MACLAURIN’S SERIES EXPANSIONS OF REAL POWERS OF INVERSE (HYPERBOLIC) COSINE FUNCTIONS AND APPLICATIONS

FENG QI

Dedicated to people facing and battling COVID-19

Abstract. In the paper, by means of the Faà di Bruno formula, with the help of explicit formulas for special values of the Bell polynomials of the second kind with respect to a specific sequence, and by virtue of two combinatorial identities containing the Stirling numbers of the first kind, the author establishes Maclaurin’s series expansions for real powers of the inverse cosine function and the inverse hyperbolic cosine function. By applying different series expansions for the square of the inverse cosine function, the author not only finds infinite series representations of the circular constant $\pi$ and its square, but also derives two combinatorial identities involving central binomial coefficients.

1. Motivations

The classical Euler gamma function $\Gamma(z)$ can be defined [25, Chapter 3] by

$$
\Gamma(z) = \lim_{m \to \infty} \frac{m!m^z}{m! \prod_{k=0}^{m} (z+k)}, \quad z \in \mathbb{C} \setminus \{0, -1, -2, \ldots \}.
$$

The modified Bessel function of the first kind $I_\nu(z)$ can be represented [1, p. 375, 9.6.10] by

$$
I_\nu(z) = \sum_{n=0}^{\infty} \frac{1}{n!\Gamma(\nu+n+1)} \left( \frac{z}{2} \right)^{2n+\nu}, \quad z \in \mathbb{C}.
$$

The rising factorial, or say, the Pochhammer symbol, of $\alpha \in \mathbb{C}$ is defined [12, p. 7497] by

$$
(\alpha)_n = \prod_{k=0}^{n-1} (\alpha+k) = \begin{cases} 
\alpha(\alpha+1)\cdots(\alpha+n-1), & n \geq 1; \\
1, & n = 0.
\end{cases}
$$

In [26, p. 377, (3.5)] and [27, pp. 109–110, Lemma 1], it was obtained that

$$
I_\mu(x)I_\nu(x) = \frac{1}{\Gamma(\mu+1)\Gamma(\nu+1)} \sum_{n=0}^{\infty} \frac{(\mu+\nu+n+1)_n}{n!(\mu+1)_n(\nu+1)_n} \left( \frac{x}{2} \right)^{2n+\mu+\nu}.
$$

Maclaurin’s series expansion; real power; inverse cosine function; inverse hyperbolic cosine function; Stirling number of the first kind; Bell polynomial of the second kind; Faà di Bruno formula; central binomial coefficient; combinatorial identity; infinite series representation; pi.

This paper was typeset using \LaTeX.
In [4, p. 310], there exists the power series expansion

$$[I_\nu(z)]^2 = \sum_{k=0}^{\infty} \frac{1}{[\Gamma(\nu + k + 1)]^2} \left( \frac{2k + 2\nu}{k} \right) \left( \frac{z}{2} \right)^{2k + 2\nu}.$$  

More generally, the series expansions of the functions $[I_\nu(z)]^r$ for $\nu \in \mathbb{C} \setminus \{-1, -2, \ldots\}$ and $r, z \in \mathbb{C}$ have been surveyed and investigated in [3, 4, 11, 13, 14, 16]. One of the reasons why one investigates the series expansions of the functions $[I_\nu(z)]^r$ is that the products of the (modified) Bessel functions of the first kind appear occasionally in problems of statistical mechanics and plasma physics [2, 17, 18].

In the articles [5, 6, 11, 12, 20, 23, 24], Maclaurin’s series expansions of the powers

$$\sin^m z, \quad \cos^m z, \quad \tan^m z, \quad \cot^m z, \quad \sec^m z, \quad \csc^m z, \quad (\arctan z)^m, \quad (\arctanh z)^m,$$

for $m \geq 2$ and their history were reviewed, established, discussed, and applied. Now we recite several nice series expansions as follows.

**Theorem 1.1** ([11, Theorem 2.1]). For $m \in \mathbb{N}$ and $|x| < 1$, the function $(\arcsin x)^m$, whose value at $x = 0$ is defined to be 1, has the nice Maclaurin series expansion

$$\left( \frac{\arcsin x}{x} \right)^m = 1 + \frac{(-1)^k}{m+k} \sum_{\ell=0}^{2k} \left( \frac{m+\ell-1}{m-1} \right) s(m+2k-1, m+\ell-1) \left( \frac{m+2k-2}{2} \right) \left( \frac{2x}{2k} \right)^{2k}, \quad (1.2)$$

where $s(n,k)$ denotes the first kind Stirling numbers which can be analytically computed by

$$|s(n+1, m+1)| = n! \sum_{\ell_1=m}^{\infty} \sum_{\ell_2=m-1}^{\ell_1-1} \cdots \sum_{\ell_{m-1}=2}^{\ell_{m-2}-1} \sum_{\ell_m=1}^{\ell_{m-1}-1} 1 \quad n \geq m \geq 1. \quad (1.3)$$

