S4 Table. Postprocedural outcome variables of patients with and without hypotension

| Secondary outcomes                        | Hypotension (n=153) | No hypotension (n=198) | P value |
|-------------------------------------------|---------------------|------------------------|---------|
| Successful reperfusion, n (%)<sup>b</sup> | 123/153 (80)        | 172/197 (87)           | .14     |
| Early neurologic recovery, n (%)<sup>c</sup> | 38/144 (26)         | 43/189 (23)            | .64     |
| Symptomatic intracranial hemorrhage, n (%)<sup>d</sup> | 16/153 (10)        | 7/198 (3.5)            | .02     |
| In-hospital mortality, n (%)              | 19/153 (12)         | 15/198 (7.6)           | .18     |

<sup>a</sup>Threshold was set to a mean arterial pressure value of 70 mm Hg.
<sup>b</sup>Successful reperfusion was defined as modified Thrombolysis In Cerebral Infarction score of ≥2B.
<sup>c</sup>Early neurologic recovery was defined as National Institutes of Health Stroke Scale score of 0 or 1 within 24 hours postprocedural, or a decrease of 8 points relative to baseline.
<sup>d</sup>Symptomatic intracranial hemorrhage was defined as parenchymal hemorrhage with early neurologic deterioration (an increase of ≥4 points in score on the National Institutes of Health Stroke Scale).
