DECAY ESTIMATES FOR STEADY SOLUTIONS OF THE NAVIER–STOKES EQUATIONS IN TWO DIMENSIONS IN THE PRESENCE OF A WALL

CHRISTOPH BOECKLE and PETER WITTWER

Abstract. Let $\omega$ be the vorticity of a stationary solution of the two-dimensional Navier–Stokes equations with a drift term parallel to the boundary in the half-plane $\Omega_+ = \{(x, y) \in \mathbb{R}^2 \mid y > 1\}$, with zero Dirichlet boundary conditions at $y = 1$ and at infinity, and with a small force term of compact support. Then $|x_0 \omega(x, y)|$ is uniformly bounded in $\Omega_+$. The proof is given in a specially adapted functional framework, and the result is a key ingredient for obtaining information on the asymptotic behavior of the velocity at infinity.

Key words. Navier–Stokes, exterior domain, fluid-structure interaction, asymptotic behavior

1. Introduction. In this paper we consider the steady Navier–Stokes equations in a half-plane $\Omega_+ = \{(x, y) \in \mathbb{R}^2 \mid y > 1\}$ with a drift term parallel to the boundary, a small driving force of compact support, with zero Dirichlet boundary conditions at the boundary of the half-plane and at infinity. See [14] and [15] for a detailed motivation of this problem. Existence of a strong solution for this system was proved in [14] together with a basic bound on the decay at infinity, and the existence of weak solutions was shown in [15]. By elliptic regularity weak solutions are smooth, and their only possible shortcoming is the behavior at infinity, since the boundary condition may not be satisfied there in a pointwise sense. In [15] it was also shown that for small forces there is only one weak solution. This unique weak solution therefore coincides with the strong solution and as a consequence satisfies the boundary condition at infinity in a pointwise sense.

The aim of this paper is to provide additional information concerning the behavior of this solution at infinity by analyzing the solution obtained in [14] in a more stringent functional setting. More precisely, we obtain more information on the decay behavior of the vorticity of the flow. Bounds on vorticity as a step towards bounds on the velocity are a classical procedure in asymptotic analysis of fluid flows (see the seminal papers [7], [8], and [1]). In [14] and the current work, the equation for the vorticity is Fourier-transformed with respect to the coordinate $x$ parallel to the wall, and then rewritten as a dynamical system with the coordinate $y$ perpendicular to the wall playing the role of time. In this setting information on the behavior of the vorticity at infinity is studied by analyzing the Fourier transform at $k = 0$, with $k$ the Fourier conjugate variable of $x$. In the present work, we also control the derivative of the Fourier transform of the vorticity, which yields more precise decay estimates for the vorticity and the velocity field in direct space than the ones found in [14]. Our proof

is then based on a new linear fixed point problem involving the solution obtained in [14] and the derivative of the vorticity with respect to \( k \).

Since the original equation is elliptic, the dynamical system under consideration contains stable and unstable modes and no spectral gap, so that standard versions of the center manifold theorem are not sufficient to prove existence of solutions. Functional techniques that allow one to deal with such a situation go back to [6] and were adapted to the case of the Navier–Stokes equations in [16] and in [17], [18]. For a general review, see [11]. The linearized version of the current problem was studied in [13]. A related problem in three dimensions was discussed in [9].

The results of the present paper are the basis for the work described in [2], where we extract several orders of an asymptotic expansion of the vorticity and the velocity field at infinity. The asymptotic velocity field obtained this way is divergence-free and may be used to define artificial boundary conditions of Dirichlet type when the system of equations is restricted to a finite subdomain to be solved numerically. The use of asymptotic terms as artificial boundary conditions was pioneered in [3], [4] for the related problem of an exterior flow in the whole space in two dimensions, and in [10] for the case in three dimensions.

Let \( \mathbf{x} = (x, y) \), and let \( \Omega_+ = \{(x, y) \in \mathbb{R}^2 \mid y > 1\} \). The model under consideration is given by the Navier–Stokes equations with a drift term parallel to the boundary,

\[
\begin{align*}
-\partial_x u + \Delta u &= F + u \cdot \nabla u + \nabla p, \\
\nabla \cdot u &= 0,
\end{align*}
\]

subject to the boundary conditions

\[
\begin{align*}
u(x, 1) &= 0, & x \in \mathbb{R} , \\
\lim_{x \to \infty} u(x) &= 0 .
\end{align*}
\]

The following theorem is our main result.

**Theorem 1.1.** For all \( F \in C^\infty_c(\Omega_+) \) with \( F \) sufficiently small in a sense to be defined below, there exist a unique vector field \( \mathbf{u} = (u, v) \) and a function \( p \) satisfying the Navier–Stokes equations (1.1), (1.2) in \( \Omega_+ \) subject to the boundary conditions (1.3) and (1.4). Moreover, there exists a constant \( C > 0 \), such that \( |y^{3/2}u(x,y)| + |y^{1/2}v(x,y)| + |y^3\omega(x,y)| + |xy\omega(x,y)| \leq C \) for all \( (x,y) \in \Omega_+ \).

This theorem is a consequence of Theorem 5.4, which is proved in section 5. The crucial improvement with respect to [14] is the bound on the function \( xy\omega(x,y) \).

**Remark 1.2.** The smallness condition for the force \( F \) is necessary because of the techniques used in the proofs of the current theorem as well as in the existence theorem of [14], and in the uniqueness theorem proved in [15]. To our knowledge, for forces \( F \) that are large nothing is known concerning the decay at infinity beyond what follows from the existence theorem of weak solutions in [12], i.e., that the \( L^2 \) average of the velocity on circles of radius \( R \) is absolutely continuous and converges to zero as \( R \) goes to infinity. Moreover, for large forces, one does not expect uniqueness of solutions. In any case, stationary solutions are expected to become unstable, and physically relevant solutions will be time dependent.

The paper is organized as follows. In section 2 we rewrite (1.1) and (1.2) as a dynamical system with \( y \) playing the role of time, and Fourier-transform the equations with respect to the variable \( x \). Then, in section 3, we recall the integral equations for the vorticity discussed in [14] and complement them by the ones for the derivative
with respect to $k$. We then introduce in section 4 certain well-adapted Banach spaces which encode the information concerning the decay of the functions at infinity. Finally, in section 5, we reformulate the problem of showing the existence of the derivative of vorticity with respect to $k$ as the fixed point of a continuous map, based on the existence of solutions proved in [14]. We present in sections 6 and 7 the proofs of the lemmas used in section 5. In the appendix, we recall results from [14] which are needed here.

2. Reduction to an evolution equation. We recall the procedure used in [14] to frame the Navier–Stokes equations for the studied case as a dynamical system. Let $\mathbf{u} = (u, v)$ and $\mathbf{F} = (F_1, F_2)$. Then (1.1) and (1.2) are equivalent to

\begin{align}
\omega &= -\partial_y u + \partial_x v, \\
-\partial_x \omega + \Delta \omega &= \partial_x (u \omega) + \partial_y (v \omega) + \partial_x F_2 - \partial_y F_1, \\
\partial_x u + \partial_y v &= 0.
\end{align}

The function $\omega$ is the vorticity of the fluid. Once (2.1)–(2.3) are solved, the pressure $p$ can be obtained by solving the equation

$$\Delta p = -\nabla \cdot (\mathbf{F} + \mathbf{u} \cdot \nabla \mathbf{u})$$

in $\Omega_+$, subject to the Neumann boundary condition

$$\partial_y p(x, 1) = \partial_y^2 v(x, 1).$$

Let

\begin{align}
q_0 &= u \omega, \\
q_1 &= v \omega,
\end{align}

and furthermore let

\begin{align}
Q_0 &= q_0 + F_2, \\
Q_1 &= q_1 - F_1.
\end{align}

We then rewrite the second order differential equation (2.2) as a first order system

\begin{align}
\partial_y \omega &= \partial_x \eta + Q_1, \\
\partial_y \eta &= -\partial_x \omega + \omega + Q_0.
\end{align}

Note that, unlike the right-hand side of (2.2), the expressions for $Q_0$ and $Q_1$ do not contain derivatives. This is due to the fact that, in contrast to standard practice, we did not set, say, $\partial_y \omega = \eta$, but we chose with (2.8) a more sophisticated definition. The fact that the nonlinear terms in (2.8), (2.9) do not contain derivatives simplifies the analysis of the equations considerably. An additional trick allows one to reduce complexity even further. Namely, we can replace (2.3) and (2.1) with the equations

\begin{align}
\partial_y \psi &= -\partial_x \varphi - Q_1, \\
\partial_y \varphi &= \partial_x \psi + Q_0
\end{align}

if we use the decomposition

\begin{align}
\mathbf{u} &= -\eta + \varphi, \\
\mathbf{v} &= \omega + \psi.
\end{align}
The point is that in contrast to $u$ and $v$ the functions $\psi$ and $\phi$ decouple on the linear level from $\omega$ and $\eta$. Since on the linear level we have $\Delta \phi = 0$ and $\Delta \psi = 0$, it will turn out that $\phi$ and $\psi$ have a dominant asymptotic behavior which is harmonic when $Q_0$ and $Q_1$ are small.

Equations (2.8)–(2.11) are a dynamical system with $y$ playing the role of time. We now take the Fourier transform in the $x$-direction.

**Definition 2.1.** Let $\hat{f}$ be a complex valued function on $\Omega_+$. Then we define the inverse Fourier transform $f = \mathcal{F}^{-1}[\hat{f}]$ by the equation

$$f(x, y) = \mathcal{F}^{-1}[\hat{f}(x, y)] = \frac{1}{2\pi} \int_{\mathbb{R}} e^{-ikx} \hat{f}(k, y) dk$$

and $\hat{h} = \hat{f} \ast \hat{g}$ by

$$\hat{h}(k, y) = (\hat{f} \ast \hat{g})(k, y) = \frac{1}{2\pi} \int_{\mathbb{R}} \hat{f}(k - k', y) \hat{g}(k', y) dk'$$

whenever the integrals make sense. We note that for a function $f$ which is smooth and of compact support in $\Omega_+$ we have $f = \mathcal{F}^{-1}[\hat{f}]$, where

$$\hat{f}(k, y) = \mathcal{F}[f](k, y) = \int_{\mathbb{R}} e^{ikx} f(x, y) dx ,$$

and that $fg = \mathcal{F}^{-1}[\hat{f} \ast \hat{g}]$.