**Theorem 1.2** ([11, Theorem 5.1]). For $m \in \mathbb{N}$ and $|x| < \infty$, the function $(\arcsinh x)^m$, whose value at $x = 0$ is defined to be 1, has the nice Maclaurin series expansion

$$\left( \frac{\arcsinh x}{x} \right)^m = 1 + \frac{1}{m+k} \sum_{\ell=0}^{2k} \left( \frac{m+\ell-1}{m-1} \right) s(m+2k-1, m+\ell-1) \left( \frac{m+2k-2}{2} \right) \left( \frac{2x}{2k} \right)^{2k}, \quad (1.4)$$

where $s(n,k)$ stands for the first kind Stirling numbers generated by $(1.5)$, where $s(n,m)$ denotes the Stirling numbers of the first kind which can be analytically generated by

$$\text{ln}(1+x)^m = \sum_{n=m}^{\infty} s(n,m) \frac{x^n}{n!}, \quad |x| < 1. \quad (1.5)$$

In [11, 12], the series expansion (1.2) was applied to derive closed-form formulas for special values of the Bell polynomials of the second kind, asked in [19] when studying Grothendieck’s inequality and completely correlation preserving functions, and was applied to establish series representations of the generalized log-sine function, considered in [4, 13].

The formula (1.3) is a reformulation of [21, Corollary 2.3] and the generating function (1.5) can be found in [23, p. 20, (1,30)].

The series expansions (1.2) and (1.4) in Theorems 1.1 and 1.2 were also recovered in [22, Section 3].

**Theorem 1.3** ([22, Theorem 4.1]). For $|x| < 1$, we have

$$\frac{(\arccos x)^2}{2!} = \sum_{m=0}^{\infty} \frac{m!}{(2m+1)!!} \frac{(1-x)^m+1}{m+1}, \quad (1.6)$$

and

$$\frac{(\arccosh x)^2}{2!} = -\sum_{m=0}^{\infty} \frac{m!}{(2m+1)!!} \frac{(1-x)^m+1}{m+1}. \quad (1.7)$$

For $k \geq 2$ and $|x| < 1$, we have

$$\frac{(\arccos x)^{2k}}{(2k)!} = \sum_{m=0}^{\infty} (-1)^m \left( \frac{\ell + 2k - 1}{2k - 1} \right) \left[ 2(1-x)^{m+k} \right] \left( \frac{2(1-x)^{m+k}}{(2m+2k)!} \right), \quad (1.8)$$
and
\[
\frac{(\text{arccosh } x)^{2k}}{(2k)!} = \sum_{m=0}^{\infty} (-1)^{m+k} \frac{1}{\ell!} \left( \sum_{\ell=0}^{2m} \binom{\ell + 2k - 1}{2k - 1} s(2m + 2k - 1, \ell + 2k - 1)(m+k-1)_{\ell} \right) [2(1 - x)]^{m+k} \frac{(2m + 2k)!}{(2m + 2k)!}. \tag{1.9}
\]

The series expansions \((1.6), (1.7), (1.8),\) and \((1.9)\) in Theorem 1.3 are Taylor’s series expansions at the point \(x = 1\) of even powers of the inverse cosine function \(\text{arccos } x\) and the inverse hyperbolic cosine function \(\text{arccosh } x\) in terms of the Stirling numbers of the first kind \(s(n, m)\).

What are Maclaurin’s series expansions at the point \(x = 0\) for \((\text{arccos } x)^{\alpha}\) and \((\text{arccosh } x)^{\alpha}\) with \(\alpha \in \mathbb{R}\)? In Section 3 of this paper, we will answer this interesting and significant question. Besides this, we also

1. establish explicit formulas for special values of the Bell polynomials of the second kind with respect to a specific sequence \(1, 0, 1, 0, 9, 0, 225, \ldots\), see Theorem 2.1 below;
2. apply different series expansions of \((\text{arccos } x)^{2}\), including Taylor’s series expansion \((1.6)\) in Theorem 1.3 to find infinite series representations of \(\pi\) and \(\pi^2\) respectively, see Theorem 1.4 below;
3. apply different series expansions of \((\text{arccos } x)^{2}\) to derive two combinatorial identities involving central binomial coefficients, see Theorem 5.1 below.

