jasco FP8300 spectrofluorometer, in a standard cell quartz cuvette with 1 cm light path length. The widths of the excitation slit and the emission slit were both set to 2.5 nm with the scanning speed at 1000 nm/min. Pure solvents were used as blank correction. We used acetonitrile as solvent if not mentioned else, the concentration was 5 µM or 0.5 µM.

The quantum yields were determined by recording the fluorescence spectra of a series of different concentrations. The gradient of the integrated fluorescence intensities plotted against absorbance at the excitation wavelength was used for the calculation of the quantum yields:

$$\Phi_x = \Phi_{St} \cdot \left( \frac{\text{Grad}_x}{\text{Grad}_{St}} \right) \cdot \left( \frac{\eta_x^2}{\eta_{St}^2} \right)$$
The 18d, h, l, k, m and 21l compounds were excited at 380 nm, Coumarin-153 was used as reference ($\Phi_{FEtOH}=0.55$). The 18b and 22b compounds were excited at 339 nm, quinine sulfate was used as reference ($\Phi_{F(0.5 \text{ M } H_2SO_4)}=0.54$). During the computations we used refraction coefficients from literature.

The solvent screen measurement was carried out with 5 μM solutions of the 18l boroisoquinoline in acetonitrile, 1,4-dioxane, water, toluene, dichloromethane, tetrahydrofuran, ethanol, hexane and ethyl acetate.

The photostability measurement was carried out with 5 μM solutions of compound 18l in acetonitrile. We used 8 W, 366 nm emitting UV lamp, and measured the emission spectrum in every hour for 4 hours. During the photophysical measurements the solutions were excited at 380 nm.

Method B

In a three-necked round bottom flask 20 mL anhydrous tetrahydrofuran and 0.88 mL diisopropylamine (0.63 g, 6.25 mmol, 2.5 equiv.) was cooled below –70 °C, under nitrogen atmosphere. Then 6.25 mmol (2.5 equiv.) n-BuLi was added dropwise [except 17m when 3 mmol (1.2 equiv.) was used], the reaction mixture was stirred for 1h. Then the corresponding 2.5 mmol isoquinoline in tetrahydrofuran solution (0.51 g 16b, 0.54 g 16e) was added dropwise. After it the reaction mixture was stirred for 1h, then the appropriate ester (6.25 mmol, 2.5 equiv.) was added dropwise in 10 mL tetrahydrofuran [17k: ethyl acetate (0.55 g, 0.62 ml); 17l: ethyl benzoate (0.94 g, 0.89 ml); 17j: ethyl 4-nitrobenzoate (1.2 g); 17m: ethyl pentafluorbenzoate (1.5 g, 1.1 ml)]. Then the reaction mixture was allowed to warm to room temperature, and stirred for 1h. The solution was quenched with 30 mL water, and extracted with 80 mL ethyl acetate. The aqueous layer was washed with ethyl acetate (2x30 mL) and dichloromethane (2x30 mL). The combined organic phases were dried (MgSO$_4$), filtered and evaporated under reduced pressure. The residue was purified by flash column chromatography on silica gel using hexane/ethyl acetate.