With these definitions we have in Fourier space, instead of (2.8)–(2.11), the equations

$$\partial_y \hat{\omega} = -ik \hat{\eta} + \hat{Q}_1 ,$$

$$\partial_y \hat{\eta} = (ik + 1)\hat{\omega} + \hat{Q}_0 ,$$

$$\partial_y \hat{\psi} = ik \hat{\phi} - \hat{Q}_1 ,$$

$$\partial_y \hat{\phi} = -ik \hat{\psi} + \hat{Q}_0 .$$

From (2.6) and (2.7) we get

$$\hat{Q}_0 = \hat{q}_0 + \hat{F}_2 ,$$

$$\hat{Q}_1 = \hat{q}_1 - \hat{F}_1 ,$$

from (2.4) and (2.5) we get

$$\hat{q}_0 = \hat{u} \ast \hat{\omega} ,$$

$$\hat{q}_1 = \hat{v} \ast \hat{\omega} ,$$

and instead of (2.12) and (2.13) we have the equations

$$\hat{u} = -\hat{\eta} + \hat{\phi} ,$$

$$\hat{v} = \hat{\omega} + \hat{\psi} .$$
3. Integral equations. We now reformulate the problem of finding a solution to (2.14)–(2.17) which satisfies the boundary conditions (1.3) and (1.4) in terms of a system of integral equations. The equations for \( \hat{\omega}, \hat{\eta}, \hat{\varphi}, \) and \( \hat{\psi} \) are as in [14]. In particular we recall that

\[
\hat{\omega} = \sum_{m=0}^{1} \sum_{n=1}^{3} \hat{\omega}_{n,m},
\]

where, for \( n = 1, 2, 3, m = 0, 1, \)

\[
\hat{\omega}_{n,m}(k,t) = K_n(k, t-1) \int_{I_n} f_{n,m}(k, s-1) Q_m(k, s) ds,
\]

where, for \( k \in \mathbb{R} \setminus \{0\} \) and \( \sigma, \tau \geq 0, \)

\[
\hat{K}_n(k, \tau) = \frac{1}{2} e^{-\kappa \tau} \text{ for } n = 1, 2,
\]

\[
\hat{K}_3(k, \tau) = \frac{1}{2} (e^{\kappa \tau} - e^{-\kappa \tau}),
\]

and

\[
\hat{f}_{1,0}(k, \sigma) = \frac{ik}{\kappa} e^{\kappa \sigma} - \frac{(|k| + \kappa)^2}{\kappa} e^{-\kappa \sigma} + 2 (|k| + \kappa) e^{-|k| \sigma},
\]

\[
\hat{f}_{2,0}(k, \sigma) = 2 (\kappa + |k|) \left( e^{-|k| \sigma} - e^{-\kappa \sigma} \right),
\]

\[
\hat{f}_{3,0}(k, \sigma) = \frac{ik}{\kappa} e^{-\kappa \sigma},
\]

\[
\hat{f}_{1,1}(k, \sigma) = e^{\kappa \sigma} + \frac{(|k| + \kappa)^2}{ik} e^{-\kappa \sigma} - 2 \frac{|k| (|k| + \kappa)}{ik} e^{-|k| \sigma},
\]

\[
\hat{f}_{2,1}(k, \sigma) = 2 \left( \frac{|k| (|k| + \kappa)}{ik} - 1 \right) e^{-\kappa \sigma} - 2 \frac{|k| (|k| + \kappa)}{ik} e^{-|k| \sigma},
\]

\[
\hat{f}_{3,1}(k, \sigma) = -e^{-\kappa \sigma},
\]

and where \( I_1 = [1, t] \) and \( I_2 = I_3 = [t, \infty). \)

We introduce the integral equation for \( \partial_k \hat{\omega} \), noting that \( \hat{\omega} \) is continuous at \( k = 0 \) (see [14]). From (3.2) we get that

\[
\partial_k \hat{\omega} = \sum_{m=0}^{1} \sum_{n=1}^{3} \sum_{l=1}^{3} \partial_k \hat{\omega}_{l,n,m},
\]

where, for \( n = 1, 2, 3, m = 0, 1, \)

\[
\partial_k \hat{\omega}_{1,n,m}(k,t) = \partial_k \hat{K}_n(k, t-1) \int_{I_n} f_{n,m}(k, s-1) Q_m(k, s) ds,
\]

\[
\partial_k \hat{\omega}_{2,n,m}(k,t) = \hat{K}_n(k, t-1) \int_{I_n} \partial_k f_{n,m}(k, s-1) Q_m(k, s) ds,
\]

\[
\partial_k \hat{\omega}_{3,n,m}(k,t) = \hat{K}_n(k, t-1) \int_{I_n} f_{n,m}(k, s-1) \partial_k Q_m(k, s) ds,
\]
where, for \( k \in \mathbb{R} \setminus \{0\} \) and \( \sigma, \tau \geq 0 \),

\[
\partial_k \hat{K}_n(k, \tau) = \frac{12k-i}{4} \kappa e^{-\kappa \tau} \quad \text{for } n = 1, 2 ,
\]

\[
\partial_k \hat{K}_3(k, \tau) = \frac{12k-i}{4} \kappa (e^{\kappa \tau} + e^{-\kappa \tau}) ,
\]

where \( \hat{f}_{n,m} \) is as above, where

\[
\partial_k \hat{f}_{1,0}(k, \sigma) = \frac{i}{2\kappa}(e^{\kappa \sigma} + e^{-\kappa \sigma} - 2e^{-|k|\sigma}) - \frac{ik^2}{2\kappa^3}(e^{\kappa \sigma} - e^{-\kappa \sigma})
\]

\[
+ \frac{2k^2 + |k|\kappa}{\kappa k} (e^{-|k|\sigma} - e^{-\kappa \sigma}) + i \frac{k^2 + \kappa^2}{2\kappa^2} (e^{\kappa \sigma} - e^{-\kappa \sigma}) \sigma
\]

\[
+ \frac{k^2 + |k|\kappa k^2 + \kappa^2}{\kappa^2} e^{-\kappa \sigma} - 2 \frac{k^2 + |k|\kappa}{k} e^{-|k|\sigma} \sigma ,
\]

\[
\partial_k \hat{f}_{2,0}(k, \sigma) = \frac{(|k| + \kappa)^2}{\kappa k} (e^{-|k|\sigma} - e^{-\kappa \sigma})
\]

\[- 2 \frac{\kappa + |k|}{\kappa k} (|k|\kappa e^{-|k|\sigma} - \frac{k^2 + \kappa^2}{2} e^{-\kappa \sigma}) \sigma ,
\]

\[
\partial_k \hat{f}_{3,0}(k, \sigma) = \frac{k}{2\kappa^3} e^{-\kappa \sigma} - i \frac{k^2 + \kappa^2}{2\kappa^2} e^{-\kappa \sigma} ,
\]

\[
\partial_k \hat{f}_{1,1}(k, \sigma) = \frac{i(|k| + \kappa)^2}{\kappa|k|} (e^{-|k|\sigma} - e^{-\kappa \sigma}) + \frac{k^2 + \kappa^2}{2\kappa k} (e^{\kappa \sigma} + e^{-\kappa \sigma}) \sigma
\]

\[+ 2i \frac{k^2 + |k|\kappa}{k^2} \left( \frac{k^2 + \kappa^2}{2\kappa} e^{-\kappa \sigma} - |k|e^{-|k|\sigma} \right) \sigma ,
\]

\[
\partial_k \hat{f}_{2,1}(k, \sigma) = \frac{i(|k| + \kappa)^2}{\kappa|k|} (e^{-\kappa \sigma} - e^{-|k|\sigma}) + i(|k| + \kappa) \frac{k^2 + \kappa^2}{k^2} e^{-\kappa \sigma} \sigma
\]

\[- 2i \frac{(|k| + \kappa)^2}{\kappa^2} e^{-|k|\sigma} \sigma ,
\]

\[
\partial_k \hat{f}_{3,1}(k, \sigma) = \frac{k^2 + \kappa^2}{2\kappa k} e^{-\kappa \sigma} \sigma ,
\]

and where the functions

\[
\partial_k \hat{Q}_0 = \partial_k \hat{q}_0 + \partial_k \hat{F}_2 ,
\]

\[
\partial_k \hat{Q}_1 = \partial_k \hat{q}_1 - \partial_k \hat{F}_1
\]

are obtained from (2.18) and (2.19). Since \( \hat{q}_0 \) and \( \hat{q}_1 \) are convolution products (see (2.20) and (2.21)), and noting that \( \hat{u} \) and \( \hat{v} \) are continuous bounded functions on \( \mathbb{R} \), that \( \hat{\omega} \) is continuous on \( \mathbb{R} \) and differentiable on \( \mathbb{R} \setminus \{0\} \), and that \( \partial_k \hat{\omega} \) is absolutely integrable, we conclude (see [5, Proposition 8.8, page 241]) that \( \hat{q}_0 \) and \( \hat{q}_1 \) are continuously differentiable functions and that

\[
\partial_k \hat{q}_0 = \hat{u} \ast \partial_k \hat{\omega} ,
\]

\[
\partial_k \hat{q}_1 = \hat{v} \ast \partial_k \hat{\omega} .
\]

This means that it is sufficient to add (3.11) to the ones for \( \hat{\omega} \), \( \hat{\eta} \), \( \hat{\varphi} \), and \( \hat{\psi} \) in order to get a set of integrals equations determining also \( \partial_k \hat{\omega} \).
Remark 3.1. The products $K_n f_{n,m}$ are equal to $K_n f_{n,m}$ as defined in [14], and we have $K_{n=1,2} = K_{n=1,2}$, $K_3 = \frac{\mu_k}{\kappa} K_3$, $f_{n=1,2,m} = f_{n=1,2,m}$, and $f_{3,m} = \frac{\mu_k}{\kappa} f_{3,m}$. We chose to rewrite the equations in the new form for convenience later on.

4. Functional framework. We recall the definition of the function spaces introduced in [14] and extend it to include functions with a certain type of singular behavior. Let $\alpha, r \geq 0$, $k \in \mathbb{R}$, $t \geq 1$, and let

$$
\mu_{\alpha,r}(k,t) = \frac{1}{1 + (|k|^r)^\alpha}.
$$

Let furthermore

$$
\bar{\mu}_\alpha = \mu_{\alpha,1}(k,t),
$$

$$
\hat{\mu}_\alpha = \mu_{\alpha,2}(k,t).
$$

We also define

$$
\kappa = \sqrt{k^2 - ik}
$$

and

$$
\Lambda_- = -\text{Re}(\kappa) = -\frac{1}{2} \sqrt{2k^2 + k^4 + 2k^2}.
$$

Throughout this paper we use the inequalities

$$
|\kappa| = (k^2 + k^4)^{1/4} \leq |k|^{1/2} + |k| \leq 2^{3/4} |\kappa| \leq 2^{3/4}(1 + |k|).
$$

We have in particular that

$$
|k|^{1/2} \leq \text{const.} |\kappa|
$$

and that

$$
e^{\Lambda_- |\sigma|} \leq e^{-|k| |\sigma|},
$$

which will play a crucial role for small and large values of $k$, respectively.