2. Explicit formulas for special values of Bell polynomials of second kind

In [7] Definition 11.2 and [3] p. 134, Theorem A], the Bell polynomials of the second kind, denoted by \(B_{n,k}(x_1, x_2, \ldots, x_{n-k+1})\) for \(n \geq k \geq 0\), are defined by

\[
B_{n,k}(x_1, x_2, \ldots, x_{n-k+1}) = \sum_{1 \leq i_1 \leq n-k+1} \frac{n!}{\prod_{i=1}^{n-k+1} i!} \prod_{i=1}^{n-k+1} \binom{x_i}{i^\ell}. \tag{2.1}
\]

The Faà di Bruno formula [7, Theorem 11.4] and [3] p. 139, Theorem C] can be described in terms of \(B_{k,\ell}(x_1, x_2, \ldots, x_{k-\ell+1})\) by

\[
\frac{d^k}{d x^k} f \circ h(x) = \sum_{\ell=0}^{k} f^{(\ell)}(h(x)) B_{k,\ell}(h'(x), h''(x), \ldots, h^{(k-\ell+1)}(x)), \quad k \in \mathbb{N}. \tag{2.1}
\]

To establish Maclaurin’s series expansions at the point \(x = 0\) for real powers of the inverse cosine function \(\text{arccos } x\) and the inverse hyperbolic cosine function \(\text{arccosh } x\), we need the following explicit formulas for special values of the Bell polynomials of the second kind with respect to the sequence

\(1, 0, 1, 0, 9, 0, 225, \ldots, 0, [(2r - 1)!!]^2, 0, \ldots.\)

**Theorem 2.1.** For \(r, k \in \mathbb{N}\), we have

\[
B_{2r+k,k}(1, 0, 1, 0, 9, 0, 225, \ldots, 0, [(2r - 1)!!]^2)
= (-1)^r 2^r \sum_{\ell=0}^{2r} \binom{k + \ell - 1}{k - 1} s(k + 2r - 1, k + \ell - 1) \left(\frac{k + 2r - 2}{2}\right)^{\ell}. \tag{2.2}
\]

and

\[
B_{2r+k-1,k}(1, 0, 1, 0, 9, 0, 225, \ldots, [(2r - 3)!!]^2, 0) = 0, \tag{2.3}
\]

where \((-1)!! = 0!! = 1\).

**Proof.** In [10] p. 60, 1.641], there is the series expansion

\[
\text{arccos } x = \frac{\pi}{2} - \sum_{\ell=0}^{\infty} (2\ell - 1)!! \frac{x^{2\ell + 1}}{2\ell + 1}, \quad |x| < 1. \tag{2.4}
\]

The series expansion (2.4) means that

\[
(\text{arccos } x)^{(2\ell)} \big|_{x=0} = 0 \quad \text{and} \quad (\text{arccos } x)^{(2\ell-1)} \big|_{x=0} = -[(2\ell - 3)!!]^2 \tag{2.5}
\]

for \(\ell \in \mathbb{N}\).
At the end of [8 p. 133], there is the formula
\[ \frac{1}{k!} \left( \sum_{m=1}^{\infty} x_m t^m \right)^k = \sum_{n=k}^{\infty} B_{n,k}(x_1, x_2, \ldots, x_{n-k+1}) \frac{t^n}{n!} \] (2.6)
for \( k \geq 0 \). Making use of the formula (2.6) yields
\[ B_{n+k,k}(x_1, x_2, \ldots, x_{n+k+1}) = \left(\frac{n+k}{k}\right) \lim_{t \to 0} \frac{d^n}{dt^n} \left[ \sum_{m=0}^{\infty} \frac{x_{m+1}}{(m+1)!} t^m \right]^k. \] (2.7)
Taking \( x_m = (\text{arccos } x)^{(m)} \) for \( m \geq 1 \) in (2.7), employing the values in (2.5), and utilizing the series expansion (1.2) in Theorem 1.1 give
\[
B_{n+k,k}((\text{arccos } x)|_{x=0}, (\text{arccos } x)^{n+1})|_{x=0})
= B_{n+k,k}(-1, 0, -1, 0, -9, 0, -225, \ldots, -1 - \frac{(n-1)^{n+1}}{2 ((n-1)!!)^2})
= \left(\frac{n+k}{k}\right) \lim_{t \to 0} \frac{d^n}{dt^n} \left[ \sum_{m=0}^{\infty} \frac{(\text{arccos } x)^{(m+1)}}{(m+1)!} t^m \right]^k
= (-1)^k \left(\frac{n+k}{k}\right) \lim_{t \to 0} \frac{d^n}{dt^n} \left[ 1 \sum_{m=1}^{\infty} \frac{(\text{arcsin } t)^{(m)}}{m!} t^m \right]^k
= (-1)^k \left(\frac{n+k}{k}\right) \lim_{t \to 0} \frac{d^n}{dt^n} \left[ 1 \sum_{m=1}^{\infty} \frac{(\arcsin t)^{(m)}}{m!} t^m \right]^k
= (-1)^k \left(\frac{n+k}{k}\right) \lim_{t \to 0} \frac{d^n}{dt^n} \left[ \sum_{q=1}^{\infty} \frac{(-1)^q}{(k+q)^2} \sum_{\ell=0}^{2q} \binom{k+q-1}{k-1} s(k+2q-1, k+\ell-1) \left(\frac{k+2q-2}{2}\right) \ell \right] \left(\frac{2q}{2q!}\right)^n
= (-1)^k \left(\frac{n+k}{k}\right) \lim_{t \to 0} \frac{d^n}{dt^n} \left[ 2r \sum_{\ell=0}^{2r} \binom{k+\ell-1}{k-1} s(k+2r-1, k+\ell-1) \left(\frac{k+2r-2}{2}\right) \ell \right] \left(\frac{2r}{2r!}\right)^n
\begin{cases}
\text{(2.7)} & n = 2r - 1
\end{cases}
\]
for \( r \in \mathbb{N} \), where the falling factorial \((z)_k\) of \( z \in \mathbb{C} \) is defined by
\[ (z)_k = \prod_{\ell=0}^{k-1} (z - \ell) = \begin{cases} z(z-1) \cdots (z-k+1), & k \geq 1; \\
1, & k = 0. \end{cases} \] (2.8)
Further employing the identity
\[ B_{n,k}(abx_1, ab^2x_2, \ldots, ab^{n-k+1}x_{n-k+1}) = a^k b^n B_{n,k}(x_1, x_2, \ldots, x_{n-k+1}) \] (2.9)
for \( n \geq k \geq 0 \) and \( a, b \in \mathbb{C} \) in [7 p. 412] and [8 p. 135] and simplifying result in the formulas (2.2) and (2.3). The proof of Theorem 2.1 is complete. \( \square \)

