Abstract. English is an Indo European Germanic language. It is made up of 26 letters. The English alphabet originates from the Latin alphabet, while the Latin alphabet comes from the Greek alphabet and the Greek letters are from Phoenician letters. It is also a broadly adopted language in the overall world. English includes around 490000 words, plus around 300000 technical terms. It has the largest vocabulary. Also it is the official language of many states, for example the European Union, many international organizations and Commonwealth countries.

1. Introduction
It has the third most users of native language in the world, only inferior to the number of users of native language of Chinese and Spanish. English evolved from the language spoken by the Anglo Saxons who immigrated from Scandinavia such as Denmark, Germany, the Netherlands and the surrounding areas to the British Isles, as well as the white people of the jute tribe, and extend to everywhere of the world by British colonial activities. Due to its relationship with a lot of national languages, the words has varied from unitary to plural, its grammar has varied from more inflectional to less inflectional, and its pronunciation has varied regularly. In the 19th-20th century, for Britain and the United States, it is the leading position in every aspect in the world that made English become an international language [1]. Today, English is adopted as a medium for communicating in a lot of international cases. Also, English is most closely relative to computers. Almost all the programming languages adopt English expression. Lowland Saxon, Danish, German, Dutch and English are also very close. Normans of French descent conquered the kingdom of England in the 11th century, bringing tens of thousands of French and Latin words, greatly enriching English vocabulary, and relatively driving many original vocabulary to be invalid [2].

2. The application of English Teaching
Logically, this aspect may be clarified into two stages: first, you have to transfer the meaning from the source language, and then transfer the information into the target language. The two steps need to
know linguistic semantics and to understand the culture of language users. In addition to retaining the original meaning, a good translation, for the target language users, should be able to speak or write as fluently as the native language users, and conform to the habits of the target language (unless in special circumstances, the speaker does not intend to speak as a native language user, such as in Drama). As Figure 1.

Translation includes interpretation, translation, machine translation, simultaneous interpretation, film and television translation, website sinicization, book translation and other forms. With the development and maturity of IT technology and communication technology, the "telephone translation" of real person service is finally born, so there are more and more forms and more convenient services [3]. In terms of the material form of translation, it shows the choice and combination of various symbol systems, which can be divided into four categories:

1. The verbal language of natural language is represented by telephone communication, internal and external negotiation and reception of foreign guests,

2. Silent language symbols, including text symbols and image symbols, are expressed in the form of negotiation resolutions, social letters, telegrams, communications, various literary works and other printed matters,

3. There are sound and non-verbal signs, that is, the so-called "similar language" signs with sound but without syllable in the process of communication. The common ways are: special stress, tone change, laughter and applause when speaking. Such signs have no specific syllable to be separated, and their semantics are not fixed. Their information is transmitted in a certain language environment. For example, laughter may be loaded with positive information, or it may be loaded with negative information, such as applause can spread welcome, approval, happiness and other information, or it can also convey a polite negation and so on.

4. Silent nonverbal symbols, namely various human body language symbols, are represented by silent accompanying language symbols such as human actions, expressions and costumes. Such symbols have distinctive national culture, such as some human actions, which represent different semantic information in different national cultures. Not only that, they can also strengthen the
communication effect of vocal language, such as when talking, if With appropriate human language, it will obviously enhance the expression effect of oral language.

These four kinds of symbols can express not only the translated original code, but also the translated decoding. They can be used as the material carrier of the original code or decoding, or they can be composed of two, three and four kinds of carrier of the original code.

From the perspective of the operation procedure of translation, it actually includes three links: understanding, conversion and expression. Understanding is to analyze the original code and accurately grasp the information expressed by the original code. Conversion is to use a variety of methods, such as the form of interpretation or translation, the selection and combination of various symbol systems, the application of translation techniques such as extension and concentration, etc., to convert the information expressed by the original code into that in decoding, etc. Value information, expression is accurately expressed in a new language system.[4]

In fact, translation is a special form of information dissemination. In fact, the whole translation activity is a kind of social information transmission, a series of interactive relations among communicators, channels and receivers. Different from the common communication process, translation is carried out between two cultures. The symbol chosen by the manipulator is no longer the original symbol system, but the cultural code change, but its principle is the same as the common communication.

3. Changes in English Teaching
In the near future, great new changes will take place in English itself, and the trend of change will be more and more simple. In his article "the characteristics of English in the 21st Century", Professor Zhou Haizhong, a famous linguist in China, boldly predicted that by the end of the 21st century, the rules of English spelling and pronunciation will gradually converge, and the changes of vocabulary and grammar will be transformed by analogy, abbreviations, ellipsis and short sentences will be used more frequently to create words economically, the conversion of parts of speech is extremely flexible, and the way of expression will be more concise. The boundaries between countable nouns and uncountable nouns, transitive verbs and intransitive verbs almost disappear. All of these will greatly facilitate people to learn and use English as a communicative tool.

English majors mainly study English language, literature and other basic theories and knowledge. They are well trained in English listening, speaking, reading, writing, translation and other aspects. They have professional level, good quality and strong ability in research and teaching. English majors train senior English professionals with a solid foundation of English language and a wide range of scientific and cultural knowledge, who can be engaged in economy, trade, press and publication.

4. Summary
English is a necessary language in many international organizations or conferences. The Secretary General of the United Nations requires that he be proficient in English. Britain and the United States are two states that talk English mainly are the leaders of the world, have a great influence, and have nice behaviour and leading positions in the fields of science and technology, business and economy. A lot of people use English as a foreign language or a second language, and around 300-500 million people use it as a foreign language. In Europe and Japan, English is the most popular foreign language (94%), followed by French and Spanish. English is a major foreign language course in China and other countries. English as a second language and as a foreign language are used in two different ways, showing that English is increasingly regarded as a tool for international communication. It is no longer the unique language of some countries or nations, but a neutral tool or medium for information exchange. In order to facilitate international communication, basic English has been greatly simplified. It is frequently adopted by many aircraft manufacturers and international enterprises to write manuals and communicate. Some schools in the far East teach it as basic English.