Definition 4.1. We define, for fixed $\alpha \geq 0$, and $n, p, q \geq 0$, $B^0_{\alpha,p,q}$ to be the Banach space of functions $\hat{f} : \mathbb{R} \setminus \{0\} \times [1, \infty) \to \mathbb{C}$ for which $\hat{f}_n = \kappa^n \cdot \hat{f} \in C(\mathbb{R} \setminus \{0\} \times [1, \infty), \mathbb{C})$ and for which the norm

$$
\left\| \hat{f} ; B^0_{\alpha,p,q} \right\| = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|\hat{f}_n(k,t)|}{|\bar{\mu}_\alpha(k,t) + \frac{1}{\kappa} \hat{\mu}_\alpha(k,t)|}
$$

is finite. We use the shorthand $B_{\alpha,p,q}$ for $B^0_{\alpha,p,q}$. Furthermore we set, for $\alpha > 2$,

$$
D^1_{\alpha-1,p,q} = B^1_{\alpha,p,q} \times B^1_{\alpha-\frac{1}{2},p+\frac{1}{2},q+\frac{1}{2}} \times B^1_{\alpha-1,p+\frac{1}{2},q+1},
$$

$$
V_\alpha = B_{\alpha,\frac{1}{2},1} \times B_{\alpha,\frac{1}{2},0} \times B_{\alpha,\frac{1}{2},1}.
$$

Remark 4.2. We present two elementary properties of the spaces $B^0_{\alpha,p,q}$, which will be routinely used without mention. Let $\alpha, \alpha' \geq 0$ and $p, p', q, q' \geq 0$; then

$$
B^n_{\alpha,p,q} \cap B^n_{\alpha',p',q'} \subset B^n_{\min\{\alpha',\alpha\}, \min\{p',p\}, \min\{q',q\}}.
$$
In addition we have

\[ B_{\alpha,p,q}^n \subset B_{\alpha,\min\{p,q\},\infty}^n, \]

where the space with \( q = \infty \) is to be understood to contain functions for which the norm

\[ \left\| \tilde{f}; B_{\alpha,p,\infty}^n \right\| = \sup_{t \geq 1} \sup_{k \in \mathbb{R} \setminus \{0\}} \frac{|\tilde{f}_n(k, t)|}{\|k\alpha(k, t)\|} \]

is finite.

5. Existence of solutions. In [14] it was shown that one can rewrite the integral equations as a fixed point problem, and that, for \( F \) sufficiently small, there exist functions \( \hat{\omega}, \hat{u}, \) and \( \hat{v} \), which are solutions to (2.1)–(2.3), satisfying the boundary conditions (1.3) and (1.4). More precisely, we have, for \( \alpha > 3 \),

\begin{align*}
(5.1) & \quad \hat{\omega} \in B_{\alpha,\frac{3}{2},1}, \\
(5.2) & \quad \hat{u} \in B_{\alpha,\frac{3}{4},0}, \\
(5.3) & \quad \hat{v} \in B_{\alpha,\frac{3}{2},1},
\end{align*}

and, for \( i = 0, 1 \),

\[ \hat{Q}_i \in B_{\alpha,\frac{3}{2},\frac{3}{2}}. \]

We now show that using this solution as a starting point, we may define a linear fixed point problem with a unique solution for \( \partial_k \hat{\omega} \). The structure of (3.11) is rather complicated, and it turns out to be necessary to decompose the sum into three parts which are analyzed independently. Let \( \hat{d} = (d_1, d_2, d_3) \), where

\[ \hat{d}_1 = \sum_{m=0}^{1} \sum_{n=1}^{3} \partial_k \hat{\omega}_{l,n,m}; \]

then \( \partial_k \hat{\omega} = \sum_{l=1}^{3} \hat{d}_l \). The function \( \hat{d}_3 \) depends on \( \partial_k \hat{\omega} \), but \( \hat{d}_1 \) and \( \hat{d}_2 \) do not.

**Proposition 5.1.** The functions \( \hat{d}_1 \) and \( \hat{d}_2 \) are in \( D_{\alpha-1,\frac{3}{4},0}^1 \).

**Proof.** See sections 7.1 and 7.2. \( \square \)

We now define the fixed point problem.

**Lemma 5.2.** Let \( \alpha > 3 \), and let \( \hat{u} \) and \( \hat{v} \) be as in (5.2) and (5.3), respectively. Then

\[ \mathcal{L}_1 : D_{\alpha-1,\frac{3}{4},0}^1 \rightarrow B_{\alpha,\frac{3}{2},1} \times B_{\alpha,\frac{3}{2},2} \]

\[ \hat{d} \rightarrow \begin{pmatrix} \hat{u} * \hat{d} \\ \hat{v} * \hat{d} \end{pmatrix} \]

defines a continuous linear map.

**Proof.** The map \( \mathcal{L}_1 \) is linear by definition of the convolution operation. Using Corollary 6.3 we get that the map \( \mathcal{L}_1 \) is bounded, since

\[ \left\| \hat{u} * \hat{d}; B_{\alpha,\frac{3}{2},1} \right\| \leq \text{const.} \left\| \hat{u}; B_{\alpha,\frac{3}{2},0} \right\| \cdot \left\| \hat{d}; D_{\alpha-1,\frac{3}{4},0}^1 \right\| \]

and

\[ \left\| \hat{v} * \hat{d}; B_{\alpha,\frac{3}{2},2} \right\| \leq \text{const.} \left\| \hat{v}; B_{\alpha,\frac{3}{2},1} \right\| \cdot \left\| \hat{d}; D_{\alpha-1,\frac{3}{4},0}^1 \right\|. \] \( \square \)
LEMMA 5.3. Let $\alpha > 3$, $\hat{d}_3 = \sum_{m=0}^{1} \sum_{n=1}^{3} \partial_k \hat{\omega}_{3,n,m}$, and let $\partial_k \hat{\omega}_{3,n,m}$ be given by (3.14). Then we have

$$L_2 : \mathcal{B}_{\alpha, \frac{3}{2}, 1} \times \mathcal{B}_{\alpha, \frac{3}{2}, 2} \to \mathcal{D}_{\alpha-1, \frac{3}{2}, 0}$$

$$\begin{pmatrix} \partial_k \hat{Q}_0 \\ \partial_k \hat{Q}_1 \end{pmatrix} \to \hat{d}_3,$$

which defines a continuous linear map.

Proof. The map $L_2$ is linear by definition of $\hat{d}_3$ and is proved to be bounded in section 7.3. □

5.1. Proof of Theorem 1.1. Theorem 1.1 is a consequence of the following theorem.

THEOREM 5.4 (existence). Let $\alpha > 3$, $F = (F_1, F_2) \in C^\infty(\Omega_\alpha)$, and let $\hat{F} = (\hat{F}_1, \hat{F}_2)$ be the Fourier transform of $F$. If $\| (\hat{F}_2, -\hat{F}_1) ; \mathcal{B}_{\alpha, \frac{3}{2}, \frac{3}{2}} \times \mathcal{B}_{\alpha, \frac{3}{2}, \frac{3}{2}} \|$ is sufficiently small, then there exists a unique solution $(\hat{\omega}, \hat{u}, \hat{v}, \hat{d})$ in $\mathcal{V}_\alpha \times \mathcal{D}_{\alpha-1, \frac{3}{2}, 0}$.

Proof. We have the existence and uniqueness of $(\hat{\omega}, \hat{u}, \hat{v})$ in $\mathcal{V}_\alpha$ thanks to [14] and [15]. Since $\alpha > 3$, we have by Lemmas 5.2 and 5.3 that the map $\mathcal{C} : \mathcal{D}_{\alpha-1, \frac{3}{2}, 0} \to \mathcal{D}_{\alpha-1, \frac{3}{2}, 0}$, $x \mapsto \mathcal{C}[x] = \mathcal{L}_2[\hat{\mathcal{C}}_1[\hat{d}_1 + \hat{d}_2 + x] + (\partial_k \hat{F}_2, -\partial_k \hat{F}_1)]$ is continuous. Since from [14] we have that $\| (\hat{\omega}, \hat{u}, \hat{v}) ; \mathcal{V}_\alpha \| \leq \text{const} \cdot \| (\hat{F}_2, -\hat{F}_1) ; \mathcal{B}_{\alpha, \frac{3}{2}, \frac{3}{2}} \times \mathcal{B}_{\alpha, \frac{3}{2}, \frac{3}{2}} \|$, we find with (5.5) and (5.6) that the image of $\mathcal{L}_2$ is arbitrarily small. We then have by linearity of $L_2$ that $\mathcal{C}$ has a fixed point since $\| (\partial_k \hat{F}_2, -\partial_k \hat{F}_1) ; \mathcal{B}_{\alpha, \frac{3}{2}, 1} \times \mathcal{B}_{\alpha, \frac{3}{2}, 2} \| < \infty$. This completes the proof of Theorem 5.4. □

Theorem 1.1 now follows by inverse Fourier transform, and the decay properties are a direct consequence of the spaces of which $\hat{u}, \hat{v}, \hat{\omega}$, and $\partial_k \hat{\omega}$ are elements. Indeed, for a function $\hat{f} \in \mathcal{B}_{\alpha, p, q}^n$ with $\alpha > 3$, $n = 0, 1$, and $p, q \geq 0$, we have from the definition of the Fourier transform that

$$\sup_{x \in \mathbb{R}} |f(x, y)| \leq \frac{1}{2\pi} \int_{\mathbb{R}} \left| \hat{f}(k, y) \right| \, dk$$

and from the definition of the function spaces that

$$\int_{\mathbb{R}} \left| \hat{f}(k, t) \right| \, dk \leq \left\| \hat{f}_n ; \mathcal{B}_{\alpha, p, q}^n \right\| \int_{\mathbb{R}} \frac{1}{k^n} \left( \frac{1}{t^p} \mu_{\alpha}(k, t) + \frac{1}{t^q} \mu_{\alpha}(k, t) \right) \, dk$$

$$\leq \text{const.} \cdot \left\| \hat{f}_n ; \mathcal{B}_{\alpha, p, q}^n \right\| \left( \frac{1}{(p+1-n)} + \frac{1}{(q+2-n)} \right)$$

$$\leq \frac{\text{const.}}{t_{\text{min}}(p+(1-n), q+2(1-n))} \left\| \hat{f}_n ; \mathcal{B}_{\alpha, p, q}^n \right\|. \quad (5.8)$$

Combining (5.7) and (5.8) we have

$$\sup_{x \in \mathbb{R}} |f(x, y)| \leq \frac{\text{const.}}{y_{\text{min}}(p+(1-n), q+2(1-n))} \left\| \hat{f}_n ; \mathcal{B}_{\alpha, p, q}^n \right\|. \quad (5.9)$$

Finally, we have, using that $(\hat{\omega}, \hat{u}, \hat{v}, \hat{d}) \in \mathcal{V}_\alpha \times \mathcal{D}_{\alpha-1, \frac{3}{2}, 0}$ and

$$|x\omega(x, y)| \leq \frac{1}{2\pi} \int_{\mathbb{R}} |\partial_k \omega(k, y)| \, dk,$$
that

\[
|y^{3/2}u(x, y)| \leq C_1 , \quad |y^{3/2}v(x, y)| \leq C_2 , \\
|y^3\omega(x, y)| \leq C_3 , \quad |yx\omega(x, y)| \leq C_4 ,
\]

with \( C_i \in \mathbb{R} \) for \( i = 1, \ldots, 4 \), which proves the bound in Theorem 1.1.