3. Maclaurin’s series expansions for real powers of inverse cosine function

In his section, by means of the Faà di Bruno formula (2.1), with the help of explicit formulas (2.2) and (2.3) in Theorem 2.1, and by virtue of two combinatorial identities in [22 Lemmas 2.1 and 2.2], we establish Maclaurin’s series expansions at the point \( x = 0 \) for \((\text{arccos } x)^{\alpha}\) and \((\text{arcosh } x)^{\alpha}\) with \( \alpha \in \mathbb{R} \).

**Theorem 3.1.** For \( \alpha \in \mathbb{R} \) and \( |x| < 1 \), we have
\[ \left(\frac{2 \text{arccos } x}{\pi}\right)^{\alpha} = 1 + \frac{\langle\alpha\rangle_2}{\pi^2} \frac{(2x)^2}{2!}, \]
Proof. Let $d$ denote the Stirling numbers of the first kind generated in where we used the identity (2.9) and Theorem 2.1.

The proof of Theorem 3.1 is complete.

Combining these four limits (3.2), (3.3), (3.4), and (3.5) and simplifying yield the series expansion (3.1). The proof of Theorem [3.1] is complete.
Corollary 3.1. For $|x| < 1$, we have
\[
\left(\frac{2 \arccos x}{\pi}\right)^2 = 1 - \frac{4}{\pi^2} \sum_{r=1}^{\infty} [(2r - 3)!!]^2 \frac{x^{2r-1}}{(2r - 1)!} + \frac{8}{\pi^2} \sum_{r=1}^{\infty} [(2r - 2)!!]^2 \frac{x^{2r}}{(2r)!}. \tag{3.6}
\]

Proof. Setting $\alpha = 2$ in the series expansion \([3.1]\) in Theorem \([3.1]\) arrives at
\[
\left(\frac{2 \arccos x}{\pi}\right)^2 = 1 + \frac{2}{\pi^2} (2x)^2 + \sum_{r=2}^{\infty} (-1)^{r+1} \left[\frac{2}{\pi^2} \sum_{q=0}^{2r-2} (q + 1)s(2r - 1, q + 1)(r - 1)^q \right] \frac{(2x)^{2r}}{(2r)!} + \sum_{r=1}^{\infty} (-1)^r \left[\frac{2}{\pi} \sum_{q=0}^{2r-2} s(2r - 2, q) \left(\frac{2r - 3}{2}\right)^q \right] \frac{(2x)^{2r-1}}{(2r - 1)!}.
\]

Further using the identities
\[
\sum_{\ell=0}^{2k} (\ell + 1)s(2k + 1, \ell + 1)k^\ell = (-1)^k(k!)^2, \quad k \in \mathbb{N}
\tag{3.7}
\]
and
\[
\sum_{\ell=0}^{2k} s(2k, \ell)(k - 1/2)^\ell = (-1)^k \left[\frac{(2k - 1)!!}{2^k}\right]^2, \quad k \in \mathbb{N}
\tag{3.8}
\]
in \([22]\) Lemmas \(2.1\) and \(2.2\), we acquire
\[
\left(\frac{2 \arccos x}{\pi}\right)^2 = 1 + \frac{2}{\pi^2} (2x)^2 + \frac{2}{\pi^2} \sum_{r=2}^{\infty} [(r - 1)!!]^2 \frac{(2x)^{2r}}{(2r)!} - \frac{2}{\pi^2} \sum_{r=1}^{\infty} \left[\frac{(2r - 3)!!}{2^{r-1}}\right] \frac{(2x)^{2r-1}}{(2r - 1)!}.
\]
The series expansion \((3.6)\) follows. The proof of Corollary \(3.1\) is complete. \(\square\)

