SUMMARY

The study was designed to assess the various factors pertaining to alcohol and drug abuse among internees with the help of the youth survey questionnaire developed by the WHO. 22.67% of the males indulged in alcohol abuse at least once a month. Correspondingly, cannabis was abused by 9.33% of the boys, which is the most commonly abused drug of addiction, followed by sedatives and tranquilizers.

The commonest explanation offered for the non-medical drug abuse were, to be sociable, for enjoyment, curiosity and relief of psychological stress. Friends have been the main source of introduction. Most of them reported that it was easy to obtain the drugs like marijuana and amphetamines.

Though India has traditionally been described as an abstinent culture, in the recent past we find that it is by no means so. On the contrary, the excessive abusers pose difficult problems for themselves, for quite a number of families, for industrial and other establishments and the society. The increasing magnitude of this problem in our society has led to the public and scientific attention to be focussed on it, though it can not be equated to the studies conducted in the West. The present study was aimed at to assess the prevalence, frequency and allied factors pertaining to alcohol and drug abuse among a batch of internees attached to a teaching hospital in the city of Madras. Also, it was directed towards assessment of the operational aspect of the “Youth survey questionnaire”.

MATERIAL AND METHODS

A batch of internees (Feb. 1982 batch) numbering 116, working in the Madras Medical College and Govt. General Hospital, Madras were selected for the study. The youth survey questionnaire developed by the W. H. O. in co-operation with the United Nations fund for drug abuse control (Smart et al., 1980) was used for his purpose. The questions elicit informations on, a few demographic characteristics, age of first intake, frequency of drug abuse, reasons for non-medical drug use, source of introduction and allied informations pertaining to 13 types of drugs including alcohol and tobacco.

Each internee was supplied with a printed questionnaire by two of their colleagues who were also included in the study team. They were specifically instructed to desist from writing their names in order to ensure strict anonymity and confidentiality. The questionnaires were collected either on the spot or a little later by the same team for transmission to the file maintained for the purpose. The study was conducted from September to November 1982. The subjective responses thus obtained from 116 internees were analysed.

RESULTS AND DISCUSSION

Out of the 116 (M—75, F—41),

1. Asst. Professor of Psychiatry, Madras Medical College and Asst. Surgeon, Govt. General Hospital, Madras-3.
2. Professor and Head, Dept. of Psychiatry, Govt. General Hospital, Madras.
3 & 4. Internes, Madras Medical College, Madras.
58 (73.33%) males have tasted alcohol at least once and it is equally so for tobacco (72.00%). On the other hand 21.95% of the females have resorted to liquor at least once and 14.63% for tobacco. Further our findings point out that 20 (26.67%) boys had resorted to cannabis at some time or the other whereas 28 (37.33%) boys had taken tranquilizers and sedatives. So did one girl with cannabis and 4 (9.76%) girls with tranquilizers and sedatives (Table I). However 13.33% of the men and

Table I Drugs used at least once

| Drugs                       | Male N=75 | Female N=41 |
|-----------------------------|-----------|-------------|
| Tobacco                     | 54 (72.00)| 6 (14.63)   |
| Alcohol                     | 58 (77.33)| 9 (21.95)   |
| Cannabis                    | 20 (26.67)| 1 (2.44)    |
| Cocaine                     | 1 (1.33)  |             |
| Amphetamine                 | 8 (10.67)| 1 (2.44)    |
| Hallucinogen                | 9 (12.00)|             |
| Glue, Aerosol spray Gases   | 2 (2.67)  |             |
| Tranquilizers               | 16 (21.33)| 1 (2.44)    |
| Sedatives                   | 12 (16.00)| 3 (7.32)    |
| Opium                       | 3 (4.00)  |             |
| Heroin                      | 2 (2.67)  |             |
| Other opiates (Methadone, Morphine etc.) | 2 (2.67) |             |

Figures in parenthesis indicate percentage.

73.17% of the ladies had taken neither alcohol nor any of the drugs even once (Table II). The first indulgence in vast majority of them had been at or above the age of 19 Yrs. Tobacco-28 (46.66%), Alcohol-45 (60.16%), Cannabis-18 (85.71%), Sedatives—12 (80%).

Two boys (3.45%) had reported that they had been taking alcohol on more than 20 days during the month prior to the study and so was one boy (5%) on cannabis. It is possible that this group could turn out to be addicts. Alcoholic consumption for 6-19 days was resorted to by 5 (8.62%) boys and also by one (11.11%) girl. So was with 2 (10%) boys on cannabis. For the consumption of alcohol for 1-5 days during the month prior to the study was seen in 10 (17.24%) males and 2 (22.22%) girls. Likewise cannabis was chosen by 4 (20%) males and sedatives and tranquilizers by 5.

Other drugs taken by the boys on not more than a few days are hallucinogens, glue/gases, heroin, opium and its derivatives.