### 6. Convolution with singularities

We first recall the convolution result from [14].

**Proposition 6.1 (convolution).** Let \( \alpha, \beta > 1 \), and \( r, s \geq 0 \), and let \( a, b \) be continuous functions from \( \mathbb{R}_0 \times [1, \infty) \) to \( \mathbb{C} \) satisfying the bounds

\[
|a(k, t)| \leq \mu_{\alpha, r}(k, t) , \\
|b(k, t)| \leq \mu_{\beta, s}(k, t) .
\]

Then the convolution \( a * b \) is a continuous function from \( \mathbb{R} \times [1, \infty) \) to \( \mathbb{C} \), and we have the bound

\[
|(a * b)(k, t)| \leq \text{const.} \left( \frac{1}{t^\alpha} \mu_{\beta, s}(k, t) + \frac{1}{t^\alpha} \mu_{\alpha, r}(k, t) \right) ,
\]

uniformly in \( t \geq 1, k \in \mathbb{R} \).

Since \( \partial_k \hat{\omega} \) diverges like \( |\kappa|^{-1} \) at \( k = 0 \) we need to strengthen this result.

**Proposition 6.2 (convolution with \( |\kappa|^{-1} \) singularity).** Let \( \alpha, \beta > 1 \) and \( r, \tilde{s} \geq 0 \), let \( a \) be as in Proposition 6.1, and let \( b \) be a continuous function from \( \mathbb{R}_0 \times [1, \infty) \) to \( \mathbb{C} \), satisfying the bound

\[
|\tilde{b}(k, t)| \leq |\kappa(k)|^{-1} \mu_{\beta, \tilde{s}}(k, t) .
\]

Then the convolution \( a * \tilde{b} \) is a continuous function from \( \mathbb{R} \times [1, \infty) \to \mathbb{C} \) and we have the bounds

\[
(a * \tilde{b})(k, t) \leq \text{const.} \max \left\{ \frac{1}{t^\alpha} , \frac{1}{t^\beta} \right\} \mu_{\beta, \tilde{s}'}(k, t) + \frac{1}{t^\alpha} \mu_{\alpha, r}(k, t) ,
\]

\[
(a * \tilde{b})(k, t) \leq \text{const.} \max \left\{ \frac{1}{t^\alpha} , \frac{1}{t^\beta} \right\} \mu_{\beta, \tilde{s}'}(k, t) + \frac{1}{t^\alpha} \mu_{\alpha, r}(k, t)
\]

for \( \tilde{s}' \leq \tilde{s} \) and \( c \in \{ 1, 2 \} \).

**Proof.** We drop the \( \sim \) to unburden the notation. Continuity is elementary. Since the functions \( \mu_{\alpha, r} \) are even in \( k \), we only consider \( k \geq 0 \). The proof is in two parts, one for \( 0 \leq k \leq t^{-\delta'} \) and the other for \( t^{-\delta'} < k \). The first part is valid for both (6.1) and (6.2). For \( 0 \leq k \leq t^{-\delta'} \) and \( \alpha' \geq 0 \), we have

\[
\|(a * b)(k, t)| \leq \int_{\mathbb{R}} \mu_{\alpha, r}(k', t)|\kappa(k - k')|^{-1} \mu_{\beta, s}(k - k', t)dk' \\
\leq \sup_{k' \in \mathbb{R}} (\mu_{\alpha, r}(k', t)) \int_{\mathbb{R}} \frac{t^\alpha}{|k|^\alpha} \mu_{\beta, s}(\tilde{k}, 1) \frac{dk}{t^\alpha} \\
\leq \text{const.} \frac{t^\alpha}{t^\alpha} \mu_{\alpha', \delta'}(k, t) ,
\]
where we have used the change of variables \( k - k' = \tilde{k}/t^s \). For \( k > t^{-s'} \) and \( s' \leq s \) we have

\[
|a \ast b(k, t)| \leq \int_{-\infty}^{k/2} \mu_{\alpha, r}(k', t) \frac{1}{|\kappa(k - k')|} \mu_{\beta, s}(k - k', t) dk' \\
\leq \int_{-\infty}^{k/2} \mu_{\alpha, r}(k', t) \frac{\mu_{\beta, s}(k - k', t)}{|\kappa(k - k')|} dk' + \int_{k/2}^{\infty} \mu_{\alpha, r}(k', t) \frac{\mu_{\beta, s}(k - k', t)}{|\kappa(k - k')|} dk' .
\]

The integral \( I_2 \) is the same for (6.1) and (6.2),

\[
I_2 = \int_{k/2}^{\infty} \mu_{\alpha, r}(k', t) \frac{1}{|\kappa(k - k')|} \mu_{\beta, s}(k - k', t) dk' \\
\leq \text{const.} \mu_{\alpha, r}(k/2, t) \int_{\mathbb{R}} \frac{t^s}{|k|^2} \mu_{\beta, s}(\tilde{k}, 1) \frac{dk}{t^s} \\
\leq \text{const.} \frac{1}{t^s/2} \mu_{\alpha, r}(k, t),
\]

where again we have used the change of variables \( k - k' = \tilde{k}/t^s \). To compute the integral \( I_1 \) we use that

\[
\mu_{\alpha, s}(k, t) \leq \mu_{\alpha, s'}(k, t),
\]

\[
\mu_{\alpha, s}(k, t) \cdot \mu_{\beta, s}(k, t) \leq \text{const.} \mu_{\alpha + \beta, s}(k, t),
\]

and, for \( k > t^{-s'} \),

\[
\frac{1}{t^s} \leq \text{const.} \frac{1}{t^s/2} \leq \text{const.} \frac{1}{2t^s/2} \leq \text{const.} \frac{1}{1 + (t^s/2)^2} \leq \frac{1}{t^s} \mu_{r, s'}(k, t),
\]

\[
\frac{1}{t^s} \leq \text{const.} \frac{1}{t^s/2} \leq \text{const.} \frac{1}{2t^s/2} \leq \text{const.} \frac{1}{1 + |k|t^s} \leq \text{const.} \frac{1}{t^s} \mu_{1, s'}(k, t).
\]

To prove (6.1), we note that

\[
I_1^{(6.1)} \leq \int_{-\infty}^{k/2} \frac{\mu_{\alpha, r}(k', t)}{|k'^{1/2}|} \frac{|k'^{1/2}|}{|k - k'|^{1/2}} \mu_{\beta, s}(k - k', t) dk' \\
\leq \int_{-\infty}^{k/2} \frac{\mu_{\alpha, r}(k', t)}{|k'^{1/2}|} \frac{|k'^{1/2}|}{|k - k'|^{1/2}} \mu_{\beta, s}(k - k', t) dk' \\
+ \int_{-\infty}^{k/2} \frac{\mu_{\alpha, r}(k', t)}{|k'^{1/2}|} \frac{|k'^{1/2}|}{|k - k'|^{1/2}} \mu_{\beta, s}(k - k', t) dk' \\
\leq \frac{|k|^{1/2}}{|k/2|^{1/2}} \mu_{\beta, s}(k/2, t) \int_{-\infty}^{k/2} \frac{\mu_{\alpha, r}(k', t)}{|k'|^{1/2}} dk' \\
+ \int_{-\infty}^{k/2} \frac{\mu_{\alpha, r}(k', t)}{|k'|^{1/2}} \frac{1}{t^s/2} \mu_{\beta - \frac{1}{2}, s}(k - k', t) dk' \\
\leq \frac{1}{t^s/2} \mu_{\beta - \frac{1}{2}, s}(k, t) \int_{-\infty}^{k/2} \frac{\mu_{\alpha, r}(k', t)}{|k'|^{1/2}} dk' \\
\leq \text{const.} \frac{1}{t^s/2} \mu_{\beta - \frac{1}{2}, s}(k, t) \frac{1}{t^s} \\
\leq \text{const.} \frac{t^s}{t^s} \mu_{\beta - \frac{1}{2}, s}(k, t) \mu_{\beta - \frac{1}{2}, s}(k, t) \frac{1}{t^s} \leq \text{const.} \frac{1}{t^s} \mu_{\beta, s}(k, t).
\]
where we have used the family of inequalities

\[(6.3) \quad |k|^\rho \mu_{\alpha,r}(k,t) \leq \text{const.} \frac{1}{t^{\rho r}} \mu_{\alpha-p,r}(k,t) \quad \text{for all } \rho > 0.\]

Finally, to prove (6.2), we note that

\[I_1^{(6.2)} \leq \int_{-\infty}^{k/2} \mu_{\alpha,r}(k',t) \frac{1}{|k(k-k')|} \mu_{\beta,s}(k-k',t) dk' \]

\[\leq \frac{t^{\epsilon'}}{t^{\epsilon'}} \frac{1}{|k(k/2)|} \mu_{\beta,s}(k/2,t) \int \mu_{\alpha,r}(k',t) dk' \]

\[\leq \text{const.} t^{\epsilon'} \mu_{\alpha,s}(k,t) \int \mu_{\alpha,r}(k',t) dk' \]

\[\leq \text{const.} \frac{1}{t^{\epsilon'-c\epsilon}} \mu_{\alpha+c,s}(k,t).\]

Collecting the bounds on the integrals \(I_{(6.1)}^{(6.2)}\), \(I_1^{(6.2)}\), and \(I_2\) proves the claim in Proposition 6.2. \[\square\]