Corollary 3.2. For $k \in \mathbb{N}$ and $|x| < 1$, we have
\[
\left(\frac{2 \text{arccosh} x}{\pi}\right)^2 = -1 + \frac{4}{\pi^2} \sum_{r=1}^{\infty} [(2r - 3)!!]^2 \frac{x^{2r-1}}{(2r - 1)!} - \frac{8}{\pi^2} \sum_{r=1}^{\infty} [(2r - 2)!!]^2 \frac{x^{2r}}{(2r)!}. \tag{3.9}
\]

and
\[
(-1)^k \left(\frac{2 \text{arccosh} x}{\pi}\right)^{2k} = 1 + \frac{(2k)!! (2x)^{2k}}{\pi^{2k} 2!} + \sum_{r=2}^{\infty} (-1)^r \sum_{\ell=1}^{r} \left[\frac{(2k)!!}{\pi^{2\ell}} \sum_{q=0}^{2\ell - 2} \frac{2\ell + q - 1}{2\ell - 1} s(2r - 1, 2\ell + q - 1)(r - 1)^q \right] \frac{(2x)^{2r}}{(2r)!} + \sum_{r=1}^{\infty} (-1)^r \left[\frac{(2k)!!}{\pi^{2\ell}} \sum_{q=0}^{2\ell - 2} \frac{2\ell + q - 2}{2\ell - 2} s(2r - 2, 2\ell + q - 2) \left(\frac{2r - 3}{2}\right)^q \right] \frac{(2x)^{2r-1}}{(2r - 1)!}. \tag{3.10}
\]
where the falling factorials $(2k)_r$ for $k, r \in \mathbb{N}$ are defined by \((2.8)\).

Proof. This follows from substituting the relation $\text{arccosh} x = -i \text{arccos} x$ into the series expansions \((3.6)\) and \((3.1)\) for $\alpha = 2k$. \(\square\)

4. Infinite Series Representations Related to $\pi$ and Its Square

By means of comparing the series expansion \((1.6)\) in Theorem \(1.3\) with the series expansion \((3.6)\) in Corollary \(3.1\) we can find the following infinite series representations of $\pi$ and $\pi^2$.

Theorem 4.1. For $r \in \mathbb{N}$, the constants $\pi$ and $\pi^2$ can be represented by
\[
\pi = \frac{2^{2r-1}}{(2r-1)!} \sum_{m=2r-1}^{\infty} \frac{2m}{m} \left(\frac{m-1}{2m}\right), \tag{4.1}
\]
and
\[
\pi^2 = 8 \sum_{m=1}^{\infty} \frac{2m}{m^2} \left(\frac{1}{2m}\right). \tag{4.2}
\]
Proof. Maclaurin’s series expansion (3.6) can be reformulated as
\[(\arccos x)^2 = \frac{\pi^2}{4} - \pi \sum_{r=1}^{\infty} \left( (2r-3)!! \right)^2 \frac{x^{2r-1}}{(2r-1)!} + 2 \sum_{r=1}^{\infty} \left( (2r-2)!! \right)^2 \frac{x^{2r}}{(2r)!}, \quad |x| < 1. \tag{4.3} \]

The series expansion (4.6) in Theorem 1.3 can be rearranged as
\[
\begin{align*}
(\arccos x)^2 &= 1 - x + \sum_{m=0}^{\infty} \frac{m!}{(2m+1)!!(m+1)} \sum_{\ell=0}^{m+1} (-1)^\ell \left( \frac{m+1}{\ell} \right) x^\ell \\
&= \sum_{m=0}^{\infty} \frac{m!}{(2m+1)!!(m+1)} \left( \sum_{\ell=0}^{\infty} \frac{m!}{(2m+1)!!} \right) + \sum_{m=0}^{\infty} \frac{m!}{(2m+1)!!(m+1)} \sum_{\ell=2}^{\infty} (-1)^\ell \left( \frac{m!}{(2m-1)!!m} \right) x^\ell \\
&= \sum_{m=0}^{\infty} \frac{m!}{(2m+1)!!(m+1)} \left[ 2^{m+1} \frac{1}{(m+1)^2} + \sum_{\ell=2}^{\infty} \frac{m!}{m+1} \right] x^\ell.
\end{align*}
\]