Sethi and Manchanda (1977) have adopted the criteria for abuse as indulgence with a frequency of at least once a month without medical prescription. When this criteria was applied on the whole 17 (22.67%) boys could be labelled as alcohol abusers. Correspondingly cannabis was abused by 7 (9.33%) boys which is the most abused among the drugs and the next most abused drugs were sedatives and tranquilizers. In a survey conducted by Dube and Handa (1971) in and around Agra, 2% of the population studied was found to have problems of drug abuse and out of them 60% abused alcohol.

When an attempt was made to
compare the parental status of the monthly abusers of alcohol and drugs and others the authors could not draw any significant conclusion (Table III).

**Table III** Comparison of monthly abusers with others in relation to their parental education

| Drugs | Monthly Abusers (N=35) | Others (N=81) | Monthly Abusers (N=20) | Others (N=96) |
|-------|------------------------|--------------|------------------------|--------------|
| **Father** | | | | |
| No formal schooling | 1 | 1 | 6 | 8 |

| **X²=4.11, N.S. X²=9.18, N.S.** | | | | |

The commonest explanations for the non medical drug use, offered by the males were enjoyment (25.33%), to be sociable (20%), and curiosity (18.67%). To be sociable, enjoyment, curiosity and relief of psychological stress were some of the explanations offered by the girls. Curiosity was also the usual offered reasons according to Varma et al. (1977) (Table IV).

**Table IV** Reasons for nonmedical drug use

| Reasons | Male (N=75) | Female (N=41) |
|---------|-------------|---------------|
| Religious Custom | - | - |
| To be accepted by others | - | - |
| To be sociable | 15 (20.00) | 2 (4.88) |
| Enjoyment | 19 (25.33) | 1 (2.44) |
| Enhancement of Sex | 1 (1.33) | - |
| Curiosity | 14 (18.67) | 1 (2.44) |
| Treatment of Health Disorder | - | (1.33) |
| Relief of Psychological Stress | 3 (4.00) | 1 (2.44) |
| Relief of Cold Hunger or Fatigue | 1 (1.33) | - |
| Not Known | 29 (38.67) | 36 (87.80) |

Figures in Parenthesis indicate percentage.

Most of the boys and girls had expressed that they would have confessed if they had abused drugs (M—85.33%, F—36.59%) (Table VI).

**Table VII.** Perceived

| Drug | Probably impossible | Very difficult |
|------|---------------------|----------------|
|       | M | F | M | F |
| Marijuana | 2(2.66) | 3(7.32) | 4(5.33) | 6(14.63) |
| Amphetamines and other stimulants | 4(5.33) | 3(7.32) | 2(2.66) | 6(14.63) |

Figures in Parenthesis indicate percentage.
Though marijuana use has been disapproved by most of the girls and boys, quite a number of boys do not disapprove of the occasional use of marijuana (18.67%).

It has been revealed by most of the males that it is rather easy to get the drugs like marijuana and amphetamine (Table VII). Personality of the drug abusers is equally ambitious and antisocial (Table VIII). And friends have been the main source of introduction both for the males (56%) and females (7.32%) (Table V).

**Table V Source of introduction**

| Sources               | Male (N=75) | Female (N=41) |
|-----------------------|-------------|---------------|
| Family                |             | 1 (2.44)      |
| Casual Acquaintance   | 2 (2.67)    | —             |
| Friends               | 42 (56.00)  | 3 (7.32)      |
| Drug Pusher           | 1 (1.33)    | —             |
| Doctor                | 1 (1.33)    | —             |
| Other Health Workers  | —           | —             |
| Pharmacist or Druggist| —           | —             |
| Others                | 1 (1.33)    | —             |
| Not known             | 28 (37.33)  | 37 (90.24)    |

*Figures in parenthesis indicate percentage.*

The results of the data generated, indicate the overwhelming usefulness of this W. H. O. questionnaire, though incorporation of the local commercial names of the drugs and a few more details like the frequency of tobacco intake, motivating factors for the current usage etc., may yield additional information. Further, to assess the availability, apart from Marijuana, amphetamine and other stimulants, other drugs of addiction could also have been included. In addition incorporation of the operational definitions for the Personality types of the drug abusers would enlighten the respondents.
TABLE VIII Opinion about personality of drug users

| Ambitious | Antisocial |
|-----------|------------|
| a) Much less than average | 14 (12.07) | 11 (9.48) |
| b) Less than average | 11 (9.48) | 8 (8.90) |
| c) About average | 18 (15.52) | 15 (12.93) |
| d) More than average | 15 (12.93) | 14 (12.07) |
| e) Much more than average | 1 (0.86) | 9 (7.76) |

Figures in parentheses indicate percentage.

CONCLUSION

About one fourth of the males had been on liquor more than once a month. Cannabis is the choicest of all the drugs for our drug abusing internees, followed by sedatives and tranquilizers. In view of the easy availability of the drugs like marijuana and amphetamine eliminating the source of supply will be one of the fruitful methods to prevent the growing menace of alcohol and drug abuse.

ACKNOWLEDGEMENT

The authors record their sincere thanks for the financial assistance rendered by the Tamil Nadu State Research Committee. The statistical assistance rendered by Mr. Srinivasan, Statistician, Govt. General Hospital, Madras, is also gratefully acknowledged.