**Corollary 6.3.** Let \(\alpha > 2\) and, for \(i = 1, 2\), \(p_i, q_i \geq 0\). Let \(f \in B_{\alpha,p_1,q_1}\) and \(g \in D^1_{\alpha-1,p_2,q_2}\). Let

\[p = \min \left\{ p_1 + p_2 + \frac{1}{2}, p_1 + q_2 + 1, q_1 + p_2 + \frac{1}{2} \right\}, \]

\[q = \min \left\{ q_1 + q_2 + 1, q_1 + p_2 + \frac{1}{2} \right\}.\]

Then \(f \ast g \in B_{\alpha,p,q}\), and there exists a constant \(C\), depending only on \(\alpha\), such that

\[\|f \ast g; B_{\alpha,p,q}\| \leq C \|f; B_{\alpha,p_1,q_1}\| \cdot \|g; D^1_{\alpha-1,p_2,q_2}\|.\]

**Proof.** We consider the three cases \(c \in \{0, \frac{1}{2}, 1\}\). Let \(\tilde{g}\) be a function in \(B^1_{\alpha-p,q}\), with \(\tilde{\alpha} = \alpha - c, \tilde{p}, \tilde{q} \geq 0\). The convolution product \(f \ast \tilde{g}\) is in each case bounded by a function in \(B^1_{\alpha-p,q}\) with \(p\) and \(q\) given by the following:

- if \(c = 0\), \(p = \min\{p_1 + \tilde{p} + \frac{1}{2}, p_1 + \tilde{q} + 1, q_1 + \tilde{p} + \frac{1}{2}\}\), \(q = \min\{q_1 + \tilde{q} + 1, q_1 + \tilde{p} + \frac{1}{2}\}\);

- if \(c = \frac{1}{2}\), \(p = \min\{p_1 + \tilde{p} + \frac{1}{2}, p_1 + \tilde{q} + 1, q_1 + \tilde{p} + \frac{1}{2}\}\), \(q = \min\{q_1 + \tilde{q} + 1, q_1 + \tilde{p} + \frac{1}{2}\}\);

- if \(c = 1\), \(p = \min\{p_1 + \tilde{p} + 1, p_1 + \tilde{q} + 0, q_1 + \tilde{p} + \frac{1}{2}\}\), \(q = \min\{q_1 + \tilde{q} + 0, q_1 + \tilde{p} + \frac{1}{2}\}\).

These are consequences of Proposition 6.2. Using (6.1) for the first case and (6.2) for the following two cases, and choosing \(s' = 1\) to bound the term \(\frac{1}{t^{\epsilon'}} \mu_{\alpha} \ast \frac{1}{t^{\epsilon'}} \mu_{\tilde{\alpha}}\), it is now clear that for a function in \(D^1_{\alpha-1,p_2,q_2}\), the terms that yield the lowest \(p\) and \(q\) are covered by the \(c = 0\) case above, because what is lost in the bounds on convolution due to lower \(\tilde{\alpha}\) is gained through higher values of \(\tilde{p}\) and \(\tilde{q}\) by definition of the space \(D^1_{\alpha-1,p_2,q_2}\). This corollary allows us to streamline the notation and shorten calculations throughout the paper. \[\square\]

**7. Bounds on \(\hat{d}\).** We present some elementary inequalities and expressions used throughout this section. Throughout the calculations we will use without further mention that for all \(z \in \mathbb{C}\) with \(\text{Re}(z) \leq 0\) and \(N \in \mathbb{N}_0\),

\[\left| e^z - \sum_{n=0}^{N} \frac{1}{n!} z^n \right| \leq \text{const.} ,\]
and for all \( z \in \mathbb{C} \) with \( \text{Re}(z) > 0 \)
\[
\left| \frac{e^z - \sum_{n=0}^{N} \frac{1}{n!} z^n}{z^{N+1}} \right| \leq \text{const. } e^{\text{Re}(z)}.
\]

We also have that
\[
\partial_k \kappa = \frac{2k - i}{2\kappa}.
\]

By definition of the norm on \( \mathcal{D}_{\alpha-1}^1 \) we must bound \( \kappa \partial_k \kappa \). We thus bound all the terms \( \kappa \partial_k \omega_{l,n,m} \), with \( l = 1,2,3 \), \( n = 1,2,3 \), and \( m = 0,1 \) (see definitions (3.11), (3.12)–(3.14), and (3.5)–(3.22)). This requires a good deal of book-keeping to track what happens to \( \alpha, p, \) and \( q \). Some of it may be spared when one realizes that all losses in \( \alpha \) occur when applying (6.3) where there are explicit factors \( |k|^r \) with \( c = \{ \frac{1}{2},1 \} \), which automatically brings forth a structure satisfying the conditions of Corollary 6.3. This allows us to show that each component \( \partial_k \omega_{l,n,m} \) is an element of \( \mathcal{D}_{\alpha-l}^1 \) without explicit mention throughout these proofs. We thus bound all the losses in \( \omega_l \). From (5.4) we obtain, for \( i = 0,1 \),
\[
\left| \hat{Q}_i(k,s) \right| \leq \left\| \hat{Q}_i; \mathcal{B}_{\alpha,\frac{3}{2}+\frac{1}{3}} \right\| \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right),
\]
which we will use throughout without further mention. We also make use of (4.5) and (6.3) without explicit mention throughout these proofs.

The bounds for the terms \( n = 2 \) take advantage of the fact that, for \( 1 \leq t < 2 \),
\[
\hat{\mu}_\alpha(k,t) \leq \text{const. } \hat{\mu}_\alpha(k,t) \leq \text{const.}
\]
and, for \( t \geq 2 \) and \( \alpha' > 0 \),
\[
e^{|A-1(t-1)|} \hat{\mu}_{\alpha',\tau}(k,t) \leq \text{const. } e^{|A-1(t-1)|} \leq \text{const. } \hat{\mu}_\alpha(k,t),
\]
so that the inequality
\[
e^{|A-1(t-1)|} \hat{\mu}_{\alpha',\tau}(k,t) \leq \text{const. } \hat{\mu}_\alpha(k,t)
\]
holds for all \( t \) and \( \alpha > 0 \).

### 7.1. Bounds on \( \hat{d}_1 \)

To show that \( \hat{d}_1 = \sum_{m=0}^{1} \sum_{n=1}^{3} \partial_k \omega_{1,n,m} \) is in \( \mathcal{D}_{\alpha-l}^1 \), which constitutes the first part of Proposition 5.1, we first need to recall a proposition proved in [14].

**Proposition 7.1.** Let \( f_{n,m} \) be as given in section 3. Then we have the bounds

\[
\begin{align*}
|f_{1,0}(k,\sigma)| & \leq \text{const. } e^{|A-1\sigma| \min \{ |\Lambda_+|, |\Lambda_-|, |\Lambda_-|^3 \sigma^2 \}} , \\
|f_{2,0}(k,\sigma)| & \leq \text{const. } (|k| + |k|^1/2) e^{-|k|\sigma} , \\
|f_{3,0}(k,\sigma)| & \leq \text{const. } e^{A-\sigma} \min \{ 1, |\Lambda_-| \} , \\
|f_{1,1}(k,\sigma)| & \leq \text{const. } (1 + |\Lambda_+|) e^{A-\sigma} \min \{ 1, |\Lambda_-| \} , \\
|f_{2,1}(k,\sigma)| & \leq \text{const. } (1 + |k|) e^{-|k|\sigma} , \\
|f_{3,1}(k,\sigma)| & \leq \text{const. } e^{A-\sigma} \min \{ 1, |\Lambda_-| \}
\end{align*}
\]

uniformly in \( \sigma \geq 0 \) and \( k \in \mathbb{R}_0 \).
We then note that
\[
|\kappa \partial_t \hat{K}_n(k, \tau)| = \left| e^{-\kappa \tau} \frac{2k - i}{2\kappa} e^{-n\tau} \right| \leq \text{const. } \tau (1 + |k|) e^{\Lambda - \tau} \text{ for } n = 1, 2,
\]
\[
|\kappa \partial_t \hat{K}_3(k, \tau)| = \left| e^{-\kappa \tau} \frac{2k - i}{2\kappa} (e^{n\tau} + e^{-n\tau}) \right| \leq \text{const. } \tau (1 + |k|) (e^{\Lambda - \tau} + e^{\Lambda - n\tau}).
\]

The bound on the function \(\kappa \partial_t \hat{\omega}_{1,0}\) uses (7.2) and Propositions A.1 and A.2, leading to
\[
|\kappa \partial_t \hat{\omega}_{1,0}| = \left| \frac{1}{2} \kappa e^{-\kappa \tau} \int_1^t \hat{f}_{1,0}(k, \sigma) \hat{Q}_0(k, \sigma) d\sigma \right|
\leq \text{const. } \tau (1 + |k|) e^{\Lambda - \tau} \int_1^t \left( |\Lambda| - |\Lambda| - |\Lambda| \right) \left( \frac{1}{s^2} \dot{\mu}_\alpha + \frac{1}{s^2} \ddot{\mu}_\alpha \right) d\sigma
\leq \text{const. } \tau (1 + |k|) e^{\Lambda - \tau} \int_1^t \left( |\Lambda| - |\Lambda| \right) \left( \frac{1}{s^2} \dot{\mu}_\alpha + \frac{1}{s^2} \ddot{\mu}_\alpha \right) d\sigma
\leq \text{const. } (1 + |k|) \left( \frac{1}{t^2} \dot{\mu}_\alpha + \frac{1}{t^2} \ddot{\mu}_\alpha \right),
\]
which shows that \(\kappa \partial_t \hat{\omega}_{1,0} \in \mathcal{D}^{1,\frac{5}{4}}_{\alpha,1,2} \).

The bound on the function \(\kappa \partial_t \hat{\omega}_{1,2,0}\) uses (7.3), Proposition A.4, and (7.1), leading to
\[
|\kappa \partial_t \hat{\omega}_{1,2,0}| = \left| \frac{1}{2} \kappa e^{-\kappa \tau} \int_1^t \hat{f}_{1,2,0}(k, \sigma) \hat{Q}_0(k, \sigma) d\sigma \right|
\leq \text{const. } \tau (1 + |k|) e^{\Lambda - \tau} \int_1^t \left( |\Lambda| - |\Lambda| - |\Lambda| \right) \left( \frac{1}{s^2} \dot{\mu}_\alpha + \frac{1}{s^2} \ddot{\mu}_\alpha \right) d\sigma
\leq \text{const. } (1 + |k|) \left( \frac{1}{t^2} \dot{\mu}_\alpha + \frac{1}{t^2} \ddot{\mu}_\alpha \right),
\]
which shows that \(\kappa \partial_t \hat{\omega}_{1,2,0} \in \mathcal{D}^{1,\frac{5}{4}}_{\alpha,1,2} \).