Accordingly, we obtain
\[
(\arccos x)^2 = 2 \sum_{m=0}^{\infty} \frac{2^{m+1}}{(m+1)^2} \frac{1}{(2m+2)} + 2 \sum_{m=0}^{\infty} (-1)^m \left[ \sum_{m=\ell}^{\infty} \frac{2m}{m+1} \frac{(m-1)!}{(m)!} \right] x^\ell. \tag{4.4}
\]

Comparing the series expansion (4.4) with the series expansion (4.3) produces
\[
2 \sum_{m=0}^{\infty} \frac{2^{m+1}}{(m+1)^2} \frac{1}{(2m+2)} = \frac{\pi^2}{4},
\]

and
\[
2(-1)^{2r-1} \left\{ \sum_{m=2r-1}^{\infty} \frac{2m}{m+1} \frac{(m-1)!}{(m)!} \right\} x^{2r-1} = -\pi [(2r-3)!!]^2 \frac{x^{2r-1}}{(2r-1)!},
\]

and
\[
2(-1)^2 \left[ \sum_{m=2r-1}^{\infty} \frac{2m}{m+1} \frac{(m-1)!}{(m)!} \right] \frac{x^{2r}}{2r} = 2(2r-2)!! \frac{x^{2r}}{(2r)!}. \tag{4.5}
\]
for \( r \in \mathbb{N} \). The second equation can be rewritten as
\[
\sum_{m=2r-1}^{\infty} \frac{2m}{m+1} \frac{(m-1)!}{(m)!} = \frac{\pi}{2} \frac{[(2r-3)!!]^2}{(2r-2)!} = \frac{\pi}{2} \left( \frac{2r-3}{2r-2} \right)
\]
for \( r \in \mathbb{N} \). The series representations (4.1) and (4.2) follows. The proof of Theorem 4.1 is complete. \( \square \)

By taking the special value \( x = \frac{1}{2} \) on both sides of (3.1) in Theorem 3.1, we can obtain the following interesting series representation.

**Theorem 4.2.** For \( \alpha \in \mathbb{R} \), we have
\[
\left( \frac{2}{3} \right)^\alpha = 1 + \sum_{r=1}^{\infty} (-1)^r \left[ \sum_{\ell=0}^{\infty} \frac{(-1)^\ell}{(2\ell)!} \left( \frac{2\ell + q - 1}{2\ell - 1} \right) s(2r-1, 2\ell-1) + \sum_{q=1}^{2\ell - 2} \left( \frac{2\ell + q - 1}{2\ell - 1} \right) s(2r-1, 2\ell + q - 1)(r-1)^q \right] \left( \frac{\alpha}{\pi^2} \right)^{2\ell} \\
+ \sum_{\ell=1}^{\infty} (-1)^\ell \left[ \sum_{r=\ell}^{\infty} \frac{(-1)^r}{(2\ell-1)!} \left( \frac{2\ell + q - 2}{2\ell - 2} \right) s(2r-2, 2\ell + q - 2)(r-1)^q \right] \left( \frac{\alpha}{\pi^2} \right)^{2\ell-1}. \tag{4.6}
\]

**Proof.** This follows from taking the special value \( x = \frac{1}{2} \) on both sides of (3.1) in Theorem 3.1 and interchanging the orders of sums. The proof of Theorem 4.2 is complete. \( \square \)

**Corollary 4.1.** The circular constant \( \pi \) can be represented as
\[
\frac{\pi}{6} = \sum_{r=1}^{\infty} \frac{[(2r-3)!!]^2}{(4r-2)!}. \tag{4.7}
\]
Proof. From taking \( \alpha = 1 \) on both sides of (4.6) in Theorem 4.2 and simplifying, we discover
\[
\frac{\pi}{3} = \sum_{r=1}^{\infty} \frac{(-1)^{r-1} 2^{r-2}}{(2r-1)!} \sum_{q=0}^{2r-2} s(2r - 2, q) \left( \frac{2r - 3}{2} \right)^{q}.
\]
Further making use of the identity (3.8) and simplifying, we conclude the series representation (4.7). The proof of Corollary 4.1 is complete. \( \square \)

**Corollary 4.2** ([22, Theorem 5.1]). The constant \( \pi^2 \) satisfies
\[
\frac{\pi^2}{18} = \sum_{r=1}^{\infty} \frac{[(r - 1)!]^2}{(2r)!}.
\]  \( (4.8) \)