The bound on the function \(\kappa \partial_t \hat{\omega}_{1,3,0}\) uses (7.4) and Proposition A.3, leading to
\[
|\kappa \partial_t \hat{\omega}_{1,3,0}| = \left| \frac{1}{2} \kappa e^{-\kappa \tau} \int_1^t \hat{f}_{1,3,0}(k, \sigma) \hat{Q}_0(k, \sigma) d\sigma \right|
\leq \text{const. } \tau (1 + |k|) (e^{\Lambda - \tau} + e^{\Lambda - \tau})
\times \int_1^t \min \{1, |\Lambda|\} e^{\Lambda - \tau} \left( \frac{1}{s^2} \dot{\mu}_\alpha + \frac{1}{s^2} \ddot{\mu}_\alpha \right) d\sigma
\leq \text{const. } e^{\Lambda - \tau} \int_1^t \left( 1 + |\Lambda| \right) \min \{1, |\Lambda|\} e^{\Lambda - \tau} \left( \frac{1}{s^2} \dot{\mu}_\alpha + \frac{1}{s^2} \ddot{\mu}_\alpha \right) d\sigma
\leq \text{const. } \left( \frac{1}{t^2} \dot{\mu}_\alpha + \frac{1}{t^2} \ddot{\mu}_\alpha \right),
\]
which shows that \(\kappa \partial_t \hat{\omega}_{1,3,0} \in \mathcal{D}^{1,\frac{5}{4}}_{\alpha,1,2} \).
The bound on the function $\kappa \partial_k \hat{\omega}_{1,1,1}$ uses (7.5) and Propositions A.1 and A.2, leading to

$$
|\kappa \partial_k \hat{\omega}_{1,1,1}| = \left| \frac{1}{2} \kappa \partial_k e^{-\kappa \tau} \int_1^t f_{1,1,1}(k, s-1) \hat{Q}_1(k, s) ds \right|
\leq \text{const. } \tau (1 + |k|) e^{\Lambda_\tau} \int_1^t (1 + |\Lambda_-|) e^{\Lambda_- |\sigma|} \min(1, |\Lambda_-| |\sigma|) \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{s^2} \bar{\mu}_\alpha \right) ds
\leq \text{const. } (1 + |k|) \left( \frac{1}{t^2} \bar{\mu}_\alpha + \frac{1}{t^2} \bar{\mu}_\alpha \right),
$$

which shows that $\kappa \partial_k \hat{\omega}_{1,1,1} \in D^1_{\alpha-1, \frac{1}{4}, 0}$.

The bound on the function $\kappa \partial_k \hat{\omega}_{1,2,1}$ uses (7.6), Proposition A.4, and (7.1), leading to

$$
|\kappa \partial_k \hat{\omega}_{1,2,1}| = \left| \frac{1}{2} \kappa \partial_k e^{-\kappa \tau} \int_1^t f_{2,1,1}(k, s-1) \hat{Q}_1(k, s) ds \right|
\leq \text{const. } (1 + |k|) \tau e^{\Lambda_\tau} \int_1^t (1 + |\alpha|) e^{-|\alpha| |\sigma|} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{s^2} \bar{\mu}_\alpha \right) ds
\leq \text{const. } (1 + |k|) e^{\Lambda_\tau} \left( \frac{1}{t^2} \bar{\mu}_\alpha + \frac{1}{t^2} \bar{\mu}_\alpha \right) \leq \text{const. } (1 + |k|) \frac{1}{t^2} \bar{\mu}_\alpha,
$$

which shows that $\kappa \partial_k \hat{\omega}_{1,2,1} \in D^1_{\alpha-1, \frac{1}{4}, 0}$.

The bound on the function $\kappa \partial_k \hat{\omega}_{1,3,1}$ uses (7.7) and Proposition A.3, leading to

$$
|\kappa \partial_k \hat{\omega}_{1,3,1}| = \left| \frac{1}{2} \kappa \partial_k (e^{\kappa \tau} - e^{-\kappa \tau}) \int_1^t f_{3,1,1} \hat{Q}_1(k, s) ds \right|
\leq \text{const. } \tau (1 + |k|) (e^{\Lambda_-} + e^{\Lambda_-}) \int_1^t e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{s^2} \bar{\mu}_\alpha \right) ds
\leq \text{const. } \tau (e^{\Lambda_-} + e^{\Lambda_-}) \int_1^t (1 + |\Lambda_-|) e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{s^2} \bar{\mu}_\alpha \right) ds
\leq \text{const. } \left( \frac{1}{t^2} \bar{\mu}_\alpha(k, t) + \frac{1}{t^2} \bar{\mu}_\alpha(k, t) \right),
$$

which shows that $\kappa \partial_k \hat{\omega}_{1,3,0} \in D^1_{\alpha-1, \frac{1}{4}, 0}$.

Collecting the bounds, we find that $\hat{d}_1 \in D^1_{\alpha-1, \frac{1}{4}, 0}$, which completes the first part of the proof of Proposition 5.1.

**7.2. Bounds on $d_2$.** To show that $\hat{d}_2 = \sum_{m=0}^1 \sum_{n=1}^3 \partial_k \hat{\omega}_{2,n,m}$ is in $D^1_{\alpha-1, \frac{1}{4}, 0}$, which constitutes the second part of the proof of Proposition 5.1, we first need to show bounds on the functions $\partial_k f_{n,m}$.
Proposition 7.2. Let \( \partial_k f_{n,m} \) be as given in section 3. Then we have the bounds

(7.8) \[ |\kappa \partial_k \tilde{f}_1,0(k, \sigma)| \leq \text{const. } \min \{(1 + |\Lambda_+| \sigma), (s + |\Lambda_-|) |\Lambda_-|^2 \sigma \} e^{\Lambda_- |\sigma|}, \]

(7.9) \[ |\kappa \partial_k \tilde{f}_2,0(k, \sigma)| \leq \text{const. } (|k|^2 + |k|^2 \sigma e^{-|k| \sigma}), \]

(7.10) \[ |\kappa \partial_k \tilde{f}_3,0(k, \sigma)| \leq \text{const. } (1 + |\Lambda_-| \sigma) e^{\Lambda_- \sigma}, \]

(7.11) \[ |\kappa \partial_k \tilde{f}_1,1(k, \sigma)| \leq \text{const. } (1 + |\Lambda_-|^2) \sigma e^{\Lambda_- |\sigma|}, \]

(7.12) \[ |\kappa \partial_k \tilde{f}_2,1(k, \sigma)| \leq \text{const. } (1 + |k|^2) \sigma e^{-|k| \sigma}, \]

(7.13) \[ |\kappa \partial_k \tilde{f}_3,1(k, \sigma)| \leq \text{const. } (1 + |\Lambda_-|) \sigma e^{\Lambda_- \sigma} \]

uniformly in \( \sigma \geq 0 \) and \( k \in \mathbb{R}_0 \).

Proof. We multiply (3.17)–(3.22) by \( \kappa \) and bound the products. The function \( \kappa \partial_k \tilde{f}_{1,0} \) is bounded in two ways. We have a straightforward bound

\[ |\kappa \partial_k \tilde{f}_{1,0}(k, \sigma)| \leq \text{const. } (1 + |\Lambda_-| \sigma) e^{\Lambda_- |\sigma|}. \]

Since leading terms cancel, we get

\[
\begin{align*}
|\kappa \partial_k \tilde{f}_{1,0}(k, \sigma)| &\leq \frac{i}{2} \left( e^{\kappa \sigma} + e^{-\kappa \sigma} - 2e^{-|k| \sigma} \right) - \frac{i k^2}{2 \kappa^2} \left( e^{\kappa \sigma} - e^{-\kappa \sigma} \right) \\
&\quad + \left( \frac{k^2 + |k| \kappa}{k} (e^{-|k| \sigma} - e^{-\kappa \sigma}) + i \frac{k^2 + \kappa^2}{2 \kappa} (e^{\kappa \sigma} - e^{-\kappa \sigma}) \right) \\
&\quad + \left( \frac{k^2 + |k| \kappa^2 + \kappa^2}{k} e^{-\kappa \sigma} - 2 \kappa \frac{2 + |k| \kappa}{k} e^{-|k| \sigma} \right) \\
&\leq \text{const. } \left( (e^{\kappa \sigma} - 1 - \kappa \sigma) + (e^{-\kappa \sigma} - 1 + \kappa \sigma) - 2(e^{-|k| \sigma} - 1) \right) \\
&\quad + \text{const. } \frac{k^2}{\kappa^2} \left( (e^{\kappa \sigma} - 1 - (e^{-\kappa \sigma} - 1) \right) \\
&\quad + \text{const. } |\Lambda_-| \frac{1}{(e^{-|k| \sigma} - 1 - (e^{-\kappa \sigma} - 1) \right) \\
&\quad + \text{const. } \frac{k^2 + \kappa^2}{2 \kappa} \left( (e^{\kappa \sigma} - 1 - (e^{-\kappa \sigma} - 1) \right) \sigma \\
&\quad + \text{const. } \frac{k^2 + |k| \kappa^2 + \kappa^2}{k} e^{-\kappa \sigma} \sigma + \text{const. } \frac{k^2 + |k| \kappa}{k} e^{-|k| \sigma} \sigma \\
&\leq \text{const. } \left( |\Lambda_-| \sigma e^{\Lambda_- |\sigma|} + \text{const. } |\Lambda_-| \sigma e^{\Lambda_- |\sigma|} \\
&\quad + \text{const. } |\Lambda_-| \sigma e^{\Lambda_- |\sigma|} + \text{const. } |\Lambda_-| \sigma e^{\Lambda_- |\sigma|} \right) \\
&\leq \text{const. } (s + |\Lambda_-|) |\Lambda_-|^2 \sigma e^{\Lambda_- |\sigma|}. \\
\end{align*}
\]

Then we have

\[ |\kappa \partial_k \tilde{f}_{1,0}(k, \sigma)| \leq \text{const. } \min \{(1 + |\Lambda_-| \sigma), (s + |\Lambda_-|) |\Lambda_-|^2 \sigma \} e^{\Lambda_- |\sigma|}, \]

which proves (7.8).

To bound \( \kappa \partial_k \tilde{f}_{2,0}(k, \sigma) \) we use that, since \( |k| \leq \text{Re}(\kappa) \) for all \( k \),

\[
\begin{align*}
|e^{-|k| \sigma} - e^{-\kappa \sigma}| &\leq \text{const. } e^{-|k| |\sigma|} \left| 1 - e^{(|k| - \kappa) \sigma} \right| \\
&\leq \text{const. } e^{-|k| |\sigma|} |k| - \kappa | \sigma \\
&\leq \text{const. } (|k|^2 + |k|) \sigma e^{-|k| \sigma},
\end{align*}
\]
such that
\[
|\kappa \partial_k \tilde{f}_{2,0}(k, \sigma)| \\
\leq \left| \frac{(|k| + \kappa)^2}{k} e^{-|k|\sigma} - e^{-\kappa \sigma} \right| - 2^{\kappa + |k|} \left( |k| \kappa e^{-|k|\sigma} - \frac{k^2 + \kappa^2}{2} e^{-\kappa \sigma} \right) \sigma \\
\leq \text{const.} \ (1 + |k|)(|k| + |k|) e^{-|k|\sigma} + \text{const.} \ (|k| + |k|^2) e^{-|k|\sigma} \\
+ \text{const.} \ (|k| + |k|) e^{-|k|\sigma} \\
\leq \text{const.} \ (|k| + |k|^2) e^{-|k|\sigma},
\]
which gives (7.9).

To bound \( \kappa \partial_k \tilde{f}_{3,0}(k, \sigma) \) we have the straightforward bound
\[
|\kappa \partial_k \tilde{f}_{3,0}(k, \sigma)| \leq \left| \frac{k^2 + \kappa^2}{2k^3} e^{-\kappa \sigma} \right| \\
\leq \text{const.} \ (1 + |\Lambda^-|) \sigma e^{\Lambda^- \sigma},
\]
which yields (7.10).

To bound \( \kappa \partial_k \tilde{f}_{1,1}(k, \sigma) \) we have
\[
|\kappa \partial_k \tilde{f}_{1,1}(k, \sigma)| \leq \left| \frac{i(|k| + \kappa)^2}{|k|} e^{-|k|\sigma} - e^{-\kappa \sigma} \right| + \left| \frac{k^2 + \kappa^2}{2k^2} e^{\kappa \sigma} + e^{-\kappa \sigma} \right| \\
+ \left| 2i(\kappa + |k| + |k|) \kappa e^{-|k|\sigma} \right| \\
\leq \text{const.} \ (1 + |k| + |\Lambda^-|) \sigma + \text{const.} \ (1 + |k|) \sigma e^{\Lambda^- \sigma} \\
+ \text{const.} \ |\Lambda^-|(1 + |k| + |\Lambda^-|) \sigma \leq \text{const.} \ (1 + |\Lambda^-|^2) \sigma e^{\Lambda^- \sigma},
\]
and thus we have (7.11).

To bound \( \kappa \partial_k \tilde{f}_{2,1}(k, \sigma) \) we use (7.14) to bound
\[
|\kappa \partial_k \tilde{f}_{2,1}(k, \sigma)| \leq \left| \frac{i(|k| + \kappa)^2}{|k|} e^{-|k|\sigma} - e^{-|k|\sigma} \right| + \left| i(|k| + \kappa) \kappa e^{-|k|\sigma} \right| \\
+ \left| 2i\kappa (|k| + \kappa) e^{-|k|\sigma} \right| \\
\leq \text{const.} \ (1 + |k|)(|k| + |k|) e^{-|k|\sigma} \\
+ \text{const.} \ (|k| + |k|^2)(1 + |k|^{-1}) e^{-|k|\sigma} \\
+ \text{const.} \ (|k| + |k|^2) e^{-|k|\sigma} \leq \text{const.} \ (1 + |k|^2) e^{-|k|\sigma},
\]
which leads to (7.12).

Finally, to bound \( \kappa \partial_k \tilde{f}_{3,1}(k, \sigma) \) we have the straightforward bound
\[
|\kappa \partial_k \tilde{f}_{3,1}(k, \sigma)| \leq \left| \frac{k^2 + \kappa^2}{2k^2} e^{-\kappa \sigma} \right| \leq \text{const.} \ (1 + |\Lambda^-|) \sigma e^{\Lambda^- \sigma},
\]
and therefore we have (7.13). This completes the proof of Proposition 7.2. \( \square \)
We may now bound $\hat{d}_2$. The bound on the function $\kappa \partial_k \hat{\omega}_{2,1,0}$ uses (7.8) and Propositions A.1 and A.2, leading to

$$
|\kappa \partial_k \hat{\omega}_{2,1,0}| = \left| \frac{1}{2} e^{-\kappa \tau} \int_1^t \kappa \partial_k \hat{f}_{1,0}(k, \sigma) \hat{Q}_0(k, s) ds \right|
$$

$$
\leq \text{const.} \ e^{\Lambda - \tau} \int_1^t \min \{ (1 + |\Lambda_-| \sigma), (s + |\Lambda_-|)|\Lambda_-|^2 \sigma \} e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\leq \text{const.} \ e^{\Lambda - \tau} \int_1^t (s + |\Lambda_-|)|\Lambda_-|^2 \sigma e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\text{+ const.} \ e^{\Lambda - \tau} \int_1^t (1 + |\Lambda_-|) e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\leq \text{const.} \ (1 + |\Lambda_-|) \frac{1}{t^2} \hat{\mu}_\alpha + \text{const.} \ \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right),
$$

which shows that $\kappa \partial_k \hat{\omega}_{2,1,0} \in D_{\alpha - 1, \frac{5}{2}, \frac{5}{2}}^1$.

The bound on the function $\kappa \partial_k \hat{\omega}_{2,2,0}$ uses (7.9), Proposition A.4, and (7.1), leading to

$$
|\kappa \partial_k \hat{\omega}_{2,2,0}| = \left| \frac{1}{2} e^{-\kappa \tau} \int_1^t \kappa \partial_k \hat{f}_{2,0}(k, s - 1) \hat{Q}_0(k, s) ds \right|
$$

$$
\leq \text{const.} \ e^{\Lambda - \tau} \int_1^t (|k| + |k|^2) \sigma e^{-|k| \sigma} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\leq \text{const.} \ (1 + |k|) e^{\Lambda - \tau} \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right) \leq \text{const.} \ (1 + |k|) \frac{1}{t^2} \hat{\mu}_\alpha,
$$

which shows that $\kappa \partial_k \hat{\omega}_{2,2,0} \in D_{\alpha - 1, \infty, 1}^1$.

The bound on the function $\kappa \partial_k \hat{\omega}_{2,3,0}$ uses (7.10) and Proposition A.3, leading to

$$
|\kappa \partial_k \hat{\omega}_{2,3,0}| = \left| \frac{1}{2} (e^{\kappa \tau} - e^{-\kappa \tau}) \int_1^t \kappa \partial_k \hat{f}_{3,0}(k, s - 1) \hat{Q}_0(k, s) ds \right|
$$

$$
\leq \text{const.} \ e^{\Lambda - \tau} \int_1^t (1 + |\Lambda_-|) e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\leq \text{const.} \ e^{\Lambda - \tau} \int_1^t e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\text{+ const.} \ e^{\Lambda - \tau} \int_1^t |\Lambda_-| e^{\Lambda_- |\sigma|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds
$$

$$
\leq \text{const.} \ \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right),
$$

which shows that $\kappa \partial_k \hat{\omega}_{2,3,0} \in D_{\alpha - 1, \frac{5}{2}, \frac{5}{2}}^1$.

The bound on the function $\kappa \partial_k \hat{\omega}_{2,1,1}$ uses (7.11) and Propositions A.1 and A.2,
leading to

$$|\kappa \partial_k \hat{\omega}_{2,1,1}| = \frac{1}{2} e^{-\kappa t} \int_1^t \kappa \partial_k \hat{f}_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds$$

$$\leq \text{const. } e^{\lambda - \tau} \int_1^t \kappa \partial_k \hat{f}_{1,1}(k, s - 1) \hat{Q}_1(k, s) ds$$

$$\leq \text{const. } \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right) + \text{const. } |\lambda_\sigma| \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right),$$

which shows that $\kappa \partial_k \hat{\omega}_{2,1,1} \in D^{\alpha,0}_1$. 

The bound on the function $\kappa \partial_k \hat{\omega}_{2,2,1}$ uses (7.12), Proposition A.4, and (7.1), leading to

$$|\kappa \partial_k \hat{\omega}_{2,2,1}| = \frac{1}{2} e^{-\kappa t} \int_t^\infty \kappa \partial_k \hat{f}_{2,1}(k, s - 1) \hat{Q}_1(k, s) ds$$

$$\leq \text{const. } e^{\lambda_\sigma - \tau} e^{\lambda |s|} \int_t^\infty (1 + |\lambda_\sigma|) e^{\lambda |t|} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds$$

$$\leq \text{const. } (1 + |k|) e^{\lambda_\sigma} \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right) \leq \text{const. } (1 + |k|) \frac{1}{t^2} \hat{\mu}_\alpha,$$

which shows that $\kappa \partial_k \hat{\omega}_{2,2,1} \in D^{\alpha,0}_1$.

The bound on the function $\kappa \partial_k \hat{\omega}_{2,3,1}$ uses (7.13) and Proposition A.3, leading to

$$|\kappa \partial_k \hat{\omega}_{2,3,1}| = \frac{1}{2} (e^{\kappa t} - e^{-\kappa t}) \int_t^\infty \kappa \partial_k \hat{f}_{3,1}(k, s) \hat{Q}_1(k, s) ds$$

$$\leq \text{const. } (e^{\lambda_\sigma} - e^{\lambda_\sigma}) \int_t^\infty (1 + |\lambda_\sigma|) e^{\lambda_\sigma} \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right) ds$$

$$\leq \text{const. } \left( \frac{1}{t^2} \hat{\mu}_\alpha + \frac{1}{t^2} \hat{\mu}_\alpha \right),$$

which shows that $\kappa \partial_k \hat{\omega}_{2,3,1} \in D^{\alpha,0}_1$.

Collecting the bounds we have that $\hat{d}_2 \in D^{\alpha,0}_1$, which completes the second part of the proof of Proposition 5.1.