**Proof.** The series representation (4.9) comes from taking \( \alpha = 2 \) on both sides of (4.6) in Theorem 4.2 and simplifying give
\[
\frac{4}{9} = 1 - \frac{2}{\pi^2} \sum_{r=1}^{\infty} \frac{(-1)^r}{(2r)!} \left[ s(2r - 1, 1) + \sum_{q=1}^{2r-2} (q + 1)s(2r - 1, q + 1)(r - 1)^q \right]
\]
\[
+ \frac{2}{\pi^2} \sum_{r=1}^{\infty} \frac{(-1)^r}{(2r)!} \sum_{q=0}^{2r-2} s(2r - 2, q) \left( \frac{2r - 3}{2} \right)^{q}.
\]
Further using the formula \( s(r, 1) = (-1)^{r-1} (r - 1)! \) for \( r \in \mathbb{N} \), employing the identities (3.7) and (3.8), and simplifying, we acquire
\[
\frac{4}{9} = 1 - \frac{2}{\pi^2} \sum_{r=1}^{\infty} \frac{(-1)^r}{(2r)!} \left[ (-1)^r ((r - 1)!)^2 + \frac{2}{\pi} \sum_{r=1}^{\infty} \frac{(-1)^r}{(2r)!} \left( \frac{2r - 3}{2r - 1} \right)^{r-1} \right]^2,
\]
that is,
\[
\frac{4}{9} = 1 - \frac{4}{\pi^2} \sum_{r=1}^{\infty} \frac{[(2r - 3)!]^2}{(4r - 2)!} + \frac{2}{\pi^2} \sum_{r=1}^{\infty} \frac{[(r - 1)!]^2}{(2r)!}.
\]  \( (4.9) \)

Substituting (4.7) in Corollary 4.1 into (4.9) reveals
\[
\frac{4}{9} = 1 - \frac{4 \pi}{\pi^2} + \frac{2}{\pi^2} \sum_{r=1}^{\infty} \frac{[(r - 1)!]^2}{(2r)!}.
\]
The series representation (4.8) is thus obtained. The proof of Corollary 4.2 is complete. \( \square \)

5. Two combinatorial identities

Squaring on both sides of the equation (2.4) and comparing with Maclaurin’s series expansion (3.6) in Corollary 3.1, as well as rewriting the equation (4.5), we can derive the following two combinatorial identities.

**Theorem 5.1.** For \( r \in \mathbb{N} \), we have
\[
\sum_{q=0}^{r-1} \frac{(2q)!}{2q + 1} \frac{(2r - 2q - 2)}{(2r - q - 1)} = \frac{2^{4r-3}}{r^2} (\frac{r}{2})^r
\]  \( (5.1) \)

and
\[
\sum_{m=2r}^{\infty} \frac{2^m m!}{m} \left( \frac{2m}{4^m} \right) = \frac{2^{2r-2}}{2r - 1} \frac{1}{(2r - 2)!}.
\]  \( (5.2) \)

**Proof.** From the series expansion (2.4) and Cauchy’s product, we conclude that
\[
(\text{arccos } x)^2 = \left( \frac{\pi}{2} - \sum_{r=0}^{\infty} \frac{(2r - 1)!}{(2r)!} \frac{x^{2r+1}}{2r + 1} \right)^2
\]
\[
= \left( \frac{\pi}{2} \right)^2 - \pi \sum_{r=0}^{\infty} \frac{(2r - 1)!}{(2r)!} x^{2r+1} \frac{2r + 1}{2r + 1} + x^2 \sum_{r=0}^{\infty} \frac{(2r - 1)!}{(2r)!} \frac{x^{2r}}{2r + 1}.
\]
\[
\left( \frac{\pi}{2} \right)^2 - \frac{\pi}{2} \sum_{r=0}^{\infty} \frac{(2r-1)!!}{(2r-2)!!} \frac{x^{2r+1}}{(2r-1)!} + \sum_{r=0}^{\infty} \left[ \sum_{q=0}^{r} \frac{(2q-1)!!}{(2q)!!(2q+1)!} \frac{(2r-2q-1)!!}{(2r-2q)!} \right] x^{2r+2}
\]

Comparing this with \((4.3)\), the coefficients of the factors \(x^{2r}\), and simplifying reveal the combinatorial identity \((5.1)\).

The equation \((4.5)\) can be simplified as

\[
\sum_{m=2r}^{\infty} \frac{2^m}{m^2} \left( \frac{m-1}{2m} \right) = \frac{(2r-2)!!}{(2r-1)!} \left( 2r - \frac{2r-3}{2} \right), \quad r \in \mathbb{N}.
\]

The combinatorial identity \((5.2)\) is thus proved. The proof of Theorem \((5.1)\) is complete. \(\square\)

### 6. Remarks

Finally, we give several remarks related to our main results.

**Remark 6.1.** Using the formulas \((2.2)\) and \((2.3)\) in Theorem \((2.1)\), we can compute Maclaurin’s series expansions at \(x=0\) for the kind of composite functions \(f(\arccos x)\) and \(f(\arcsin x)\), if the derivatives of \(f\) is explicitly computable.