### 7.3. Bounds on $\hat{d}_3$.

We prove the bounds on $\hat{d}_3$ needed to complete the proof of Lemma 5.3. For compatibility with the maps $\Sigma_1$ and $\Sigma_2$ we will bound $\kappa \partial_k \hat{d}_3$ instead of $\hat{d}_3$. Throughout this proof we will use without further mention the bounds

$$|\partial_k \hat{Q}_0(k, s)| \leq \|\partial_k \hat{Q}_0\| \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right),$$

$$|\partial_k \hat{Q}_1(k, s)| \leq \|\partial_k \hat{Q}_1\| \left( \frac{1}{s^2} \hat{\mu}_\alpha + \frac{1}{s^2} \hat{\mu}_\alpha \right).$$
The bound on the function $\kappa \partial_k \hat{\omega}_{3,1,0}$ uses (7.2) and Propositions A.1 and A.2, leading to

$$|\kappa \partial_k \hat{\omega}_{3,1,0}| = \left| \frac{1}{2} e^{-\kappa \tau} \int_1^t \hat{f}_{1,0}(k, \sigma) \kappa \partial_k \hat{Q}_0(k, s) \, ds \right|$$

$$\leq \text{const.} |\Lambda_-| e^{\Lambda_- \tau} \int_1^t e^{(1+|k|) \Lambda_- |\xi|^2} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$\leq \text{const.} |\Lambda_-| e^{\Lambda_- \tau} \int_1^t e^{(1+|k|) \Lambda_- |\xi|^2} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$+ \text{const.} |\Lambda_-| e^{\Lambda_- \tau} \int_1^t e^{(1+|k|) \Lambda_- |\xi|^2} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$\leq \text{const.} |\Lambda_-| \left( \frac{1}{t^2} \bar{\mu}_\alpha + \frac{1}{12} \bar{\mu}_\alpha \right),$$

which shows that $\kappa \partial_k \hat{\omega}_{3,1,0} \in D^1_{-1, \frac{3}{2}}$.

The bound on the function $\kappa \partial_k \hat{\omega}_{3,2,0}$ uses (7.3), (7.1), and Proposition A.4, which, to be applicable, requires first the use of (6.3) to trade a $|k|$ for an $s^{-1}$ multiplying $\bar{\mu}_\alpha$ and $\bar{\mu}_\alpha$. We then have

$$|\kappa \partial_k \hat{\omega}_{3,2,0}| = \left| \frac{1}{2} e^{-\kappa \tau} \int_t^\infty \hat{f}_{2,0}(k, s-1) \kappa \partial_k \hat{Q}_0(k, s) \, ds \right|$$

$$\leq \text{const.} e^{\Lambda_- \tau} \int_t^\infty (|k| + |k|^\frac{1}{2})(|k|^\frac{1}{2} + |k|) e^{-|k| \sigma} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$\leq \text{const.} e^{\Lambda_- \tau} \int_t^\infty |k| e^{-|k| \sigma} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$+ \text{const.} e^{\Lambda_- \tau} \int_t^\infty (1 + |k|) e^{-|k| \sigma} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$\leq \text{const.} e^{\Lambda_- \tau} \left( \frac{1}{t^2} \bar{\mu}_\alpha + \frac{1}{t^2} \bar{\mu}_\alpha \right)$$

$$\leq \text{const.} \left( \frac{1}{t^2} \bar{\mu}_\alpha + \frac{1}{t^2} \bar{\mu}_\alpha \right),$$

which shows that $\kappa \partial_k \hat{\omega}_{3,2,0} \in D^1_{-1, \frac{3}{2}}$.

The bound on the function $\kappa \partial_k \hat{\omega}_{3,3,0}$ uses (7.4) and Proposition A.3, which, to be applicable, requires first the use of (6.3) to trade a $|\Lambda_-|$ for an $s^{-1/2}$ multiplying $\bar{\mu}_\alpha$. We then have

$$|\kappa \partial_k \hat{\omega}_{3,3,0}| = \left| \frac{1}{2} (e^{\kappa \tau} - e^{-\kappa \tau}) \int_t^\infty \hat{f}_{3,0}(k, s-1) \kappa \partial_k \hat{Q}_0(k, s) \, ds \right|$$

$$\leq \text{const.} e^{\Lambda_- \tau} \int_t^\infty \min\{1, |\Lambda_-|\} e^{\Lambda_- \sigma} |\Lambda_-| \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$\leq \text{const.} e^{\Lambda_- \tau} \int_t^\infty |\Lambda_-| e^{\Lambda_- \sigma} \left( \frac{1}{s^2} \bar{\mu}_\alpha + \frac{1}{8} \bar{\mu}_\alpha \right) \, ds$$

$$\leq \text{const.} \left( \frac{1}{t^2} \bar{\mu}_\alpha + \frac{1}{t^2} \bar{\mu}_\alpha \right),$$

which shows that $\kappa \partial_k \hat{\omega}_{3,3,0} \in D^1_{-1, \frac{3}{2}}$. 
The bound on the function $\kappa\partial_\kappa \hat{\omega}_{3,1,1}$ uses (7.5) and Propositions A.1 and A.2, leading to

$$|\kappa\partial_\kappa \hat{\omega}_{3,1,1}| = \left| \frac{1}{2} e^{-\kappa r} \int_1^t f_{1,1}(k, s - 1) \kappa \partial_\kappa \hat{Q}_1(k, s) ds \right|$$

$$\leq \text{const.} \ e^{\Lambda_0 - r} \int_1^t (1 + |\Lambda_-|) e^{\Lambda_- |\sigma|} \min\{1, |\Lambda_-| \} \left| \Lambda_- \right| \left( \frac{1}{s^2} \bar{\mu}_\sigma + \frac{1}{s^2} \bar{\mu}_\alpha \right) \ ds$$

$$\leq \text{const.} \ (1 + |\Lambda_-|) e^{\Lambda_0 - r} \int_1^t |\Lambda_-| e^{\Lambda_- |\sigma|} \left| \Lambda_- \right| \left( \frac{1}{s^2} \bar{\mu}_\sigma + \frac{1}{s^2} \bar{\mu}_\alpha \right) \ ds$$

which shows that $\kappa\partial_\kappa \hat{\omega}_{3,1,1} \in D_{\alpha-1, \frac{3}{2}, 2}^1$.

The bound on the function $\kappa\partial_\kappa \hat{\omega}_{3,2,1}$ uses (7.6), Proposition A.4, and (7.1), leading to

$$|\kappa\partial_\kappa \hat{\omega}_{3,2,1}| = \left| \frac{1}{2} e^{-\kappa r} \int_1^t f_{2,1}(k, s - 1) \kappa \partial_\kappa \hat{Q}_1(k, s) ds \right|$$

$$\leq \text{const.} \ e^{\lambda - r} \int_1^t (1 + |k|) |\Lambda_-| e^{-|k| |\sigma|} \left( \frac{1}{s^2} \bar{\mu}_\sigma + \frac{1}{s^2} \bar{\mu}_\alpha \right) \ ds$$

which shows that $\kappa\partial_\kappa \hat{\omega}_{3,2,1} \in D_{\alpha-1, \infty, 1}^1$.

The bound on the function $\kappa\partial_\kappa \hat{\omega}_{3,3,1}$ uses (7.7) and Proposition A.3, leading to

$$|\kappa\partial_\kappa \hat{\omega}_{3,3,1}| = \left| \frac{1}{2} \left( e^{|k| r} - e^{-\kappa r} \right) \int_1^t f_{3,1} \kappa \partial_\kappa \hat{Q}_1(k, s) ds \right|$$

$$\leq \text{const.} \ (e^{\lambda - |\sigma|} + e^{\Lambda_0 - r}) \int_1^t e^{\Lambda_0 - |\sigma|} |\Lambda_-| \left( \frac{1}{s^2} \bar{\mu}_\sigma + \frac{1}{s^2} \bar{\mu}_\alpha \right) \ ds$$

which shows that $\kappa\partial_\kappa \hat{\omega}_{3,3,1} \in D_{\alpha-1, \frac{3}{2}, 2}^1$.

Collecting the bounds we have that $\hat{d}_3 \in D_{\alpha-1, \frac{3}{2}, 1}^1 \subset D_{\alpha-1, \frac{3}{2}, 0}^1$, which proves Lemma 5.3.

**Appendix. Convolution with the semigroups $e^{\Lambda_0 - t}$ and $e^{-|k| t}$.** To make this paper self-contained, we recall the following results proved in [14]. In order to bound the integrals over the interval $[1, t]$ we systematically split them into integrals over $[1, \frac{k+1}{2}]$ and integrals over $[\frac{k+1}{2}, t]$ and bound the resulting terms separately. For the semigroup $e^{\Lambda_0 - t}$ we have the following.

Copyright © by SIAM. Unauthorized reproduction of this article is prohibited.
Proposition A.1. Let \( \alpha \geq 0, \ r \geq 0, \delta \geq 0, \) and \( \gamma + 1 \geq \beta \geq 0. \) Then
\[
e^{-\Lambda_{-}(t-1)} \int_{1}^{t+1} e^{\Lambda_{-}(s-1)} |\Lambda_{-}|^\beta \frac{(s-1)\gamma}{s^\beta} \mu_{\alpha,r}(k,s) \, ds
\]
uniformly in \( t \geq 1 \) and \( k \in \mathbb{R}. \)

Proposition A.2. Let \( \alpha \geq 0, \ r \geq 0, \delta \in \mathbb{R}, \) and \( \beta \in \{0,1\}. \) Then
\[
e^{-\Lambda_{-}(t-1)} \int_{1}^{t} e^{\Lambda_{-}(s-1)} |\Lambda_{-}|^\beta \frac{1}{s^\beta} \mu_{\alpha,r}(k,s) \, ds \leq \text{const.} \frac{t^{\beta-1}}{t^{\beta-1+\beta}} \mu_{\alpha,r}(k,t)
\]
uniformly in \( t \geq 1 \) and \( k \in \mathbb{R}. \)

For the integral over the interval \([t, \infty)\) we need only one of the bounds in [14].

Proposition A.3. Let \( \alpha \geq 0, \ r \geq 0, \delta > 1, \) and \( \beta \in \{0,1\}. \) Then
\[
e^{-\Lambda_{-}(t-1)} \int_{t}^{\infty} e^{\Lambda_{-}(s-1)} |\Lambda_{-}|^\beta \frac{1}{s^\beta} \mu_{\alpha,r}(k,s) \, ds \leq \text{const.} \frac{t^{\beta-1}}{t^{\beta-1+\beta}} \mu_{\alpha,r}(k,t)
\]
uniformly in \( t \geq 1 \) and \( k \in \mathbb{R}. \)

For the semigroup \( e^{-|k|t} \) we have the following.

Proposition A.4. Let \( \alpha \geq 0, \ r \geq 0, \delta > 1, \) and \( \beta \in \{0,1\}\) Then
\[
e^{-|k|(t-1)} \int_{t}^{\infty} e^{-|k|(s-1)} |k|^\beta \frac{1}{s^\beta} \mu_{\alpha,r}(k,s) \, ds \leq \text{const.} \frac{t^{\beta-1}}{t^{\beta-1+\beta}} \mu_{\alpha,r}(k,t)
\]
uniformly in \( t \geq 1 \) and \( k \in \mathbb{R}. \)