**Remark 6.2.** In the series expansion \((3.1)\), if \(0^0\) is assumed to be 1, the term \(\frac{(\alpha^r)(2x^2)^r}{2r!}\) can be combined into the first sum in Theorem \((3.1)\). Then the series expansion \((3.1)\) can be reformulated as

\[
\left( \frac{2 \arccos x}{\pi} \right)^\alpha = 1 + \sum_{r=1}^{\infty} (-1)^r \sum_{n=0}^{r-1} \frac{(\alpha)_{2n} 2^{2r-2n} (2n+1)!}{(2n)!} \left( \sum_{k=0}^{n} \frac{2\ell + q - 1}{2\ell - 1} \right) s(2\ell - 1, 2\ell + q - 1)(r-1)! \frac{(2x)^{2r}}{(2r)!}
\]

\[
+ \sum_{r=1}^{\infty} (-1)^r \left[ \sum_{\ell=0}^{2r-2} \sum_{q=0}^{2\ell+1} \frac{2\ell + q - 2}{2\ell - 1} \right] s(2\ell - 1, 2\ell + q - 2)(r-1)! \frac{(2x)^{2r-1}}{(2r-1)!}
\]

for \(\alpha \in \mathbb{R}\) and \(|x| < 1\). Similarly, the series expansion \((3.10)\) in Corollary \((3.2)\) can be reformulated as

\[
\left( \frac{2 \arccosh x}{\pi} \right)^q = 1 + \sum_{r=2}^{\infty} (-1)^r \sum_{\ell=1}^{r-1} \frac{(2k)_{2\ell}}{2\ell!} \left[ \sum_{q=0}^{2\ell+1} \frac{2\ell + q - 1}{2\ell - 1} \right] s(2\ell - 1, 2\ell + q - 1)(r-1)! \frac{(2x)^{2r}}{(2r)!}
\]

\[
+ \sum_{r=2}^{\infty} (-1)^r \left[ \sum_{\ell=2}^{2r-2} \sum_{q=0}^{2\ell+1} \frac{2\ell + q - 2}{2\ell - 1} \right] s(2\ell - 1, 2\ell + q - 2)(r-1)! \frac{(2x)^{2r-1}}{(2r-1)!}
\]

for \(k \in \mathbb{N}\) and \(|x| < 1\).

**Remark 6.3.** Maclaurin’s series expansion \((3.9)\) can be reformulated as

\[
(\arccosh x)^2 = \frac{\pi^2}{4} + \pi \sum_{r=0}^{\infty} \left( \frac{2(r-3)!!}{(2r-1)!} \right) x^{2r-1} - 2 \sum_{r=1}^{\infty} \left( \frac{2(r-2)!!}{(2r)!} \right) x^{2r}, \quad |x| < 1.
\]

The series expansions \((4.3)\) and \((6.1)\) are more beautiful and concise in form.

**Remark 6.4.** The relation

\[
\text{arccos } x = 2 \arctan \sqrt{\frac{1-x}{1+x}}, \quad 1 < x \leq 1
\]

can be utilized to derive series expansions of powers of the inverse tangent function \(\arctan x\) from series expansions \((1.6)\), \((1.8)\), \((3.1)\), \((3.6)\), and \((4.3)\) of powers of the inverse cosine function \(\arccos x\).

**Remark 6.5.** As for the infinite series representations \((4.1)\) and \((4.2)\) in Theorem \((4.1)\) and the series representation \((4.7)\) in Corollary \((4.1)\), we would like to mention the first unsolved problem posed by Herbert Wilf on December 13, 2010 at https://www2.math.upenn.edu/~wilf/website/UnsolvedProblems.pdf see Figure \([\text{Figure 1}]\).
Some unsolved problems

Herbert Wilf

December 13, 2010

Here are some mathematical problems that are, as far as I know, unsolved, and which I have encountered in recent work.

1 Series for \( \pi \)

A great many rapidly converging series for \( \pi \) are known. Most often they are of the form

\[
\pi = \sum_{n=0}^{\infty} t_n,
\]

where \( t_n \) is a hypergeometric term, that is, \( t_{n+1}/t_n \) is a rational function of \( n \). Our question roughly is this - how fast can such a series converge to \( \pi \)?

Of course without further conditions the question is trivial, so we must add that the hypergeometric term \( t_n \) has rational coefficients. The known series all seem to converge exponentially fast, that is, \( C = \lim t_n/n \) exists and is finite and nonzero. Given any such series it is simple to construct another one in which \( C \) is replaced by \( C^2 \), so there exist such representations of \( \pi \) in which the constant \( C \) is arbitrarily small. But can it be 0? That is, can such a series converge superexponentially fast?

We ask the question precisely as follows.

Does there exist an entire function \( f(z) = \sum_{n=0}^{\infty} a_n z^n \) such that the coefficients \( a_n \) are hypergeometric terms over the rational numbers, and \( f(1) = \pi \)?

It is worth noting that if we replace “\( \pi \)” by “\( e \)” in the above it becomes quite trivial, since \( e^\pi \) is an entire function.

Figure 1. Series for \( \pi \)
